C. Install in accordance with manufacturer's instructions for below grade installation.

D. Install in accordance with manufacturer's instructions for below grade installation and exposed weather installation with jacketing.

E. Insulated Pipe Exposed to Weather: Where piping is exposed to weather, cover cellular glass insulation with aluminum jacket. Seal watertight jacket per manufacturer's recommendations. Install metal jacket with 2-inch overlap at longitudinal and butt joints with exposed lap pointing down. Secure jacket with stainless-steel draw bands 12-inches on center and at butt joints.

3.5 TYPE 5, GLASS WOOL EQUIPMENT INSULATION

A. See General Installation Requirements above.

B. Apply insulation and accessories to roof drain underbodies per manufacturer's recommendations.

C. Roof Drain/Overflow Drain Underbodies: Cover underside of drain body with glass wool insulation; attached with adhesive and supported externally with 26 gauge galvanized flat strapping anchored to structure.

D. Storage Tanks: Cover with glass wool, 2-inches thick. Finish with canvas jacket and adhesive. Overlap joints minimum of 4-inches. Apply two coats latex paint; color selected by Architect.

3.6 TYPE 6, FOAMED PLASTIC EQUIPMENT INSULATION

A. See General Installation Requirements above.

B. Apply insulation and accessories to roof drain and overflow drain underbodies per manufacturer's recommendations.

C. Roof Drain/Overflow Drain Underbodies: Cover underside of drain body with glass wool insulation; attached with adhesive and supported externally with 26 gauge galvanized flat strapping anchored to structure.

3.7 TYPE 7, ADA ACCESSIBLE LAVATORY/SINK INSULATION KIT

A. See General Installation Requirements above.

B. Install in accordance with manufacturer's instructions.

C. Provide lavatory/sink insulation kit. Install on waste fittings, hot and cold water stops and supplies.

3.8 ACCESSORIES

A. See General Installation Requirements above.

B. Install in accordance with manufacturer's instructions.

C. Furnish and install accessories for all insulation types listed in this Section.

3.9 PIPE FITTING INSULATION COVERS

A. See General Installation Requirements above.

B. Install in accordance with manufacturer's instructions.

END OF SECTION 22 07 00

SECTION 22 08 00 - COMMISSIONING OF PLUMBING

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. See Division 01, General Requirements for overall objectives and comply with requirements.
2. This section covers the Contractor's responsibilities for commissioning; installer responsible for installation of a particular system or equipment item to be commissioned is responsible for commissioning activities relating to that system or equipment item.
3. Plumbing systems to be commissioned will include the following:
    a. Sanitary Waste and Vent.
    b. Roof and Storm Drainage.
    c. Sump/ejector pumps.
    d. Domestic water booster pumps.
    e. Domestic water heaters.
    f. Domestic hot water circulating pumps.
    g. Domestic cold water distribution.
    h. Domestic hot water distribution.
    i. Plumbing fixtures.
4. Pre-Functional Checklist and Functional Test requirements specified in this Section are in addition to, not a substitute for, inspection or testing specified in other sections.

1.2 RELATED SECTIONS

A. Contents of Division 22, Plumbing and Division 01, General Requirements apply to this section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 22 00 00, Plumbing Basic Requirements and Division 01, General Requirements.

B. Meet requirements of ASHRAE Guideline 0, The Commissioning Process.

1.4 SUBMITTALS

A. Submittals as required by Section 22 00 00, Plumbing Basic Requirements and Division 01, General Requirements.

B. In addition, provide Pressure Tests, Flushing Reports, and Startup Reports. Submit for approval of Commissioning Authority.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 22 00 00, Plumbing Basic Requirements and Division 01, General Requirements.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 22 00 00, Plumbing Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Commissioning, inspecting, and testing will not modify terms or time periods of mechanical equipment, systems, and controls warranties including related equipment and system, and adjacent work.
2. Control system warranty period starts from date of Commissioning Agent acceptance.

1.7 COORDINATION

A. Reference Section 01 91 13, General Commissioning Requirements for requirements pertaining to coordination during the commissioning process.

1.8 PURPOSE

A. Purpose of commissioning process is to provide Owner assurance that systems have been installed in prescribed manner and will operate within performance guidelines. Commissioning is intended to enhance quality of system startup and aid in orderly transfer of systems to beneficial use by Owner.

B. Commissioning procedures and results will be observed by Commissioning Authority or Owner's staff. Contractor is expected to verify functional readiness of systems to be tested prior to performing the tests in presence of Owner's witness. A high rate of test failure will indicate that Contractor has not adequately verified readiness of systems.

PART 2 - PRODUCTS

2.1 TEST EQUIPMENT

A. Provide standard testing equipment required to perform startup and initial checkout and required functional performance testing; unless otherwise noted such testing equipment will NOT become property of Owner.

B. Specialized tools, test equipment, and instruments required to execute Start-up, checkout, and testing of equipment are to be of sufficient quality and accuracy to test and/or measure system performance within specified tolerances. A testing laboratory must have calibrated its test equipment within the previous 12 months. Calibration to be NIST traceable. Contractor must calibrate test equipment and instruments according to manufacturer's recommended intervals and whenever the test equipment is dropped or damaged. Calibration tags must be affixed to the test equipment or certificates readily available.

C. Equipment-Specific Tools: Where special testing equipment, tools and instruments are specific to a piece of equipment, are only available from the vendor, and are required in order to accomplish startup or Functional Testing, provide such equipment, tools, and instruments as part of the work at no extra cost to Owner; such equipment, tools, and instruments are to become property of Owner.

PART 3 - EXECUTION

3.1 PREPARATION

A. Cooperate with Commissioning Authority in development of the Pre-Functional Checklists and Functional Test Procedures.

B. As part of required submittals for contract, within three months of award of contract, submit for each piece of equipment and controls, manufacturer's startup and installation procedures as well as controls point-to-point and sequence checkout and provide in check list format.

C. Furnish additional information requested by the Commissioning Authority.

D. Prepare a preliminary schedule for plumbing pipe systems testing, flushing and cleaning, equipment start-up and testing, adjusting, and balancing start and completion for use by the Commissioning Authority; update schedule as appropriate.

E. Notify Commissioning Authority when pipe system testing, flushing, cleaning, startup of each piece of equipment and testing, adjusting, and balancing will occur; when commissioning activities not yet performed or not yet scheduled will delay construction notify ahead of time and be proactive in seeing that Commissioning Authority has scheduling information needed to efficiently execute commissioning process.

F. Put equipment and systems into operation and continue operation during each working day of testing, adjusting, and balancing and commissioning, as required.

G. Provide temperature and pressure taps in accordance with Contract Documents.

H. Provide a pressure/temperature plug at each water sensor which is an input point to control system.

3.2 CONTRACTOR'S RESPONSIBILITIES

A. Perform commissioning tests at the direction of the Commissioning Authority.

B. Participate in Plumbing systems, assemblies, equipment, and component maintenance orientation and inspection as directed by the Commissioning Authority.

C. Provide information requested by the Commissioning Authority for final commissioning documentation.

D. Include requirements for submittal data, operation and maintenance data, and training in each purchase order or sub-contract written.

E. Prepare preliminary schedule for Plumbing system orientations and inspections, operation and maintenance manual submissions, training sessions, pipe and duct system testing, flushing and cleaning, equipment startup, testing and balancing and task completion for Owner. Distribute preliminary schedule to commissioning team members.

F. Update schedule as required throughout the construction period.

G. During the startup and initial checkout process, execute the related portions of the Pre-Functional Checklists for commissioned equipment.

H. Contractor to participate and complete checklists using the Commissioning Authority's web based commissioning software Facility Grid. A desktop, laptop, tablet, or iPad will be required.

I. Assist the Commissioning Authority in verification and Functional Performance Tests.

J. Gather operation and maintenance literature on equipment and assemble in binders as required by the Specifications. Submit to Commissioning Authority 45 days after substantial completion.

K. Coordinate with the Commissioning Authority to provide 48 hour advance notice so that the witnessing of equipment and system startup and testing can begin.

L. Notify the Commissioning Authority a minimum of one week in advance of the time for the start of the balancing work.

M. Participate in, and schedule vendors and contractors to participate in the training sessions.

N. Provide written notification to the CM/GC and Commissioning Authority that the following work has been completed in accordance with the Contract Documents, and that the equipment, systems, and sub-system are operating as required.

1. Plumbing equipment including domestic water heaters, pumps, plumbing fixtures, and other equipment furnished under this Division.
2. Gas piping, sanitary waste and vent piping, storm drainage piping, sump pumps and automatic sprinkler system.

O. Provide training of the Owner's operating staff using expert qualified personnel, as specified.

P. Reference Section 01 91 13, General Commissioning Requirements, for additional contractor responsibilities.

3.3 OWNER'S RESPONSIBILITIES

A. Reference Section 01 91 13, General Commissioning Requirements for Owner's responsibilities.

3.4 DESIGN PROFESSIONAL'S RESPONSIBILITIES

A. Reference Section 01 91 13, General Commissioning Requirements for the Architect, Mechanical, Electrical, and Plumbing Engineer's responsibilities.

3.5 COMMISSIONING AUTHORITY'S RESPONSIBILITIES

A. Reference Section 01 91 13, General Commissioning Requirements for the Commissioning Authority's responsibilities.

3.6 TESTING PREPARATION

A. Certify, in writing, to the Commissioning Authority that plumbing instrumentation and control systems have been completed and calibrated, that they are operating according to the Contract Documents, and that pre-test setpoints have been recorded.

B. Certify, in writing, that discrepancies discovered during the test and balance process have been resolved and that testing, adjusting, and balancing is completed.

C. Set systems, subsystems, and equipment into operating mode to be tested (e.g. normal auto position, normal manual position, unoccupied mode, emergency power and alarm conditions.

D. Inspect and verify the position of each device and interlock identified on checklists.

E. Check safety cutouts, alarms, and interlocks with smoke control and life-safety systems during each mode operation.

3.7 TAB COORDINATION

A. TAB: Testing, adjusting, and balancing of Plumbing.

B. Coordinate commissioning schedule with TAB schedule.

C. Review the TAB plan to determine capabilities of the control system toward completing TAB.

D. Provide necessary unique instruments and instruct TAB technicians in their use; such as handheld control system interface, etc.

E. Have required Pre-Functional Checklists, calibrations, startup and component Functional Tests of the system completed and approved by Commissioning Authority prior to starting TAB.

F. Provide a qualified control system technician to operate controls to assist TAB technicians or provide sufficient training for TAB technicians to operate system without assistance.

3.8 GENERAL TESTING REQUIREMENTS

A. Provide technicians, instrumentation, and tools to perform commissioning test at the direction of Commissioning Authority.

B. Scope of Plumbing testing to include entire Plumbing installation. Testing to include measuring capacities and effectiveness of operational and control functions.

C. Test operating modes, interlocks, control responses, and responses to abnormal or emergency conditions, and verify proper response of building automation system controllers and sensors.

D. The Commissioning Authority along with the Plumbing contractor, balancing subcontractor to prepare detailed testing plans, procedures, and checklists for Plumbing systems, subsystems, and equipment.

E. Tests will be performed using design conditions whenever applicable.

F. Simulated conditions may need to be imposed using an artificial load when it is not practical to test under design conditions. Before simulating conditions, calibrate testing instruments. Provide equipment to simulate loads. Set simulated conditions as directed by the Commissioning Authority and document simulated conditions and methods of simulation. After tests, return settings to normal operating conditions.

G. The Commissioning Authority may direct that setpoints be altered when simulating conditions is not practical.

H. The Commissioning Authority may direct that sensor values be altered with a signal generator when design or simulating conditions and altering setpoints are not practical.

I. If tests cannot be completed because of a deficiency outside the scope of the Plumbing system, document the deficiency and report it to the Owner. After deficiencies are resolved, reschedule tests.

3.9 PLUMBING SYSTEMS, SUBSYSTEMS AND EQUIPMENT TESTING PROCEDURES

A. Pipe system cleaning, flushing, hydrostatic tests, and chemical treatment: Test requirements are specified in Division 22, Plumbing Piping sections. Plumbing Contractor to prepare a pipe system cleaning, flushing, and hydrostatic testing plan. Provide cleaning, flushing, testing, and treating plan and final reports to the Commissioning Authority. Plan should include the following.

1. Sequence of testing procedures for each section of pipe to be tested, identified by pipe zone or sector identifications marker. Markers to be keyed to Drawings for each pipe sector, showing the physical location of each designated pipe test section. Drawings keyed to pipe zones or sectors to be formatted to allow each section to be physically located and identified when referred to in pipe system cleaning, flushing, hydrostatic testing, and chemical treatment plan.
2. Description of equipment for flushing operations.
3. Minimum flushing velocity.

B. Functional Performance Tests: Tests will be fully documented with test procedures, expected results for each procedure, and documented in either pass or fail. Tests are written by the Commissioning Authority and performed by the Contractor. The Commissioning Authority documents the results of the test.

3.10 DEFICIENCIES / NON-CONFORMANCE AND COST OF RETESTING

A. The Commissioning Authority documents the results of the tests. Corrections of minor deficiencies identified are made during the tests at the discretion of the Commissioning Authority. The Commissioning Authority documents the testing results on the Functional Performance Testing document. Deficiencies or non-conformance issues are noted and reported to the GC and Owner via the Master Cx Issues/Resolutions Log. The Contractor with then correct deficiencies, notify the Commissioning Authority of the correction, and then schedule retesting of the issue with the GC and Commissioning Authority. For areas in dispute of the issue between the Commissioning Authority and Contractor to go directly to the A/E. A/E to provide direction of the design intent and expected result to clear up the dispute.

B. If the Plumbing contractor fails to demonstrate proper sequence of operation in any of the second round of Functional Performance Tests, the Commissioning Authority's costs for witnessing further demonstration of that test procedure may be assigned to the Plumbing contractor by the Owner as a deduct to their contracted price. The Plumbing contractor will not be responsible for costs related to failure due to design or other factors beyond their control, though it is expected to call any design concerns (and other factors beyond their control that might cause failure) to the attention of the GC and Commissioning Authority.

C. Reference Section 01 91 13, General Commissioning Requirements for additional contractor responsibilities

3.11 OPERATION AND MAINTENANCE MANUALS

A. See Division 01, General Requirements for additional requirements.

B. Submit manuals related to items that were commissioned to Commissioning Authority for review; make changes recommended by Commissioning Authority.

C. Commissioning Authority will add commissioning records to manuals after submission to Owner.

3.12 DEMONSTRATION AND TRAINING

A. See Division 01, General Requirements for additional requirements.

B. Demonstrate operation and maintenance of Plumbing systems to Owner's personnel; if during any demonstration, system fails to perform in accordance with information included in Operations and Maintenance (O&M) manual, stop demonstration, repair or adjust, and repeat demonstration. Demonstrations may be combined with training sessions if appropriate.

C. These demonstrations are in addition to, and not a substitute for, Pre-Functional Checklists and demonstrations to Commissioning Authority during Functional Testing.

D. Training:

1. Submit a written training plan to the Owner and Architect/Engineer for review and approval. Contractor's training plan to cover the following elements:
    a. Equipment included in training.
        1) Intended audience.
        2) Location of training.
        3) Objectives.
    b. Subjects covered.
    c. Duration of training on each subject.
    d. Instructor for each subject.
    e. Methods (classroom lecture, video, Site walk-through, actual operational demonstrations, written hand outs, etc.).
    f. Instructors and qualifications.
2. Contractor is to have the following training responsibilities:
    a. Provide a training plan ten calendar days prior to the scheduled training, in accordance with Division 01, General Requirements.
    b. Provide Owner personnel with comprehensive training in the understanding of the systems and the operation and maintenance of each major piece of commissioned mechanical equipment or system.
    c. Training to start with classroom sessions, if necessary, followed by hands-on training on each piece of equipment, which will illustrate the various modes of operation, including start-up, shutdown, fire/smoke alarm, power failure, etc.
    d. During any demonstration, should the system fail to perform in accordance with the requirements of the O&M manual or sequence of operations, the system will be repaired or adjusted as necessary and the demonstration repeated.
    e. The appropriate trade or manufacturer's representative will provide the instructions on each major piece of equipment. This representative may be the Start-up technician for the piece of equipment, the installing contractor, or the manufacturer's representative. Practical building operating expertise, as well as in-depth knowledge of modes of operation of the specific piece of equipment, is required. More than one party may be required to execute the training.

E. Provide the services of manufacturer representatives to assist instructors where necessary.

END OF SECTION 22 08 00

SECTION 22 10 00 - PLUMBING PIPING

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Sanitary, Drainage (Rain/Stormwater) DWV Piping, Buried Within 5-feet of Building
2. Sanitary, Drainage (Rain/Stormwater) DWV Piping, Above Grade
3. Water Piping, Buried Within 5-feet of Building
4. Hot and Cold Domestic Water Above Grade
5. Condensate Piping
6. Primer Piping
7. Piping Specialties
8. Cleanouts

1.2 RELATED SECTIONS

A. Contents of Division 22, Plumbing and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 22 00 00, Plumbing Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. NSF 61, Annex G.
2. Steel pipe to conform to ASTM and ANSI Standards as specified in this Section.
3. Copper piping to conform to ASTM B88, B306 and B208 and the standards of Copper Development Association (CDA), and American Welding Society, (AWS).
4. Cast Iron Piping to conform to standards of ASTM A-74, CISPI 301 and FM 1680.
5. Manufacturer's Standards Society (MSS) for valving and support reference standard.
6. American Water Works Association (AWWA) for Valving Assembly Standards.
7. American Society of Sanitation Engineers (ASSE) for Valving Standards.
8. American National Standards Institute (ANSI) for Piping Standards.
9. NFPA Standard 51B - “Fire Prevention in Use of Cutting and Welding Processes.”
10. Crosslinked polyethylene (PEX) pipe conforming to ASTM F876, F877 and CSA B1375, or DIN 16892 and 16893.

1.4 SUBMITTALS

A. Submittals as required by Section 22 00 00, Plumbing Basic Requirements and Division 01, General Requirements.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 22 00 00, Plumbing Basic Requirements and Division 01, General Requirements.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 22 00 00, Plumbing Basic Requirements and Division 01, General Requirements.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. See component manufacturers listed in individual articles below.

B. ADS

C. American-USA

D. Cerro

E. Charlotte

F. Clamp-All

G. Conbraco/Apollo Press

H. Elkhart

I. Enfield

J. Fuseseal

K. Gruvlok

L. Husky

M. Ideal

N. Mifab

O. Mission

P. Mueller

Q. Nibco

R. Orion

S. Shurjoint Mechanical Couplings

T. Sioux Chief

U. Spears

V. Tyler

W. Uponor

X. Viega

Y. Zurn

Z. Or approved equivalent.

AA. Cleanouts:

1. J.R. Smith
2. Mifab
3. Sioux Chief
4. Wade
5. Watts
6. Zurn
7. Or approved equivalent.

BB. Firestopping Penetrations in Fire Rated Wall Floor Assemblies:

1. Hilti
2. Proset
3. Or approved equivalent.

2.2 GENERAL

A. Provide pipe, tube, and fittings of the same type, fitting requirements, grade, class, and the size and weight indicated or required for each service, as indicated in other Division 22, Plumbing Specifications. Where type, grade, or class is not indicated, provide proper selection as determined by installer for installation requirements, and comply with governing regulations and industry standards.

B. Manufactured materials delivered, new to the project site and stored in their original containers.

C. Product Marking: Furnish each item with legible markings indicating name brand and manufacturer, manufacturing process, heat number and markings as required per ASTM and UL/FM Standards.

2.3 SANITARY, DRAINAGE (RAIN/STORMWATER) DWV PIPING, BURIED WITHIN 5-FEET OF BUILDING

A. PVC Pipe: ASTM D 2665 IPS Schedule 40, **SOLID WALL** piping for drainage/waste and vent (DWV).

1. Fittings: PVC DWV ASTM D2665.
2. Joints: Solvent welded, with ASTM D2564 solvent cement, 2-step glue (primer and glue) is required.

2.4 SANITARY, DRAINAGE (RAIN/STORMWATER) DWV PIPING, ABOVE GRADE

A. PVC Pipe: ASTM D 2665 IPS Schedule 40, **SOLID WALL** piping for drainage/waste and vent (DWV).

1. Fittings: PVC DWV ASTM D2665.

2. Joints: Solvent welded, with ASTM D2564 solvent cement, 2-step glue (clear primer and glue) is required.

2.5 WATER PIPING, BURIED WITHIN 5-FEET OF BUILDING

A. Copper Pipe: ASTM B88, hard drawn, Type K (A).

1. Fittings: ASME B16.18, cast copper alloy or ASME B16.22 wrought copper and bronze.
2. Joints: Brazed - BCuP2.

B. Ductile Iron Pipe: AWWA C151/A21.51.

1. Fittings: Ductile or gray iron, standard thickness.
2. Joints: AWWA C111/A21.11, rubber gasket with 3/4-inch diameter rods, mega lug type.

2.6 HOT AND COLD DOMESTIC WATER ABOVE GRADE

A. Copper Tube: 3-inches and above. ASTM B88 (ASTM BA88m), Type K (A), Drawn.

1. Fittings: ASME B16.18, cast copper alloy or ASME B16.22, wrought copper and bronze.
2. Joints: Brazed BCuP2.

B. Copper Tube: 2-1/2-inches and smaller. ASTM B88 (ASTM B88M), Type L (B), Drawn.

1. Fittings: ASME B16.18 copper.
2. Joints: ASTM B32, alloy Sn95 solder.

C. Cross-Linked Polyethylene Tubing - Type "A" - Engle Method - Fittings and Accessories (except exposed locations).

1. Tubing:
   a. Cross-linked polyethylene (PEX) tubing complies with requirements of ASTM F876 and F877, and cross-linking method must be Type A (hot) method.
   b. PEX tubing to have minimum working pressure of not less than 160 PSI for water at 73.4 degrees F, 100 PSI for water at 180 degrees F and 80 PSI for water at 200 degrees F determined in accordance with Plastic Pipe Institute Technical Report TR-3/92, and listed in Plastic Pipe Institute Technical Report TR-4/95.
   c. Co-extruded – “colored piping” (blue/red) is not to be utilized.
2. Fittings:
   a. Fittings: Engineered Plastic Fittings for above grade applications. Engineered plastic fittings for below grade applications. Serrated type with reinforcement rings.
   b. Reinforcement Rings: Manufactured using "Engel Method" to ensure that viscoelastic stress regenerative properties are sufficient to produce pressure tight seal.
   c. Fitting Insert: Of such dimension in that tubing must be expanded in order to facilitate insertion of fitting into tube.
   d. Accomplish expansion of tubing and ring by an expansion tool designed expressly for that purpose.
   e. Fittings complies with requirements of ASTM F877.
3. Manifolds: Provide premanufactured copper manifolds of same manufacturer as piping.
4. Stub-out Ells and Stub-out Brackets: Provide premanufactured Type L copper stub-out ells and copper stub-out brackets.

2.7 CONDENSATE PIPING

A. Copper Tube: ASTM B 88 (ASTM B898M), Type K (A), L (B), or M (C).

1. Fittings: ASME B16.29, wrought copper.
2. Joints: ASTM B32, alloy Sn50 solder.

B. Use chemical resistant piping for drainage of condensate from combustion fuel sources (such as condensing boilers and water heaters), as noted in this Section for area of application.

C. CPVC (Chlorinated Polyvinyl Chloride) Pipe and Fittings - Except Exterior of the Building and in Plenums and Rated Assemblies:

1. Pipe and Fittings: Schedule 40, NSF-14, ASTM 439, IAPMO IS20-96, socket fittings, solvent weld.

2.8 PRIMER PIPING

A. Above Ground: Type L hard-drawn copper tubing with wrought sweat fittings and soldered joints.

B. Below Ground: Type L soft annealed copper tubing with wrought sweat fittings and brazed joints.

C. Below Ground: Cross-linked polyethylene (PEX) and engineered plastic fittings.

2.9 PIPING SPECIALTIES

A. Pipe Escutcheons:

1. Provide pipe escutcheons as specified with inside diameter closely fitting pipe outside diameter, or outside of pipe insulation where pipe is insulated. Select outside diameter of escutcheon to completely cover pipe penetration hole in floors, walls, or ceilings; and pipe sleeve extension, if any. Furnish pipe escutcheons with nickel or chrome finish for occupied areas, prime zinc base paint finish for unoccupied areas.
2. Pipe Escutcheons for Moist Areas: For waterproof floors, and areas where water and condensation can be expected to accumulate, provide stainless steel, cast brass or sheet brass escutcheons, solid or split hinged.
3. Pipe Escutcheons for Dry Areas: Provide stainless steel escutcheons, solid or split hinged.

B. Low Pressure Y-Type Pipeline Strainers:

1. Provide strainers full line size of connecting piping, with ends matching piping system materials. Select strainers for 125 percent of the working pressure of piping system with Type 304 stainless steel screens made with 1/16-inch perforations on 4-inch and smaller strainers, and 1/8-inch perforations on 6-inch and larger strainers.
2. Threaded Ends, 2-inch and Smaller: Cast-iron body, screwed screen retainer with centered blowdown fitted with plus.
3. Flanged Ends, 2-1/2-inch and Larger: Cast-iron body, bolted screen retainer with off-center blowdown fitted with hose bibb.

C. Air Vent with Valves:

1. Install automatic air vents in all closed and open-loop water systems at high points and at any other point necessary to free system of air. Provide shut-off valve in riser to each automatic vent valve to facilitate servicing. Manual type vent may be used in lieu of automatic type, where specifically shown on the Drawings.
2. Manufacturer: Hoffman #79.

D. Dielectric Waterways:

1. Provide standard products recommended by manufacturers in service indicated, which effectively isolate ferrous from non-ferrous piping (eliminating electrical conductance) to prevent galvanic action and stop corrosion.
2. Provide dielectric waterways or brass nipple fitting for transitions between dissimilar metal piping.

E. Unions:

1. Unions to comply with the following schedule:
   a. Black Steel, 2-inch and smaller: 150 PSI screwed malleable iron, ground joint, brass to iron seat.
   b. Black Steel, 2-1/2-inch and larger: 150 PSI cast iron screwed flanged, flat faced, full faced gasket.
   c. Soldered Copper or Brass Pipe, 2-inch and smaller: 150 PSI cast bronzed or copper, ground joint, non-ferrous seat with soldered ends.
   d. Screwed Copper or Brass Pipe, 2-inch and smaller: 150 PSI cast brass, ground joint, brass to brass seat, threaded ends.
   e. Flanged Copper or Brass Pipe, 2-1/2-inch and larger: Two 150 PSI cast bronze flanges.
   f. Manufacturer: EPCO, Mueller, Stanley G. Flagg, Watts, or approved equivalent.

F. Flexible Piping Connectors - Expansion Loops or Seismic Joints:

1. Provide flexible expansion loops of size and material noted on Drawings. Design flexible loops to impart no thrust loads on the anchors. The loop consists of two flexible sections of hose and braid, two 90 degree elbows, and a 180 degree return. Install loops in a neutral, precompressed, or pre-extended condition as required for the application. Provide drain plug for loops installed hanging down. Loops installed straight up may be fitted with an automatic air release valve to purge air from the high point of the loop. Loops installed in any position other than hanging down must have the 180 degree return supported.
2. Copper Pipe: Copper fittings, bronze hose and braid sweat solder ends, Metraloop Series MLS 8000.
3. Steel Pipe: Schedule 40 carbon steel fittings, stainless steel hose and braid.
4. Threaded Ends: Metraloop Series MLT 80000.
5. Flanged Ends: Metraloop Series MLF 80000.
6. Welded Ends: Metraloop Series MLW 80000.
7. Grooved Ends: Metraloop Series MLG 80000.
8. Gas Lines, CSA Approved: Metraloop - Gas MLT or MLF Series.
9. Provide expansion joints by Mason, Flexionics, or Shur Fit, for vertical and horizontal straight run hot water and domestic hot water recirculation piping exceeding 1,000-feet. Install per manufacturer's installation directions.

2.10 CLEANOUTS

A. Locate cleanouts as shown on Drawings and as required by local code. Cleanouts same size as pipe except that greater than 4-inches will not be required. Plastic components not allowed, except unless specifically noted.

B. Types:

1. Tile Floor Cleanouts: J. R. Smith 4020 with round heavy-duty nickel bronze top, taper thread, ABS plug and standard screws.
2. Carpeted Floor Cleanout: J. R. Smith 4020-X with carpet clamping frame, round heavy-duty nickel bronze top, taper thread, ABS plug, carpet clamping device and standard screws.
3. Concrete Floor Cleanout (General): J. R. Smith 4020 with round heavy-duty nickel bronze top, taper thread and ABS plug with standard screws.
4. Parking, Drives and Concrete Floor Cleanouts (Heavy Load): J. R. Smith 4100 with round heavy-duty nickel bronze top, taper thread and ABS plug with standard screws.
5. Wall Cleanout: J. R. Smith 4472-U, countersunk bronze taper thread plug, stainless steel shallow cover and vandalproof screws.
6. Outside Area Walks: J. R. Smith 4020-U with round heavy-duty nickel bronze top, taper thread, ABS plug and top secured with vandalproof screws. Install in 18- by 18- by 6-inch deep concrete pad flush with grade.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS

A. Underground Piping Systems:

1. Examination: Verify that excavations are to required grade, dry, and not over-excavated.
2. Perform necessary excavation and backfill required for installation of plumbing work. Repair piping or other work at no expense to Owner.
3. Water: Keep excavations free of standing water. Re-excavate and fill back excavations damaged or softened by water or frost to original level with sand, crushed rock or other approved material at no expense to Owner.
4. Tests: During progress of work for compacted fill, Owner reserves right to request compaction tests made under direction of testing laboratory.
5. Trench Excavation: Excavate trenches to necessary depth and width, removing rocks, unstable soil (muck, peat), roots and stumps. Excavation material is classified as "base fill" and "native." Base fill excavation material consisting of placed crushed rock may be used as backfill above "Pipe Zone." Remove and dispose off site native excavation material. Adequate width of trench for proper installation of piping or conduit.
6. Support Foundations:
    a. Foundations: Excavate trenches located in unstable ground areas below elevation required for installation of piping to depth which is determined by Architect as appropriate for conditions encountered. Place and compact approved foundation material in excavation up to "Bedding Zone." Dewatering, placement, compaction and disposal of excavated materials to conform to requirements contained in other Specification Sections or Drawings.
    b. Over-Excavations: Where trench excavation exceeds required depths, provide, place and compact suitable bedding material to proper grade or elevation at no additional cost to Owner.

c. Foundation Material: Where native material has been removed, place and compact necessary foundation material to form base for replacement of required thickness of bedding material.

	Class A		Class B	
Material Passing	**Min.**	**Max.**	**Min.**	**Max.**
3/4-inch Square Opening	**27**	**47**	**0**	**1**

d. Bedding Material: Full bed piping on sand, pea gravel, or 3/4-inch minus crushed rock. Place minimum 4-inch deep layer of sand, pea gravel, or crushed rock on leveled trench bottom for this purpose. Remove bedding to necessary depth for piping bells and couplings to maintain contact of pipe on bedding for its entire length. Provide additional bedding in excessively wet, unstable, or solid rock trench bottom conditions as required to provide firm foundation.

7. Backfilling:
   a. Following installation and successful completion of required tests, backfill piping in lifts.
      1) In "Pipe Zone" place backfill material and compact in lifts not to exceed 6-inches in depth to height of 12-inches above top of pipe. Place backfill material to obtain contact with entire periphery of pipe, without disturbing or displacing pipe.
      2) Place and compact backfill above "Pipe Zone" in layers not to exceed 12-inches in depth.
   b. Backfill Material:
      1) Backfill Material in "Pipe Zone": 3/4-inch minus crushed rock, sand or pea gravel.
      2) Crushed rock, fill sand or other backfill material approved elsewhere in Specifications may be used above "Pipe Zone."
8. Compaction of Trench Backfill:
   a. Where compaction of trench backfill material is required, use one of following methods or combination thereof:
      1) Mechanical tamper,
      2) Vibratory compactor, or
      3) Other approved methods appropriate to conditions encountered.
   b. Architect to have right to change methods and limits to better accommodate field conditions. Compaction sufficient to attain 95 percent of maximum density at optimum moisture content unless noted otherwise on Drawings or elsewhere in Specifications. Water "puddling" or "washing" is prohibited.

B. General Installation:

1. Work performed by experienced journeyman plumbers. No exceptions.
2. Provide access panels for concealed valves, shock arrestors, trap primers and the like.
3. Install pipes and pipe fittings in accordance with recognized industry practices and manufacturer's recommendations.
4. Align piping accurately at connections, within 3/32-inch misalignment tolerance. Comply with ANSI B31 Code for Pressure Piping.

5. Locate piping runs, as indicated, vertically and horizontally (pitched to drain) and avoid diagonal runs wherever possible. Orient horizontal runs parallel with walls and column lines. Locate runs as shown or described by diagrams, details, and notations or, if not otherwise indicated, run piping in shortest route which does not obstruct space or block access for servicing building and its equipment. Hold piping close to walls, overhead construction, and other structural and permanent-enclosure elements of building. Limit clearance to 1/2-inch where furring is shown for enclosure or concealment of piping, but allow for insulation thickness, if any. Where possible, locate insulated piping for 1-inch clearance outside insulation. Whenever possible in finished and occupied spaces, conceal piping from view by locating it in column enclosures, hollow wall construction or above suspended ceilings. Do not encase horizontal runs in solid partitions, except as indicated.
   a. Do not run piping through transformer vaults, telephone, elevator, electrical or electronic equipment spaces or enclosures unless indicated on Drawings.
   b. Concealed Piping Above Suspended Ceiling: Plan and coordinate to avoid interferences; install to maintain suspended ceiling heights shown on Architectural Drawings. Allow sufficient space above removable ceiling panels for panel removal. Locate piping so that valves are visible and accessible within 24-inches horizontally and vertically from point of access to the ceiling space. Provide plenum rated materials for ceiling spaces which are being used as plenums.
   c. Exposed Work: Run pipes parallel to the closest wall unless otherwise shown on Drawings; maintain maximum headroom; avoid light fixtures.
   d. Insulation Space Allowance: In piping work, allow space for pipe insulation and jackets. If interferences occur, move the piping to accommodate insulation thickness specified.
   e. Pipe Lengths: Do not use short lengths or nipples at locations where a full length of pipe will fit.
   f. Alignment Prior to Supporting and Anchoring: Place piping in proper alignment and position prior to connection to anchors, expansion loops, and equipment. Furnish jacking devices, temporary steel structural members, and assembled structures as necessary. Remove temporary equipment and structures supplied by contractor at completion; such items to remain Contractor property.
   g. Valve and Equipment Connections: Piping not to place undue stress on flanged valves and equipment connections. Install mating flange faces true and parallel to each other and not requiring springing of piping for assembly. Pipe hangers and supports to carry the full weight of the pipe and fluid.
   h. Piping Leaks: Correct immediately; use new materials; leak-sealing compounds or peening not permitted.
   i. Pressure Ratings of Fittings, Valves, and Devices in Piping Systems: Pressure rating to be equal to, or greater than, the maximum working pressure of the system.
   j. Equipment Vents and Drains: Provide for coils and vessels which contain water. Provide isolation valves and outlet valves at piping high and low points to permit venting and draining of the vessel without venting and draining connected piping. Provide hose connections and caps on drain lines.
   k. Escutcheon Plates: Where exposed insulated and uninsulated piping passes through walls, floors or ceilings; provide spring clip type. Provide plates on both sides of wall or floor.

C. Testing:

1. General:

a. Provide temporary equipment for testing, including pumps, compressors, tanks, and gauges, as required. Test piping systems before insulation (if any) is installed and remove or disengage control devices before testing. Where necessary, test sections of each piping system independently, but do not use piping valves to isolate sections where test pressures exceed local valve operating pressure rating. Fill each section with water, compressed air, or nitrogen and pressurize for the indicated pressure and time.
b. Notify Architect and local Plumbing Inspector 2 days before tests.
c. Drainage, Waste and Vent Piping: Test in accordance with governing plumbing code or as follows: Test drainage and venting systems, with necessary openings plugged, to permit system to be filled with water and subjected to water pressure of minimum of 5 PSI head. System to hold water without water level drop greater than 1/2 pipe diameter of largest nominal pipe size within 24-hour period. Test system in sections if minimum head cannot be maintained in each section. 5 PSI head to be minimum pressure at highest joint.
d. Water Piping: Eliminate air from system. Fill and test at 125 PSIG or minimum 1-1/2 times static pressure at connection to serving utility main for period of two hours with no loss in pressure.
e. Send test results to Architect for review and approval and include in Operation and Maintenance Manual.

2. Testing of Pressurized Systems:
   a. Test each pressurized piping system at 150 percent of operating pressure indicated, but not less than 125 PSIG test pressure.
   b. Observe each test section for leakage at end of test period. Test fails if leakage is observed or if pressure drop exceeds 2 percent of test pressure.
3. Test hot and cold domestic water piping systems upon completion of rough-in and before connection to fixtures at hydrostatic pressure of 125 PSIG.

D. Corrosive Soil Conditions:

1. Wrap steel, iron, copper or other metal piping materials/fittings with Protecto Wrap 200, 30 mils or greater. Maintain a 1/2-inch overlap and install per manufacturer's recommendations.
2. Provide epoxy coated cast iron pipe and fittings for drainage systems.
3. Obtain and review project soils report for verification of requirements concerning corrosive soils.

E. Protection:

1. Keep pipe openings closed by means of plugs or caps to prevent entrance of foreign matter. Protect piping, ductwork, fixtures, equipment and apparatus against dirty water, chemical or mechanical damage both before and after installation. Restore to its original condition or replace fixtures, equipment or apparatus damaged prior to final acceptance of work.

F. Firestopping Penetrations in Fire-Rated Wall/Floor Assemblies:

1. Provide proper sizing when providing sleeves or core-drilled holes to accommodate penetration. Firestop voids between sleeve or core-drilled hole and pipe passing through to meet requirements of ASTM E814.

G. Cut piping squarely, free of rough edges and reamed to full bore. Insert piping fully into fittings.

H. Provide joints of type indicated in each piping system.

I. Thread pipe in accordance with ANSI/ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded ends to remove burrs and restore full inside diameter. Remove excess cutting oil from piping prior to assembly. Apply pipe joint compound, or pipe joint tape (Teflon) where recommended by pipe/fitting manufacturer, on male threads at each joint and tighten joint to leave not more than 3 threads exposed.

J. Sleeves:

1. Pipe Sleeves:
   a. Layout work in advance of pouring concrete, furnish, and set sleeves necessary to complete work.
   b. Floor Sleeves: Provide sleeves on pipes passing through concrete or masonry construction. Extend sleeve 1-inch above finished floor. Caulk pipes passing through floor with non-shrinking grout or approved caulking compound (Except DWV Piping penetrating a concrete slab set on finish grade), provide "Link-Seal" sleeve sealing system for concrete/slab penetrations which are below grade. Caulk/seal piping passing through fire rated building assembly with UL rated assemblies. Provide fire-rated assemblies per local AHJ requirements
   c. Wall Sleeves: Provide sleeves on pipes passing through concrete or masonry construction. Provide sleeve flush with finished face of wall. Caulk pipes passing through walls with non-shrinking caulking compound. Provide modular link sealing system for concrete penetrations which are below grade. Caulk/seal piping passing through fire-rated assemblies per local AHJ requirements.
   d. Beam Sleeves: Coordinate with trades for locations of pipe sleeves in reinforced concrete and steel beams. Indicate penetrations on structural shop drawings. See Drawings and Specifications for specific sleeve location limitations. Plumbing Drawings are diagrammatic. Offset piping as required to meet these limitations. Pipe sleeve locations must be indicated on reinforced concrete and steel beam shop drawings. Field cutting of beams not allowed without written approval of structural engineer. No extra costs allowed for failure to coordinate beam penetrations prior to reinforced concrete and steel beam shop drawing submittal.
2. Installation of metallic or plastic piping penetrations through non fire-rated walls and partitions and through smoke-rated walls and partitions:
   a. Install fabricated pipe sleeve.
   b. After installation of sleeve and piping, tightly pack entire annular void between piping or piping insulation and sleeve identification.
   c. Seal each end airtight with a resilient nonhardening seal per code.
3. Piping penetrations through fire-rated (1 to 3 hour) assemblies:
   a. Select and install pre-engineered pipe penetration system in accordance with UL listing and manufacturer's recommendation.
   b. Provide proper sizing when providing sleeves or core-drilled holes to accommodate penetration. Firestop voids between sleeve or core-drilled hole and pipe passing through to meet requirements of ASTM E84.

3.2 SANITARY, DRAINAGE (RAIN/STORMWATER) DWV PIPING, BURIED WITHIN 5-FEET OF BUILDING

A. Excavation and Backfill:

1. See General Installation Requirements above.

B. Drainage, Waste and Vent Piping: Test in accordance with governing plumbing code or as follows: Test drainage and venting systems, with necessary openings plugged, to permit system to be filled with water and subjected to water pressure of minimum of 5 PSI head. System to hold water without water level drop greater than 1/2 pipe diameter of largest nominal pipe size within 24-hour period. Test system in sections if minimum head cannot be maintained in each section. 5 PSI head to be minimum pressure at highest joint.

C. Corrosive Soil Conditions:

1. Wrap steel, iron, copper or other metal piping materials/fittings with Protecto Wrap 200, 30 mils or greater. Maintain a 1/2-inch overlap and install per manufacturer's requirements.
2. Provide epoxy coated cast iron pipe and fittings for drainage systems.

D. Cast-Iron Joints: Comply with coupling manufacturer's Cast Iron Soil Pipe Institute Standards and installation instructions.

E. Sanitary and Storm Drainage:

1. Grade piping at a uniform pitch of 2 percent unless otherwise noted on Drawings.
2. Drains:
   a. Install drains to suit finished floor. Install drains and components per manufacturer's instructions. Slope flooring to floor drain or sink a minimum of 1/2-inch below finished floor elevation.
   b. Install P-traps for hub drains, floor drains and floor sinks. P-traps to be of the same materials as soil and waste piping. Provide trap primer assembly for each drain or floor sink.

F. Epoxy Coated Cast Iron Pipe and Fittings: Coat the piping terminus of any cut piping with an applied epoxy per manufacturer's instructions. Denso Protal 7200 fast-cure epoxy repair coating.

3.3 SANITARY, DRAINAGE (RAIN/STORMWATER) DWV PIPING, ABOVE GRADE

A. Drainage, Waste and Vent Piping: Test in accordance with governing plumbing code or as follows: Test drainage and venting systems, with necessary openings plugged, to permit system to be filled with water and subjected to water pressure of minimum of 5 PSI head. System to hold water without water level drop greater than 1/2 pipe diameter of largest nominal pipe size within 24-hour period. Test system in sections if minimum head cannot be maintained in each section. 5 PSI head to be minimum pressure at highest joint.

B. Firestopping Penetrations in Fire-Rated Wall/Floor Assemblies:

1. Provide proper sizing when providing sleeves or core-drilled holes to accommodate penetration. Firestop voids between sleeve or core-drilled hole and pipe passing through to meet requirements of ASTM E814.

C. Solder copper tube and fitting joints with lead free nickel/silver bearing solder meeting ASTM Std. B-32, in accordance with IAPMO Is 3-93, ASTM B-828 and Copper Development Association recommended procedures. Clean joints by other than chemical means prior to assembly. "Shock" cooling is prohibited. Fluxes to be water soluble for copper and brass potable water applications, and meeting CDA standard test method 1.0 and ASTM B813-91. Apply solder until a full fillet is present around the joint. Do not apply solder and flux in such excessive quantities as to run down interior of pipe. Lead solder or corrosion flux not to be present at the jobsite.

D. Cast-Iron Joints: Comply with coupling manufacturer's Cast Iron Soil Pipe Institute Standards and installation instructions.

E. Sanitary and Storm Drainage:

1. Grade piping at a uniform pitch of 2 percent unless otherwise noted on Drawings.
2. Indirect Waste or Drain Piping: Extend piping to discharge as shown on Drawings. Maintain minimum air gap. Provide traps on indirect waste or drain piping exceeding 60-inches.
3. Fixture Carriers: Concealed fixture carriers for wall hung plumbing fixtures are specified in Section 22 40 00, Plumbing Fixtures.
4. Drains:
   a. Install drains to suit finished floor or roof surface. Install drains and components per manufacturer's instructions. Slope flooring to floor drain or sink a minimum of 1/2-inch below finished floor elevation.
   b. Install P-traps for hub drains, floor drains and floor sinks. P-traps to be of the same materials as soil and waste piping. Provide trap primer assembly for each drain or floor sink.
5. Wall Access Panel: Secure to wall framing and install so that flange forms a close fitting joint with the finished wall surface.
6. Heat trace and insulate P-traps exposed to freezing conditions. Provide heat trace and electronic components to Division 26 for installation.
7. Insulate horizontal branch lines from floor sinks, receptors and drains receiving cold discharge from equipment and appliances.

3.4 WATER PIPING, BURIED WITHIN 5-FEET OF BUILDING

A. Excavation and Backfill:

1. See General Installation Requirements above.

B. Water Piping: Eliminate air from system. Fill and test at 125 PSIG or minimum 1-1/2 times static pressure at connection to serving utility main for period of two hours with no loss in pressure.

C. Domestic Water:

1. "Piping" to include pipes, fittings, nipples, valves and accessories connected thereto.
2. Run piping generally parallel to the axis of the building, arranged to conform to the building requirements and to suit the necessities of clearance for other mechanical ducts, flues, conduits and work of other trades, and as close to ceiling or other construction as practical, free of unnecessary traps or bends.
3. Grade water supply piping for complete drainage of the system. Install hose bibbs at low points.
4. Use unions for piping connections to equipment.
5. Provide sufficient elbows, swings and offsets to permit free expansion and contraction.

6. Use reducers or increasers. Use no bushings.
7. Ream or file each pipe to remove burrs. Inspect each length of pipe and each fitting for workmanship and clear passageways.
8. Cover, cap or otherwise protect open ends of piping during construction to prevent damage to threads or flanges and prevent entry of foreign matter. Disinfect and sterilize water supply piping as specified. Furnish written report on final water quality results.
9. Install exposed connections to equipment with special care, showing no tool marks or threads at fittings and piping. No bowed or bent piping permitted.
10. Make ferrous to non-ferrous connections with dielectric fittings.
11. Use extra heavy pipe for nipples, where unthreaded portion is less than 1-1/2-inches. Use no close nipples. Use only shoulder-type nipples.
12. Through-Wall Pipes: Type 'L' copper tubing for through-wall pipes which connect to exposed stops at wall surface. Anchor the pipes in the wall; attach pipe with U-bolts to steel back-up plates or steel angles anchored in the wall. Provide wrought copper elbow which securely anchors ears in wall at through-wall pipes.
13. Provide drain valves at base of risers and at low points on the system.
14. Backflow Preventers: Pipe relief to nearest drain. Slope at 2 percent.

D. Sterilization of Domestic Water System:

1. General: Upon completion of tests and necessary replacements, thoroughly flush and disinfect domestic water piping.
2. Method: After thoroughly flushing system with water to remove sediment, fill system with a solution containing 50 parts per million of chlorine for not less than 24 hours or 200 parts per million of chlorine for not less than 3 hours. After retention, drain, reflush and return system to service.
3. Certification: Provide copy of domestic water chlorination certificate in each operations and maintenance manual.
4. Provide water line disinfections performed by a licensed contractor with training in potable water line disinfections.

E. Buried Pre-Insulated Pipe Installation:

1. Installation and Testing: Install and test products in accordance with manufacturer’s installation instructions.
2. Manufacturer’s installation instructions are to describe the following:
   a. Storage and handling of pipes.
   b. Trench preparation.
   c. Installing pipe.
   d. Installing accessories.
   e. Installing fittings.
   f. Building penetrations.
   g. Field insulation kits.
   h. Testing.

3.5 HOT AND COLD DOMESTIC WATER ABOVE GRADE

A. Water Piping: Eliminate air from system. Fill and test at 125 PSIG or minimum 1-1/2 times static pressure at connection to serving utility main for period of two hours with no loss in pressure.

B. Testing of Pressurized Systems:

1. Test each pressurized piping system at 150 percent of operating pressure indicated, but not less than 125 PSIG test pressure.

2. Observe each test section for leakage at end of test period. Test fails if leakage is observed or if pressure drop exceeds 2 percent of test pressure.

C. Test hot and cold domestic water piping systems upon completion of rough-in and before connection to fixtures at hydrostatic pressure of 125 PSIG.

D. Firestopping Penetrations in Fire-Rated Wall/Floor Assemblies:

1. Provide proper sizing when providing sleeves or core-drilled holes to accommodate penetration. Firestop voids between sleeve or core-drilled hole and pipe passing through to meet requirements of ASTM E814.

E. Solder copper tube and fitting joints with lead free nickel/silver bearing solder meeting ASTM Std. B-32, in accordance with IAPMO Is 3-93, ASTM B-828 and Copper Development Association recommended procedures. Clean joints by other than chemical means prior to assembly. "Shock" cooling is prohibited. Fluxes to be water soluble for copper and brass potable water applications, and meeting CDA standard test method 1.0 and ASTM B813-91. Apply solder until a full fillet is present around the joint. Do not apply solder and flux in such excessive quantities as to run down interior of pipe. Lead solder or corrosion flux not to be present at the jobsite.

F. Braze copper tube and fitting socket with BCuP series filler metal without flux. Use listed brazing flux for joining of copper tube to brass or bronze fittings, meeting AWS FB3A or FB3C. "Shock" cooling is prohibited. A continuous fillet is to be visible around the completed joint. After cooling, thoroughly remove flux residue with warm water and a brush prior to testing. Do not use BCuP filler on copper alloys containing over 10 percent nickel. Cap or plug piping during construction to prevent entry of foreign material.

G. Domestic Water:

1. "Piping" to include pipes, fittings, nipples, valves and accessories connected thereto.
2. Run piping generally parallel to the axis of the building, arranged to conform to the building requirements and to suit the necessities of clearance for other mechanical ducts, flues, conduits and work of other trades, and as close to ceiling or other construction as practical, free of unnecessary traps or bends.
3. Grade water supply piping for complete drainage of the system. Install hose bibbs at low points.
4. Use unions for piping connections to equipment.
5. Provide sufficient elbows, swings and offsets to permit free expansion and contraction.
6. Use reducers or increasers. Use no bushings.
7. Ream or file each pipe to remove burrs. Inspect each length of pipe and each fitting for workmanship and clear passageways.
8. Cover, cap or otherwise protect open ends of piping during construction to prevent damage to threads or flanges and prevent entry of foreign matter. Disinfect and sterilize water supply piping as specified. Furnish written report on final water quality results.
9. Install exposed connections to equipment with special care, showing no tool marks or threads at fittings and piping. No bowed or bent piping permitted.
10. Make ferrous to non-ferrous connections with dielectric fittings.
11. Use extra heavy pipe for nipples, where unthreaded portion is less than 1-1/2-inches. Use no close nipples. Use only shoulder-type nipples.
12. Through-Wall Pipes: Type 'L' copper tubing for through-wall pipes which connect to exposed stops at wall surface. Anchor the pipes in the wall; attach pipe with U-bolts to steel back-up plates or steel angles anchored in the wall. Provide wrought copper elbow which securely anchors ears in wall at through-wall pipes.

13. Provide drain valves at base of risers and at low points on the system.
14. Backflow Preventers: Pipe relief to nearest drain. Slope at 2 percent.

H. Sterilization of Domestic Water System:

1. General: Upon completion of tests and necessary replacements, thoroughly flush and disinfect domestic water piping.
2. Method: After thoroughly flushing system with water to remove sediment, fill system with a solution containing 50 parts per million of chlorine for not less than 24 hours or 200 parts per million of chlorine for not less than 3 hours. After retention, drain, reflush and return system to service.
3. Certification: Provide copy of domestic water chlorination certificate in each operations and maintenance manual.
4. Provide water line disinfections performed by a licensed contractor with training in potable water line disinfections.

3.6 CONDENSATE PIPING

A. Firestopping Penetrations in Fire-Rated Wall/Floor Assemblies:

1. Provide proper sizing when providing sleeves or core-drilled holes to accommodate penetration. Firestop voids between sleeve or core-drilled hole and pipe passing through to meet requirements of ASTM E814.

3.7 PRIMER PIPING

A. Excavation and Backfill:

1. See General Installation Requirements above.

B. Testing:

1. See General Installation Requirements above.

3.8 PIPING SPECIALTIES

A. Excavation and Backfill:

1. See General Installation Requirements above.

B. Drainage, Waste, and Vent Piping: Test in accordance with governing plumbing code or as follows: Test drainage and venting systems, with necessary openings plugged, to permit system to be filled with water and subjected to water pressure of minimum of 5 PSI head. System to hold water without water level drop greater than 1/2 pipe diameter of largest nominal pipe size within 24-hour period. Test system in sections if minimum head cannot be maintained in each section. 5 PSI head to be minimum pressure at highest joint.

C. Corrosive Soil Conditions:

1. Wrap steel, iron, copper or other metal piping materials/fittings with Protecto Wrap 200, 30 mils or greater. Maintain a 1/2-inch overlap and install per manufacturer's requirements.
2. Provide epoxy coated cast iron pipe and fittings for drainage systems.

D. Cast-Iron Joints: Comply with coupling manufacturer's Cast Iron Soil Pipe Institute Standards and installation instructions.

3.9 CLEANOUTS

A. Install in aboveground piping and building drain piping as indicated, as required by code; at each change in direction of piping greater than 135 degrees; at minimum intervals of 100-feet; and at base of each vertical soil or waste stack. Install floor and wall cleanout covers for concealed piping. Select type to match adjacent building finish. Provide shop drawings to Architect to coordinate locations and types of cleanouts with Architect prior to installation.

B. Install wall cleanout at each urinal as required by code.

END OF SECTION 22 10 00

22 11 13 – FACILITY WATER DISTRIBUTION PIPING (WATER SUPPLY)

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Piping inside the treatment building.

B. Related Requirements:

1. Section 22 05 17 “Sleeves and Sleeve Seals for Plumbing Piping (Water Supply).”
2. Section 22 05 29 "Hangers and Supports for Plumbing Piping.”
3. Section 33 00 00 “Pipe & Pipe Fittings: General Statement (Water Supply).”
4. Section 33 11 00 “Water Utility Distribution Piping (Water Supply).”

1.2 REFERENCES

A. National Sanitation Foundation (NSF International):

1. NSF 61 - Drinking Water System Components – Health Effects

1.3 SUBMITTALS

A. See Section 01 33 00 “Submittal Procedures.”

B. Product Data: Provide data on pipe materials, pipe fittings, expansion joint fittings, flex fittings, valves, accessories and miscellaneous products. Provide manufacturer’s catalog information and manufacturer’s certification. Indicate valve and data ratings.

C. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

D. Pressure test results on all piping systems, see “Section 33 11 00 “Water Utility Distribution Piping (Water Supply)” for requirements.

1.4 Project Record Documents: Record actual locations of pipe, valves, and connections. Contractor records and drawings shall be submitted with as-built submittals. Contractor to maintain as-built throughout the project duration during construction on-site.

1.5 Operation and Maintenance Manuals consistent with Section 01 79 00 “Demonstration and Training.”

1.6 QUALIFICATIONS

A. Installer: All water system work outlined shall be performed by a company specializing in performing work of this section with a minimum of 5 years documented experience. This includes documented experience with plumbing piping in interior buildings.

1.7 DELIVERY, STORAGE, PROTECTION AND HANDLING

A. Provide temporary end caps and closures on piping and fittings. Maintain in place until installation.

B. Deliver and store piping covered to protect piping from ultraviolet UV exposure.

C. Protect piping systems from entry of foreign materials by temporary covers, completing sections of the work, and isolating parts of the completed system.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

A. All materials coming into contact with potable water shall be NSF 61 certified.

2.2 WATER PIPE

A. PVC Pipe

1. ASTM D 1785 schedule 80.
2. Solvent Weld.

2.3 FITTINGS

A. General: Bolts, nuts and washers used for securing fittings shall be of similar materials. Steel bolts shall meet the requirements of ASTM A 307 or ASTM 568 for carbon steel or ASTM F 593 or ASTM F 738 for stainless steel. Nuts shall meet the requirements of ASTM A 563 for carbon steel or ASTM F 594 or ASTM F 836 for stainless steel. Iron bolts and nuts shall meet the requirements of ASTM A 536, grade 65-45-12.

B. PVC Pipe: Fittings for PVC pipe shall be schedule 80 solvent weld and meet the requirements of ASTM D2467.

PART 3 - EXECUTION

3.1 EXAMINATION

A. The contractor shall inspect each pipe and fitting prior to installation to ensure that there are no damaged portions of the pipe. Pipe damage prior to completion of the project shall be repaired or replaced by the Contractor.

B. Handling: Pipe, fittings and accessories shall be carefully inspected before and after installation and those found defective shall be rejected. Pipe and fittings shall be free from fins and burrs. Before being placed in position, pipe, fittings, and accessories shall be cleaned, and shall be maintained in a clean condition.

C. Storage: Pipe should be stored, if possible, at the job site in unit packages provided by the manufacturer. Pipe should be stored in such a way as to prevent sagging or bending and

protected from exposure to direct sunlight by covering with an opaque material while permitting adequate air circulation above and around the pipe.

D. Ensure piping is sufficiently supported to bear weight of valves when installed.

3.2 PREPARATION

A. Cut pipe ends square, ream pipe ends to full pipe diameter, remove burrs.

B. Remove scale and dirt on inside and outside before assembly.

C. Prepare pipe connections to equipment with flanges or mechanical joints.

3.3 INSTALLATION

A. Maintain separation of non-potable water main from potable water sources in accordance with State code.

B. Install pipe to allow for expansion and contraction without stressing pipe or joints.

3.4 CONNECTIONS TO EXISTING WATER PIPE

A. Connection to existing water pipes shall be made where and as indicated on the drawings and as directed by the engineer. The sizes of pipe, fittings, valves and appurtenant items required to make connection shall correspond to the sizes of existing pipe and of project pipe.

B. Determine actual conditions of existing pipe and all fittings and appurtenant items required to make the connection; and have all materials needed on site prior to any shut down or cutting into existing pipes.

C. Connection which involves cutting into existing pipelines include: cutting and removing sections of existing pipe and fittings as required; cleaning and preparing ends of existing pipe as required for connection; furnishing and installing all new pipe, fittings and valves required to make the connection of project pipe to the existing pipe as indicated; and all appurtenant work required to complete the connection.

D. Connection to existing pipe shall be made at such times and within the time limits and according to the directions as agreed upon between the Contractor and the Engineer.

E. Contractor shall dispose of removed pipe in an approved manner.

3.5 CLEANING

A. Clean interior of piping systems thoroughly before installing.

B. Maintain pipe in clean condition during installation.

C. Before joining piping, thoroughly clean and wipe joint contact surfaces and then properly dress and make joint.

D. Immediately prior to pressure testing, clean and remove grease, metal cuttings, dirt, or other foreign materials which may have entered the system.

E. At completion of work and prior to final acceptance, thoroughly clean work installed under these specifications. Clean fixtures, pipe, valves, and fittings of grease, metal cuttings, and sludge which may have accumulated by operation of system, from testing, or from other causes.

3.6 PRESSURE TEST

A. See “Section 33 11 00 “Water Utility Distribution Piping (Water Supply)” for requirements.

3.7 DISINFECTION OF WATER PIPING

A. See “Section 33 13 00 “Disinfecting Water Utility Distribution (Water Supply)” for requirements

END OF SECTION 22 11 13

22 12 23 – FACILITY STEEL, INDOOR POTABLE-WATER STORAGE PRESSURE TANKS (WATER SUPPLY)

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Bladder pressure tank in the treatment building.

B. Related Requirements:

1. Section 22 05 23.2 "General-Duty Valves for Plumbing Piping (Water Supply)" for pressure relief valve accompanying pressure tank.
2. Section 33 00 00 “Piping & Pipe Fittings: General Statement (Water Supply).”

1.2 REFERENCES

A. American Society of Mechanical Engineers (ASME):

1. ASME Section VIII – Boiler and Pressure Vessel Code - Pressure Vessels

B. National Sanitation Foundation (NSF International):

1. NSF 61 - Drinking Water System Components – Health Effects

1.3 SUBMITTALS

A. Submit for review and approval by Engineer before installation:

1. Manufacturer product info.
2. Manufacturer installation instructions.
3. Manufacturer's Certificate: Certify products meet or exceed specified requirements.

B. Submit for review and approval by Engineer prior to project closeout:

1. Project Record Documents: Record actual locations of valves and equipment
2. Operation and Maintenance Data: Submit spare parts list, exploded assembly views and recommended maintenance intervals.

1.4 QUALITY ASSURANCE

A. Perform Work in accordance with the project plans, State, and County standards.

B. All piping and components used in contact with drinking water shall comply with ANSI/NSF 61, Drinking Water System Components - Health Effects.

1.5 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years' experience.

B. Installer: Company specializing in performing Work of this section with minimum three years' experience.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Accept equipment on site in shipping containers with labeling in place. Inspect for damage.

B. Protect equipment from entry of foreign materials and other damage by temporary covers, completing sections of the Work, and isolating parts of completed system.

1.7 EXTRA MATERIALS

A. Provide manufacturer-recommended spare parts and maintenance products.

PART 2 - PRODUCTS

2.1 BLADDER PRESSURE TANKS

A. Meet the following requirements:

1. Steel shell
2. Butyl rubber diaphragm
3. Stainless steel system connection
4. Maximum working pressure: 125 psi (minimum)
5. Pre-charged

B. Valves: Furnish gate, ball, or butterfly valves on waterline to each tank as shown in the drawings.

C. Pressure Relief Valves: Provide ASME Section VIII pressure relief valve between tank and isolation valve as shown on the Drawings.

D. Couplers: Provided couplers as shown on the Drawings to allow tanks to be easily removed for servicing.

E. Manufacturer:

1. Well-x-trol WX-202
2. Engineer approved equal

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install per manufacturer's recommendations.

3.2 FIELD QUALITY CONTROL

A. Section 01 40 00 "Quality Requirements" and Section 01 79 00 "Demonstration and Training."

END OF SECTION 22 12 23

SECTION 22 30 00 - PLUMBING EQUIPMENT

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Water Heaters Tank-Less Electric
2. Air Source Heat Pump Water Heaters
3. Domestic Expansion Tanks Non-ASME
4. Domestic Circulation Pumps - Close-Coupled, In-Line
5. Packaged Domestic Booster Pump System with Variable Speed Drive

1.2 RELATED SECTIONS

A. Contents of Division 22, Plumbing and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 22 00 00, Plumbing Basic Requirements and Division 01, General Requirements.

1.4 SUBMITTALS

A. Submittals as required by Section 22 00 00, Plumbing Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Seismic anchor details and calculations signed and stamped by licensed Washington structural engineer with equipment data.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 22 00 00, Plumbing Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. NSF 61, Annex G compliant.
2. ISO 9001 Certified.
3. IAPMO Low Lead Certification.

C. Products approved for installation by state authorizing agency, no exceptions.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 22 00 00, Plumbing Basic Requirements and Division 01, General Requirements.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Water Heaters Tank-Less Electric:

1. Chronomite InstaFlow Micro Model M
2. EEMax
3. Stiebel Eltron
4. Or approved equivalent.

B. Air Source Heat Pump Water Heaters:

1. American
2. Aegis
3. Nyle
4. Laars
5. Or approved equivalent.

C. Domestic Expansion Tanks Non-ASME:

1. Bell and Gossett Series PT
2. American Wheatley
3. Amtrol
4. Armstrong
5. Watts
6. Or approved equivalent.

D. Domestic Circulation Pumps - Close-Coupled, In-Line:

1. Bell and Gossett Series
2. Armstrong
3. Grundfos
4. Paco
5. Taco
6. Or approved equivalent.

E. Packaged Domestic Booster Pump System with Variable Speed Drive:

1. System: ITT Bell and Gossett Series 70V Booster Pump System as manufactured by FlowTherm Systems.
2. EnviroSep
3. Federal Pump
4. Grundfos
5. QuantumFlo
6. Paco
7. Peerless
8. Precision
9. Syncro Flo
10. Or approved equivalent.

2.2 GENERAL

A. Reference Drawings for capacities and specific model numbers.

2.3 WATER HEATERS TANK-LESS ELECTRIC

A. System: Domestic water.

B. Factory assembled packaged tank-less electric water heater utilizing microprocessor for temperature control. Heat water ways with high temperature coil electrical heating elements. 150 PSI working pressure. Cast aluminum or steel jacket with baked enamel finish. Pilot light to indicate when unit is operating. Prewire heaters ready for single electrical connection and bear UL label. Heater capable of operation within minimum and maximum operating flow rates and pressures of fixtures served and system operating pressure

2.4 AIR SOURCE HEAT PUMP WATER HEATER

A. Construction

1. The system to be constructed of sheet metal, with RAL 9018 epoxy-polyester coating with removeable panels for ease of access during maintenance and installation.
2. All refrigerant piping to be TIG welded stainless steel.
3. The system to be suitable for indoor or outdoor installation and to operate at ambient temperatures as low as -4 degrees F without the need for supplemental heat and as high as 113 degrees F.
4. The heat pump water heating system to have an optional coil coating treatment option for coastal or poor air quality areas to protect against salt spray.
5. The system to have an optional cool recovery option available for the simultaneous production of hot and cold water.

B. Components

1. Compressor - Compressor to be a semi-hermetic piston type purposely design to be used for heating with refrigerant R744. The compressor to be equipped with thermal protection, oil level indicator light and crankcase electrical heater and is mounted on rubber vibration dampers to reduce the transmission of vibrations to the unit. The compressor to also be equipped with an internal oil cooling system.

C. Source Side Heat Exchanger (Evaporator)

1. The source side heat exchanger to consist of a coil with copper pipes and aluminum fins with a large exchange surface. De-icing resistance electric heaters to be integrated into the evaporator to be used during defrost cycles. An antifreeze resistance heater to be fitted at the bottom of the condensation collection tray to ensure the outflow of water is towards the drain. The finned tube bundle to be protected by metal mesh.

D. User Side Heat Exchanger (Gas Cooler)

1. The user side heat exchanger to consist of brazed plates made of AISI 316 stainless steel with closed cell thermal insulation along with a temperature probe for frost protection, connected to the control. The exchange of heat to take place in countercurrent to optimize the coefficient of performance (COP) and to allow the unit to reach high temperatures.

E. Optional: Cool Recovery

1. If selected, the cool recovery option provides a water source heat exchanger (evaporator), three-way water valve, flow switch, inlet and outlet temperature sensor, and control logic to select between air-source and water-source operation.
2. The cool recovery heat exchanger to consist of brazed plates made of AISI 316 stainless steel with closed cell thermal. The exchange of heat to take place in countercurrent flow to optimize the unit COP.

F. Fans

1. Axial fans to be directly coupled to the 6-pole electric motor with external rotor, protection rating IP 54. Each fan to be housed in shaped nozzles and include a protective safety grille in compliance with UNI EN 294.
2. Optional: An optional electrically commutated (EC) fan can be provided instead of the standard alternating current (AC) fans.

G. Refrigeration Circuit

1. Circuit to include the compressor, system side plate heat exchanger (gas cooler), regenerative heat exchanger, source side finned tube bundle (evaporator), inlet valves, electronic thermostatic expansion valve, high- and low-pressure switches, low pressure safety valve, high pressure safety valve, liquid receiver, and service taps.

H. Refrigerant Type

1. System to operate on the refrigerant type R744, also known as carbon dioxide (CO_2), and to have a global warming potential (GWP) of 1 and an ozone depletion potential (ODP) of 0.

I. Hydraulic Circuit

1. Optional: Circuit to feature an optional variable speed circulator pump on the system (primary) side. The circulator will be directly controlled by the control unit. Depending on the required water outlet set point, the flow rate will vary in order to reach the set temperature and to maximize the COP value.

J. Electrical Panel

1. Electrical panel to be able to control the utility set point temperature and manage the primary and domestic (secondary) circulator/pumps.
2. Panel to consist of a circuit breaker and isolating switch and fuses to protect the auxiliary and power circuits, compressor contractor, fan revolution regulator for condensation control, a pump relay or motor protection and contractor, and a microprocessor control with display of the main functions.

K. Dynamic Defrost Protection

1. Heat pump must have dynamic defrost cycle based on evaporation temperature with option for fixed defrost temperature option.
2. Defrost must be accomplished by integral resistance heating elements. Units that defrost based on a reverse cycle will not be accepted.
3. Unit must include an antifreeze resistance heating element fitted at the bottom of the condensation collection tray to ensure the outflow of water towards the drain.

L. Electronic High Pressure Control Valve

1. The valve to have a maximum operating temperature of at least 2031 psi and a maximum operating pressure difference of at least 1233 psi.
2. Control valve to ensure precise control even in operation at part loads.
3. Control valve to be constructed without the use of gears.

M. Circulation Pump

1. Optional: If selected, the circulation pump to be an internally mounted brushless variable speed pump powered by an EC motor with automatic power adjustment.

N. Electronic Control System

1. The controller to provide the option for external control by a central Building Management System.
2. Control system to feature an LCD touchscreen display, digital and probe inputs, analog and digital outputs, ethernet, USB, and mini-USB ports, and an internal clock.

O. Communications

1. The heat pump water heater to be an integrated component of a high-speed, peer-to-peer internetwork of ANSI/ASHRAE Standard 135, BACnet using native BACnet communications via RTU or IP/MSTP. System to also support Modbus networking.
2. The integrated LCD display to provide fast commissioning via user-friendly menu driven configuration.

P. Optional Aegis Sequencing Controller

1. Sequencer can control between two and six separate units installed in parallel.
2. Single point of connection for all system temperature sensors
3. System can manage secondary side (DHW) pump and optional anti-Legionella disinfection cycles.
4. Device can detect the thermal demand of the tank system, in order to activate the suitable number of units.
5. Automatically rotate lead-lag units to balance total run hours.
    a. Includes (9) 10 kΩ RTD temperature probes for installation in tanks and return piping to detect the water temperature stratification in the tank system.
    b. Digital I/O to dialogue with third party systems.
    c. Capable of operating on 120 VAC or 240 VAC single phase power. Maximum current draw 0.5 A.
    d. Sequencer communicates with Aegis heat pumps via Modbus IP ethernet connection.
    e. UL listed enclosure with IP 66 protection.
    f. The sequencer to provide the option for external control by a central Building Management System (BMS) via Modbus or BACnet.

2.5 DOMESTIC EXPANSION TANKS NON-ASME

A. Welded steel, constructed, tested and stamped in accordance with IAPMO Standards for working pressure of 125 PSI. Support floor mounted tanks with steel legs or base. Provide single flexible diaphragm securely sealed into tank to separate air charge from system water, to maintain design expansion capacity. Provide pressure gauge and air-charging fitting, and drain fitting. Diaphragm: Removable and replaceable in line.

2.6 DOMESTIC CIRCULATION PUMPS - CLOSE-COUPLED, IN-LINE

A. System: Domestic water

B. Description: Factory-assembled and tested, single-stage, close-coupled, in-line, seal-less centrifugal pump.

1. Pump and Motor Assembly: Hermetically sealed, replaceable-cartridge-type unit with motor and impeller on common shaft and designed for installation with pump and motor shaft mounted horizontally.
2. Casing: Bronze/stainless steel, with threaded companion-flange connections.
3. Impeller: Corrosion-resistant material.
4. Motor: Non-overloading at any point on pump curve, Single speed, unless otherwise indicated. Comply with requirements in Division 22 Section "Common Motor Requirements."

C. Capacities and Characteristics as per Drawings.

D. See detail on Drawings for pump controls.

2.7 PACKAGED DOMESTIC BOOSTER PUMP SYSTEM WITH VARIABLE SPEED DRIVE

A. System: Domestic Cold Water

B. Entire unit is to be delivered complete with operating controls and require only plumbing and electrical service connections.

C. Furnish and install prefabricated water pressure booster system. System capable of automatically providing constant system pressure.

D. System is based on a design pressure of 40 PSI residual and 35 PSI static. Contractor to field verify flow test numbers are correct.

E. Pressure for BP-1 set at 35 and 30 PSI - 4-feet above top of highest roof level.

F. System factory assembled, wired, electrically tested, hydrostatic pressure tested and shipped ready for field piping connection and wiring. Field startup by manufacturer is required for final acceptance.

G. Factory Test Certification: Factory certifies in writing that water pressure booster system and its component parts have undergone complete electric and hydraulic test prior to shipment. Test includes system operating flow test from zero to 100 percent design flow rate under specified suction and net system pressure conditions. Certification includes copies of test data as recorded by X-Y plotter. System test may be witnessed by Owner, Architect, or Engineer by reporting intent to do so to factory.

H. System furnished with suction and discharge headers constructed of welded stainless steel Schedule 10 pipe. Header pipe sizing designed for maximum of 8 fps velocity. Connections to headers flanged. Pipe welding performed by ASME Section IX certified welders. Piping built to ASME/ANSI B31.9 specifications.

I. Pressure gauges supplied on suction and discharge manifold headers and provided with stainless steel cases, glycerin filled, and rated for plus 1 or minus 1 percent accuracy. Gauges selected for operation at mid-scale.

J. System furnished with three pumps as listed on project schedule. Standard Bell and Gossett Series 1531 single stage centrifugal pumps with bronze-fitted construction and internally flushed mechanical seals. Pump casings to have vent and drain ports at top and bottom of casings.

K. Each pump fitted with isolation valves and union connections or flanges to facilitate future service requirements. Each pump furnished with silent check valve with bronze trim.

L. Common pump discharge header includes thermally activated purge valve built into header system for booster pumps to allow water to be purged to remote drain in event of system control failure.

M. Single point disconnect panel skid mounted and factory wired. Factory wiring includes variable frequency drive wiring, motor wiring, differential pressure switch wiring and low suction pressure switch wiring. Pressure transducer shipped loose for field installation at high point in system as standard for optimal performance. Transducer located next to hydropneumatic tank at 31st Level.

N. An ITT Bell and Gossett Technologic 500 Pump Logic Controller provided as pressure booster control panel. This is to be combination Pump Controller and Variable Frequency Drive in single enclosure.

O. Technologic pump logic controller assembly listed by and bear label of Underwriter's Laboratory, Inc. (UL) and Canadian Underwriter's Laboratory (CUL) and CE marked. Controller specifically designed for variable speed pump applications. Controller functions to proven program that safeguards against damaging hydraulic conditioning including:

1. Pump flow surges.
2. Hunting
3. Low suction pressure.
4. System over pressure.

P. Pump logic controller microcomputer based and hold its software in EPROM. On-line field modified data entries, such as setpoint, stored in EEPROM. EEPROM memory storage prevents accidental loss of data due to voltage surge or spike. In event of complete power outage, field preset values remain stored and able to be recalled by operator.

Q. Pump logic controller capable of receiving up to two discrete analog inputs from transmitters indicated on Drawings. It will then select analog signal that has deviated greatest amount from its setpoint. This selected signal will be used as command feedback input for hydraulic stabilization function to minimize hunting. Each input signal capable of maintaining different set point value. Controller capable of controlling up to three pumps in parallel. Scan and compare rate that selects command setpoint and process variable signal continuous and automatically set for optimum operation. Each sensor scanned every 2 milliseconds.

R. Controller have fused door interlock disconnect, local-off-remote switch, motor overload protection, diagnostic display, manual and automatic alternation, auto start of lag pump on lead failure and accept pump differential pressure switch signals for pump fail notification.

S. External transmitters furnished by ITT Bell and Gossett powered by Technologic Pump Logic Controller through quality integral 24 volt dc power supply and protected from reverse polarity of analog inputs. Overvoltage and short circuit protection on board. Hydraulic stabilization programs utilize proportional integral derivative control function. Proportional, integral and derivative values user adjustable over an infinite range. Pump logic controller self prompting. Fault messages displayed in plain English. Operator interface have following features:

1. Multi-fault memory and recall of last 10 faults and related operational data.
2. Red fault light, Yellow warning light, and Green power on light.
3. Soft-touch membrane keypad switches.

T. Display four lines, with 20 characters on three lines and eight large characters on one line. Actual pump information displayed indicating pump status.

U. Controller capable of performing the following pressure booster functions:

1. Low suction pressure cut-out to protect pumps against operating with insufficient suction pressure. This function resets automatically.
2. High system pressure cut-out to protect piping system against high pressure conditions. This function requires manual reset.
3. No flow shut down to turn the pumps off automatically when system demand is low enough to be supplied by hydropneumatic tank. No flow shutdown requires external flow meters, flow switches, nor pressure switches to determine when no flow condition exists.

V. The following hardwire communication features provided to BAS:

1. Remote system start/stop non-powered digital input.
2. Failure of any system component. Output closes to indicate alarm condition.
3. One 4-20 mA output with selectable output of:
    a. Frequency
    b. Process Variable
    c. Output Current
    d. Output Power

W. Entire booster system, including piping, wiring, and controls, UL listed.

X. Entire system pre-assembled onto heavy duty structural steel frame constructed of 4-inch minimum angle iron with channel iron pump bases. Frame welded in accordance with AWS D1.1 Specifications. Frame includes sturdy lifting and bolt-down clips.

Y. Provide remote hydropneumatic tank for domestic water system and included as part of booster pump system.

Z. Components pre-piped, wired, and tested prior to shipment. System hydrostatic tested, cleaned, flushed, and painted with an industrial grade of epoxy based enamel.

AA. Field plumbing connections required will be system suction and discharge headers, temp probe drain line, piping of hydropneumatic pressure tank with union ball valve, pressure gauge and drain provided.

BB. Field electrical connections required will be input power supply to the control panel and remote pressure transducer control wiring.

CC. Coordinate location of unit and electrical characteristics with Division 26, Electrical work.

DD. Unit mounted on housekeeping pad. Provide seismic anchor calculations for this equipment, stamped and signed by licensed Washington structural engineer.

EE. Manufacturer's representative provides system check and start-up service for the system.

PART 3 - EXECUTION

3.1 GENERAL

A. Examine areas and conditions under which equipment is to be installed. Do not proceed with work until unsatisfactory conditions have been corrected.

B. Install equipment in accordance with manufacturer's installation instructions. Install units plumb and level, firmly anchored in locations indicated, and maintain manufacturer's recommended clearances.

C. Orients so controls and devices needing service and maintenance have adequate access.

D. Certificates: Submit appropriate Certificates of Shop Inspection and Data Report as required by provisions of ASME Boiler and Pressure Vessel Code.

E. Connect water piping to units with shutoff valves and unions.

F. Equipment Rigging: Heavy duty rigging eye bolts for Crosby Group swivel hoist rings installed over pump access covers for removal or maintenance.

G. Equipment Start-Up:

1. Start-up, test, and adjust equipment in accordance with manufacturer's start-up instructions. Check and calibrate controls.
2. Start-up performed by authorized manufacturer's representative or agent. Provide credentials of start-up personnel to Architect and Owner's Authorized Representative for approval.
3. Remove and replace filters when start-up testing is executed.
4. Manufacturer adjusts operating parameters of equipment to compensate to elevation of 500-feet above sea level.
5. Architect, Commissioning Agent, and Owner's Authorized Representative will be notified 10 days prior to start-up and will be present at start-ups.
6. Provide written report from manufacturer's representative on results of start-up within 48 hours.
7. Technical Training of maintenance staff includes two hours minimum per each piece of equipment.
8. Seismic Verification:
    a. Contractor will retain structural engineer who will submit stamped and signed anchoring and restraint details on plumbing equipment with submittal data in accordance with Division 22, Plumbing requirements.
    b. Contractor's Structural Engineer will test and verify in writing that seismic restraints have been installed in accordance with their details.

3.2 WATER HEATERS TANK-LESS ELECTRIC

A. Examine areas and conditions under which equipment is to be installed. Do not proceed with work until unsatisfactory conditions have been corrected.

B. Install equipment in accordance with manufacturer's installation instructions. Install units plumb and level, firmly anchored in locations indicated, and maintain manufacturer's recommended clearances.

C. Orients so controls and devices needing service and maintenance have adequate access.

D. Certificates: Submit appropriate Certificates of Shop Inspection and Data Report as required by provisions of ASME Boiler and Pressure Vessel Code.

E. Connect water piping to units with shutoff valves and unions.

3.3 AIR SOURCE HEAT PUMP WATER HEATERS

A. Certificates: Submit appropriate Certificates of Shop Inspection and Data Report as required by provisions of ASME Boiler and Pressure Vessel Code.

B. Connect water piping to units with shutoff valves and unions.

C. Equipment Start-Up:

1. Start-up, test, and adjust equipment in accordance with manufacturer's start-up instructions. Check and calibrate controls.
2. Start-up performed by authorized manufacturer's representative or agent. Provide credentials of start-up personnel to Architect and Owner's Authorized Representative for approval.
3. Remove and replace filters when start-up testing is executed.
4. Manufacturer adjusts operating parameters of equipment to compensate to elevation of 500-feet above sea level.
5. Architect, Commissioning Agent, and Owner's Authorized Representative will be notified 10 days prior to start-up and will be present at start-ups.
6. Provide written report from manufacturer's representative on results of start-up within 48 hours.
7. Technical Training of maintenance staff includes two hours minimum per each piece of equipment.
8. Seismic Verification: Contractor will retain structural engineer who will submit stamped and signed anchoring and restraint details on plumbing equipment with submittal data in accordance with Division 22, Plumbing requirements.

3.4 DOMESTIC EXPANSION TANKS NON-ASME

A. Precharge tank per manufacturers recommendation.

B. Examine areas and conditions under which equipment is to be installed. Do not proceed with work until unsatisfactory conditions have been corrected.

C. Install equipment in accordance with manufacturer's installation instructions. Install units plumb and level, firmly anchored in locations indicated, and maintain manufacturer's recommended clearances.

D. Orients so controls and devices needing service and maintenance have adequate access.

E. Certificates: Submit appropriate Certificates of Shop Inspection and Data Report as required by provisions of ASME Boiler and Pressure Vessel Code.

F. Connect water piping to units with shutoff valves and unions.

3.5 DOMESTIC CIRCULATION PUMPS - CLOSE-COUPLED, IN-LINE

A. Install equipment in accordance with manufacturer's installation instructions. Install units plumb and level, firmly anchored in locations indicated, and maintain manufacturer's recommended clearances.

B. Orients so controls and devices needing service and maintenance have adequate access.

C. Connect water piping to units with shutoff valves and unions.

D. Provide lift check valves 5 diameters downstream of pump discharge for circulating pumps piped in a parallel configuration.

E. Equipment Start-Up:

1. Start-up, test, and adjust equipment in accordance with manufacturer's start-up instructions. Check and calibrate controls.
2. Architect, Commissioning Agent, and Owner's Authorized Representative will be notified 10 days prior to start-up and will be present at start-ups.
3. Seismic Verification:
    a. Contractor will retain structural engineer who will submit stamped and signed anchoring and restraint details on plumbing equipment with submittal data in accordance with Division 22, Plumbing requirements.
    b. Contractor's Structural Engineer will test and verify in writing that seismic restraints have been installed in accordance with their details.

3.6 PACKAGED DOMESTIC BOOSTER PUMP SYSTEM WITH VARIABLE SPEED DRIVE

A. Examine areas and conditions under which equipment is to be installed. Do not proceed with work until unsatisfactory conditions have been corrected.

B. Install equipment in accordance with manufacturer's installation instructions. Install units plumb and level, firmly anchored in locations indicated, and maintain manufacturer's recommended clearances.

C. Orients so controls and devices needing service and maintenance have adequate access.

D. Certificates: Submit appropriate Certificates of Shop Inspection and Data Report as required by provisions of ASME Boiler and Pressure Vessel Code.

E. Connect water piping to units with shutoff valves and unions.

F. Equipment Rigging: Heavy duty rigging eye bolts for Crosby Group swivel hoist rings installed over pump access covers for removal or maintenance.

G. Equipment Start-Up:

1. Start-up, test, and adjust equipment in accordance with manufacturer's start-up instructions. Check and calibrate controls.
2. Start-up performed by authorized manufacturer's representative or agent. Provide credentials of start-up personnel to Architect and Owner's Authorized Representative for approval.
3. Remove and replace filters when start-up testing is executed.

4. Manufacturer adjusts operating parameters of equipment to compensate to elevation of 500-feet above sea level.
5. Architect, Commissioning Agent, and Owner's Authorized Representative will be notified 10 days prior to start-up and will be present at start-ups.
6. Provide written report from manufacturer's representative on results of start-up within 48 hours.
7. Technical Training of maintenance staff includes two hours minimum per each piece of equipment.

END OF SECTION 22 30 00

SECTION 22 40 00 - PLUMBING FIXTURES

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. General Plumbing Fixtures:
    a. China Fixtures, White Only
    b. Faucet Fittings
    c. Molded Resin or Stone Fixtures
    d. Shower Valves
    e. Stainless Steel Fixtures
    f. Thermostatic Mixing Valves
    g. Trench Drains
2. Carriers
3. Downspout Boot/Nozzle/Cover
4. Electric Water Coolers
5. Fixture Trim
6. Floor Drains
7. Floor Sinks
8. Flushometers - Water Closet/Urinal
9. Hose Bibbs
10. Hub Drains
11. Roof/Overflow Drains
12. Water Closet Seats
13. Drain Boxes
14. Water Supply Boxes

1.2 RELATED SECTIONS

A. Contents of Division 22, Plumbing and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 22 00 00, Plumbing Basic Requirements and Division 01, General Requirements.

1.4 SUBMITTALS

A. Submittals as required by Section 22 00 00, Plumbing Basic Requirements and Division 01, General Requirements.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 22 00 00, Plumbing Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. Comply with lead free (less than or equal to 0.25 percent) products in drinking water systems.

2. NSF 61, Annex G, Drinking Water System Components, Compliant.
3. ISO 9001, Quality Management Standard Certified.
4. IAPMO Low Lead Certification.
5. Provide fixtures, faucets and accessories to meet barrier free requirements of the governing code with respect to plumbing fixtures provided for the physically handicapped.
6. Items approved for use by State of Washington.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 22 00 00, Plumbing Basic Requirements and Division 01, General Requirements.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. "Or approved equivalent" as defined in 22 00 00, Plumbing Basic Requirements. Substitution process requirements apply to approved equivalent products.

B. General Plumbing Fixtures: See Schedule on Drawings for type.

1. China Fixtures - White Only:
   a. American Standard
   b. Kohler
   c. Sloan
   d. Or approved equivalent.
2. Faucet Fittings:
   a. Public:
      1) American Standard
      2) Chicago
      3) Delta Commercial
      4) Moen Commercial
      5) Sloan
      6) Symmons
      7) T & S Brass
      8) Toto
      9) Or approved equivalent.
3. Molded Resin or Stone Fixtures:
   a. Fiat
   b. Mustee
   c. Stern Williams
   d. Or approved equivalent.
4. Shower Valves:
   a. Acorn
   b. Chicago
   c. Delta
   d. Moen
   e. Powers
   f. Symmons
   g. Zurn
   h. Or approved equivalent.
5. Stainless Steel Fixtures:
   a. Amerisink
   b. Elkay

c. Haws
d. Just
e. Moen
f. Or approved equivalent.

6. Thermostatic Mixing Valves:
   a. Bradley
   b. Powers
   c. Symmons
   d. Holby
   e. Or approved equivalent.
7. Trench Drains:
   a. Channel-Slope
   b. DuraTrench
   c. JR Smith
   d. PolyDrain
   e. Polycast
   f. Quazite
   g. Zurn
   h. Or approved equivalent.

C. Carriers:

1. JR Smith
2. Zurn
3. Or approved equivalent.

D. Downspout Boot/Nozzle/Cover:

1. JR Smith
2. Mifab
3. Sioux Chief
4. Zurn
5. Or approved equivalent.

E. Electric Water Coolers:

1. Elkay
2. Halsey-Taylor
3. Haws
4. Murdock
5. Oasis
6. Sunroc
7. Or approved equivalent.

F. Fixture Trim:

1. McGuire
2. Dearborn Brass
3. Oatey
4. Or approved equivalent.

G. Floor Drains:

1. Mifab

2. Sioux Chief
3. Smith
4. Wade
5. Watts
6. Zurn

H. Floor Sinks:

1. Commercial Enameling
2. Mifab
3. Sioux Chief
4. Smith
5. Wade
6. Watts
7. Zurn
8. Or approved equivalent.

I. Flushometers - Water Closet/Urinal:

1. American Standard
2. Delaney
3. Kohler
4. Sloan
5. Zurn
6. Or approved equivalent.

J. Hose Bibbs:

1. Chicago
2. JR Smith
3. Mifab
4. Wade
5. Woodford
6. Zurn
7. Or approved equivalent.

K. Hub Drains:

1. JR Smith
2. Zurn
3. Or approved equivalent.

L. Roof/Overflow Drains:

1. JR Smith
2. Mifab
3. Sioux Chief
4. Watts
5. Zurn
6. Or approved equivalent.

M. Water Closet Seats:

1. American Standard

2. Bemis
3. Kohler
4. Sloan
5. Or approved equivalent.

N. Drain Boxes:

1. IPS
2. Oatey
3. Sioux Chief
4. Or approved equivalent.

O. Water Supply Boxes:

1. IPS
2. Oatey
3. Sioux Chief
4. Or approved equivalent.

2.2 GENERAL PLUMBING FIXTURES

A. Review substitution request requirements in Division 01, General Requirements and 22 00 00, Plumbing General Requirements.

B. Reference Architectural Details for mounting height and location of fixtures.

C. Provide factory fabricated fixtures of type, style and material indicated on the plumbing fixture connection schedule shown on the Drawings. For each type fixture, provide fixture manufacturer's standard trim, carrier, seats, and valves as indicated by their published product information; either as designed and constructed, or as recommended by manufacturer, or required for complete installation. Where more than one type is indicated, selection is installer's option; but, fixtures of same type must be furnished by a single manufacturer. Where type is not otherwise indicated, provide fixtures complying with governing regulations.

D. Provide fixtures complete with fittings, supports, fastening devices, bolt caps, faucets, valves, traps, stops and appurtenances.

E. Plumbing Fixture Thermostatic Mixing Valves:

1. Lavatories provide ASSE 1070 compliant mixing valves or multiple lavatories served by a single ASSE 1070 compliant mixing valve.
2. Sinks serviced with a single ASSE 1070 mixing valve or multiple sinks served by a single ASSE 1070 mixing valve.
3. Commercial kitchen handsinks provide ASSE 1070 mixing valves.
4. Janitor sinks or process/maintenance type sinks do not require ASSE 1070 mixing valves if operated by trained personnel. Provide signage per Section 22 05 53, Identification for Plumbing Piping and Equipment.
5. Hot water hose bibbs do not require ASSE 1070 mixing valves if operated by trained personnel. Provide signage per Section 22 05 53, Identification for Plumbing Piping and Equipment.

2.3 CARRIERS

A. Wall Hung Urinal: Zurn Z-1218-WS or Z-1222-WS. (JR Smith 637). Coupling type or plate type with bearing plate 200 lb. capacity.

B. Wall Hung Lavatory: Zurn Z-1231 (D). (JR Smith 700). Concealed arm or Plate type, 250 lb. capacity.

C. Wall Hung Drinking Fountain: Zurn Z-1225-BL (JR Smith 834-97-98). Plate type. 300 lb. capacity.

2.4 DOWNSPOUT BOOT/NOZZLE/COVER

A. See Schedule on Drawings for type.

2.5 ELECTRIC WATER COOLERS

A. See Schedule on Drawings for type.

2.6 FIXTURE TRIM

A. Traps: Provide heavy duty commercial grade traps on fixtures except fixtures with integral traps. Exposed traps will be chromium plated cast brass or 17 gauge chromium plated brass tubing.

1. Sink: McGuire 8912CDF.
2. Lavatory: McGuire 8902CDF.

B. Supplies and Stops: Lead free heavy duty commercial grade, chrome plated with brass stems. Stops: T-handle or Loose Key type.

1. Lavatory: McGuire LFH2165LK.
2. Sink: McGuire LFH2167LK.
3. Water Closets: McGuire.

C. Lavatory Grid Strainer: McGuire 155A.

D. Sink Grid Strainer: McGuire 152N.

E. Shower Grid Strainer: McGuire 1266.

F. Sink Basket Strainer: McGuire 151.

G. Trim barrier-free wrap for P-traps and supplies by McGuire, Pro-Wrap, Plumberex or True-bro.

H. Escutcheons: McGuire wrought brass deep bell.

I. Wax Rings and Toilet Bolts: WM Harvey No Seep No. 1 053065-N.

2.7 FLOOR DRAINS

A. See Schedule on Drawings for types.

2.8 FLOOR SINKS

A. See Schedule on Drawings for types.

B. Plastic components are not allowed.

2.9 FLUSHOMETERS - WATER CLOSET/URINAL

A. See Schedule on Drawings for types.

2.10 HOSE BIBBS

A. See Schedule on Drawings for types.

2.11 HUB DRAINS

A. See Schedule on Drawings for type.

2.12 ROOF/OVERFLOW DRAINS

A. See Schedule on Drawings for type.

B. Plastic components are not allowed.

2.13 WATER CLOSET SEATS

A. See Schedule on Drawings for type.

2.14 DRAIN BOXES

A. See Schedule on Drawings for type.

B. Provide fire rated ASTM E-84 rated boxes where required by building construction.

2.15 WATER SUPPLY BOXES

A. See Schedule on Drawings for type.

B. Provide fire rated ASTM E-84 rated boxes where required by building construction.

PART 3 - EXECUTION

3.1 GENERAL PLUMBING FIXTURE INSTALLATION INFORMATION

A. Verification of Conditions:

1. Examine rough-in work of water supply and waste piping systems to verify actual locations of piping connections prior to installing fixtures. Examine floors and substrates, and conditions under which fixture work is to be accomplished. Correct any incorrect locations of piping and other unsatisfactory conditions for installation of plumbing fixtures.
2. Examine walls, floors and cabinets for suitable conditions where fixtures are to be installed.

3. Install plumbing fixtures level and plumb, in accordance with fixture manufacturer's written instructions, rough-in drawings and pertinent codes and regulations, design and referenced standards.
4. Fasten plumbing fixtures securely to supports or building structure. Secure supplies behind or within wall construction to provide rigid installation.
5. Install a stop valve in a readily accessible location in water connection to each fixture.
6. Install escutcheons at each wall, floor and ceiling penetration in exposed finished locations and within cabinets and millwork.
7. Seal fixtures to walls and floors using silicone sealant Dow Corning No. 780 or approved equivalent. Match sealant color to fixture color.
8. Test fixtures to demonstrate proper operation upon completion of installation and after units are water pressurized. Replace malfunctioning units, then retest.
9. Inspect each unit for damage prior to installation. Replace damaged fixtures.
10. Replace washers or cartridges of leaking or dripping faucets and stops.
11. Clean fixtures, trim and strainers using manufacturer's recommended cleaning methods and materials.
12. During construction, cover installed fixtures, drains, sinks and water coolers with cardboard and wrap with sheet plastic.
13. Provide trap primers for floor drains, floor sinks, trench drains and hub drains.
14. Install roof and overflow roof drains per architectural details. Cover drains during roof construction to protect drain. Provide offsets or expansion joints at each roof/overflow drain.
15. Do not use lead flashing.

B. Owner Furnished Equipment:

1. Rough-in and make final connections to Owner furnished equipment. Provide necessary items to complete installation.
2. Comply with requirements of this Section and Drawings for installation procedures.

C. Adjusting and Cleaning: Clean plumbing fixtures, trim, and strainers of dirt and debris upon completion of installation. Adjust water pressure at drinking fountains, faucets, shower valves and flush valves to provide proper flow stream and specified GPM. Repair leaks at faucets and stops.

D. Extra Stock: Furnish special wrenches and other devices necessary for servicing plumbing fixtures and trim to Owner.

E. Field Quality Control: Upon completion of installation of plumbing fixtures, test fixtures to demonstrate capability and compliance with Specifications. Correct or replace malfunctioning units at site, then retest to demonstrate compliance.

F. Protection: Protect fixtures and equipment from damage. Cover finished fixtures with cardboard and sheet plastic. Fixtures are not to be used during construction. Replace damaged items with new.

G. Signage: For fixtures that do not have ASSE 1070 mixing valve protection for hot water temperature, provide signage per Section 22 05 53, Identification for Plumbing Piping and Equipment.

3.2 CARRIERS INSTALLATION

A. Install components in accordance with manufacturer's instructions and approved product data submittals.

B. Set plumb, level and rigid.

C. Coordinate wall thickness so carrier has adequate depth to be concealed.

3.3 DOWNSPOUT BOOT/NOZZLE/COVER INSTALLATION

A. Install components in accordance with manufacturer's instructions and approved product data submittals.

B. Set plumb, level and rigid.

3.4 ELECTRIC WATER COOLER INSTALLATION

A. Install components in accordance with manufacturer's instructions and approved product data submittals.

B. Set plumb, level and rigid.

3.5 FIXTURE TRIM INSTALLATION

A. Install components in accordance with manufacturer's instructions and approved product data submittals.

B. Set plumb, level and rigid.

3.6 FLOOR DRAINS INSTALLATION

A. Install components in accordance with manufacturer's instructions and approved product data submittals.

B. Set plumb, level and rigid.

3.7 FLOOR SINK INSTALLATION

A. Install components in accordance with manufacturer's instructions and approved product data submittals.

B. Set plumb, level and rigid. Set fixture rim/grate flush with surrounding finish surface unless specifically noted otherwise.

3.8 FLUSHOMETERS - WATER CLOSET/URINAL INSTALLATION

A. Install components in accordance with manufacturer's instructions and approved product data submittals.

B. Set plumb, level and rigid.

3.9 HOSE BIBB INSTALLATION

A. Install components in accordance with manufacturer's instructions and approved product data submittals.

B. Set plumb, level and rigid.

3.10 HUB DRAINS INSTALLATION

A. Install components in accordance with manufacturer's instructions and approved product data submittals.

B. Set plumb, level and rigid.

3.11 ROOF/OVERFLOW DRAINS INSTALLATION

A. Install components in accordance with manufacturer's instructions and approved product data submittals.

B. Set plumb, level and rigid.

3.12 WATER CLOSET SEAT INSTALLATION

A. Install components in accordance with manufacturer's instructions and approved product data submittals.

B. Set plumb, level and rigid.

3.13 DRAIN BOX INSTALLATION

A. Install components in accordance with manufacturer's instructions and approved product data submittals.

B. Set plumb, level and rigid.

3.14 WATER SUPPLY BOX INSTALLATION

A. Install components in accordance with manufacturer's instructions and approved product data submittals.

B. Set plumb, level and rigid.

END OF SECTION 22 40 00

22 45 19 – SELF-CONTAINED EYEWASH EQUIPMENT (WATER SUPPLY)

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Self-contained emergency eyewash station located in the treatment building.

1.2 REFERENCES

A. American National Standards Institute (ANSI).

B. American Society of Mechanical Engineers (ASME).

C. National Fire Protection Association (NFPA).

D. Occupational Safety and Health Administration (OSHA).

E. Underwriters Laboratories, Inc. (UL).

1.3 SUBMITTALS

A. Submit as specified in Section 01 33 00 “Submittal Procedures.”

B. Product Data: Submit data on eyewash station and associated appurtenances.

C. Manufacturer’s Certificate: Submit Statement of Compliance, supporting data, from material supplies attesting that eyewash station and accessories provided meet or exceed AWWA Standards and specification requirements.

D. Requirements for warranties: Section 01 77 00 “Closeout Procedures.”

E. Furnish manufacturer’s warranty for eyewash station.

1.4 QUALITY ASSURANCE

A. Regulatory requirements:

1. As applicable, equipment of this Section shall comply with the requirements of state and local jurisdictions, as well ASME, NFPA, OSHA and UL regulations.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Packing and shipping: Deliver to the job site in manufacturer's original containers.

B. Delivery: After wet operations in building are completed.

C. Storage and protection:

1. Store materials in original, unopened containers in compliance with manufacturer's printed instructions.
2. Keep materials dry until ready for use.
3. Keep packages of material off the ground, under cover, and away from sweating walls and other damp surfaces.
4. Protect finished surfaces from soiling and damage during handling and installation. Keep covered with a protective covering.

PART 2 - PRODUCTS

2.1 SELF-CONTAINED EMERGENCY EYEWASH STATION

A. General design requirements:

1. Wall mounted, gravity flow portable eyewash with dual spray heads.
2. Material: Polyethylene.
3. 16-gallon solution tank.
4. Eyewash flow rate: 8 gallons over 15 minutes, minimum.
5. Wastewater drain built into unit.
6. Meet or exceed all requirements of ANSI Z358.1, current edition.
7. Provide ANSI compliant identification sign and markings.

B. Manufacturers and Products:

1. Guardian G1540.
2. Engineer approved equal.

PART 3 - EXECUTION (Not Used)

END OF SECTION 22 45 19

SECTION 23 00 00 - HEATING, VENTILATING AND AIR CONDITIONING (HVAC) BASIC REQUIREMENTS

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Work included in 23 00 00, HVAC Basic Requirements applies to Division 23, HVAC work to provide materials, labor, tools, permits, incidentals, and other services to provide and make ready for Owner's use of heating, ventilating and air conditioning systems for proposed project.

B. Contract Documents include, but are not limited to, Specifications including Division 00, Procurement and Contracting Requirements and Division 01, General Requirements, Drawings, Addenda, Owner/Architect Agreement, and Owner/Contractor Agreement. Confirm requirements before commencement of work.

C. Definitions:

1. Provide: To furnish and install, complete and ready for intended use.
2. Furnish: Supply and deliver to project site, ready for unpacking, assembly and installation.
3. Install: Includes unloading, unpacking, assembling, erecting, installation, applying, finishing, protecting, cleaning and similar operations at project site as required to complete items of work provided.
4. Approved or Approved Equivalent: To possess the same performance qualities and characteristics and fulfill the utilitarian function without any decrease in quality, durability or longevity. For equipment/products defined by the Contractor as "equivalent", substitution requests must be submitted to Engineer for consideration, in accordance with Division 01, General Requirements, and approved by the Engineer prior to submitting bids for substituted items.
5. Authority Having Jurisdiction (AHJ): Indicates reviewing authorities, including local fire marshal, Owner's insurance underwriter, Owner's Authorized Representative, and other reviewing entity whose approval is required to obtain systems acceptance.

1.2 RELATED SECTIONS

A. Contents of Section applies to Division 23, HVAC Contract Documents.

B. Related Work:

1. Additional conditions apply to this Division including, but not limited to:
   a. Specifications including Division 00, Procurement and Contracting Requirements and Division 01, General Requirements.
   b. Drawings
   c. Addenda
   d. Owner/Architect Agreement
   e. Owner/Contractor Agreement
   f. Codes, Standards, Public Ordinances and Permits

1.3 REFERENCES AND STANDARDS

A. References and Standards per Division 01, General Requirements, individual Division 23, HVAC Sections and those listed in this Section.

B. Codes to include latest adopted editions, including current amendments, supplements and local jurisdiction requirements in effect as of the date of the Contract Documents, of/from:

1. State of Washington:
   a. IBC - International Building Code
   b. IFC - International Fire Code
   c. IMC - International Mechanical Code
   d. NEC - National Electrical Code
   e. UPC - Uniform Plumbing Code
   f. WAC - Washington Administrative Code
   g. WSEC - Washington State Energy Code

C. Reference standards and guidelines include but are not limited to the latest adopted editions from:

1. ABMA - American Bearing Manufacturers Association
2. ADA - Americans with Disabilities Act
3. AHRI - Air-Conditioning Heating & Refrigeration Institute
4. AMCA - Air Movement and Control Association
5. ANSI - American National Standards Institute
6. ASCE - American Society of Civil Engineers
7. ASHRAE - American Society of Heating, Refrigeration and Air-Conditioning Engineers
8. ASHRAE Guideline 0, The Commissioning Process
9. ASME - American Society of Mechanical Engineers
10. ASPE - American Society of Plumbing Engineers
11. ASSE - American Society of Sanitary Engineering
12. ASTM - ASTM International
13. AWWA - American Water Works Association
14. CFR - Code of Federal Regulations
15. CGA - Compressed Gas Association
16. CISPI - Cast Iron Soil Pipe Institute
17. EPA - Environmental Protection Agency
18. ETL - Electrical Testing Laboratories
19. FM - FM Global
20. GAMA - Gas Appliance Manufacturers Association
21. HI - Hydraulic Institute Standards
22. IAPMO - International Association of Plumbing & Mechanical Officials
23. IFGC - International Fuel Gas Code
24. ISO - International Organization for Standardization
25. MSS - Manufacturers Standardization Society
26. NEC - National Electric Code
27. NEMA - National Electrical Manufacturers Association
28. NFPA - National Fire Protection Association
29. NFGC - National Fuel Gas Code
30. NRCA - National Roofing Contractors Association
31. NSF - National Sanitation Foundation
32. OSHA - Occupational Safety and Health Administration
33. SMACNA - Sheet Metal and Air Conditioning Contractors' National Association, Inc.

34. TEMA - Tubular Exchanger Manufacturers Association
35. TIMA - Thermal Insulation Manufacturers Association
36. UL - Underwriters Laboratories, Inc.

D. See Division 23, HVAC individual Sections for additional references.

1.4 SUBMITTALS

A. See Division 01, General Requirements for Submittal Procedures as well as specific individual Division 23, HVAC Sections.

B. Provide drawings in format and software release equal to the design documents. Drawings to be the same sheet size and scale as the Contract Documents.

C. In addition:

1. "No Exception Taken" constitutes that review is for general conformance with the design concept expressed in the Contract Documents for the limited purpose of checking for conformance with information given. Any action is subject to the requirements of the Contract Documents. Contractor is responsible for the dimensions and quantity and will confirm and correlate at the job site, fabrication processes and techniques of construction, coordination of the work with that of all other trades, and the satisfactory performance of the work.
2. Provide product submittals and shop drawings in electronic format only. Electronic format must be submitted via zip file via e-mail and be native/searchable PDF format. Scanned copies are not acceptable. For electronic format, provide one file per division containing one bookmarked PDF file with each bookmark corresponding to each Specification Section. Arrange bookmarks in ascending order of Specification Section number. Individual submittals sent piecemeal in a per Specification Section method will be returned without review or comment. All transmissions/submissions to be submitted to Architect. At Contractor’s option, four separate submittals may be provided, consisting of long lead items, underground/site work, building work, and building automation system. Deviations will be returned without review.
3. Product Data: Provide Manufacturer's descriptive literature for products specified in Division 23, HVAC Sections.
4. Identify/mark each submittal in detail. Note what differences, if any, exist between the submitted item and the specified item. Failure to identify the differences will be considered cause for disapproval. If differences are not identified and/or not discovered during the submittal review process, Contractor remains responsible for providing equipment and materials that meet the Specifications and Drawings.
    a. Label submittal to match numbering/references as shown in Contract Documents. Highlight and label applicable information to individual equipment or cross out/remove extraneous data not applicable to submitted model. Clearly note options and accessories to be provided, including field installed items. Highlight connections by/to other trades.
    b. Include technical data, installation instructions and dimensioned drawings for products, fixtures, equipment and devices installed, furnished or provided. Reference individual Division 23, HVAC Specification Sections for specific items required in product data submittal outside of these requirements.
    c. Provide pump curves, operation characteristics, capacities, ambient noise criteria, etc. for equipment.
    d. For vibration isolation of equipment, list make and model selected with operating load and deflection.

e. See Division 23, HVAC individual Sections for additional submittal requirements outside of these requirements.

5. Maximum of two reviews of submittal package. Arrange for additional reviews and/or early review of long-lead items; Bear costs of these additional reviews at Engineer's hourly rates. Incomplete submittal packages/submittals will be returned to contractor without review.
6. Resubmission Requirements: Make corrections or changes in submittals as required, and in consideration of Engineer’s comments. Identify Engineer’s comments and provide an individual response to each of the Engineer’s comments. Cloud changes in the submittals and further identify changes which are in response to Engineer’s comments.
7. Structural/Seismic: Provide weights, dimensions, mounting requirements and like information required for mounting, seismic bracing, and support. Indicate manufacturer's installation and support requirements to meet Section 23 05 48, Vibration and Seismic Controls for HVAC Equipment. Provide engineered seismic drawings and equipment seismic certification. Equipment Importance Factor as specified in Division 01 and in Structural documents.
8. Trade Coordination: Include physical characteristics, electrical characteristics, device layout plans, wiring diagrams, and connections as required by Division 23, HVAC Coordination Documents. For equipment with electrical connections, furnish copy of approved submittal for inclusion in Division 26, Electrical submittals.
9. Make provisions for openings in building for admittance of equipment prior to start of construction or ordering of equipment.
10. Substitutions and Variation from Basis of Design:
    a. The Basis of Design designated product establishes the qualities and characteristics for the evaluation of any comparable products by other listed acceptable manufacturers if included in this Specification or included in an approved Substitution Request as judged by the Design Professional.
    b. If substitutions and/or equivalent equipment/products are being proposed, it is the responsibility of parties proposing the substitute and/or equivalent equipment to verify and compare the characteristics and requirements of that furnished to that specified and/or shown. If greater capacity and/or more materials and/or more labor is required for the rough-in, circuitry or connections than for the item specified and provided for, then provide compensation for additional charges required for the proper rough-in, circuitry and connections for the equipment being furnished. No additional charges above the Base Bid, including resulting charges for work performed under other Divisions, will be allowed for such revisions. Coordinate with the requirements of "Submittals." For any product marked "or approved equivalent," a substitution request must be submitted to Engineer for approval prior to bid.
11. Shop Drawings: Provide coordinated shop drawings which include physical characteristics of all systems, equipment, ductwork and piping layout plans, and control wiring diagrams. Reference individual Division 23, HVAC Specification Sections for additional requirements for shop drawings outside of these requirements.
    a. Provide Shop Drawings indicating access panel locations for items that require Code or maintenance access, size and elevation for approval prior to installation.
12. Samples: Provide samples when requested by individual Sections.
13. Resubmission Requirements:
    a. Make any corrections or change in submittals when required. Provide submittals as specified. The Engineer will not be required to edit and/or interpret the Contractor's submittals. Indicate changes for the resubmittal in a cover letter with reference to page(s) changed and reference response to comment. Cloud changes in the submittals.
        1) Resubmit for review until review indicates no exception taken or make "corrections as noted."

2) When submitting drawings for Engineer's re-review, clearly indicate changes on drawings and "cloud" any revisions. Submit a list describing each change.

14. Operation and Maintenance Manuals, Owner's Instructions:
    a. Submit, at one time, electronic files (native/searchable PDF format) of manufacturer's operation and maintenance instruction manuals and parts lists for equipment or items requiring servicing. Submit data when work is substantially complete and in same order format as submittals. Include name and location of source parts and service for each piece of equipment.
        1) Include copy of approved submittal data along with submittal review letters received from Engineer. Data to clearly indicate installed equipment model numbers. Delete or cross out data pertaining to other equipment not specific to this project.
        2) Include copy of manufacturer's standard Operations and Maintenance for equipment. At front of each tab, provide routine maintenance documentation for scheduled equipment. Include manufacturer's recommended maintenance schedule and highlight maintenance required to maintain warranty. Furnish list of routine maintenance parts, including part numbers, sizes, quantities, relevant to each piece of equipment: belts, motors, lubricants, and filters.
        3) Include Warranty per Division 00, Procurement and Contracting Requirements, Division 01, General Requirements, Section 23 00 00, HVAC Basic Requirements and individual Sections.
        4) Include product certificates of warranties and guarantees.
        5) Include copy of complete parts list for equipment. Include available exploded views of assemblies and sub assemblies.
        6) Include copy of startup and test reports specific to each piece of equipment.
        7) Include copy of final air and water systems balancing log along with pump, fan and distribution system operating data.
        8) Include commissioning reports.
        9) Include copy of valve charts/schedules.
        10) Engineer will return incomplete documentation without review. Engineer will provide one set of review comments in Submittal Review format. Contractor must arrange for additional reviews; Contractor to bear costs for additional reviews at Engineer's hourly rates.
    b. Thoroughly instruct Owner in proper operation of equipment and systems. Where noted in individual Sections, training will include classroom instruction with applicable training aids and systems demonstrations. Field instruction per Section 23 00 00, HVAC Basic Requirements Article titled "Demonstration."
    c. Copies of certificates of code authority inspections, acceptance, code required acceptance tests, letter of conformance and other special guarantees, certificates of warranties, specified elsewhere or indicated on Drawings.
15. Record Drawings:
    a. Maintain at site at least one set of drawings for recording “As-constructed” conditions. Indicate on drawings changes to original documents by referencing revision document, and include buried elements, location of cleanouts, and location of concealed mechanical items. Include items changed by field orders, supplemental instructions, and constructed conditions.
    b. Record Drawings are to include equipment and fixture/connection schedules, control dampers, fire smoke dampers, fire dampers, valves, bottom of pipe, duct and equipment elevations and dimensioned locations for all distribution systems (hydronic and air). Invert elevations and dimensioned locations for underground systems below grade to 5-feet outside building that accurately reflect "as constructed or installed" for project.

c. At completion of project, input changes to original project Revit Model and make one set of black-line drawings created from Revit Model in version/release equal to contract drawings. Submit Revit Model and drawings upon substantial completion.
d. See Division 23, HVAC individual Sections for additional items to include in record drawings.

1.5 QUALITY ASSURANCE

A. Regulatory Requirements: Work and materials installed to conform with all local, State and Federal codes, and other applicable laws and regulations. Where code requirements are at variance with Contract Documents, meet code requirements as a minimum requirement and include costs necessary to meet these in Contract. Machinery and equipment are to comply with OSHA requirements, as currently revised and interpreted for equipment manufacturer requirements. Install equipment provided per manufacturer recommendations.

B. Whenever this Specification calls for material, workmanship, arrangement or construction of higher quality and/or capacity than that required by governing codes, higher quality and/or capacity take precedence.

C. Drawings are intended to be diagrammatic and reflect the Basis of Design manufacturer's equipment. They are not intended to show every item in its exact dimensions, or details of equipment or proposed systems layout. Verify actual dimensions of systems (i.e., piping) and equipment proposed to assure that systems and equipment will fit in available space. Contractor is responsible for design and construction costs incurred for equipment other than Basis of Design, including, but not limited to, architectural, structural, electrical, HVAC, fire sprinkler, and plumbing systems.

D. Manufacturer's Instructions: Follow manufacturers' written instructions. If in conflict with Contract Documents, obtain clarification. Notify Engineer/Architect, in writing, before starting work.

E. Items shown on Drawings are not necessarily included in Specifications or vice versa. Confirm requirements in all Contract Documents.

F. Provide products that are UL listed.

G. Piping and duct insulation products to contain less than 0.1 percent by weight PBDE in all insulating materials.

H. ASME Compliance: ASME listed water heaters and boilers with an input of 200,000 BTUH and higher, hot water storage tanks which exceed 120 gallons, and hot water expansion tanks which are connected to ASME rated equipment or required by code or local jurisdiction.

I. Provide safety controls required by National Boiler Code (ASME CSD 1) for boilers and water heaters with an input of 400,000 BTUH and higher.

1.6 WARRANTY

A. Provide written warranty covering the work for a period of one year from date of Substantial Completion in accordance with Division 00, Contracting and Procurement Requirements, Division 01, General Requirements, Section 23 00 00, HVAC Basic Requirements and individual Division 23, HVAC Sections.

B. Sections under this Division can require additional and/or extended warranties that apply beyond basic warranty under Division 01, General Requirements and the General Conditions. Confirm requirements in all Contract Documents.

1.7 COORDINATION DOCUMENTS

A. Prior to construction, prepare and submit coordinated layout drawings (composite drawings), to coordinate installation and location of ductwork, grilles, diffusers, piping, fire sprinklers, plumbing, lights, and electrical services. Composite Drawings show services on single sheet. Key Drawings to structural column identification system. Prior to completion of Drawings, coordinate proposed installation with architectural and structural requirements, and other trades (including plumbing, HVAC, fire protection, electrical, ceiling suspension, and ceiling tile systems, etc.), and provide maintenance access requirements. Coordinate with submitted architectural systems (i.e. roofing, ceiling, finishes) and structural systems as submitted, including footings and foundation. Identify zone of influence from footings and ensure systems are not routed within the zone of influence.

B. Prepare Drawings as follows:

1. Drawings in Revit model. Revit model release equal to design documents. Drawings to be same sheet size and scale as Contract Drawings and indicate location, size, and elevation above finished floor of equipment and distribution systems.
2. Review and revise, as necessary, section cuts in Contract Drawings after verification of field conditions.
3. Indicate hydronic and air distribution system piping including fittings, hangers, access panels, valves, and bottom of pipe and duct elevations above finished floor.
4. Indicate inverts and provision for piping that must be graded to have right-of-way over more flexible items. Drawings also to indicate proposed ceiling grid and lighting layout as shown on electrical drawings and architectural reflected ceiling drawings and HVAC equipment, ductwork and piping.
5. Incorporate Addenda items and change orders.
6. Distribute drawings to trades and provide additional coordination as requested by other trades.

C. Advise Architect in event conflict occurs in location or connection of equipment. Bear costs resulting from failure to properly coordinate installation or failure to advise Architect of conflict.

D. Submit final Coordination Drawings with changes as Record Drawings at completion of project.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Articles, fixtures, and equipment of a kind to be standard product of one manufacturer, including but not limited to pumps, fans, valves, control devices, air handlers, vibration isolation devices, etc.

2.2 STANDARDS OF MATERIALS AND WORKMANSHIP

A. Base contract upon furnishing materials as specified. Materials, equipment, and fixtures used for construction are to be new, latest products as listed in manufacturer's printed catalog data and are to be UL or ETL listed and labeled or be approved by State, County, and City authorities prior to procurement and installation.

B. Names and manufacturer's names denote character and quality of equipment desired and are not to be construed as limiting competition.

C. Hazardous Materials:

1. Comply with local, State of Washington, and Federal regulations relating to hazardous materals.
2. Comply with Division 00, Procurement and Contracting Requirements and Division 01, General Requirements for this project relating to hazardous materials.
3. Do not use any materials containing a hazardous substance. If hazardous materials are encountered, do not disturb; immediately notify Owner and Architect. Hazardous materials will be removed by Owner under separate contract.

PART 3 - EXECUTION

3.1 ACCESSIBILITY AND INSTALLATION

A. Confirm Accessibility and Installation requirements in Division 00, Procurement and Contracting Requirements, Division 01, General Requirements, Section 23 00 00, HVAC Basic Requirements and individual Division 23, HVAC Sections.

B. Install equipment having components requiring access (i.e., drain pans, drains, control operators, valves, motors and vibration isolation devices) so that they may be serviced, reset, replaced or recalibrated by service people with normal service tools and equipment. Do not install equipment in obvious passageways, doorways, scuttles or crawlspaces which would impede or block intended usage.

C. Install equipment and products complete as directed by manufacturer's installation instructions including all appurtenances recommended in manufacturer's installation instructions, at no additional charge to Owner. Obtain installation instructions from manufacturer prior to rough-in of equipment and examine instructions thoroughly. When requirements of installation instructions conflict with Contract Documents, request clarification from Architect prior to proceeding with installation. This includes proper installation methods, sequencing and coordination with other trades and disciplines.

D. Earthwork:

1. Confirm Earthwork requirements in Contract Documents. In absence of specific requirements, comply with individual Division 23, HVAC Sections and the following:
   a. Perform excavation, dewatering, shoring, bedding, and backfill required for installation of work in this Division in accordance with related earthwork Sections. Contact utilities and locate existing utilities prior to excavation. Repair any work damaged during excavation or backfilling.
   b. Excavation: Do not excavate under footings, foundation bases, or retaining walls.
   c. Provide protection of underground systems. Review the project Geotechnical Report for references to corrosive or deleterious soils which will reduce the performance or service life of underground systems materials.

E. Firestopping:

1. Confirm Firestopping requirements in Division 07, Thermal and Moisture Protection. In absence of specific requirements, comply with individual Division 23, HVAC Sections and the following:

a. Coordinate location and protection level of fire and/or smoke rated walls, ceilings, and floors. When these assemblies are penetrated, seal around piping, ductwork and equipment with approved firestopping material. Install firestopping material complete as directed by manufacturer's installation instructions. Meet requirements of ASTM E814, Standard Test Method for Fire Tests of Through-Penetration Fire Stops.

F. Pipe Installation:

1. Provide installation of piping systems coordinated to account for expansion and contraction of piping materials and building, as well as anticipated settlement or shrinkage of building. Install work to prevent damage to piping, equipment, and building and its contents. Provide piping offsets, loops, seismic flexible joints, expansion joints, sleeves, anchors or other means to control pipe movement and minimize forces on piping. Verify anticipated settlement and/or shrinkage of building with Project Structural Engineer. Verify construction phasing, type of building construction products and rating for coordinating installation of piping systems.
2. Include provisions for servicing and removal of equipment without dismantling piping.

G. Plenums:

1. Plenums: Materials within plenums shall be noncombustible or shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723. Immediately notify Architect/Engineer of any discrepancy.

H. Provide miscellaneous supports/metals required for installation of equipment, piping, and ductwork.

3.2 SEISMIC CONTROL

A. Confirm Seismic Control requirements in Division 01, General Requirements, Structural documents, Section 23 0548, Vibration and Seismic Controls for HVAC Equipment, and individual Division 23 HVAC Sections.

B. Piping and Ductwork:

1. Per "Seismic Restraints Manual Guidelines for Mechanical Systems" latest edition published by SMACNA or local requirements.

C. Provide means to prohibit excessive motion of mechanical equipment during earthquake.

3.3 REVIEW AND OBSERVATION

A. Confirm Review and Observation requirements in Division 00, Procurement and Contracting Requirements, Division 01, General Requirements, Section 23 00 00, HVAC Basic Requirements and individual Division 23, HVAC Sections.

B. Notify Architect, in writing, at following stages of construction so that they may, at their option, visit site for review and construction observation:

1. Underground system installation prior to backfilling.
2. Prior to covering walls.

3. Prior to ceiling cover/installation.
4. After major equipment is installed.
5. When main systems, or portions of, are being tested and ready for inspection by AHJ.

C. Final Punch:

1. Prior to requesting a final punch visit from the Engineer, request from Engineer the Mechanical Precloseout Checklist, complete the checklist confirming completion of systems' installation, and return to Engineer. Request a final punch visit from the Engineer, upon Engineer's acceptance that the mechanical systems are ready for final punch.
2. Costs incurred by additional trips required due to incomplete systems will be the responsibility of the Contractor.

3.4 CUTTING AND PATCHING

A. Confirm Cutting and Patching requirements in Division 00, Procurement and Contracting Requirements and Division 01, General Requirements. In absence of specific requirements, comply with individual Division 23, HVAC Sections and the following:

1. Proposed floor cutting/core drilling/sleeve locations to be approved by Project Structural Engineer. Submit proposed locations to Architect/Project Structural Engineer. Where slabs are of post tension construction, perform x-ray scan of proposed penetration locations and submit scan results including proposed penetration locations to Project Structural Engineer/Architect for approval. Where slabs are of waffle type construction, show column cap extent and cell locations relative to proposed penetration(s).
2. Cutting, patching and repairing for work specified in this Division including plastering, masonry work, concrete work, carpentry work, and painting included under this Section will be performed by skilled craftspeople of each respective trade in conformance with appropriate Division of Work.
3. Additional openings required in building construction to be made by drilling or cutting. Use of jack hammer is specifically prohibited. Patch openings in and through concrete and masonry with grout.
4. Restore new or existing work that is cut and/or damaged to original condition. Patch and repair specifically where existing items have been removed. This includes repairing and painting walls, ceilings, etc. where existing conduit and devices are removed as part of this project. Where alterations disturb lawns, paving, and walks, surfaces to be repaired, refinished and left in condition matching existing prior to commencement of work.
5. Additional work required by lack of proper coordination will be provided at no additional cost to the Owner.

3.5 EQUIPMENT SELECTION AND SERVICEABILITY

A. Replace or reposition equipment which is too large or located incorrectly to permit servicing, at no additional cost to Owner.

B. Maintain design intent where equipment other than as shown as Basis of Design in Contract Documents is provided. Where equipment requires ductwork or piping arrangement, controls/control diagrams, or sequencing different from that indicated in Contract Documents, provide at no additional cost to Owner.

3.6 DELIVERY, STORAGE AND HANDLING

A. Confirm requirements in Division 00, Procurement and Contracting Requirements and Division 01, General Requirements. In absence of specific requirements, comply with individual Division 23, HVAC Sections and the following:

1. Handle materials delivered to project site with care to avoid damage. Store materials on site inside building or protected from weather, dirt and construction dust. Insulation and lining that becomes wet from improper storage and handling to be replaced before installation. Products and/or materials that become damaged due to water, dirt, and/or dust as a result of improper storage to be replaced before installation.
2. Protect equipment and pipe to avoid damage. Close pipe openings with caps or plugs. Keep motors and bearings in watertight and dustproof covers during entire course of installation.
3. Protect bright finished shafts, bearing housings and similar items until in service.

3.7 DEMONSTRATION

A. Confirm Demonstration requirements in Division 00, Procurement and Contracting Requirements and Division 01, General Requirements, Section 23 00 00, HVAC Basic Requirements and individual Division 23, HVAC Sections.

B. Upon completion of work and adjustment of equipment and test systems, demonstrate to Owner's Authorized Representative, Architect and Engineer that equipment furnished and installed or connected under provisions of these Specifications functions in manner required. Provide field instruction to Owner's Maintenance Staff as specified in Division 01, General Requirements, Section 23 00 00, HVAC Basic Requirements and individual Division 23, HVAC Sections.

C. Manufacturer's Field Services: Furnish services of a qualified person at time approved by Owner, to instruct maintenance personnel, correct defects or deficiencies, and demonstrate to satisfaction of Owner that entire system is operating in satisfactory manner and complies with requirements of other trades that may be required to complete work. Complete instruction and demonstration prior to final job site observations.

3.8 CLEANING

A. Confirm Cleaning requirements in Division 00, Procurement and Contracting Requirements, Division 01, General Requirements, Section 23 00 00, HVAC Basic Requirements and individual Division 23, HVAC Sections.

B. Upon completion of installation, thoroughly clean exposed portions of equipment, removing temporary labels and traces of foreign substances. Throughout work, remove construction debris and surplus materials accumulated during work.

3.9 START UP

A. Start up equipment, in accordance with manufacturer's start-up instructions, and in presence of manufacturer's representative. Test controls and demonstrate compliance with requirements. Replace damaged or malfunctioning controls and equipment.

1. Do not place equipment in sustained operation prior to initial balancing of HVAC systems.

3.10 PAINTING

A. Confirm Painting requirements in Division 01, General Requirements and Division 09, Finishes. In absence of specific requirements, comply with individual Division 23, HVAC Sections and the following:

1. Ferrous Metal: After completion of work, thoroughly clean and paint exposed supports constructed of ferrous metal surfaces in mechanical rooms, i.e., hangers, hanger rods, equipment stands, with one coat of black asphalt varnish for exterior or black enamel for interior, suitable for hot surfaces.
2. After acceptance by Authority Having Jurisdiction (AHJ), In a mechanical room, on roof or other exposed areas, machinery and equipment not painted with enamel to receive two coats of primer and one coat of rustproof enamel, colors as selected by Architect.
3. See individual equipment Specifications for other painting.
4. Structural Steel: Repair damage to structural steel finishes or finishes of other materials damaged by cutting, welding or patching to match original.
5. Piping and Ductwork: Clean, primer coat and paint exposed piping and ductwork on roof or at other exterior locations with two coats paint suitable for metallic surfaces and exterior exposures. Color selected by Architect.
6. Covers: Covers such as manholes, cleanouts and the like will be furnished with finishes which resist corrosion and rust.

3.11 ACCEPTANCE

A. Confirm requirements in Division 00, Procurement and Contracting Requirements and Division 01, General Requirements. In absence of specific requirements, comply with individual Division 23, HVAC Sections and the following:

1. System cannot be considered for acceptance until work is completed and demonstrated to Architect that installation is in strict compliance with Specifications, Drawings and manufacturer's installation instructions, particularly in reference to following:
   a. Testing and Balancing Reports
   b. Cleaning
   c. Operation and Maintenance Manuals
   d. Training of Operating Personnel
   e. Record Drawings
   f. Warranty and Guaranty Certificates
   g. Start-up/Test Document
   h. Commissioning Reports

3.12 FIELD QUALITY CONTROL

A. Confirm Field Quality Control requirements in Division 01, General Requirements, Section 23 00 00, HVAC Basic Requirements and individual Division 23, HVAC Sections.

B. Tests:

1. Conduct tests of equipment and systems to demonstrate compliance with requirements specified. Reference individual Specification Sections for required tests. Document tests and include in Operation and Maintenance Manuals.
2. During site evaluations by Architect or Engineer, provide appropriate personnel with tools to remove and replace trims, covers, and devices so that proper evaluation of installation can be performed.

3.13 LETTER OF CONFORMANCE

A. Provide Letter of Conformance, copies of manufacturers' warranties and extended warranties with a statement that HVAC items were installed in accordance with manufacturer's recommendations, UL listings and FM Global approvals. Include Letter of Conformance, copies of manufacturers' warranties and extended warranties in Operation and Maintenance Manuals.

3.14 ELECTRICAL INTERLOCKS

A. Where equipment motors are to be electrically interlocked with other equipment for simultaneous operation, utilize equipment wiring diagrams to coordinate with electrical systems so that proper wiring of equipment involved is affected.

3.15 TEMPORARY HEATING, COOLING AND HUMIDITY CONTROL

A. Provide temporary heating, cooling, controls, humidification and dehumidification as required to facilitate the construction of the project. Size and select temporary system based on the requirements of the various trades during construction. This includes, but is not limited to, drywall, case work, wood flooring and wood finishes that are subject to warping. Size and install system to prevent mold growth. Coordinate the location of the temporary system. The house system can be used. Develop a procedure for how the house system will be used including a sketch depicting the house system, how filtration will be used to prevent construction debris from entering the system and how often the filters will be changed, how the ductwork will be cleaned after use to ensure a clean system is turned over to the Owner and how the units are sized. Submit this procedure to the Mechanical Engineer for review. Follow National Air Duct Cleaners Association (NADCA) duct cleaning procedures and guidelines. Warranties for the house system, if new, to commence when the Owner moves in if house system is used as the means to maintain the climate within the building during construction. Include this warranty requirement in the original bid or proposal amount. Coordinate and provide any temporary power, controls, ductwork, piping, plumbing anchorage, miscellaneous steel and structural supports required to support the temporary system. Installation of the system to comply with all applicable codes and be acceptable to the Authority Having Jurisdiction (AHJ).

END OF SECTION 23 00 00

SECTION 23 00 05 - HEATING, VENTILATING AND AIR CONDITIONING PRE-CLOSEOUT CHECKLIST

PART 1 - GENERAL

1.1 WORK INCLUDED

A. HVAC System Controls

B. Energy Metering

C. BAS Graphics

D. Piping for Hydronic Piping System

E. Pumps

F. Ductwork

G. Fans

H. High Volume Low Speed Fans

I. Dryer Booster Fan

J. Diffusers/Grilles

K. Boilers

L. Heat Exchanger

M. Packaged Rooftop Unit/Air-to-Air Heat Pump

N. Energy Recovery Ventilator

O. Condensing Units

P. Chiller/Heat Pump

Q. Energy Recovery Unit

R. Air Handling Units

S. Make-Up Air Unit

T. Mini-Split Air Conditioning Unit

U. Fan Coil Units

1.2 PRE-CLOSEOUT CHECKLIST SUBMITTAL

A. Two weeks prior to the Engineer's Punch-Walk request, complete and submit Pre-Closeout Checklist to document compliance with the Contract Documents and that systems are functionally operational and ready for Closeout Inspection.

B. A Closeout/Punch-Walk inspection will only be scheduled after completion of Pre-Closeout Checklist and Engineer's acceptance of its completeness.

C. The Pre-closeout Checklist is a general guide to document compliance with the Contract Documents and is not an all-inclusive list of Contract requirements, and it is the responsibility of the Contractor to ensure the installation is complete and in full conformance with the Contract Documents.

D. Complete and submit Pre-Closeout Checklist, as indicated in Part 3.

E. Unless all similar equipment have exactly the same level of completeness, reproduce the Checklist as needed and submit one checklist for each equipment.

PART 2 - EQUIPMENT - NOT USED

PART 3 - INSTALLATION

3.1 PRE-CLOSEOUT CHECKLIST

A. HVAC System Controls:

1. Installation:

Yes	No	N/A	Task	Comment
			As-built shop drawings submitted.	
			Controls system commissioned and Sequence of Operations, implemented and commissioned.	
			Framed instructions mounted in or near control panel.	
			Control wiring and tubing labeled at all terminations, splices, and junctions.	
			Shielded wiring used on electric sensors.	
			Temperature sensors installed in each room specified.	
			Carbon dioxide sensors installed in each room specified.	
			Graphical Screens completed.	
			Web based access completed, and credentials provided to Owner.	
			Uninterruptable Power System (UPS) has been provided for the	

			Operator Workstation.	
			Portable Terminal has been provided to the Owner.	
			Specified training of Owner staff has been scheduled or already conducted.	

2. Electrical/IT:

Yes	No	N/A	Task	Comment
			120-volt AC power provided to controllers and servers.	
			Where specified, emergency power provided to controllers.	
			Data drop has been provided.	

B. Energy Metering - BAS:

1. Installation:

Yes	No	N/A	Task	Comment
			Proper meter has been installed in the right location.	
			Meter is reading properly and values are within expected range.	
			Meter display can be easily read.	
			Meter is properly sized for its application.	
			CT is sized properly for its operation (electrical).	

2. Hydronic Water Energy Metering:

Yes	No	N/A	Task	Comment
			Water supply and return temperatures along with the water flow to the building are monitored and provided on an energy metering graphic to show the current energy demand.	
			BAS monitors and records the peak high and low demand reading from the water flow meter. Readings are recorded on a daily, month to date, and year to date basis.	
			BAS monitors and records the hot water energy readings to provide a history of energy use. Usage readings are recorded on a daily, month to date, and year to date	

			basis.	
			An alarm is generated at the OWS whenever a sensor indicates an invalid demand value.	

3. Domestic Hot Water Energy Metering:

Yes	No	N/A	Task	Comment
			Domestic hot water supply and return temperatures along with the water flow to the building are monitored and provided on an energy metering graphic to show the current energy demand.	
			BAS monitors and records the peak high and low demand reading from the water flow meter. Readings are recorded on a daily, month to date, and year to date basis.	
			BAS monitors and records the domestic hot water energy readings to provide a history of energy use. Usage readings are recorded on a daily, month to date, and year to date basis.	
			An alarm is generated at the OWS whenever a sensor indicates an invalid demand value.	

4. Electrical Metering:

Yes	No	N/A	Task	Comment
			BAS is interfaced with the electrical switchgear to monitor the normal and emergency power demand and consumption on a continual basis.	
			BAS monitors and records the peak high and low demand reading from the electrical meter. Readings are recorded on a daily, month to date, and year to date basis.	
			BAS monitors and records the electric meter readings to provide a history of power consumption. Usage readings are recorded on a daily, month to date, and year to date basis.	
			An alarm is generated at the OWS whenever a sensor indicates a loss	

			of pulse output from the electric meter.	

5. Water Use Metering:

Yes	No	N/A	Task	Comment
			BAS is interfaced with the water meter to monitor water consumption on a continual basis.	
			BAS monitors and records the peak high and low demand reading from the water meter. Readings are recorded on a daily, month to date, and year to date basis.	
			BAS monitors and records the water meter readings to provide a history of water consumption. Usage readings are recorded on a daily, month to date, and year to date basis.	
			An alarm is generated at the OWS whenever a sensor indicates a loss of pulse output from the water meter.	

C. BAS Graphics:

1. Graphics

Yes	No	N/A	Task	Comment
			Graphics provided are the most current format available at time of control system programming.	
			Building graphic, typically a photograph of the building, with links to each floor plan is complete.	
			Central plant graphic with equipment (water source heat pump, pumps, valves, storage tanks, etc.), temperature sensors, pressure sensors, BTU meters, and flow sensors complete.	
			Floor plans with temperature sensors, pressure sensors, temperature control zones, heating/cooling zones, ventilation zones, and supply air zones identified	

			Floor plan graphic zones have a temperature symbol that changes color over the range from low (blue) through normal (green) to high (red) and indicate an alarm (flashing red). The zone temperature and or pressure symbol(s) to be a link to a zone control pop-up graphic. Individual floor plan graphics to provide links to related mechanical systems. The mechanical room plan graphics to show the relative location of, and provide links to, either the equipment pop-up or flow and control graphic for mechanical equipment monitored or controlled by the BAS.	

2. Energy and Weather Data Reporting:

Yes	No	N/A	Task	Comment
			Energy monitoring graphics page complete. Graphic displays graph showing yearly use of all sub-metered BTU data showing how much heating and cooling is used and where. At close of project, provide the mechanical engineer with a “read only” access to view and track the building's EUI and energy use graph.	
			Consumption and Peak usage values provided. System to display archived data in tabular format form for both consumption and peak values. Data shown in hourly, daily, weekly, monthly and yearly formats. In each format the user able to select a specific period of data to view.	
			Electrical Meter Report: Provide monthly report showing daily electrical consumption and peak electrical demand with time and date stamp for equipment (such as chillers) and variable frequency drives. Provide an annual (12-	

			month) report showing monthly electrical consumption and peak electrical demand with time and date stamp for each individual meter.	
			Weather Data Report: Provide monthly report showing daily minimum, maximum, and average outdoor air temperature (dry bulb, wet bulb) and humidity. Provide annual (12-month) report showing minimum, maximum, and average outdoor air temperature for month.	

D. Piping for Hydronic Piping System:

1. Installation:

Yes	No	N/A	Task	Comment
			Piping complete.	
			As-built drawings submitted.	
			Piping flushed and cleaned, and Report issued min one week in advance.	
			Strainers cleaned.	
			Valves installed as required.	
			Piping insulated as required.	
			Thermometers and gauges installed as required.	
			Air vents installed as specified.	
			Flexible connectors installed as specified.	
			Verify that piping has been labeled and valves are identified as specified.	
			Piping properly supported.	

2. Testing, Adjusting and Balancing:

Yes	No	N/A	Task	Comment
			Hydrostatic test complete and Report submitted.	
			TAB operation complete, report submitted to Architect/Engineer, comments received, and closeout items resolved.	

E. Pumps:

1. General:

Yes	No	N/A	Task	Comment
			Vibration isolation devices installed and functional.	
			Seismic restraints installed.	
			Piping system installed.	
			Piping system pressure tested.	
			Pump not leaking.	
			Couplings aligned to meet manufacturer's prescribed tolerances.	
			Pressure and temperature gauges properly installed.	
			Test ports installed at inlet and outlet of pumps.	
			Automatic control valves operational.	

2. Electrical:

Yes	No	N/A	Task	Comment
			Power available to pump disconnect.	
			Pump rotation verified.	
			Control system interlocks functional.	
			Power disconnect is located within sight of the unit it controls.	
			VFD is installed and connected.	
			Maintenance power outlet provided.	

3. Testing, Adjusting and Balancing:

Yes	No	N/A	Task	Comment
			Water balance complete.	
			Water balance with design maximum flow.	
			TAB report submitted.	
			TAB closeout items resolved.	

F. Ductwork:

1. Installation:

Yes	No	N/A	Task	Comment
			Ductwork complete.	
			As-built shop drawings submitted.	
			Ductwork leak/pressure test, complete.	

			Fire dampers, smoke dampers, and access doors installed as required.	
			Ductwork leak test complete.	
			Thermometers and gauges installed as required.	
			Verify open/closed status of dampers.	
			Flexible connectors installed as specified.	

2. Testing, Adjusting and Balancing:

Yes	No	N/A	Task	Comment
			TAB operation complete.	
			TAB checklist items resolved.	

G. Fans:

1. Installation:

Yes	No	N/A	Task	Comment
			Fan belt is adjusted.	
			Vibration isolation devices installed.	
			Inspection and access doors are operable and sealed.	
			Casing is undamaged.	
			Manufacturer’s required maintenance clearance provided.	

2. Electrical:

Yes	No	N/A	Task	Comment
			Power available to fan disconnect.	
			Power disconnect is located within sight of the unit it controls.	
			VFD is installed and connected.	
			Proper motor rotation verified.	
			Maintenance power outlet provided.	

3. Controls:

Yes	No	N/A	Task	Comment
			Control interlocks properly installed.	
			Connections to BMS confirmed.	
			Control interlocks operable.	

4. Garage Exhaust Fan Controls:

Yes	No	N/A	Task	Comment
			Nitrogen dioxide low/high level interlocks and alarms operational.	

			Carbon monoxide low/high level interlocks and alarms operational.	
			NOx and CO sensors calibrated.	
			Gas concentrations are displayed at gas detector.	

H. High Volume Low Speed Fans:

1. Unit:

Yes	No	N/A	Task	Comment
			Mounting/support system and vibration isolation installed as specified.	
			Seismic restraints installed.	
			Fan rotates freely.	
			Equipment tag installed.	

2. Electrical:

Yes	No	N/A	Task	Comment
			All electrical connections complete.	

3. Controls:

Yes	No	N/A	Task	Comment
			Confirm fan speed is adjustable from manufacturer-provided controller.	
			Confirm connection to BMS and incorporation into Graphical screens, where specified.	
			Confirm unit shut down by FACP for units 6-foot diameter and larger.	

I. Dryer Booster Fan:

1. Unit:

Yes	No	N/A	Task	Comment
			Lint trap is installed between booster fan and dryer.	
			Fan securely mounted and secured.	
			Ductwork is complete.	

2. Electrical:

Yes	No	N/A	Task	Comment
			All electrical connections complete.	
			Fan is interlocked with the operation of the dryer.	

J. Diffusers/Grilles:

1. Installation:

Yes	No	N/A	Task	Comment
			Register mounting at T-bar or gyp-board ceiling is secure.	
			Flexible duct connection is secure with clamp around register collar.	
			(If hard duct connection) duct connection is secured with at least 3 sheet metal screws.	
			There is no leak at duct collar connection.	
			Flexible duct has good smooth radii.	
			Flexible duct is provided with hanger strap secured to structure.	
			Volume damper is provided at branch ductwork.	

2. With Sheet Metal Boot and Side Connection:

Yes	No	N/A	Task	Comment
			Boot is connected to collar with 2 sheet metal screws on each side.	
			Boot is provided with hanger strap secure to structure.	
			There is no leak at collar connection (boot) and flexible connection (to boot).	

3. Round Exposed Diffuser:

Yes	No	N/A	Task	Comment
			Diffuser is secured to supply/return duct.	
			Supply/return duct is provided with hanger support secured to structure.	

4. Wall-Type Linear-Type Register

Yes	No	N/A	Task	Comment
			Sheet metal boot is provided and secured to register.	
			Flexible duct is secured to duct collar connection (boot).	
			Linear blades are adjusted as designed to correct angle of diffusion.	

K. Boilers:

1. Mounting:

Yes	No	N/A	Task	Comment
			Vibration isolation devices installed.	
			Unit is installed per plans and specifications.	

2. Unit:

Yes	No	N/A	Task	Comment
			Equipment identification plate intact.	
			Equipment tag provided.	
			Chemical cleaning and treatment, complete.	

3. Piping:

Yes	No	N/A	Task	Comment
			Piping connection provided with union or flexible connector.	
			Valves and fittings installed per piping diagram (and boiler manufacturer recommendation).	
			Pressure and temperature gauges provided.	
			Makeup water PRV set at specified setting.	
			Relief valve set at relief/release pressure.	
			Relief valve piped to floor sink/drain.	
			Integral boiler circulator accessible (if provided).	
			Piping pressure tested.	
			Piping inlet-outlet connection matched with supply-return flow.	
			Safety interlocks, operational.	
			Shutoff valves installed per local boiler code.	

4. Air Separator:

Yes	No	N/A	Task	Comment
			Air separator supported adequately.	
			Air separator installed in correct flow direction.	
			Strainer installed in correct flow direction (if provided at air separator).	

5. Expansion Tank:

Yes	No	N/A	Task	Comment
			Expansion tank has adequate mounting support.	
			Piping connection coupling provided.	
			Isolation valve provided.	
			Tank pressure set at required pressure.	

6. Gas Supply:

Yes	No	N/A	Task	Comment
			Local isolation valve provided at boiler.	
			Gas train piping supported.	
			Gas piping properly supported.	

L. Heat Exchanger:

1. General:

Yes	No	N/A	Task	Comment
			Equipment ID and capacity match schedule.	
			Unit mounting is per detail.	
			Support is provided at pipe inlet/outlet sections.	
			Valve, fitting, and piping assembly are installed per detail.	
			Drain valve is provided at bottom of tank and is piped directly to drain.	
			Equipment is provided with equipment ID.	
			Piping is provided with pressure and temperature gauges.	
			Pressure/temperature/flow sensors are installed at correct locations.	
			Unit is completely insulated.	
			Pipe connections are installed in counterflow arrangement.	

M. Packaged Rooftop Unit/Air-to-Air Heat Pump:

1. General:

Yes	No	N/A	Task	Comment
			Vibration isolation devices installed and released from shipping restraints.	

			Filters clean and tight fitting.	
			Unit is provided with disconnect switch and convenience power outlet.	
			Damper linkages are connected.	
			Duct connections have flexible connectors.	
			Filters are clean.	
			Dampers move freely / close tightly. Linkages have minimum play.	
			Combination Fire & Smoke dampers in distribution ductwork close when unit is off and open before unit starts.	
			Condensate drain has trap and is vented.	
			Equipment tag is affixed, name plate ID and tag capacity information matches submittal/schedule.	

2. General - Gas Heating:

Yes	No	N/A	Task	Comment
			Gas supply has isolation valve.	
			Piping has drip leg with threaded cap.	
			Flexible connection is provided at unit.	

3. General - Hydronic Heating or Cooling:

Yes	No	N/A	Task	Comment
			Valve and fitting assembly are per design drawings.	
			Pipe has adequate support.	
			Piping penetration through roof has flashing.	
			Control valve is wired to unit’s or BMS control panel.	
			Piping is completely insulated.	

4. Roof Curb:

Yes	No	N/A	Task	Comment
			Unit roof curb is pre-fabricated; curb flashing is sealed all around unit.	
			(for spring isolated roof curb) spring locks are removed from	

			curb.	

5. Controls:

Yes	No	N/A	Task	Comment
			Unit mounted temperature and pressure sensors properly located and wired.	
			Airflow measuring stations installed and programmed.	
			Sequence of operation, tested and operation confirmed per controls submittal.	
			Graphical screens are 100% complete.	

6. Electrical:

Yes	No	N/A	Task	Comment
			Power available to unit disconnect.	
			Power available to unit control panel.	
			Proper motor rotation verified.	

N. Energy Recovery Ventilator:

1. Unit:

Yes	No	N/A	Task	Comment
			Adequate maintenance access to all components including removing the heat wheel and coils if necessary.	
			Access doors close tightly, gaskets installed.	
			Filters clean and tight fitting.	
			Energy wheel moves freely without obstruction.	
			Dampers move freely/close tightly. Linkages have minimum play.	
			Equipment tags attached.	

2. Electrical:

Yes	No	N/A	Task	Comment
			All electrical connections complete and tight.	
			Power disconnects installed, operational, and properly labeled.	
			Electric heater powered and operational.	
			VFD startup complete.	

3. Condensing Section:

Yes	No	N/A	Task	Comment
			System is charged per manufacturer's recommendations.	

4. Ductwork:

Yes	No	N/A	Task	Comment
			Ductwork complete and clean.	
			Duct joint sealant properly applied.	

5. Controls:

Yes	No	N/A	Task	Comment
			Thermostat installed, programming complete.	
			CO2 sensors installed and reporting accurately.	
			Smoke detector and miscellaneous safety circuits tested and operational.	
			Dampers stroked fully open and fully closed.	
			Energy wheel start/stop functioning as intended.	
			EF and SF VFD speeds accurately scaled.	
			BAS control panels wired, energized, and programmed.	
			Sequence of operations has been tested and field verified to operate per the approved controls submittal.	
			Graphics and monitoring via the Building Automation System 100-percent complete.	

O. Condensing Units:

1. Mounting:

Yes	No	N/A	Task	Comment
			Vibration isolation devices installed.	
			Seismic restraints installed.	
			Housekeeping pad or wood sleeper is anchored to roof structure.	
			Clearance at air intake and around unit is per manufacturer recommendation.	

			Clearance between two condensing units is adequate and per manufacturer recommendation.	

2. Piping:

Yes	No	N/A	Task	Comment
			Refrigerant connection is brazed.	
			Suction refrigerant line is insulated.	
			For heat pumps – both liquid and suction lines are installed.	

3. Electrical:

Yes	No	N/A	Task	Comment
			Power available to unit disconnect.	
			Power available to unit control panel.	
			Power disconnect is located within sight of the unit it controls.	
			Maintenance power outlet provided.	

P. Chiller/Heat Pump:

1. Installation:

Yes	No	N/A	Task	Comment
			Vibration isolation devices installed per detail.	
			Seismic restraints installed.	
			Insulation of evaporator and internal refrigeration piping undamaged.	
			Evaporator/condenser barrel clearance. Manufacturer required maintenance space, provided.	
			Refrigerant rupture disk relief piping provided at/for indoor chillers, and extended to outdoors.	
			Proper refrigerant level is provided.	
			Refrigerant detection system operational, if required.	

2. Water Piping:

Yes	No	N/A	Task	Comment
			Piping connected and valves installed	
			Chemical treatment and system flushing is complete and strainers, cleaned.	
			Flexible connector provided.	

			Isolation valve provided.	
			Flow direction of strainers, verified.	
			Pressure and test ports, installed.	
			Flow switch, installed.	
			Piping insulation is complete.	
			Piping type and flow direction labeled on piping.	

3. Unit Identification:

Yes	No	N/A	Task	Comment
			Chiller plate ID provided.	
			Chiller tag installed.	

4. Condenser (if air-cooled):

Yes	No	N/A	Task	Comment
			No obstructions to fan discharge.	
			Air short circuiting, not present or approved by manufacturer.	
			Condenser coils clean, combed, and in good condition.	

5. Electrical:

Yes	No	N/A	Task	Comment
			Power available to unit disconnect.	
			Power available to unit control panel.	
			Power disconnect is located within sight of the unit it controls.	
			Maintenance power outlet provided.	

6. Controls:

Yes	No	N/A	Task	Comment
			Flow switches and safety interlocks, operational.	
			Control system interlocks, interfaced and operational.	
			Control panel location acceptable.	
			Control panel front and side clearance.	
			Controls system, operational.	
			Mapping of BACNet points to the BMS, completed.	
			Graphics and monitoring via the BAS is complete.	

Q. Energy Recovery Unit:

1. Energy Wheel Type:

Yes	No	N/A	Task	Comment
			Duct connections have flexible connections.	
			Access door panels are sealed and air-tight.	
			Energy wheel is clean.	
			Direction of wheel rotation is correct.	
			Wheel motion and drain assembly are installed tight.	
			Unit is provided with disconnect switch.	
			Unit supply air stream is provided with (duct) smoke detector.	
			Unit is mounted per detail.	
			Unit is connected to BMS.	
			Filters cleans and tight fitting; filter bank has differential pressure gauge.	
			Equipment ID and tag are provided.	

2. Supply and Exhaust Side:

Yes	No	N/A	Task	Comment
			Fan assembly and motor are spring isolated.	
			Fan has disconnect switch.	
			Air filters are clean and secure.	
			Supply and exhaust air stream inside unit is sealed and air tight.	

3. Electrical:

Yes	No	N/A	Task	Comment
			Power available to unit disconnect.	
			Power available to unit control panel.	
			Proper motor rotation verified.	

R. Air Handling Units:

1. Installation:

Yes	No	N/A	Task	Comment
			Vibration isolation devices installed.	
			Seismic restraints installed.	
			Inspection and access doors are operable and sealed.	
			Casing undamaged.	

			Insulation undamaged.	
			Air filters clean and tight fitting.	
			Condensate drainage is unobstructed. (visually verify pan drains completely by pouring a cup of water into drain pan.)	
			Fan belt adjusted.	
			Manufacturer's required maintenance clearance provided.	
			Equipment Tags attached.	

2. Electrical:

Yes	No	N/A	Task	Comment
			Power available to unit disconnect.	
			Power available to unit control panel.	
			Proper motor rotation verified.	
			Power disconnect is located within sight of the unit it controls.	
			VFD installed.	
			Maintenance power outlet provided.	

3. Coils:

Yes	No	N/A	Task	Comment
			Piping properly connected.	
			Piping pressure tested.	
			Air vents installed on water coils (with shut off valves) as specified.	
			Damage to coil fins has been repaired.	

4. Controls:

Yes	No	N/A	Task	Comment
			Control valves/actuators properly installed.	
			Dampers/actuators properly installed.	
			Proper location and installation of all temperature, pressure and humidity inputs verified.	
			Fan air volume controller operable.	
			Air handler controls system, operational.	
			Outside air ventilation rates (CFM) reliability maintained.	

			Combination Fire & Smoke Dampers in distribution ductwork close when unit is off and open before unit starts.	

5. Testing, Adjusting, and Balancing:

Yes	No	N/A	Task	Comment
			Construction filters removed and replaced.	
			TAB report submitted.	
			TAB results within specified tolerances shown on drawings.	

S. Make-Up Air Unit:

1. Unit:

Yes	No	N/A	Task	Comment
			Shipping restrains removed.	
			Vibration isolation devices installed and released from shipping restraints.	
			Seismic restraints installed.	
			Access doors close tightly, gaskets installed.	
			Filters clean and tight fitting.	
			Dampers move freely/close tightly. Linkages have minimum play.	
			Freezestat sensing element is installed per the manufacturer's instructions.	
			Equipment tags attached.	

2. Electrical:

Yes	No	N/A	Task	Comment
			Electrical connections complete and tight.	
			Power disconnects installed, operational, and properly labeled.	

3. Piping:

Yes	No	N/A	Task	Comment
			Piping flushed, tested, and filled with all valves open.	
			Cooling and heating coil piping insulation complete.	
			Coil strainers have been cleaned.	
			Piping correctly labeled.	

			Adequate space provided for coil removal.	
			Heat transfer fins clean and in good condition.	
			Control valves installed correctly and wired.	
			Vent and drains installed.	
			Automatic air vents installed.	
			Condensate drain pan and piping complete and clear.	
			Piping components, valves, strainers, gauges, Pete's Plugs have been installed per design drawings.	
			No leaks observed around fittings.	

4. Compressor and Condenser:

Yes	No	N/A	Task	Comment
			Refrigerant sight glass clear of bubbles.	
			Moisture indicator shows no moisture.	
			Correct oil level.	
			Compressors and piping leak tested.	
			Crankcase heater on when unit is off.	
			Condenser coils clean and in good condition.	
			Adequate clearance for airflow around condenser.	

5. Controls:

Yes	No	N/A	Task	Comment
			Thermostat installed, programming complete.	
			Freeze, smoke and miscellaneous safety circuits tested and operational.	
			Interlock with kitchen exhaust fans verified.	
			Control valves operational.	
			BAS control panels wired, energized, and programmed.	
			Graphics and monitoring via the Building Automation System	

			complete.	

T. Mini-Split Air Conditioning Unit:

1. Unit:

Yes	No	N/A	Task	Comment
			Air filters clean and tight fitting.	
			Coil clean and in good condition.	
			Equipment tags attached.	

2. Electrical:

Yes	No	N/A	Task	Comment
			Electrical connections complete and tight.	

3. Piping:

Yes	No	N/A	Task	Comment
			Condensate drain pan complete and clear.	
			Condensate pump and piping is complete and pump is operational.	
			Piping insulation complete.	
			No leaking around refrigerant fittings.	

4. Compressor and Condenser:

Yes	No	N/A	Task	Comment
			Refrigerant sight glass clear of bubbles.	
			Moisture indicator shows no moisture.	
			Correct oil level.	
			Compressors and piping leak tested.	
			Crankcase heater on when unit is off.	
			Condenser coils clean and in good condition.	
			Adequate clearance for airflow around condenser.	

5. Controls:

Yes	No	N/A	Task	Comment
			Thermostat installed and programming is complete.	
			Zone temperature sensor installed and reading accurately.	

			Temperature monitoring provided on floor plan graphic.	
			High temperature alarm programmed and enunciates at the BAS.	
			BACnet interface connected and communicating to BAS, and mapping of points to BAS, complete.	

U. Fan Coil Units:

1. Installation:

Yes	No	N/A	Task	Comment
			FCU provided with adequate support.	
			FCU provided with seismic restraint.	
			FCU provided with approved spring isolation.	
			Coil clean and in good condition.	
			Equipment ID and tag are provided.	

2. Piping:

Yes	No	N/A	Task	Comment
			Piping installed per detail.	
			Air is already vented from coil.	
			Control valve actuator provided with power.	
			Pipe and fittings are accessible.	
			Control panel is accessible.	

3. Drain:

Yes	No	N/A	Task	Comment
			Condensate drain pan complete and clear.	
			Condensate drain is piped correctly.	
			Trap and vent provided at condensate drain piping.	
			If provided with secondary drain pan, drain terminates at a visible location.	

4. Smoke Detector (SD) if cumulative supply air into a room is over 2000CFM:

Yes	No	N/A	Task	Comment
			SD is provided.	

			SD is wired to fire life safety.	
			SD is wired to shut down FCU upon detection of smoke.	

5. Electrical:

Yes	No	N/A	Task	Comment
			Power available to unit disconnect.	
			Code clearance maintained.	
			Proper motor rotation verified.	
			Power disconnect is located within sight of the unit it controls.	
			Maintenance power outlet provided.	

END OF SECTION 23 00 05

SECTION 23 05 13 - COMMON MOTOR REQUIREMENTS FOR HVAC EQUIPMENT

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Starters
2. Shaft Grounding
3. Motors

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. NEMA Premium Efficiency
2. Energy Policy Act (EPACT), latest applicable version(s) for minimum motor efficiencies.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. Field Installed Motors: Installed motors to be of single type, from one source and from a single manufacturer.
2. Electrical components and materials to be UL and ETL listed/labeled as suitable for location and use.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. For motors 50 HP and larger, provide 5-year manufacturer's limited warranty from date of substantial completion.

PART 2 - PRODUCTS

2.1 STARTERS

A. Manufacturers

1. Cerus
2. Eaton Electrical
3. General Electric
4. Siemens
5. Schneider Electric/Square D

B. Single Phase Motors:

1. Manual across-the-line starting switch having toggle-operated switch pilot running light and built-in thermal overload device with heating element rated not more than 115 percent motor full load current indicated on name plate of motor to be protected. Surface mount starters. Provide NEMA-1 enclosure.
2. Overload relays to be melting alloy type with a replaceable control circuit module. Thermal units to be interchangeable. Starter to be non operative if thermal unit is removed.
3. Single-phase motors with automatic controls. Provide motor-rated relay with coils rated for control voltage.

C. Starters up to Size 8 to be suitable for the addition of a minimum of three external auxiliary contacts (normally open or normally closed). Contactor, coils, and relays to perform the control functions of the associated equipment and control sequence.

D. Three Phase Motors up to and Including 15 HP:

1. Provide enclosed type magnetic across-the-line starter with thermal overload and undervoltage protection.
2. Operator: "Start-Stop" pushbutton, except where automatic control is indicated on Drawings or specified. Then provide "Hand-Off-Auto" selector switch.
3. Starters for 3-phase motors to have overload protection in each of the three legs, with external manual reset.
4. Unless indicated on Drawings or in Specifications, furnish motor starters with a neon pilot light. Neon lights are required for exhaust fan switches.
5. Equip starters with integral transformer and coil for control circuit. Coordinate coil voltage with control voltage.

E. For Three Phase Motors Greater than 15 HP:

1. Provide combination starter and fused safety disconnect integral in the same enclosure. Utilize Type 'RK' or 'L' fuses. Provide fuse block with rejection type fuse holders. Size fuses per motor manufacturer's recommendations.
2. Provide a solid-state reduced voltage starter, consisting of power section, one-piece removable printed circuit logic board and field wiring interface terminals. Logic board uses quick disconnect plug-in connectors for current transformers inputs, line-and-load voltage inputs, SCR gate firing output circuits and status panel. 3-phase current sensing via current transformers. Class 10 electronic overload protection.
3. Motor starters to include the following protections:
   a. Inverse time running overcurrent protection.

b. 250 percent to 500 percent current limit adjustment.
c. Minimum and maximum voltage adjustments.
d. Voltage stability adjustment.
e. Single-phase protection with built-in short-time delay.
f. Undervoltage protection with built-in short time delay.
g. MOV surge suppression protection of SCRs rated 10 percent above the rated voltage.
h. Phase sequence protection.

4. Display: Door-mounted status LCD alphanumeric or LED display indicating run, undervoltage, phase loss, phase current unbalance, overcurrent trip, overtemperature, current limit, end of ramp, and incorrect phase rotation.
5. Enclosure: NEMA 12. Operator: "Start-Stop" pushbutton, except where automatic control is indicated on Drawings or specified, then provide "Hand-Off-Auto" selector switch
6. Input/Output Relays: Provide relays as required to provide the control sequence.
7. UL 508 listed.

2.2 SHAFT GROUNDING

A. Manufacturers

1. Shaft Grounding Inc.
2. Aegis SGR Bearing Protection Ring
3. Or approved equivalent.

B. Variable Speed Motor Shaft Grounding: Shaft grounding ring; solid ring type.

C. Provide shaft grounding assembly on motors controlled by variable frequency drive. Shaft grounding device to be in the form of brush that resides on the motor shaft. Brush assembly shall be capable of tolerating misalignment and maintaining rotating contact throughout the motors life.

D. Material: Material used in the grounding assembly shall be stable material commonly used within industry that is not believed to constitute a hazardous material under Occupational Safety & Health Administration (OSHA) regulations.

E. Brushes: Specifically developed carbon compounds of sustained performance with wear life expectancy of 3 years minimum.

F. Seals: Sealed type to keep contaminants from entering the shaft grounding system in wet or severe environment applications.

G. Shaft Grounding Assembly: For clean room air handling systems, use the type that contains the wear products within a special enclosure within the shaft grounding system.

2.3 MOTORS

A. Manufacturers:

1. Lincoln Motor
2. Century Electric Motors (formerly A.O. Smith Electrical Products)
3. Baldor Electric
4. General Electric
5. Toshiba

6. Exception: Motors integral to equipment efficiency listing (EER, COP, etc.) per listing agency.

B. Construction:

1. Open drip-proof type except where specifically noted otherwise.
2. Design for continuous operation in 40 degrees C environment.
3. Design for temperature rise in accordance with NEMA MG 1 limits for insulation class, service factor, and motor enclosure type.
4. Built-in thermal overload protection or externally protected with separate over-load with low-voltage release or lock-out. Quick trip device on hermetically sealed motors.
5. Service Factor: 1.15 for poly-phase motors except 1.25 for motors associated with shaft pressurization system fans and 1.35 for single phase motors.
6. Efficiency: Provide NEMA Premium Efficiency motors.
7. Motors used in conjunction with variable speed drives: Variable torque type matched for the full operating range of the variable frequency drive. As a minimum, motors to have Class F insulation, winding insulation rated for 1000 Volts and insulated bearings to prevent high frequency ground path. Loads not-to-exceed 80 percent of nameplate rating

C. Visible Nameplate: Indicating motor horsepower, voltage, phase, cycles, RPM, full load amps, locked rotor amps, frame size, manufacturer's name and model number, service factor, power factor, efficiency.

D. Wiring Terminations:

1. Provide terminal lugs to match branch circuit conductor quantities, sizes, and materials indicated. Coordinate conductor sizes with Division 26, Electrical. Enclose terminal lugs in terminal box sized to NFPA 70, threaded for conduit.
2. For fractional horsepower motors where connection is made directly, provide conduit connection in end frame.

E. Single Phase Power, Split Phase Motors:

1. Starting Torque: Less than 150 percent of full load torque.
2. Starting Current: Up to seven times full load current.
3. Breakdown Torque: Approximately 200 percent of full load torque.
4. Drip-proof Enclosure: Class A (50 degrees C temperature rise) insulation, NEMA Service Factor, prelubricated sleeve or ball bearings.
5. Enclosed Motors: Class A (50 degrees C temperature rise) insulation, 1.0 Service Factor, prelubricated ball bearings.

F. Single Phase Power, Permanent-Split Capacitor Motors:

1. Starting Torque: Exceeding one fourth of full load torque.
2. Starting Current: Up to six times full load current.
3. Multiple Speed: Through tapped windings.
4. Open Drip-proof or Enclosed Air Over Enclosure: Class A (50 degrees C temperature rise) insulation, minimum 1.0 Service Factor, prelubricated sleeve or ball bearings, automatic reset overload protector.

G. Single Phase Power, Capacitor Start Motors:

1. Starting Torque: Three times full load torque.

2. Starting Current: Less than five times full load current.
3. Pull-up Torque: Up to 350 percent of full load torque.
4. Breakdown Torque: Approximately 250 percent of full load torque.
5. Motors: Capacitor in series with starting winding; provide capacitor-start/capacitor-run motors with two capacitors in parallel with run capacitor remaining in circuit at operating speeds.
6. Drip-proof Enclosure: Class A (50 degrees C temperature rise) insulation, NEMA Service Factor, prelubricated sleeve bearings.
7. Enclosed Motors: Class A (50 degrees C temperature rise) insulation, 1.0 Service Factor, prelubricated ball bearings.

H. Three Phase Power, Squirrel Cage Motors:

1. Starting Torque: Between 1 and 1-1/2 times full load torque.
2. Starting Current: Six times full load current.
3. Power Output, Locked Rotor Torque, Breakdown or Pull Out Torque: NEMA Design B characteristics.
4. Design, Construction, Testing, and Performance: Conform to NEMA MG 1 for Design B motors.
5. Insulation System: NEMA Class B or better. Use class F insulation when motors are controlled by a VFD.
6. Testing Procedure: In accordance with IEEE 112. Load test motors to determine free from electrical or mechanical defects in compliance with performance data.
7. Motor Frames: NEMA Standard T-Frames of steel, aluminum, or cast iron with end brackets of cast iron or aluminum with steel inserts.
8. Thermistor System (Motor Frame Sizes 254T and Larger): Three PTC thermistors imbedded in motor windings and epoxy encapsulated solid state control relay for wiring into motor starter.
9. Bearings: Grease lubricated anti-friction ball bearings with housings equipped with plugged provision for relubrication, rated for minimum ABMA STD 9, L-10 life of 200,000 hours. Calculate bearing load with NEMA minimum V-belt pulley with belt center line at end of NEMA standard shaft extension. Stamp bearing sizes on nameplate.
10. Sound Power Levels: To NEMA MG 1.
11. Weatherproof Epoxy Treated Motors: Epoxy coat windings with rotor and starter surfaces protected with epoxy enamel; bearings double shielded with waterproof non-washing grease.
12. Nominal Efficiency: Meet or exceed NEMA Premium Efficiency rating when tested in accordance with IEEE 112.
13. Nominal Power Factor: Minimum at full load and rated voltage when tested in accordance with IEEE 112.

I. Electronically Commutated Motors:

1. Brushless DC type motor specifically designed for intended application.
2. Permanently lubricated motor with heavy duty ball bearing type to match intended application load.
3. Operation Range: 20 percent to 100 percent of full speed (80 percent turndown).
4. Motor Efficiency: Minimum 85 percent efficient at all speeds.
5. Pre-wired to specific voltage and phase. Internal motor circuitry to convert AC power supplied to the fan to DC power.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION

A. Coordinate location of disconnect and starter or motor controller. Combination starter/disconnects may be used in lieu of separate items.

B. Explosion-Proof Motors: UL approved and labeled for hazard classification, with over temperature protection.

C. Provide inverter ready motors per NEMA MG1-30 for variable speed drive or soft-start starter use. Provide shaft grounding for motors over 2 HP serving variable speed drives. Provide shaft grounding and insulated bearings on motors 25 HP and larger serving variable speed drives. Shielded cable required for power wiring from variable speed drive to motor connection.

D. Unless otherwise indicated, motors 1-HP and larger to meet/exceed NEMA Premium Efficiency and latest EPACT.

E. Vertical in-line pump motors per NEMA MG1 vertical motor requirements.

F. Exception: Motors less than 250 watts, for intermittent service, motors furnished with equipment manufacturer's standard package equipment need not conform to these specifications.

G. Single phase motors for air compressors and pumps: Capacitor start type.

H. Motors located in exterior locations or wet air streams are to be of totally enclosed type.

I. Motors located in outdoor, wet/wash-down locations: Totally enclosed weatherproof epoxy-sealed type. Provide protective covering for electronically commutated motors located in outdoor or wet/wash-down locations.

J. Disconnects: Provided by Division 26, Electrical unless specified otherwise.

K. After completing equipment installation, inspect unit components. Remove paint splatters and other spots, dirt, and debris. Repair damaged finish to match original finish.

3.2 STARTER INSTALLATION

A. Install starters in accordance with manufacturer's instructions.

B. Coordinate disconnect requirements and location with Division 26, Electrical if not integral to starter. If starter is installed out of line of sight of motor, provide additional disconnect at motor per code.

C. Provide NEMA housing appropriate to installation location.

D. Provide supports and install securely, in neat and workmanlike manner, as specified in NECA 1.

E. Meet mounting height and accessible location requirements per local code.

F. Provide fuses for fusible switches.

G. Select and install overload heater elements in motor starters to match installed motor characteristics.

H. Single Phase 120 Volt Starter: If not furnished as single packaged controller/disconnect, provide contactors, relays, wiring and devices necessary to match sequence of operation for equipment.

3.3 SHAFT GROUNDING INSTALLATION

A. Shaft grounding assembly installation not to affect the motor manufacturer warranty. Where the severe environment conditions require application of the shaft grounding types that are screwed into the motor shaft, the installation of the shaft grounding system performed either by the motor manufacturer or by the motor manufacturer authorized facility.

B. Bond the brush to the closest ground point using code sized green insulated stranded copper conductor per manufacturer instructions.

C. Test and verify the performance of the assembly to ensure that under no conditions the shaft exceeds 3 volts.

D. Install securely on firm foundation. Mount ball bearing motors with shaft in any position.

E. Check line voltage and phase and ensure agreement with nameplate.

F. Verify motor rotation.

3.4 MOTOR INSTALLATION

A. Electrical Service: Power wiring from source to motor termination under Division 26, Electrical.

B. Install in accordance with manufacturer's instructions. Coordinate with starter or variable speed controller with control sequence to provide necessary starter accessories.

C. Install securely on firm foundation. Mount ball bearing motors with shaft in any position.

D. Check line voltage and phase and ensure agreement with nameplate.

E. Verify motor rotation.

F. Field Quality Control:

1. Prepare for acceptance tests as follows:
    a. Run each motor with its controller. Demonstrate correct rotation, alignment, and speed at motor design load.
    b. Test interlocks and control features for proper operation.
    c. Verify that current in each phase is within nameplate rating.
2. Testing: Perform the following field quality-control testing:
    a. Perform each electrical test and visual and mechanical inspection stated in NETA ATS, Section 7.15.1. Certify compliance with test parameters.
    b. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
3. Manufacturer's Field Service: Engage a factory-authorized service representative to perform the following:

a. Inspect field-assembled components, equipment installation, and piping and electrical connections for compliance with requirements.
b. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
c. Verify bearing lubrication.
d. Verify proper motor rotation.
e. Test Reports: Prepare a written report to record the following test procedures used:
    1) Test results that comply with requirements.
    2) Test results that do not comply with requirements and corrective action taken to achieve compliance.

G. Align motors, bases, shafts, pulleys and belts. Tension belts according to manufacturer's written instructions.

H. Clean motors, on completion of installation, according to manufacturer's written instructions.

END OF SECTION 23 05 13

SECTION 23 05 19 - METERS AND GAUGES FOR HVAC PIPING

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Pressure Gauges
2. Thermometers
3. Dial Thermometers
4. Separable Sockets
5. Thermometer Wells
6. Differential and Filter Pressure Gauges
7. Pressure-Gauge Fittings
8. Test Plugs

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Maintenance Materials:
   a. Extra gauge Oil for Inclined Manometers: One bottle.
   b. Extra Pressure Gauges: One.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

PART 2 - PRODUCTS

2.1 PRESSURE GAUGES

A. Manufacturers:

1. Trerice Model 600CB.
2. Dwyer Instruments, Inc.
3. Moeller Instrument Co., Inc.
4. Omega Engineering, Inc.

B. ASME B40.100, phosphor-bronze bourdon type, dry type.

1. Case: Cast aluminum, stem-mounted, flangeless.
2. Size: 4-1/2 inch diameter.
3. Window: Clear glass.
4. Connector: Brass.
5. Scale: White aluminum with black graduation and markings.
6. Pointer: Black, adjustable.
7. Mid-Scale Accuracy: One percent.
8. Scale: psi.

2.2 THERMOMETERS

A. Manufacturers:

1. Trerice Model BX9.
2. Ashcroft
3. Weiss
4. Marshaltown
5. Weksler

B. Adjustable Angle: Red-or blue-appearing organic liquid in glass: ASTM E 1; lens front tube, cast aluminum case with enamel finish, cast aluminum adjustable joint with positive locking device; adjustable 360 degrees in horizontal plane, 180 degrees in vertical plane.

1. Size: 9-inch scale.
2. Window: Acrylic.
3. Scale: Aluminum, white background, black graduations and markings.
4. Stem: 3/4-inch NPT brass (aluminum for installation in air ducts).
5. Accuracy: 2 percent, per ASTM E 77.
6. Calibration: 0-160 with 2 degrees F graduations.

2.3 DIAL THERMOMETERS

A. Manufacturers:

1. Trerice Model 80742.
2. Ashcroft
3. Weiss
4. Marshaltown
5. Weksler

B. ASTM E 1, cast aluminum case, vapor or liquid actuated with brass or copper bulb, copper or bronze braided capillary, white with black markings and black pointer, glass lens, adjustable 360 degrees in horizontal plane. 180 degrees in vertical plane.

1. Size: 4-1/2-inch diameter dial.
2. Lens: Clear glass.
3. Length of Capillary: Minimum 6-feet (for remote reading if required).

4. Accuracy: 2 percent.
5. Calibration: 2 degrees F graduations.

2.4 SEPARABLE SOCKETS

A. Manufacturers:

1. Kimray
2. Weiss
3. Trerice

B. Description: Fitting with protective socket for installation in threaded pipe fitting to hold fixed thermometer stem.

1. Material: Brass, for use in copper piping.
2. Material: Stainless steel, for use in steel piping.
3. Extension-Neck Length: Nominal thickness of 2-inches, but not less than thickness of insulation. Omit extension neck for sockets for piping not insulated.
4. Insertion Length: To extend to center of pipe.
5. Cap: Threaded, with chain permanently fastened to socket.
6. Heat Transfer Fluid: Oil or graphite.

2.5 THERMOMETER WELLS

A. Manufacturers:

1. Ashcroft
2. Omega
3. Weiss

B. Description: Fitting with protective well for installation in threaded pipe fitting to hold test thermometer.

1. Material: Brass for use in copper piping.
2. Material: Stainless steel, for use in steel piping.
3. Extension Neck Length: Nominal thickness of 2-inches, but not less than thickness of insulation. Omit extension neck for wells for piping not insulated.
4. Insertion Length: To extend to center of pipe.
5. Cap: Threaded, with chain permanently fastened to socket.
6. Heat Transfer Fluid: Oil or graphite.

2.6 DIFFERENTIAL AND FILTER PRESSURE GAUGES

A. Manufacturers:

1. Orange Gauges
2. Midwest
3. Or approved equivalent.

B. Service: Air and non-combustible, compatible gases (Natural Gas option available.)

C. Wetted Materials: Consult factory.

D. Housing: Die cast aluminum case and bezel, with acrylic cover. Exterior finish is coated gray to withstand 168 hour salt spray corrosion test.

E. Accuracy: Plus or minus 2 percent of full scale throughout range at 70 degrees F.

F. Pressure Limits: Minus 20 Hg to 15 PSIG.

G. Overpressure: Relief plug opens at approximately 25 PSIG standard gauges only.

H. Temperature Limits: 20 to 140 degrees F.

I. Size: 4-inch diameter dial face.

J. Mounting Orientation: Diaphragm in vertical position. Consult factory for other position orientation.

K. Process Connections: 1/8-inch female NPT duplicate high and low pressure taps, one pair side and one pair back.

L. Standard Accessories: Two 1/8-inch NPT plugs for duplicate pressure taps, two 1/8-inch pipe thread to rubber tubing adapter and three flush mounting adapters with screws.

2.7 PRESSURE-GAUGE FITTINGS

A. Manufacturers:

1. Omega
2. Weiss
3. Trerice

B. Valves: NPS 1/4 (DN8) brass or stainless-steel needle type.

C. Syphons: NPS 1/4 (DN8) coil of brass turbine with threaded ends.

D. Snubbers: ASME B40.5, NPS 1/4 (DN8) brass bushing with corrosion-resistant porous-metal disc of material suitable for system fluid and working pressure.

2.8 TEST PLUGS

A. Manufacturers:

1. Pete's Plug
2. Or approved equivalent.

B. Description: Nickel-plated, brass-body test plug in NPS 1/2 (DN15) fitting.

C. Body: Length as required to extend beyond insulation.

D. Pressure Rating: 500 PSIG (3450 kPa) minimum.

E. Core Inserts: One or two self-sealing valves, suitable for inserting 1/8-inch OD probe from dial-type thermometer or pressure gauge.

F. Core Material for Air, Water, Oil and Gas: 20 to 200 degrees F (minus 7 to plus 93 degrees Celsius), chlorosulfonated polyethylene synthetic rubber.

G. Test Plug Cap: Gasketed and threaded cap, with retention chain or strap.

H. Test Kit: Pressure gauge and adapter with probe, two bimetal dial thermometers, and carrying case.

1. Pressure Gauge and Thermometer Ranges: Approximately two times the system's operating conditions.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS

A. Provide instruments with scale ranges selected according to service with largest appropriate scale.

3.2 PRESSURE GAUGES

A. Install pressure gauges in piping tee with pressure gauge cock, located on pipe at most readable position, visible from floor.

B. Locations: Install in the following locations as a minimum, and elsewhere as indicated.

1. At each pump inlet and outlet.
2. At inlet and discharge of each pressure reducing valve.
3. At makeup water service outlets.
4. At inlet and discharge of each chiller and boiler.

C. Install in locations where they are easily read from normal operating level. Install vertical to 45 degrees off vertical.

D. Adjust to final angle, clean windows and lenses, and calibrate to zero.

E. Pressure Gauge Range/Graduations:

System	Pressure (PSI)	Graduations (PSI)
Heating Water	0-100	1

3.3 THERMOMETERS

A. Install thermometers in piping systems in sockets in short couplings. Enlarge pipes smaller than 2-1/2-inch for installation of thermometer sockets. Ensure sockets allow clearance from insulation.

B. Install in locations where they are easily read from normal operating level. Install vertical to 45 degrees off vertical.

C. Adjust to final angle, clean windows and lenses, and calibrate to zero.

D. Thermometer Range/Graduations:

System	Temperature (degree F)	Graduations (degrees F)
Heating Water	30-240	2

3.4 DIAL THERMOMETERS

A. Install in vertical upright position, tilted so as to be easily read at floor.

3.5 SEPARABLE SOCKETS

A. Inspect the openings in the vessel for foreign material and clean the connection ports to remove scale, chips and debris.

B. Install thermostats with separable sockets. Install the separable socket using good piping practice. Be sure to use TFE tape or pipe thread sealant on external pipe threads.

C. Never stand directly over or in front of a valve or controller when the system is pressurized.

D. Assure the separable socket is completely submerged in liquid or flow stream. Partial submersion will give erratic temperature transfer to thermostat.

E. Pack separable socket full with high temp bearing grease. This helps in heat transfer and prevents air space.

3.6 THERMOMETER WELLS

A. Install in piping in vertical upright position. Fill well with oil or graphite, secure cup.

3.7 DIFFERENTIAL AND FILTER PRESSURE GAUGES

A. Install pressure gauge where exposure to heat and vibration are minimal and where the dial cc an be easily read. It is also important to install the gauge in a location with undisturbed and continuous flow of the pressure medium.

B. Provide a needle valve or gauge cock, installed between the process and the pressure gauges.

C. General: Install pressure gauges in piping tee with pressure gauge cock, located on pipe at most readable position, visible from floor.

D. Locations: Install in the following locations, and elsewhere as indicated.

1. At each pump inlet and outlet.
2. At inlet and discharge of each pressure reducing valve.
3. At make-up water service outlets.

E. Install gauges and thermometers in locations where they are easily read from normal operating level. Install vertical to 45 degrees off vertical.

3.8 PRESSURE-GAUGE FITTINGS

A. Install per manufacturer's instructions and recommendations.

B. Reference "Pressure Gauges" Article above.

3.9 TEST PLUGS

A. Locate test plugs adjacent to thermometers and thermometer sockets, adjacent to pressure gauges and pressure gauge taps, adjacent to control device sockets, or where indicated.

END OF SECTION 23 05 19

SECTION 23 05 23 - GENERAL-DUTY VALVES FOR HVAC PIPING

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Globe Valves
2. Balancing Valves
3. Ball Valves
4. Butterfly Valves
5. Swing Check Valves
6. Wafer Check Valves

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Source Limitations for Valves: Obtain each type of valve from a single source and from a single manufacturer.

B. Valves, General:

1. Apollo
2. Armstrong
3. ASCO
4. Cla-Val
5. Conbraco

6. Crane
7. Clow
8. Griswold
9. Hammond
10. Hays
11. Jenkins
12. Josam
13. Kennedy
14. Milwaukee
15. Mueller
16. Nibco
17. Red-White Valve
18. Smith
19. Stockham
20. Tour & Andersson
21. Wade
22. Watts
23. Wilkins
24. Zurn

C. Globe Valves:

1. See Valves General above.

D. Balancing Valves:

1. Griswold
2. Hays
3. Armstrong CBV
4. Tour & Andersson
5. Victaulic (T&A Valves only)

E. Ball Valves:

1. See Valves General above.
2. NSF Valves:
   a. Clow
   b. Kennedy
   c. Nibco

F. Butterfly Valves:

1. See Valves General above.

G. Swing Check Valves:

1. See Valves General above.

H. Wafer Check Valves:

1. See Valves General above.

2.2 VALVES - GENERAL

A. General:

1. Sizes: Unless otherwise indicated, provide valves of same size as upstream pipe size.
2. Operators: Provide handwheels, fastened to valve stem, for valves other than quarter-turn. Provide lever handle for quarter-turn valves 6 inches and smaller. Provide gear operators for quarter-turn valves 8 inches and larger and plug valves 5 inches and larger. Provide chain-operated sheaves and chains for overhead valves installed over 5 feet above finished floor.
3. Valve Identification: Manufacturer's name (or trademark) and pressure rating clearly marked on valve body.

B. Valves in Insulated Piping: With 2-inch stem extension and following features:

1. Ball Valves: With extended operating handle of non-thermal-conductive material, and protective sleeve that allows operation of valve without breaking the vapor seal or disturbing insulation and memory stops that are fully adjustable after insulation is applied.
   a. Basis of Design Product: Subject to compliance with requirements. Provide NIBCO NIB-SEAL handle extension or comparable product by one of the following.
      1) Conbraco Industries, Inc.: Apollo Div.

C. Valve-End Connections:

1. Flanged: With flanges according to ASME B16.1 for iron valves, ASME B16.5 for steel valves.
2. Solder Joint: With sockets according to ASME B16.18.
3. Threaded: With thread according to ASME B1.20.1.

D. Valve Bypass and Drain Connections: MSS SP-45.

E. Building Service:

1. Shutoff and Isolation Valves:
   a. Pipe Sizes 3 Inches and Smaller: Ball valve.
2. Drain Service: Ball valves.
3. Strainer Blow-Off: Ball valve.
4. Check Valves: Swing or Wafer.

2.3 GLOBE VALVES

A. 3 Inches and Smaller: Class 200, 200 lb. SWP, MSS SP-80, ASTM B61, cast bronze body, bronze bonnet, bronze disc, bronze packing gland, non-asbestos packing and aluminum or malleable iron hand-wheel.

2.4 BALANCING VALVES

A. Maximum 125 PSIG System Working Water Pressure.

B. Manual Set Balancing Valves:

1. Valves are to be of the "Y" pattern, equal percentage globe-style and provide three functions:
   a. Precise flow measurement.

b. Precision flow balancing.
c. Positive drip-tight shutoff.

2. Valve to provide multi-turn, 360 degree adjustment with micrometer type indicators located on the valve handwheel. Valves have a minimum of four full 360 degree handwheel turns. 90 degree style ball valves are not acceptable. Valve handle to have hidden memory feature, which will provide a means for locking the valve position after the system is balanced. Valves to be furnished with precision machined venturi built into the valve body to provide highly accurate flow measurement and flow balancing. The venturi to have two 1/4-inch threaded brass metering ports with check valves and gasketed caps located on the inlet side of the valve. The valve body, stem and plug to be brass. The handwheel to be high-strength resin.
3. 2-1/2 Inches and Larger: Valve body to be either cast iron with integrated cast iron flanges (2-1/2-inch to 12-inch) or ductile iron with industrial standard grooved ends (2-1/2-inch to 12-inch). Valve stem and plug disc to be bronze with handwheel that permits multi-turn adjustments. Sizes 2-1/2-inch and 3-inch: five turns; sizes 4-inch to 6-inch: 6 turns; sizes 8-inch to 10-inch: 12 turns; and size 12-inch: 14 turns. Provide flange adapters to prevent rotation.

2.5 BALL VALVES

A. Ball valves on brazed piping are to be three-piece.

B. 2-1/2 Inches and Smaller: MSS SP-110, 400-600 PSI, two-piece full port ball configuration, bronze body, extended soldered ends for copper pipe and threaded ends for iron pipe, lead-free brass or stainless steel ball, lead-free brass stem, Teflon seat, extended steel handle. Apollo 77CLF 100 Series two-piece.

C. 3 Inches and Larger: MSS SP-110, 400-600 PSI, three-piece full port ball configuration, bronze body, extended soldered ends for copper pipe and threaded ends for iron pipe, lead-free brass or stainless steel ball, lead-free brass stem, Teflon seat, extended steel handle. Apollo 82-100/82A 140 Series three-piece.

D. Full Port Ball Valve: 2- to 4-inch ductile iron, ASTM A536, micro finish steel chrome plated or stainless steel ball and stem. TFE seats, 600 PSI.

2.6 BUTTERFLY VALVES

A. Select lug type valves.

B. 6 Inches and Smaller: 200 PSI, ductile iron body, extended neck, stainless steel stem with stainless steel disc, reinforced resilient EPDM seat, memory stop control, lever handle through 5 inches, size and worm gear operator for 6 inches and larger. Mount stem in horizontal position. Manual lever and lock Nibco LD2000, for mechanical coupling fittings. MSS SP-67, Type 1.

C. 8 Inches and Larger: 200 PSI, ductile iron body, extended neck, stainless steel disc and stem reinforced resilient EPDM seat, memory stop control, lever handle through 5 inches, size and worm gear operator for 6 inches and larger. Mount stem in horizontal position. Manual lever for mechanical coupling fittings. MSS SP-67, Type 1.

2.7 SWING CHECK VALVES

A. 2 Inches and Smaller: Class 125, bronze body, horizontal swing, regrinding type, Y-pattern, renewable disc. Nibco 413. MSS SP-80, Type 4.

B. 2-1/2 Inches and Larger: Class 125, iron body, bolted bonnet, horizontal swing, renewable seat and disc, flanged ends. Nibco F918. MSS SP-71, Type 1.

C. Check Valve: Horizontal installation. Working pressure to 300 PSI. Ductile body, ASTM A536, and stainless clapper, EPDM, nitrile or optional viton bumper and bonnet seals. Stainless wetted parts.

2.8 WAFER CHECK VALVES

A. Twin disc, Class 125 spring actuated designed to be installed with gaskets between two standard Class 125 flanges. 200 PSI, cast iron body, aluminum bronze disc. Nibco W-920-W.

B. Check Valve: PPS coated ductile iron body, ASTM A536, aluminum bronze nonslamming disc, stainless steel spring and shaft. Rubber seat for intended service.

PART 3 - EXECUTION

3.1 GENERAL VALVE INSTALLATION REQUIREMENTS

A. Prepare valves for shipping as follows:

1. Protect internal parts against rust and corrosion.
2. Protect threads, flange faces, and weld ends.
3. Set angle and globe valves closed to prevent rattling.
4. Set ball open to minimize exposure of functional surfaces.
5. Block check valves in either closed or open position.

B. Inspect the shipping container before unpacking to look for damage that could have occurred during transport, and report it to the transportation company immediately. After visual inspection, remove the valve from the shipping container. Make sure the faces are free of any scratches and that there is not any obvious damage to the actuator assembly or valve body.

C. Make sure to note the valve's model number during the unpacking process. The model number will need to be provided when purchasing replacement parts.

D. Use the following precautions during storage:

1. Maintain valve end protection.
2. Store valves indoors and maintain at higher than ambient dew-point temperature. If outdoor storage is necessary, store valves off the ground in watertight enclosures.

E. Use sling to handle large valves; rig sling to avoid damage to exposed parts. Do not use handwheels or stems as lifting or rigging points.

F. Do not attempt to repair defective valves; replace with new valves.

G. Install valves per manufacturer's recommendations.

H. Install valves where required for proper operation of piping and equipment, including valves in branch lines where necessary to isolate sections of piping. Locate valves so as to be accessible and so that separate support can be provided when necessary.

I. Purge and clean piping to be connected to valve.

J. Install valves with stems pointed up, in vertical position where possible, but in no case with stems pointed downward from horizontal plane unless unavoidable. Install valve drains with hose end adapter and cap on chain for each valve that must be installed with stem below horizontal plane. Ensure installation provides full stem movement.

K. Determine that the valve and its piping is adequately supported when installed. If a valve is not adequately supported, this could prevent the valve from operating and sealing correctly. Be sure that mating flanges are in line and parallel to minimize straining on joints and valve body.

L. Insulation: Where insulation is indicated, install extended stem valves, arranged in proper manner to receive insulation.

M. Mechanical Actuators: Install with chain operators where indicated. Extend chains to 5-feet above floor and hook to clips to clear aisle passage.

N. Stem Selection: Outside screw and yoke stems, except provide inside screw, nonrising stem where space prevents full opening of OS&Y valves.

O. Seats: Renewable seats, except where otherwise indicated.

P. When soldering, use paste flux that is approved by the manufacturer for use with lead-free alloys.

Q. Boiler isolation valves with adjustable packing gland per CSD-1 requirements.

R. Valve Adjusting and Cleaning:

1. Inspect valves for leaks. Adjust or replace packing to stop leaks. Replace valve if leak persists.
2. Valve Identification: Tag valves per Section 23 05 53, Identification for HVAC Piping, Ductwork and Equipment.

S. General Requirements for Valve Applications:

1. If valve applications are not indicated, use the following:
    a. Shutoff Service: Ball valves.
    b. Throttling Service: Balancing valves.
    c. Pump-Discharge Check Valves:
        1) 2 Inches and Smaller: Swing or spring-loaded lift check valves with bronze disc.
        2) 2-1/2 Inches and Larger: Swing check valves with lever and weight or with spring or wafer - seat check valves.
    d. Provide isolation valve, check valve, and balancing valve on discharge side of pumps where indicated. Combination triple duty valves not allowed. Provide isolation valve and strainer on suction side of pump.
2. If valves with specified SWP classes or CWP ratings are not available, the same types of valves with higher SWP classes or CWP ratings may be substituted.
3. Valves, except wafer types, with the following end connections.
    a. For Copper Tubing 2-Inches and Smaller: Threaded ends.
    b. For Copper Tubing 2-1/2-Inches to NPS 4-Inches: Flanged ends.
    c. For Copper Tubing 5-Inches and Larger: Flanged ends.
    d. For Steel Piping 2-Inches and Smaller: Threaded ends.
    e. For Steel Piping 2-1/2-Inches to NPS 4-Inches: Flanged ends.
    f. For Steel Piping 5-Inches and Larger: Flanged ends.

3.2 GLOBE VALVE INSTALLATION

A. See General Installation Requirements above.

B. If valve applications are not indicated on Drawings, use the following:

1. Throttling Service: Globe valves or Pressure reducing valves.

3.3 BALANCING VALVE INSTALLATION

A. See General Installation Requirements above.

B. Install with flow in the direction of the arrow on the valve body and install at least five pipe diameters downstream from any fitting, and at least ten pipe diameters downstream from any pump. Two pipe diameters downstream from the balancing valve should be free of any fittings. When installed, easy and unobstructed access to the valve handwheel and metering ports for adjustment and measurement are to be provided. Install devices in accordance with manufacturer's recommendations to automatically balance flow in piping loops as indicated.

C. For venturi valves less than 1-1/2-inch pipe size, provide valve sized for flow to coil. Provide transitions on both inlet and outlet of valve if valve is less than line size.

3.4 BALL VALVE INSTALLATION

A. See General Installation Requirements above.

3.5 BUTTERFLY VALVE INSTALLATION

A. See General Installation Requirements above.

3.6 SWING CHECK VALVE INSTALLATION

A. See General Installation Requirements above.

B. Install in the horizontal or vertical position with upward flow. Install for proper direction of flow. Install with minimum three pipe diameters of straight pipe upstream of valve.

3.7 WAFER CHECK VALVE INSTALLATION

A. See General Installation Requirements above.

B. Install between two flanges in horizontal or vertical position, position for proper direction of flow.

END OF SECTION 23 05 23

SECTION 23 05 29 - HANGERS AND SUPPORTS FOR HVAC PIPING, DUCTWORK AND EQUIPMENT

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Hangers and Supports for HVAC Piping, Ductwork and Equipment
2. Wall and Floor Sleeves
3. Building Attachments
4. Flashing
5. Miscellaneous Metal and Materials

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. ASCE 7-16, Minimum Design Loads for Buildings and Other Structures.
2. Terminology: As defined in MSS SP-90 "Guidelines on Terminology for Pipe Hangers and Supports".
3. Install ductwork and piping per SMACNA's requirements.
4. Hanger spacing installation and attachment to meet all manufacturer's requirements and MSS SP-58.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. Welding:
   a. Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."
2. Welding for Hangers:
   a. Qualify procedures and personnel according to AWS D9.1, Sheet Metal Welding Code for duct joint and seam welding.
3. Engineering Responsibility:

a. Design and preparation of Shop Drawings and calculations for each multiple pipe support, trapeze, duct support, equipment hangers/supports, support from floor structure, roof structure or from structure above, and seismic restraint by a qualified Structural Professional Engineer.
   1) Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in jurisdiction where project is located and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of hangers and supports that are similar to those indicated for this Project in material, design, and extent.

4. Manufacturers regularly engaged in the manufacture of bolted metal framing support systems, whose products have been in satisfactory use in similar service for not less than 10 years.
5. Support systems to be supplied by a single manufacturer.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.7 PERFORMANCE REQUIREMENTS

A. Provide pipe, ductwork and equipment hangers and supports in accordance with the following:

1. When supports, anchorages, and seismic restraints for equipment, and supports, anchorages, and seismic restraints for conduit, piping, and ductwork are not shown on the Drawings, the contractor is responsible for their design.
2. Connections to structural framing not to introduce twisting, torsion, or lateral bending in the framing members. Provide supplementary steel as required.

B. Engineered Support Systems:

1. Support frames such as pipe racks or stanchions for piping, ductwork, and equipment which provide support from below.
2. Equipment, ductwork and piping support frame anchorage to supporting slab or structure.

C. Provide channel support systems, for piping to support multiple pipes capable of supporting combined weight of supported systems, system contents, and test water.

D. Provide heavy-duty steel trapezes for piping to support multiple pipes capable of supporting combined weight of supported systems, system contents, and test water.

E. Provide seismic restraint hangers and supports for piping, ductwork and equipment. See Section 23 05 48, Vibration and Seismic Controls for HVAC Equipment.

F. Obtain approval from AHJ for seismic restraint hanger and support system to be installed for piping and equipment. See Section 23 05 48, Vibration and Seismic Controls for HVAC Equipment.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Hangers and Supports for HVAC Piping, Ductwork and Equipment:

1. Anvil International
2. B-Line Systems, Inc.
3. Erico Company, Inc.
4. Nelson-Olsen Inc.
5. Rilco Manufacturing Company, Inc.
6. Snappitz Thermal Pipe Shield Manufacturing
7. Unistrut Corporation

B. Wall and Floor Sleeves:

1. Thunderline Corporation “Link Seal”
2. Or approved equivalent.

C. Building Attachments:

1. Anchor-It
2. Gunnebo Fastening Corporation
3. Hilti Corporation
4. ITW Ramset/Red Head
5. Masterset Fastening Systems, Inc.

2.2 HANGERS AND SUPPORTS FOR HVAC PIPING, DUCTWORK AND EQUIPMENT

A. Hanger Rods: Hanger rods continuously threaded or threaded ends only in concealed spaces and threaded ends only in exposed spaces; finish electro-galvanized or cadmium-plated in concealed spaces and prime painted in exposed spaces; sizes per MSS.

B. Hanger Rod Couplings: Anvil Figure 136, B-Line Figure B3220, or approved equivalent; malleable iron rod coupling with elongated center sight gap for visual inspection; to have same finish as hanger rods.

C. Channel Hanging System:

1. Framing members No. 12 gauge formed steel channels, 1-5/8-inch square, conforming to ASTM A1011 Grade 33, one side of channel to have a continuous slot within turned lips; framing nut with grooves and spring 1/2-inch size, conforming to ASTM 675 GR60; screws conforming to ASTM A307; fittings conforming to ASTM A575; parts enamel painted or electro-galvanized.
2. Concrete Inserts: Malleable iron body, hot dipped galvanized finish. Lateral adjustment. MSS Type 18.

D. Continuous Concrete Insert: Steel construction, minimum 12 gauge. Electrogalvanized finish. Pipe clamps and insert nuts to match.

E. Pipe Hangers:

1. Pipe Rings for Hanger Rods:

a. Pipe Sizes 2-inches and Smaller: Adjustable swivel ring hanger, UL listed. Erico 100 or 101, Anvil Figures 69 or 104, or approved equivalent.
b. Pipe Sizes 2-1/2-inches and Larger: Clevis type hangers with adjustable nuts on rod, UL listed. Anvil figure 260, Erico 400, or approved equivalent.
c. Pipe hangers to have same finish as hanger rods.

F. Pipe Saddles and Shields:

1. Factory fabricated saddles or shields under piping hangers and supports for insulated piping.
2. Size saddles and shields for exact fit to mate with pipe insulation. 1/2 round, 18 gauge, minimum 12-inches in length (4-inch pipe and larger to be three times longer than pipe diameter).

G. Riser Clamps: Steel, UL listed. MSS Type 8. Erico 510 or 511. Copper coated; Erico 368.

H. Pipe Slides: Anvil, reinforced Teflon slide material (3/32-inch minimum thickness) bonded to steel; highly finished steel or stainless steel contact surfaces to resists corrosion; 60-80 PSI maximum active contact surface loading; steel parts 3/16-inch minimum thickness; attachment to pipe and framing by welding.

I. Pipe Guides:

1. Furnish and install pipe guides on continuous runs where pipe alignment must be maintained. Minimum two on each side of expansion joints, spaced per manufacturer's recommendations for pipe size. Fasten guides securely to pipe and structure. Contact with chilled water pipe not to permit heat to be transferred in sufficient quantity to cause condensation on any surface.
2. Furnish and install guides approximately four pipe diameters (first guide) and 14 diameters (second guide) away from each end of expansion joints. Guides are not to be used as supports and are in addition to other pipe hangers and supports.

J. Pipe Roller Hangers: Adjustable roller hanger. Black steel yoke, cast iron roller. MSS Type 41.

K. Thermal Hanger Shield Inserts:

1. 100-PSI (690-kPa) minimum compressive strength calcium silicate insulation, encased in sheet metal shield or polyisocyanurate rigid foam exceeding the load bearing weight of the pipe at the hanger point with a PVC vapor barrier.
2. Material for Cold Piping: Water-repellent-treated, ASTM C533, Type I calcium silicate with vapor barrier or polyisocyanurate rigid foam with a PVC vapor barrier.
3. Material for Hot Piping: Water-repellent-treated ASTM C533, Type 1 calcium silicate or polyisocyanurate rigid foam with a PVC vapor barrier.
4. For Trapeze or Clamped System: Insert and shield cover entire circumference of pipe.
5. For Clevis or Band Hanger: Insert and shield cover lower 180 degrees of pipe.
6. Insert Length: Extend 2-inches beyond sheet metal shield for piping operating below ambient air temperature.
7. Thermal Hanger Shield Insulation Operating Temperature: Meet or exceed fluid temperature in pipe.

L. Freestanding Roof Supports: Polyethylene high-density UV resistant quick "pipe" block with foam pad.

2.3 WALL AND FLOOR SLEEVES

A. Pre-Engineered Firestop Pipe Penetration Systems: UL listed assemblies for maintaining fire rating of piping penetrations through fire-rated assemblies. Comply with ASTM E814.

B. Fabricated Accessories:

1. Steel Pipe Sleeves: Fabricate from Schedule 40 black or galvanized steel pipe. Remove end burrs by grinding.
2. Sheet Metal Pipe Sleeves: Fabricate from G-90 galvanized sheets closed with lock-seam joints. Provide the following minimum gauges for the sizes indicated:
    a. Sleeve Size 4-inches in Diameter and Smaller: 18 gauge.
    b. Sleeve Sizes 5-6-inches: 16 gauge.
    c. Sleeve Sizes 7-inches and Larger: 14 gauge.
    d. Fire-Rated Safing Material.
        1) Rockwool Insulation: Complying with FS-HH-I-558, Form A, Class IV, 6 pounds per cubic foot density with melting point of 1985 degrees F and K value of 0.24 at 75 degrees F.
        2) Calcium Silicate Insulation: Noncombustible, complying with FS-HH-I-523, Type II, suitable for 100 degrees F to 1200 degrees F service with K value of 0.40 at 150 degrees F.

2.4 BUILDING ATTACHMENTS

A. Beam Clamps:

1. MSS Type 19 and 23, wide throat, with retaining clip.
2. Universal Side Beam Clamp: MSS Type 20.

B. Powder-Actuated Drive Pin Fasteners: Powder actuated type, drive pin attachments with pull-out and shear capacities appropriate for supported loads and building materials where used.

C. Anchor Bolts:

1. Anchor supports to existing masonry, block and tile walls per anchoring system manufacturer's recommendations or as modified by project structural engineer. Insert-type attachments with pull-out and shear capacities appropriate for supported loads and building materials where used.
2. Anchor Bolts (Cast-In-Place): Steel bolts, ASTM A307. Nuts to conform to ASTM A194. Design values for shear and tension not more than 80 percent of the allowable listed loads.
3. Anchor (Expansion) Bolts: Carbon steel to ASTM A307; nut to conform to ASTM A194; drilled-in type. Design values for shear and tension not more than 80 percent of the allowable listed loads.
4. Anchor (Adhesive) Bolts: Consisting of two-part adhesive cartridge and zinc-plated Type A307 steel anchor bolt rod assembly with ASTM A194 nut.

2.5 FLASHING

A. Steel Flashing: 26 gauge galvanized steel.

B. Safes: 8 mil thick neoprene.

C. Caps: Steel, 22 gauge minimum, 16 gauge at fire-resistant structures.

2.6 MISCELLANEOUS METAL AND MATERIALS

A. General:

1. Provide miscellaneous supports and metal items, including materials, fabrication, fastenings and accessories required for finished installation, where indicated on drawings or otherwise not shown on drawings that are necessary for completion of the project. Contractor is responsible for their design.
2. Fabricate miscellaneous units to size shapes and profiles indicated or, if not indicated, of required dimensions to receive adjacent other work to be retained by framing. Except as otherwise shown, fabricate from structural steel shapes and plates and steel bars, of welded construction using mitered joints for field connection. Cut, drill and tap units to receive hardware and similar items.

B. Structural Shapes: Where miscellaneous metal items are needed to be fabricated from structural steel shapes and plates, provide members constructed of steel conforming with requirements of ASTM A36 or approved equivalent.

C. Steel Pipe: Provide seamless steel pipe conforming to requirements of ASTM A53, Type S, Grade A, or Grade B. Weight and size required as specified.

D. Fasteners: Provide fasteners of types as required for assembly and installation of fabricated items; surface-applied fasteners are specified elsewhere.

E. Bolts: Low carbon steel externally and internally threaded fasteners conforming with requirements of ASTM A307; include necessary nuts and plain hardened washers. For structural steel elements supporting mechanical material or equipment from building structural members or connection thereto, use fasteners conforming to ASTM A325.

F. Miscellaneous Materials: Provide incidental accessory materials, tools, methods, and equipment required for fabrication.

G. Provide hot dipped galvanized components for items exposed to weather. Cold galvanize field-welded joints and components. Use materials compatible with system being supported (i.e. aluminum for aluminum ductwork, stainless steel for stainless steel ductwork).

H. Use straps, threshold rods and wire with sizes required by SMACNA to support ductwork.

I. Grout:

1. ASTM C1107, Grade B, factory mixed and packaged, nonshrink and nonmetallic, dry, hydraulic-cement grout.
2. Characteristics: Post hardening and volume adjusting; recommended for both interior and exterior applications.
3. Properties: Nonstaining, noncorrosive, and non gaseous.
4. Design Mix: 5000-PSI (34.5-MPa), 28-day compressive strength.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS

A. Verify building materials to have hangers and attachments affixed in accordance with hangers to be used. Provide supporting calculations.

B. Examine Drawings and coordinate for verification of exact locations of fire and smoke rated walls, partitions, floors and other assemblies. Indicate, by shading and labeling on Record Drawings such locations and label as "1-Hour Wall," "2-Hour Fire/Smoke Barrier," and the like. Determine proper locations for piping penetrations. Set sleeves in place in new floors, walls or roofs prior to concrete pour or grouting.

C. Install hangers, supports, anchors and sleeves after required building structural work has been completed in areas where the work is to be installed. Coordinate proper placement of inserts, anchors and other building structural attachments.

D. Equipment Clearances: Do not route ductwork, equipment, or piping through electrical rooms, transformer vaults, IT rooms, MPOE rooms, or other electrical or electronic equipment spaces and enclosures and the like. Within equipment rooms, provide minimum 3-feet lateral clearance from all sides of electric switchgear panels. Do not route ductwork, equipment, or piping above any electric power or lighting panel, switchgear, or similar electric device. Coordinate with Electrical and coordinate exact ductwork, equipment or pipe routing to provide proper clearance with such items.

3.2 HANGERS AND SUPPORTS FOR HVAC PIPING, DUCTWORK AND EQUIPMENT

A. Hang rectangular sheet-metal ducts with a cross sectional area of less than 7 SF with galvanized strips of No. 16 USS gauge steel 1-inch wide, and larger ducts with steel angles and adjustable hanger rods similar to piping hangers. Support at a maximum of 8-feet on center.

B. Support horizontal ducts within 24-inches of each elbow and within 48-inches of each branch intersection.

C. Design hangers and supports to allow for expansion and contraction.

D. Provide aluminum supports for aluminum ductwork.

E. Provide stainless steel supports for stainless steel ductwork.

F. Support vertical ducts at maximum intervals of 16-feet and at each floor.

G. Install upper attachments to structures with an allowable load not exceeding one-fourth of failure (proof-test) load.

H. Install flexible ductwork per the more stringent of SMACNA HVAC Duct Construction Standards or the following:

1. Support horizontal duct runs at not more than 4 feet intervals.
2. Support vertical risers at not more than 6 feet intervals.
3. Limit sag between support hangers to 1/2-inch per foot of spacing support.
4. Supports shall be rigid and shall be not less than 1.5-inches wide at point of contact with the duct surface.

5. Duct bends shall be not less than 1.5 duct diameter bend radius.

I. Use double nuts and lock washers on threaded rod supports.

J. Floor supports in mechanical rooms to be elevated 1-inch above finish floor and void space filled with masonry grout.

K. Anchor ducts securely to building in such a manner as to prevent transmission of vibration to structure. Do not connect duct hanger straps directly to roof deck. Do not support ducts from other ducts, piping or equipment.

L. Attach strap hangers installed flush with end of sheet-metal duct run to duct with sheet-metal screws.

M. Construct exterior ductwork or ductwork which is otherwise exposed to weather watertight and slope 1/4-inch per foot to avoid standing water.

N. Exposed ductwork hung in clean areas such as sanitary areas, pharmaceutical areas, wash down areas or food process areas to be installed using double end, food grade trapeze hanger rods suitable for use with food grade strut.

O. Channel Support System Installation:

1. Arrange for grouping of parallel runs of piping and support together on field-assembled channel systems.
2. Field assemble and install according to manufacturer's written instructions.

P. Install hangers and supports complete with necessary inserts, bolts, rods, nuts, washers, and other accessories.

Q. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.

R. Load Distribution: Install hangers and supports so that piping live and dead loads and stresses from movement will not be transmitted to connected equipment.

S. Adjust hangers so as to distribute loads equally on attachments. Provide grout under supports to bring piping, ductwork and equipment to proper level and elevations.

T. Prime paint ferrous nongalvanized hangers, accessories, and supplementary steel which are not factory painted.

U. Horizontal Piping Hangers and Supports; Horizontal and Vertical Piping, and Hanger Rod Attachments:

1. Factory fabricated horizontal piping hangers and supports complying with MSS SP-58, to suit piping systems and in accordance with manufacturer's published product information.
2. Use only one type by one manufacturer for each piping service.
3. Select size of hangers and supports to exactly fit pipe size for bare piping, and to exactly fit around piping insulation with saddle or shield for insulated piping.
4. Pipe support spacing (pipe supported in ceiling or floor-supported) to meet latest applicable Code and manufacturer's requirements.

5. Provide copper-plated hangers and supports for uninsulated copper piping systems.

V. Plumber's Tape not permitted as pipe hangers or pipe straps.

W. Comply with MSS SP-58. Install hangers, supports, clamps, and attachments as required to properly support piping from building structure. For horizontally hung grooved-end piping, provide a minimum of 2 hangers per pipe section.

X. Pipe Ring Diameters:

1. Uninsulated and Insulated Pipe, Except Where Oversized Pipe Rings are Specified: Ring inner diameter to suit pipe outer diameter.
2. Insulated Piping Where Oversized Pipe Rings are Specified and Vibration Isolating Sleeves: Ring inner diameter to suit outer diameter of insulation or sleeve.

Y. Oversize Pipe Rings: Provide oversize pipe rings of 2-inch and larger size.

Z. Pipe Support Brackets: Support pipe with pipe slides.

AA. Steel Backing in Walls: Provide steel backing in walls to support fixtures and piping hung from steel stud walls.

BB. Pipe Guides:

1. Install on continuous runs where pipe alignment must be maintained. Minimum two on each side of expansion joints, spaced per manufacturer's recommendations for pipe size. Fasten guides to pipe structure. Contact with chilled water pipe does not permit heat to be transferred in sufficient quantity to cause condensation on any surface.
2. Install approximately four pipe diameters (first guide) and 14 diameters (second guide) away from each end of expansion joints. Do not use as supports. Provide in addition to other required pipe hangers and supports.

CC. Heavy-Duty Steel Trapeze Installation:

1. Arrange for grouping of parallel runs of horizontal piping and support together on field fabricated, heavy-duty trapezes.
2. Pipes of Various Sizes: Support together and space trapezes for smallest pipe size or install intermediate supports for smaller diameter pipes as specified above for individual pipe hangers.
3. Field fabricate from ASTM A 36/A 36M, steel shapes selected for loads being supported. Weld steel according to AWS D-1.1.

DD. Group parallel runs of horizontal piping to be supported together on trapeze-type hangers. Maximum spacings: MSS SP-58.

EE. Where piping of various sizes is to be supported together by trapeze hangers, space hangers for smallest pipe size or install intermediate supports for smaller diameter pipe.

FF. Do not support piping from other piping.

GG. Fire protection piping will be supported independently of other piping.

HH. Prevent electrolysis in support of copper tubing by use of hangers and supports which are copper plated.

II. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes and so maximum pipe deflections allowed by ASME B31.9, "Building Services Piping" is not exceeded.

JJ. Insulated Piping:

1. Attach clamps and spacers to piping.
    a. Piping Operating Above Ambient Air Temperature: Clamp may project through insulation.
    b. Piping Operating Below Ambient Air Temperature: Use thermal-hanger shield insert with clamp sized to match OD of insert.
2. Do not exceed pipe stress limits according to ASME B31.9.
3. Install MSS SP-58, Type 39 protection saddles, if insulation without vapor barrier is indicated. Fill interior voids with insulation that matches adjoining insulation.
4. Install MSS SP-58, Type 40 protective shields on cold piping with vapor barrier. Shields to span arc of 180 degrees.
5. Option: Thermal-hanger shield inserts may be used. Include steel weight-distribution plate for pipe NPS 4 (DN100) and larger if pipe is installed on rollers.
6. Shield Dimensions for Pipe, not less than the following:
    a. NPS 1/4 to NPS 3-1/2 (DN8 to DN 90): 12-inches long and 0.048-inch thick.
    b. NPS 4 (DN100): 12-inches long and 0.06-inch thick.
    c. NPS 5 and NPS 6 (DN125 and DN150): 18-inches long and 0.06-inch thick.
    d. NPS 8 to NPS 14 (DN200 to DN350): 24-inches long and 0.075-inch thick.
    e. NPS 16 to NPS 24 (DN400 to DN600): 24-inches long and 0.105-inch thick.
7. Pipes NPS 8 (DN200) and Larger: Include wood inserts.
    a. Insert Material: Length at least as long as protective shield.
8. Thermal-Hanger Shields: Install with insulation same thickness as piping insulation.

KK. Pipe Anchors: Provide anchors to fasten piping which is subject to expansion and contraction, and adjacent to equipment to prevent loading high forces onto the equipment.

LL. Pipe Curb Assemblies:

1. Provide prefabricated units for roof membrane and insulation penetrations related to equipment. Coordinate with roofing system. Set supports on the structural deck. Do not set supports on insulation or roofing. Provide level supports by prefabricated pitch built into the curb.
2. Provide for piping and electrical conduit which penetrates the structural roof deck to service equipment above the roof level (i.e., piping, electrical power and control wiring). Meet requirements of roof warranty.

MM. Escutcheon Plates: Install around horizontal and vertical piping at visible penetrations through walls, partitions, floors, or ceilings, including penetrations through closets, through below ceiling corridor walls, and through equipment room walls and floors.

NN. Vertical Piping:

1. Support with U-clamps fastened to wall to hold piping away from wall unless otherwise approved.
2. Riser clamps to be directly under fitting or welded to pipe.
    a. Riser to be supported at each floor of penetration.

b. Provide structural steel supports at the base of pipe risers. Size supports to carry forces exerted by piping system when in operation.

OO. Piping Above Roof:

1. Provide engineered roof piping supports appropriate for installation and attachment to the roof structure or structure below roof (see Architectural and Structural Drawings for roof construction, building structural systems, and sloping requirements for insulation).
2. Design a complete system unless specific details have been shown on Drawings.
3. Provide calculations signed and stamped by a Structural Engineer, registered in the State where the project is located at, as part of submittals and coordinated shop drawings.
4. Do not use freestanding supports unless approved by the Structural Engineer of Record.
5. Provide miscellaneous metal and materials as specified in Miscellaneous Metal and Materials article, above.

3.3 WALL AND FLOOR SLEEVES

A. "Link-Seal" Pipe Sleeves: Install at floor/below grade piping penetrations. Provide manufacturer's sleeve appropriate to seal type for pre-cast penetrations.

B. Fabricated Pipe Sleeves:

1. Provide either steel or sheet metal pipe sleeves accurately centered around pipe routes. Size such that piping and insulation, if any, will have free movement within the sleeve, including allowance for thermal expansion. Sleeve diameter to be determined by local seismic clearance requirements, and by waterproofing requirements.
2. Length: Equal to thickness of construction penetrated, except extend floor sleeves 1-inch above floor finish.
3. Provide temporary support of sleeves during placement in concrete and other work around sleeves. Provide temporary end closures to prevent concrete and other materials from entering pipe sleeves.
4. Seal each end airtight with a resilient nonhardening sealer, UL listed, fire rated ASTM 814.

C. Installation of metallic or plastic piping penetrations through non fire-rated walls and partitions and through smoke-rated walls and partitions:

1. Install fabricated pipe sleeve.
2. After installation of sleeve and piping, tightly pack entire annular void between piping or piping insulation and sleeve identification with specified material.
3. Seal each end airtight with a resilient nonhardening UL listed fire resistant ASTM 814.

D. Piping Penetrations Through Fire-Rated (One to Three Hour) Assemblies:

1. Select and install pre-engineered pipe penetration system in accordance with the UL listing and manufacturer's recommendation.
2. Provide proper sizing when providing sleeves or core-drilled holes to accommodate the penetration. Firestop voids between sleeve or core-drilled hole and pipe passing through to meet the requirements of ASTM E814.

3.4 BUILDING ATTACHMENTS

A. Factory fabricated attachments complying with MSS SP-58, selected to suit building substructure conditions and in accordance manufacturer's published product information.

B. Select size of building attachments to suit hanger rods.

C. Space attachments within maximum piping span length indicated in MSS SP-58.

D. Install building attachments within concrete slabs or attach to structural steel or wood. Install additional building attachments where support is required for additional concentrated loads, including valves, flanges, guides, strainers, expansion joints, and at changes in direction of piping.

E. Attachment to Wood Structure: Anvil side beam bracket Figure 202 for attachment to wooden beam or approved attachment for a wood structure.

F. Install mechanical-anchor fasteners in concrete after concrete is placed and completely cured. Install fasteners according to manufacturer's written instructions.

G. Install concrete inserts before concrete is placed; fasten inserts to forms. Where concrete with compressive strength less than 2500 PSI is indicated, install reinforcing bars through openings at top in inserts.

H. Install powder-actuated drive-pin fasteners in concrete after concrete is placed and completely cured. Use operators that are licensed by powder-actuated tool manufacturer. Install fasteners according to powder-actuated tool manufacturer's operating manual. Test powder-actuated insert attachments with a minimum load of 100 pounds.

I. Do not use powder-actuated concrete fasteners for lightweight aggregate concretes or for slabs less than 4-inches thick.

J. Bolting: Provide bored, drilled or reamed holes for bolting to miscellaneous structural metals, frames or for mounts or supports. Flame cut, punched or hand sawn holes will not be accepted.

K. Anchor Bolts:

1. Install anchor bolts for mechanical equipment, piping and ductwork as required. Tightly fit and clamp base-supported equipment anchor bolts at equipment support points. Provide locknuts where equipment, piping and ductwork are hung.
2. Anchor Bolts (Cast-In-Place): Embed anchor bolts in new cast-in-place concrete to anchor equipment. Install a pipe sleeve around the anchor bolt for adjustment of the top 1/3 of the bolt embedment; sizes and patterns to suit the installation conditions of the equipment to be anchored.

3.5 FLASHING

A. Flash and counterflash where piping, ductwork and equipment passes through weather or waterproofed walls, floors, and roofs.

B. Provide 12-inch minimum height curbs for roof-mounted mechanical equipment. Flash and counter flash with galvanized steel, soldered and waterproofed.

3.6 MISCELLANEOUS METAL AND MATERIALS

A. General: Verify dimensions prior to fabrication. Form metal items to accurate sizes and configurations as indicated on drawings and otherwise required for proper installation; make with lines straight and angles sharp, clean and true; drill, countersink, tap, and otherwise prepare items for connections with work of other trades, as required. Fabricate to detail of structural shapes, plates and bars; weld joints where practicable; provide bolts and other connection devices required. Include anchorages; clip angles, sleeves, anchor plates, and similar devices. Hot dipped galvanize after fabrication items installed in exterior locations. Set accurately in position as required and anchor securely to building construction. Construct items with joints formed for strength and rigidity, accurately machining for proper fit; where exposed to weather, form to exclude water.

B. Finishes:

1. Ferrous Metal: After fabrication, but before erection, clean surfaces by mechanical or chemical methods to remove rust, scale, oil, corrosion, or other substances detrimental to bonding of subsequently applied protective coatings. For metal items exposed to weather or moisture, galvanize in manner to obtain G90 zinc coating in accordance with ASTM A123. Provide other non-galvanized ferrous metal with 1 coat of approved rust-resisting paint primer, in manner to obtain not less than 1.0 mil dry film thickness. Touch-up damaged areas in primer with same material, before installation. Apply zinc coatings and paint primers uniformly and smoothly; leave ready for finish painting as specified elsewhere.
2. Metal in Contact with Concrete, Masonry and Other Dissimilar Materials: Where metal items are to be erected in contact with dissimilar materials, provide contact surfaces with coating of an approved zinc-chromate primer in manner to obtain not less than 1.0 mil dry film thickness, in addition to other coatings specified in these specifications.
3. For Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and apply galvanizing repair paint to comply with ASTM A780.

C. Coordinate and furnish anchorages, setting drawings, diagrams, templates, instructions, and directions for installation of anchorages, such as concrete inserts, sleeves, anchor bolts and miscellaneous items having integral anchors, which are to be embedded in concrete or masonry construction. Coordinate delivery of such items to project site.

D. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary for securing miscellaneous metal fabrications to in-place construction; including, threaded fasteners for concrete and masonry inserts, toggle bolts, through-bolts, lag bolts, wood screws and other connectors as required. Avoid cutting concrete reinforcing when drilling for inserts. Reference structural drawings and reinforcing shop drawings and determine locations of stirrups prior to drilling into concrete.

E. Cutting, Fitting and Placement: Perform cutting, drilling and fitting required for installation of miscellaneous metal fabrications. Set work accurately in location, alignment and elevation, plumb, level, true and free of rack, measured from established lines and levels. Provide temporary bracing or anchors in formwork for items, which are to be built into concrete masonry or similar construction.

F. Field Welding: Comply with AWS Code for procedures of manual shielded metal-arc welding, appearance and quality of welds made, and methods used in correcting welding work.

G. Setting Loose Plates: Clean concrete and masonry bearing surfaces of any bond reducing materials, and roughen to improve bond to surfaces. Clean bottom surface of bearing plates.

H. Set loose leveling and bearing plates on wedges, or other adjustable devices. After the bearing members have been positioned and plumbed, tighten the anchor bolts. Do not remove wedges or shims, but if protruding, cut-off flush with edge of the bearing plate before packing with grout. Use metallic non-shrink grout in concealed locations where not exposed to moisture; use non-metallic non-shrink grout in exposed locations, unless otherwise indicated.

I. Pack grout solidly between bearing surfaces and plates to ensure that no voids remain.

J. Cut, drill, and fit miscellaneous metal fabrications for heavy-duty steel trapezes and equipment supports.

K. Fit exposed connections together to form hairline joints. Field-weld connections that cannot be shop-welded because of shipping size limitations.

L. Field Welding: Comply with AWS D1.1 procedures for shielded metal arc welding, appearance and quality of welds, and methods used in correcting welding work, and with the following:

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
2. Obtain fusion without undercut or overlap.
3. Remove welding flux immediately.
4. Finish welds at exposed connections so no roughness shows after finishing and contours of welded surfaces match adjacent contours.

M. Provide galvanized components for items exposed to weather.

3.7 FIRE RATED SUPPORTS

A. Provide fire rated support as required by Codes.

END OF SECTION 23 05 29

SECTION 23 05 33 - HEAT TRACING FOR HVAC PIPING

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Heat Trace Cable (Freeze Protection)

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

B. In addition, reference the following:

1. Section 23 07 00, HVAC Insulation

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. UL 718K, Pipe Heating Cable.
2. CSA 3A, 3B, and 3C.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Project Record Documents: Record physical locations of thermostats.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. Minimum heat tape capacities per linear foot as scheduled on Drawings.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Heat Trace Cable (Freeze Protection):

1. Thermon/FLX
2. Chromalox/SRF
3. Raychem/XL-Trace
4. Nelson/CLT

2.2 HEAT TRACE CABLE (FREEZE PROTECTION)

A. General: Provide complete UL listed system of heating cables and components listed specifically for maintaining pipe temperature over entire piping system exposed to freezing temperatures.

B. Materials

1. Cable: Self-regulating flat, flexible, low-heat density, parallel electric heater strip consisting of two stranded circuit conductors enclosed in semi-conductive, polymer core insulated with plastic jacket protected with tinned-copper braid. Ability to overlapped without creating hot spots and suitable for application on plastic, copper or steel pipe.
2. Voltage: See Electrical Drawings. Provide power connections, end seals, splices tap-offs and tees for a complete system.
3. Controls: Thermostat with fixed setpoint of 40 degrees F, remote bulb and capillary sensor enclosed in a NEMA 4 enclosure.

C. Minimum Exposure Temperature: 150 degrees F continuous.

PART 3 - EXECUTION

3.1 HEAT TRACE CABLE INSTALLATION

A. Heat Trace (Freeze Protection):

1. Location: Provide heat trace on piping exposed to freezing conditions.
2. Install cable parallel to pipe or spiral wrap to achieve power density per linear foot of pipe to prevent freezing.
3. Attach heat trace cable to pipe with polyester tape; increments not exceeding 1-foot, 0-inches.
4. Install thermostat capillary and bulb to pipe with polyester tape assuring a firm bulb contact with pipe. Install bulb without contact to heat cable. Maximum 12-inch spacing between tape.
5. Install thermostat at accessible location adjacent to pipe with minimum of exposed capillary.
6. Labeling: Provide “Electric Traced” label to outside of the pipes thermal insulation on alternating sides. Locate labels at intervals of 5- to 15-feet over entire length of heat tracing.
7. Coordinate installation with work under Division 26, Electrical for electrical service to each thermostat.
8. Coordinate application of heat tape with pipe insulation and weather jacketing.

END OF SECTION 23 05 33

SECTION 23 05 48 - VIBRATION AND SEISMIC CONTROLS FOR HVAC EQUIPMENT

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Vibration Isolation
2. Seismic Restrained Spring Vibration Isolation Roof-Curb
3. Seismic Restraint Devices
4. Factory Finishes
5. Seismic-Bracing/Restraint Devices/Systems for Equipment, Piping and Ductwork

B. General:

1. Vibration isolation for mechanical ductwork, piping and equipment.
2. Seismic restraint for mechanical ductwork, piping and equipment.
3. Seismic Certification for equipment, hangers and systems.
4. Special inspections for systems.

C. Scope of Work:

1. Vibration isolation and seismic restraint of new equipment and systems within project boundary defined in architectural drawings.
2. Provide supplementary structural steel for seismic restraint systems. No hanging from roof deck is permitted on this project, unless specifically allowed by Structural Engineer of Record in writing prior to bid.

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Vibration Isolation:
   a. Product Data: Provide catalog data indicating size, type, load and deflection of each isolator; and percent of vibration transmitted based on lowest disturbing frequency of equipment.
   b. Shop Drawings: Showing complete details of construction for steel and concrete bases including:

1) Fabrication, including anchorages and attachments to structure and to supported equipment. Include auxiliary motor slides and rails, base weights, equipment static loads, power transmission, component misalignment and cantilever loads.
2) Equipment mounting holes.
3) Dimensions.
4) Size and location of concrete and steel bases and curbs.
5) Isolation selected for each support point.
6) Details of mounting brackets for isolator.
7) Weight distribution for each isolator.
8) Details of seismic snubbers.
9) Code number assigned to each isolator.

c. Design calculations: Provide calculations for selecting vibration isolators and for designing vibration isolation bases.

2. Riser Supports: Include riser diagrams and calculations showing anticipated expansion and contraction at each support point, initial and final loads on building structure, spring deflection changes and seismic loads. Include certification that riser system has been examined for excessive stress and that none will exist.
3. Seismic Restraint:
   a. Shop Drawings: Show compliance with requirements of Quality Assurance article of this Section. Shop drawings to be stamped by a professional Structural Engineer licensed in State of Washington.
   b. Calculations: Submit seismic calculations indicating restraint loadings resulting from design seismic forces. Include anchorage details and indicate quantity, diameter and depth of penetration of anchors. Calculations certified by professional Structural Engineer licensed in State of Washington.
4. Seismic Restraint Details: Detail fabrication and attachment of seismic restraints and snubbers. Show anchorage details and indicate quantity, diameter and depth of penetration of anchors.
5. Submittals for Interlocking Snubbers: Include load deflection curves up to 1/2-inch deflection in x, y and z planes.
6. Welding certificates.
7. Equipment Certification: Provide seismic certification for equipment as noted in Seismic Design Summary or schedules on Drawings.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. Vibration Isolation:
   a. Except for packaged equipment with integral isolators, single manufacturer selects and furnishes isolation required.
   b. Deflections indicated on drawings are minimum actual static deflections for specific equipment supported.
   c. Isolator Stability:
      1) Size springs of sufficient diameter to maintain stability of equipment being supported. Spring diameters not less than 0.8 of compressed height at rated load.
      2) Springs have minimum additional travel to solid equal to 50 percent of rated defection.

3) Springs support 200 percent of rated load, fully compressed, without deformation or failure.

d. Maximum Allowable Vibration Levels: Peak vibration velocities not exceed 0.08 in/sec. Correct equipment operating at vibration velocities that exceed this criteria.

2. Seismic Restraint:

a. Code and Standard Requirements:

1) Seismic restraint of equipment, piping and ductwork to be in accordance with latest enacted version of ASCE 7-16 and IBC Chapter 16.

b. Confirm Seismic Control requirements in Division 01, General Requirements and Structural documents.

c. Certification: See Seismic Design Table or schedules on Drawings for equipment, systems and seismic-restraint devices designated to have seismic certification/qualification. Horizontal and vertical load testing and analysis performed according to ASCE 7-16. Anchorage systems to bear anchorage preapproval number from an agency acceptable to authorities having jurisdiction, showing maximum seismic-restraint ratings. Ratings based on independent testing or calculations, if preapproved ratings are not available. Calculations (including combining shear and tensile loads) to support seismic-restraint designs must be sealed by qualified licensed professional engineer in State of Washington. Testing and calculations must include both shear and tensile loads and one test or analysis at 45 degrees to weakest mode.

d. Seismic restraint and anchorage of permanent equipment and associated systems listed below to building structure be designed to resist total design seismic force prescribed in local building code:

1) Floor- or roof-mounted equipment weighing 400 pounds or greater.
2) Suspended, wall-mounted or vibration isolated equipment weighing 20 pounds or greater.
3) In-line duct devices connected to ductwork weighing 75 pounds or greater.
4) Housekeeping slabs: provide reinforcement and anchorage to building structure.

e. Where required, seismic sway bracing of suspended duct and piping meet following:

1) Pipe and duct runs requiring seismic bracing have minimum of two traverse braces and one longitudinal brace. Longitudinal (or traverse) brace at 90 degree change in direction may act as traverse (or longitudinal) brace if located within 2-feet of change in direction.
2) Seismic bracing may not pass through seismic separation joint. Pipe or duct runs that pass through seismic separation joint must be restrained within 5-feet of both sides of separation.
3) Seismic brace assembly spacing not to exceed 40-feet transverse and 80-feet longitudinal.

f. Seismic restraints may be omitted from suspended piping and duct if following conditions are satisfied:

1) For piping or ducts supported by rod hangers 12-inches or less in length from top of duct to bottom of structural support. Top connections to structure have swivel joints, eye bolts, or vibration isolation hangers for entire length of system run.
2) Lateral motion of system will not cause damaging impact with surrounding systems or cause loss of system vertical support.
3) System must be welded steel pipe, brazed copper pipe, sheet metal duct or similar ductile material with ductile connections.

C. Seismic restraints, including anchors to building structure, be designed by registered professional Structural Engineer licensed in State of Washington. Design includes:

1. Number, size, capacity and location of anchors for floor- or roof-mounted equipment. For curb-mounted equipment, provide design of attachment of both unit to curb and curb to structure.
2. Number, size, capacity and location of seismic restraint devices and anchors for vibration-isolation and suspended equipment. Provide calculations and test data verifying horizontal and vertical ratings of seismic restraint devices.
3. Number, size, capacity and location of braces and anchors for suspended piping and ductwork on as-built plan drawings.
4. Maximum seismic loads to be indicated on drawings at each brace location. Drawings bear stamp and signature of registered professional Structural Engineer who designed layout of braces.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.7 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

B. Seismic Snubber Units: Furnish replacement neoprene inserts for snubbers.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Vibration Isolation:

1. The VMC Group
2. B-Line Systems, Inc.
3. Kinetics Noise Control, Inc.
4. Mason Industries, Inc.
5. M.W. Saussé - Vibrex
6. Where Mason numbers are specified, equivalent products by listed manufacturers are acceptable.

B. Seismic Restrained Spring Vibration Isolation Roof-Curb:

1. The VMC Group
2. B-Line Systems, Inc.
3. Kinetics Noise Control, Inc.
4. Mason Industries, Inc.
5. M.W. Saussé - Vibrex
6. Thybar Corporation
7. Vibration Eliminator Co., Inc.
8. California Dynamics Corporation
9. Vibro-Acoustics
10. Where Mason numbers are specified, equivalent products by listed manufacturers are acceptable.

C. Seismic Restraint Devices:

1. The VMC Group
2. B-Line Systems, Inc.
3. Kinetics Noise Control, Inc.
4. Mason Industries, Inc.
5. M.W. Saussé - Vibrex
6. California Dynamics Corporation
7. Cooper B-Line Tolco
8. Unistrut Diversified Products Co.; Wayne Manufacturing Division.
9. Hilti, Inc.

D. Factory Finishes:

1. Kynar 500 Fluoropolymer Coating
2. Or approved equivalent.

E. Seismic-Bracing/Restraint Devices/Systems for Equipment, Piping and Ductwork:

1. The VMC Group
2. Kinetics Noise Control, Inc.
3. Mason Industries, Inc.
4. Hilti, Inc.
5. Cooper B-Line, Inc.
6. California Dynamics Corporation
7. Unistrut
8. ISAT, Inc.
9. Where Mason numbers are specified, equivalent products by listed manufacturers are acceptable.

2.2 VIBRATION ISOLATION

A. Type 1 - Neoprene Pad: Natural rubber waffle pads, arranged in single or multiple layers, 3/4-inch thick per layer with pattern repeating on 1/2-inch centers; 50 durometer hardness; maximum loading 60 PSI. Minimum 1/4-inch thick steel load distribution plate and 1/16-inch shim plates between layers, factory cut to sizes matching requirements of supported equipment. Molded bridge with neoprene anchor bolt bushing and flat washer face to prevent metal to metal contact. Number of layers required for equipment scheduled. Mason Type: Super WMH.

B. Type 2 - Neoprene Mount: Double-deflection type, with ductile-iron housing containing two separate and opposing, oil-resistant natural rubber or bridge bearing neoprene elements, factory-drilled, encapsulated top plate for bolting to equipment and with baseplate for bolting to structure. Neoprene elements to prevent metal to metal contact during normal operation. Minimum static deflection of 0.30-inches. Mason Type: BR.

C. Type 3 - Spring: Freestanding, laterally stable, open-spring isolators.

1. Outside Spring Diameter: Not less than 80 percent of compressed height of spring at rated load.
2. Minimum Additional Travel: 50 percent of required deflection at rated load.
3. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
4. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.

5. Baseplates: Factory drilled for bolting to structure and bonded to 1/4-inch- thick, natural rubber or bridge bearing neoprene isolator pad attached to baseplate underside. Baseplates limit floor load to 100 PSIG (690 kPa).
6. Top Plate and Adjustment Bolt: Threaded top plate with adjustment bolt and cap screw to fasten and level equipment.
7. Brackets: Manufacturer's standard bracket, utilize height saving brackets to accommodate height restrictions.
8. Mason Type: SLFH or SLF.

D. Type 4A - Restrained Spring Isolators: Freestanding, steel, open-spring isolators with seismic restraint.

1. Housing: Steel with resilient vertical-limit stops (out of contact during normal operation) to prevent spring extension due to wind loads or if weight is removed; factory-drilled baseplate bonded to 1/4-inch thick, natural rubber or bridge bearing neoprene isolator pad attached to baseplate underside; and adjustable equipment mounting and leveling bolt that acts as blocking during installation. Restraining bolts have large rubber grommets to provide cushioning in vertical and horizontal directions. A minimum clearance of 3/8-inch maintained around restraining bolts so as not to interfere with spring action.
2. Outside Spring Diameter: Not less than 80 percent of compressed height of spring at rated load.
3. Minimum Additional Travel: 50 percent of required deflection at rated load.
4. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
6. Brackets: Manufacturer's standard bracket, utilize height saving brackets to accommodate height restrictions.
7. Mason Type: SLR.

E. Type 4B - Housed Spring Mounts: Housed spring isolator with integral seismic snubbers.

1. Housing: Ductile-iron or steel housing to provide all-directional seismic restraint with neoprene acoustical cup, spring inspection ports and rebound adjustment ports.
2. Base: Factory drilled for bolting to structure.
3. Snubbers: Vertically adjustable to allow a maximum of 1/4-inch travel before contacting a resilient collar.
4. Brackets: Manufacturer's standard bracket, utilize height saving brackets to accommodate height restrictions.
5. Mason Type: SSLFH.

F. Type 5A - Restrained Elastomeric Hangers: Double-deflection type, with molded, oil-resistant natural rubber or bridge bearing neoprene isolator elements bonded to steel housings with threaded connections for hanger rods. Color-code or otherwise identify to indicate capacity range. Seismic rebound steel and bonded LDS rubber washer to limit upward seismic movement. Mason Type: RWHD.

G. Type 5B - Spring Hangers: Combination coil-spring and elastomeric-insert hanger with spring and insert in compression.

1. Frame: Steel, fabricated for connection to threaded hanger rods and to allow for a maximum of 15 degrees of angular hanger-rod misalignment from vertical without binding or reducing isolation efficiency.

2. Outside Spring Diameter: Not less than 80 percent of compressed height of spring at rated load.
3. Minimum Additional Travel: 50 percent of required deflection at rated load.
4. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
6. Elastomeric Element: Molded, oil-resistant rubber or neoprene. Steel-washer-reinforced cup to support spring and bushing projecting through bottom of frame.
7. Mason Type: 30N.

H. Type 6 - Horizontal Thrust Restraints: Combination coil spring and elastomeric insert with spring and insert in compression and with a load stop. Include rod and angle-iron brackets for attaching to equipment.

1. Frame: Steel, fabricated for connection to threaded rods and to allow for a maximum of 30 degrees of angular rod misalignment without binding or reducing isolation efficiency.
2. Outside Spring Diameter: Not less than 80 percent of compressed height of spring at rated load.
3. Minimum Additional Travel: 50 percent of required deflection at rated load.
4. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
6. Elastomeric Element: Molded, oil-resistant rubber or neoprene.
7. Coil Spring: Factory set and field adjustable for a maximum of 1/4-inch movement at start and stop.
8. Mason Type: WBI or WBD.

I. Type 7 - Pipe Riser Resilient Support: All-directional, acoustical pipe anchor consisting of 2 steel tubes separated by a minimum of 1/2-inch thick, 60-durometer neoprene. Include steel and neoprene vertical-limit stops arranged to prevent vertical travel in both directions. Design support for a maximum load on isolation material of 500 PSIG (3.45 MPa) and for equal resistance in all directions. Mason Type: ADA.

J. Type 8 - Resilient Pipe Vertical Sliding Guide: Telescopic arrangement of 2 steel tubes separated by a minimum of 1/2-inch thick, 60-durometer neoprene. Factory set guide height with a shear pin to allow vertical motion due to pipe expansion and contraction. Shear pin be removable and reinsertable to allow for selection of pipe movement. Guides be capable of motion to meet location requirements. Mason Type: VSG. Provide pipe expansion hangers to control load shifts as the riser expands or contracts, Mason HES.

K. Type FC-1, Flexible Duct Connectors. See Specification Section 23 33 00, Air Duct Accessories.

L. Type FC-2A, Flexible Pipe Connector, Steel:

1. 321 stainless steel, close pitch, annular corrugated hose.
2. Exterior Sleeve: 304 stainless steel, braided.
3. Pressure Rating: 125 PSI at 70 degrees F for 12-inch and smaller pipe.
4. Joint: ANSI Class 150 carbon steel flanges.
5. Size: Use pipe sized units.
6. Minimum Allowable Offset: 3/4-inch on each side of installed center line.
7. Basis of Design: Metraflex Model MLP.

M. Type FC-2B, Flexible Pipe Connector, Copper:

1. Inner Hose: Bronze, close pitch, annular corrugated hose.
2. Exterior Sleeve: Braided bronze (for piping over 2-inches, to be 3 pound braided stainless steel).
3. Minimum Allowable Pressure Rating: 125 PSI at 70 degrees F.
4. Joint: Sweat ends.
5. Size: Use pipe sized units.
6. Minimum Allowable Offset: 3/8-inch on each side of installed center line.
7. Basis of Design: Metraflex Model BBS.

N. Type FC-2C, Flexible Pipe Connector, Gas:

1. Inner Hose: 304 stainless steel.
2. Exterior Sleeve: Braided, 304 stainless steel.
3. Minimum Allowable Pressure Rating: 150 PSI at 70 degrees F up to 4-inch pipe.
4. Joint: Threaded carbon steel.
5. Minimum Allowable Offset: 3/4-inch on each side of installed center line.
6. Basis of Design: Metraflex GASCT.

O. Type FC-3, Flexible Compensator, Double Sphere:

1. Body: Molded twin spherical type. Neoprene with internal cord or wire.
2. Minimum Pressure Rating, Sizes 2-inch to 12-inch: 225 PSI at 170 degrees F.
3. Minimum Pressure Rating, Sizes 14-inch to 20-inch: 125 PSI at 170 degrees F.
4. Minimum Allowable Compression: 1-1/2 inches.
5. Minimum Allowable Elongation: 1-1/8 inches.
6. Minimum Allowable Offset: 1-1/8 inches.
7. Minimum Allowable Angular Movement: 20 degrees.
8. Joint: Steel flanges.
9. Accessories: Galvanized aircraft-type cable or control rods to prevent over extension.
10. Basis of Design: Metraflex Doublesphere.

2.3 SEISMIC RESTRAINED SPRING VIBRATION ISOLATION ROOF-CURB

A. Type RC-1, Spring Roof Curb: Continuous steel frames above and below isolators. Isolators adjustable, freestanding and laterally stable and include 1/4-inch acoustical neoprene cup and leveling bolts. Continuous sheet metal flashing attached to upper frame and separated from lower frame by neoprene weather seal with removable cover plates for adjustment and inspection of isolators. Seismic snubbers with all directional neoprene bushing and 1/4-inch air gap incorporated into each corner. Fasten unit to top steel frame and lower sheet metal curb must be attached to roof structure. Mason Type: ISC.

B. Type RC-2, Spring Roof Curb: Factory-assembled, fully enclosed, insulated, air- and watertight curb rail designed to resiliently support equipment and to withstand seismic and wind forces. Mason Type: RSC.

1. Lower Support Assembly: Formed sheet-metal section containing adjustable and removable steel springs that support upper frame. Upper frame provides continuous support for equipment and be captive to resiliently resist seismic and wind forces. Lower support assembly have means for attaching to building structure and wood nailer for attaching roof materials and be insulated with a minimum of 2-inches of rigid, glass-fiber insulation on inside of assembly.

2. Spring Isolators: Adjustable, restrained spring isolators be mounted on 1/4-inch-thick, elastomeric vibration isolation pads and have access ports, for level adjustment, with removable waterproof covers, accessible for adjustment.
3. Snubber Bushings: All-directional, elastomeric snubber bushings at least 1/4-inch thick.
4. Water Seal: Galvanized sheet metal with EPDM seals at corners, attached to upper support frame, extending down past wood nailer of lower support assembly and counterflashed over roof materials.
5. Acoustic Option: Upper floating frame of curb have steel framework that supports 2 layers of 5/8-inch thick waterproof gypsum board. Gypsum board must surround ducts to provide a continuous sound break. This acoustical barrier be caulked to minimize sound transmission. 4-inch thick layer of 1.5-density fiberglass covers entire solid roof surface under unit. Gypsum board and insulation provided in field by contractor.

2.4 SEISMIC RESTRAINT DEVICES

A. Resilient Isolation Washers and Bushings: 1-piece, molded, bridge-bearing neoprene complying with AASHTO M 251 and having a durometer of 50, plus or minus 5, with a flat washer face.

B. Seismic Snubbers: Factory fabricated using welded structural-steel shapes and plates, anchor bolts and replaceable resilient isolation washers and bushings. Snubber load rating to match equipment size. Mason Type: Z-1011 or Z-1225.

1. Anchor bolts for attaching to concrete be seismic-rated, drill-in and stud-wedge or female-wedge type.
2. Resilient Isolation Washers and Bushings: 1-piece, molded, bridge-bearing neoprene complying with AASHTO M 251 and having a durometer of 50, plus or minus 5.

C. Restraining Cables: Galvanized steel aircraft cables with end connections made of steel assemblies that swivel to final installation angle and utilize two clamping bolts for cable engagement. Mason Type: SCB.

D. Anchor Bolts: Seismic-rated, drill-in and stud-wedge or female-wedge type. Select anchor bolts with strength required for anchor and as tested according to ASTM E 488/E 488M.

2.5 FACTORY FINISHES

A. Provide manufacturer's standard prime-coat finish ready for field painting. Units mounted outdoors exposed to weather: Epoxy powder coated, with 1000 hour salt spray rating per ASTM B-117. For high levels of corrosion protection utilize:

1. Conform to AAMA 605.2.
2. Apply coating following cleaning and pretreatment.
3. Cleaning: AA-C12C42R1X.
4. Dry system before final finish application.
5. Total Dry Film Thickness: Approximately 1.2 mils, when baked at 450 degrees F for 10 minutes.

B. Finish:

1. Manufacturer's standard paint applied to factory-assembled and factory-tested equipment before shipping.
2. Powder coating on springs and housings.
3. Hardware be electrogalvanized. Hot-dip galvanize metal components for exterior use.

4. Baked enamel for metal components on isolators for interior use.
5. Color-code or otherwise mark vibration isolation and seismic-control devices to indicate capacity range.

2.6 SEISMIC-BRACING/RESTRAINT DEVICES/SYSTEMS FOR EQUIPMENT, PIPING AND DUCTWORK

A. General Requirements for Restraint Components: Rated strengths, features and applications to be as defined in reports by agency acceptable to authorities having jurisdiction.

B. Structural Safety Factor: Allowable strength in tension, shear and pullout force of components be at least four times maximum seismic forces to which they will be subjected.

C. Anchor bolts for attaching to concrete to be seismic-rated, drill-in and stud-wedge or female-wedge type.

D. Resilient Isolation Washers and Bushings: Oil- and water-resistant neoprene.

E. Maximum 1/4-inch air gap and minimum 1/4-inch thick resilient cushion.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS

A. Set floor-mounted equipment with steel base rails on minimum 4-inch-high concrete housekeeping pads. Extend pad minimum 6-inches beyond footprint of equipment in each direction, but not less than twice the embedment depth of concrete anchors.

B. Provide mounts for equipment installed outdoors for wind loads of 30 lbs. psf applied to any exposed surface of isolated equipment.

C. Do not install equipment or pipe which makes rigid contact with building slabs, beams, studs, walls, etc.

D. Anchor baseplate to floor or structure. Provide rubber grommets and washers to isolate bolt from base plate. Under no circumstances is isolation efficiency to be destroyed when bolting isolators to floor.

E. Building Penetrations: Isolate water piping and ductwork penetrating wall, ceilings, floors or shafts from structure by piping isolator or by 3/8-inch thick foamed rubber insulation. Install units flush with finished structure face, using one for each side as required. Cut units to length if longer than structure thickness. Caulk around pipe or duct at equipment room wall.

F. Provide roof curbs, equipment supports and roof penetrations. Work to maintain roof warranty. Coordinate location, size, structural connections/requirements and flashing prior to installation.

G. Install Type 6 horizontal thrust restraints at centerline of thrust, symmetrical on either side of equipment.

H. Vibration isolators must not cause change of position of equipment or piping which would stress piping connections or misalignment shafts or bearings. Isolated equipment is to be level and in proper alignment with connecting ducts and pipes.

I. Pipe Hangers in Equipment Rooms: Support water and gas piping connected to rotating equipment within equipment rooms on spring and neoprene hangers. The first three hangers from a piece of vibrating equipment are to have a minimum of 1/2 static deflection of equipment isolators. Other isolators should have a minimum of 1/4 static deflection of equipment isolators.

J. Examination:

1. Examine areas and equipment to receive vibration isolation and seismic-control devices for compliance with requirements, installation tolerances and other conditions affecting performance.
2. Examine roughing-in of reinforcement and cast-in-place anchors to verify actual locations before installation.
3. Proceed with installation only after unsatisfactory conditions have been corrected.

K. Testing: Perform following field quality-control testing:

1. Isolator seismic-restraint clearance.
2. Isolator deflection.
3. Snubber minimum clearances.

L. Adjusting:

1. Adjust snubbers according to manufacturer's written recommendations.
2. Torque anchor bolts according to equipment manufacturer's written recommendations to resist seismic forces.

M. Cleaning: After completing equipment installation, inspect vibration isolation and seismic-control devices. Remove paint splatters and other spots, dirt and debris.

N. Demonstration: Engage factory-authorized service representative to train Owner's maintenance personnel to adjust, operate and maintain air-mounting systems. Reference Division 01, General Requirements.

3.2 VIBRATION ISOLATION

A. Reference General Installation Requirements above.

B. Install per manufacturer's instructions and recommendations.

C. Vibration isolators must be installed in strict accordance with manufacturer's written instructions and certified submittal data.

D. Install isolation as indicated on Drawings by type and location and where indicated below.

E. Equipment Vibration Isolation Schedule:

Equipment	Size	Vibration Isolator Type	Minimum Deflection (in)
Chillers/Heat Pumps: Reciprocating, Water or Air-Cooled	All	Type 4A or 4B, FC-3	2.5

Chillers/Heat Pumps: Centrifugal, Screw or Scroll, Water or Air-Cooled	All	Type 4A or 4B, FC-3	1.5
Boilers	All	Type 1 or 2, FC-2	0.3
Base-Mounted Pumps (Close-Coupled Only)	0 to 7.5 HP	FC-3	0.75
Base-Mounted Pumps	7.5+ HP	FC-3	1.5
Inline Pumps	All	Type 4A, 4B, 5B, FC-2	1.5
Fan-Coils, Unit Heaters, Fan-Powered Terminal Units	All	Type 5B, FC-1,2	0.75
Condensing Units	0 to 4.5 tons	Type 1 or 2	0.3
Condensing Units	5+ tons	Type 4A	2.5
Rooftop Air Handlers, AC, Heat Pump Units	0 to 19.5 tons	RC-1, FC-1,2	0.75
Rooftop Air Handlers, AC, Heat Pump Units	20+ tons	RC-2, FC-1,2	1.5
Axial, Cabinet, Centrifugal Inline Fans	0 to 23.5-inch diameter	Type 3, 4A, 4B, 5B, FC-1	0.75
Axial, Cabinet, Centrifugal Inline Fans	24-inch+ diameter	Type 3, 4A, 4B, 5B, FC-1	1.5
Propeller Fans	All	Type 2 or 5A, FC-1	0.25

F. Isolation Mounts:

1. Install minimum of four seismic snubbers on isolated equipment. Locate snubbers as close as possible to vibration isolators and bolt to equipment base and supporting structure.
2. Install resilient bolt isolation washers on equipment anchor bolts.
3. Provide flexible piping connection and flexible ductwork connection to equipment with isolation mounts or bases.

G. Isolating Hangers:

1. Support piping and ductwork connected to isolated equipment within equipment rooms on isolating hangers as scheduled on drawings. Unless otherwise noted, first three hangers from isolated equipment to have a minimum of 1/2 static deflection of equipment isolators. Other isolating hangers to have a minimum of 1/4 static deflection of equipment isolators.
2. Position isolating hanger elements as high as possible in hanger rod assembly, but not in contact with building structure. Install hangers so that hanger housing may rotate full 360 degrees about rod axis without contacting any object.
3. Unless otherwise noted, air supply units with internally isolated fans do not require isolating hangers for connecting pipes and ductwork.
4. Where parallel running pipes are hung together on an isolated trapeze, provide isolator deflections for largest determined by provisions for pipe isolation. Do not mix isolated and non-isolated pipes in same trapeze.
5. Install limit stops so they are out of contact during normal operation.

H. Adjusting:

1. Adjust isolators after piping systems have been filled and equipment is at operating weight.
2. Adjust limit stops on restrained spring isolators to mount equipment at normal operating height. After equipment installation is complete, adjust limit stops so they are out of contact during normal operation.
3. Attach thrust limits at centerline of thrust and adjust to a maximum of 1/4-inch movement during start and stop.

3.3 SEISMIC RESTRAINED SPRING VIBRATION ISOLATION ROOF-CURB

A. Reference General Installation Requirements above.

B. Install per manufacturer's instructions and recommendations.

C. Adjusting:

1. Adjust isolators after piping systems have been filled and equipment is at operating weight.
2. Adjust limit stops on restrained spring isolators to mount equipment at normal operating height. After equipment installation is complete, adjust limit stops so they are out of contact during normal operation.
3. Attach thrust limits at centerline of thrust and adjust to a maximum of 1/4-inch movement during start and stop.
4. Adjust active height of spring isolators.

3.4 SEISMIC RESTRAINT DEVICES

A. Reference General Installation Requirements above.

B. Install in strict accordance with manufacturer's written instructions and certified submittal data.

C. Install and adjust seismic restraints so equipment, piping and ductwork supports are not degraded by restraints.

D. Restraints must not short circuit vibration isolation systems or transmit objectionable vibration or noise.

E. Install restraining cables at each trapeze, individual pipe hanger and hanging vibration isolated equipment. Provide restraining cables in each of the four directions of movement. Install restraining cables no less than 45 degrees from vertical. At trapeze anchor locations, shackle piping to trapeze. Install cables so they do not bend across sharp edges of adjacent equipment or building structure.

F. Install steel angles or channel, sized to prevent buckling, clamped with ductile-iron clamps to hanger rods for trapeze and individual pipe hangers. At trapeze anchor locations, shackle piping to trapeze. Requirements apply equally to hanging equipment. Do not weld angles to rods.

3.5 FACTORY FINISHES

A. Reference General Installation Requirements above.

B. Install per manufacturer's instructions and recommendations.

C. Finishes to be factory-applied. No field patching or holidays allowed.

3.6 SEISMIC-BRACING/RESTRAINT DEVICES/SYSTEMS FOR EQUIPMENT, PIPING AND DUCTWORK

A. Reference General Installation Requirements above.

B. Install per manufacturer's instructions and recommendations.

C. Adjust seismic restraints to permit free movement of equipment within normal mode of operation.

END OF SECTION 23 05 48

SECTION 23 05 53 - IDENTIFICATION FOR HVAC PIPING, DUCTWORK AND EQUIPMENT

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Plastic Nameplates
2. Tags
3. Plastic Pipe Markers
4. Ceiling Tags
5. Plastic Duct Markers

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Schedules:
   a. Submit valve schedule for each piping system, in tabular format using Microsoft Word or Excel software. Tabulate valve number, piping system, system abbreviation (as shown on tag), location of valve (room or space), and variations for identification (if any). Mark valves which are intended for emergency shutoff and similar special uses by special "flags" in margin of schedule. In addition to mounted copies, furnish extra copies for maintenance manuals.
2. Submit schedule of identification type, including material, for each class of tagged item.
3. Submit locations at which Valve Schedules will be installed.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. Manufacturer's Qualifications: Firms regularly engaged in manufacture of identification devices of types and sizes required.
2. Codes and Standards: Comply with ANSI A13.1 for lettering size, length of color field, colors, and viewing angles of identification devices unless otherwise indicated.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

PART 2 - PRODUCTS

2.1 PLASTIC NAMEPLATES

A. Manufacturers:

1. Brady Corporation
2. Brimar
3. Champion America
4. Craftmark
5. Seton

B. Description: Engraving stock melamine plastic laminate in the size and thicknesses indicated, engraved with engraver's standard letter style of the sizes and wording indicated, black with white core (letter color), punched for mechanical fastening except where adhesive mounting is necessary because of substrate. Provide 1/8-inch thick material.

1. Letter Color: White.
2. Letter Height: 1/2-inch.
3. Background Color: Black.
4. Fasteners: Self-tapping stainless steel screws, except contact-type permanent adhesive where screws cannot or should not penetrate the substrate.
5. Access Panel Markers: Manufacturer's standard 1/16-inch thick engraved plastic laminate access panel markers, with abbreviations and numbers corresponding to concealed valve or devices/equipment. Include center hole to allow attachment.

2.2 TAGS

A. Manufacturers:

1. Brady Corporation
2. Brimar
3. Champion America
4. Craftmark
5. Seton

B. Plastic Tags: Laminated three-layer plastic with engraved black letters on light contrasting background color. Tag size minimum 2-inch diameter.

C. Metal Tags: Polished Brass with stamped letters; tag size minimum 2-inch diameter with smooth edges.

D. Valve designations to be coordinated with existing valve identifications to ensure no repetitive designations are utilized.

E. Chart/Schedules: Valve Schedule Frames. For each page of a valve schedule, provide glazed display frame with removable mounting as appropriate for wall construction upon which frame is to be mounted. Provide frames of finished hardwood or extruded aluminum, with SSB-grade sheet glass.

F. Valve Tag Fasteners: Solid brass chain (wire link or beaded type), or solid brass S-hooks.

G. Warning Tags: Preprinted or partially preprinted, accident-prevention tags; of plasticized card stock with matte finish suitable for writing.

1. Size: Approximately 4 by 7-inches.
2. Fasteners: Brass grommet and wire.
3. Nomenclature: Large-size primary caption such as DANGER, CAUTION, or DO NOT OPERATE.
4. Color: Yellow background with black lettering.

2.3 PLASTIC PIPE MARKERS

A. Manufacturers:

1. Brady Corporation
2. Brimar
3. Champion America
4. Craftmark
5. Seton

B. Color: Conform to ASME A13.1 and ANSI Z535.1.

C. Plastic Pipe Markers (for external diameters of 6-inches and larger including insulation): Factory fabricated, flexible, semi-rigid plastic, preformed to fit around pipe or pipe covering. Minimum information indicating flow direction arrow and identification of fluid being conveyed.

D. Plastic Tape Pipe Markers (for external diameters less than 6-inches including insulation): Flexible, vinyl film tape with pressure sensitive adhesive backing and printed markings. Minimum information indicating flow direction arrow and identification of fluid being conveyed.

E. Lettering:

1. 3/4-inch to 1-1/4-inch Outside Diameter of Insulation or Pipe: 8-inch long color field, 1/2-inch high letters.
2. 1-1/2-inch to 2-inch Outside Diameter of Insulation or Pipe: 8-inch long color field, 3/4-inch high letters.
3. 2-1/2-inch to 6-inch Outside Diameter of Insulation or Pipe: 12-inch long color field, 1-1/4-inch high letters.
4. 8-inch to 10-inch Outside Diameter of Insulation or Pipe: 24-inch long color field, 2-1/2-inch high letters.
5. Over 10-inch Outside Diameter of Insulation or Pipe: 32-inch long color field, 3-1/2-inch high letters.

2.4 CEILING TAGS

A. Manufacturers:

1. Brady Corporation
2. Brimar
3. Champion America
4. Craftmark
5. Seton

B. Description: Steel with 3/4-inch diameter color coded head.

C. Color code as follows:

1. Yellow - HVAC equipment.
2. Red - Fire dampers/smoke dampers.
3. Blue - Heating/cooling valves.
4. Ceiling tile labels, machine generated, adhesive backed tape labels with black letters, clear tape.

2.5 PLASTIC DUCT MARKERS

A. Manufacturers:

1. Brady Corporation
2. Brimar
3. Champion America
4. Craftmark
5. Seton

B. General: Manufacturer's standard laminated plastic, color-coded duct markers. Supply separate color codes for supply, exhaust, outside, return air and hazardous exhaust lab, chemical, fume hood, isolation room systems.

C. Include the Following Nomenclature:

1. Direction of air flow.
2. Duct service (supply, return, general exhaust, outdoor air), kitchen exhaust, dishwasher exhaust, fume hood exhaust, isolation room exhaust, etc.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION

A. Identify air handling units, pumps, heat transfer equipment, tanks, and water treatment devices with plastic nameplates riveted to equipment body.

B. Identify ductwork with plastic ductmarkers.

C. Identify piping, concealed or exposed, with plastic pipe markers.

D. Coordinate names, abbreviations and other designations used in mechanical identification work with corresponding designations shown, specified or scheduled. Provide numbers, lettering and wording as indicated or, if not otherwise indicated, as recommended by manufacturers or as required for proper identification and operation/maintenance of mechanical systems and equipment.

E. Multiple Systems: Where multiple systems of same generic name are shown and specified, provide identification which indicates individual system number as well as service (as examples: Chiller No. 3, Air Handling Unit No. 42, Standpipe F12, and the like).

F. Degrease and clean surfaces to receive adhesive for identification materials.

G. Coordination: Where identification is to be applied to surfaces which require insulation, painting or other covering or finish, including valve tags in finished mechanical spaces, install identification after completion of covering and painting. Install identification prior to installation of acoustical ceilings and similar removable concealment.

H. Install all products in accordance with manufacturer's instructions.

I. Manual Balancing Dampers: Provide 12-inch long orange marker ribbon to end of balancing damper handle.

3.2 PLASTIC NAMEPLATES

A. Install plastic nameplates with corrosive-resistant mechanical fasteners.

B. Identify control panels and major control components outside panels with plastic nameplates riveted to equipment body.

C. Identify thermostats with nameplates.

3.3 TAGS

A. Use metal tags on piping 3/4-inch diameter and smaller.

B. Tag balancing valves and major dampers with balanced GPM or CFM indicated after balancing is completed and accepted.

C. Install tags with corrosion resistant chain.

D. Small devices, such as in-line pumps, may be identified with tags.

E. Identify valves with metal tags. Indicate valve function and the normally open or closed positions on the valve tag.

F. Identify air terminal units and radiator valves with numbered plastic tags.

G. Tag automatic controls, instruments, and relays. Key to control schematic.

H. Install valve schedule at each mechanical room.

3.4 PLASTIC PIPE MARKERS

A. Install plastic pipe markers complete around pipe in accordance with manufacturer's instructions.

B. Identify service, flow direction, and pressure. Install in clear view and align with axis of piping. Locate identification not to exceed 20-feet (reduced to 10-feet in congested areas and mechanical equipment rooms) on straight runs including risers and drops, adjacent to each valve and Tee, at each side of penetration of structure or enclosure, and at each obstruction. Locate near branches, valves, control devices, equipment connections, access doors, floor/wall penetrations.

3.5 CEILING TAGS

A. Provide ceiling tags to locate valves, dampers, and equipment above accessible ceilings. Locate in corner of ceiling tee grid closest to equipment.

3.6 PLASTIC DUCT MARKERS

A. Identify air supply, return, exhaust, isolation room exhaust, and outside air intake ductwork with duct markers, showing ductwork service and direction of flow, in black or white (whichever provides most contrast with ductwork identification color). Identify with air handling unit identification number and area served. Locate identification at air handling unit, in mechanical rooms, at each side of penetration of structure or enclosure, at each obstruction, and within view of access doors/panels. In each space where ductwork is exposed, locate signs near points where ductwork originates or continues into concealed enclosures (shaft, underground or similar concealment) and at 50 foot spacing along exposed runs. Where noted on Drawings, identify ductwork in exposed/public locations.

B. Access Doors: Provide duct markers on each access door in ductwork and housings, indicating purpose of access (to what equipment) and other maintenance and operating instructions.

C. Isolation Rooms and Anteroom: Identify exhaust ducts by labeling with the words "Caution Airborne Infection Isolation Rooms Exhaust." Provide labeling in a manner which is not readily removable and appears on the exhaust duct at intervals of not more than 20-feet and at least once near each room and each story traversed by the exhaust system.

END OF SECTION 23 05 53

SECTION 23 05 93 - TESTING, ADJUSTING, AND BALANCING FOR HVAC

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. General Requirements and Procedures
2. Fundamental Air Systems Balancing Procedures
3. Temperature Control Verification
4. Constant Volume Air Systems Balancing Procedures
5. Fundamental Procedures for Hydronic Systems
6. Pump Balancing Procedures
7. Variable Flow Hydronic Systems Additional Procedures
8. Primary-Secondary Flow Hydronic Systems Additional Procedures
9. Heat Exchangers
10. Pre-Balance Reporting
11. Final Reports:
    a. Report Requirements
    b. General Report Data
    c. System Diagrams
    d. Air Handling Units
    e. Hydronic Coils
    f. Fans
    g. Duct Traverses
    h. Diffusers/Registers/Grilles
    i. Heat Exchangers
    j. Pumps
    k. Boilers
    l. Instrument Calibration
12. Additional Tests

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Quality-Assurance Submittals: Submit two copies of evidence that the Testing, Adjusting, and Balancing (TAB) Agent and Project's TAB team members meet the qualifications specified in the "Quality Assurance" Article below.
2. Pre-Construction Phase Report:

a. Provide a pre-construction phase TAB Plan at least two weeks prior to the commencement of TAB work. This report is to include:
   1) A complete set of report forms intended for use on the Project, with data filled in except for the field readings. Forms to be Project-specific.
   2) Marked up shop drawings identifying all HVAC equipment to be balanced, and associated outlets and terminal devices.
   3) Identification of the type, manufacturer, and model of the actual instruments to be used, and clear indication of which instrument will be used to take each type of reading. Calibration certifications to be included.
   4) A narrative of Project-specific and/or non-standard TAB procedures to be used, and the equipment or systems to which they apply.

3. Contract Documents Examination Report: Within 45 days from the Contractor's Notice to Proceed, submit two copies of the Contract Documents review report as specified in Part 3 of this Section.
4. Strategies and Procedures Plan: Submit two copies of the TAB strategies and step-by-step procedures as specified in Part 3 of this Section. Include a complete set of report forms intended for use on this Project.
5. Specify reports required because of editing procedures in Part 3 of this Section.
6. Certified TAB Reports: Submit two copies of reports prepared, as specified in this Section, on approved forms certified by the TAB Agent.
7. Sample Report Forms: Submit two sets of sample TAB report forms.
8. Test Instrument Calibration: Submit proof of calibration within the last 6 months.
9. Final Report.
10. Provide additional submittals to commissioning authority as dictated in Commissioning Specifications.

1.5 QUALITY ASSURANCE

A. Quality Assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. Acceptable TAB Agencies:
   a. Washington:
      1) Neudorfer
      2) Hardin & Sons
      3) Northwest Engineering Services
      4) Testcomm
      5) Precision Test & Balance, Inc.
2. Balance Firm Qualifications:
   a. General:
      1) Procure services of independent TAB agency to balance, adjust and test water circulating and air moving equipment and air distribution or exhaust systems. Minimum experience: 5 years.
      2) Provide proof of testing agency having successfully completed at least five projects of similar size and scope.
   b. Testing and Balancing firm is certified by NEBB or AABC and has a NEBB Certified Professional (CP) or a AABC Test and Balancer Engineer (TBE) on staff.
   c. Industry Standards: Testing and Balancing will conform to NEBB or AABC, and American National Standards Institute (ANSI) as follows:
      1) NEBB: Comply with Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems.
      2) AABC: Comply with National Standards for Total System Balance.

3) ANSI:
a) S1.4 Specifications for sound level meters.
b) S1.11 Specifications for Octave-Band and Fractional-Octave-Band analog and digital filters.
c) ANSI S1.13 Methods for the Measurement of Sound Pressure Levels.

d. Test Observation: If requested, conduct tests in the presence of the Commissioning Authority, AHJ, Architect or the Architect's representative.

3. Code Compliance: Perform tests in the presence of the Authority Having Jurisdiction (AHJ) where required by the Authority Having Jurisdiction (AHJ).
4. Owner Witness: Perform tests in the presence of the Commissioning Authority, Architect, Architect's Representative, or Owner's representative.
5. Engineer Witness: The engineer or engineer's representative reserves the right to observe tests or selected tests to assure compliance with the specifications.
6. Simultaneous Testing: Test observations by the AHJ, the Owner's Authorized Representative and the engineer's representative need not occur simultaneously.
7. Do not perform TAB work until heating, ventilating, and air conditioning equipment has been completely installed and is operating continuously as required.
8. Conduct air testing and balancing with clean filters in place. Clean strainers prior to performing hydronic testing and balancing.
9. TAB Conference: Meet with the Commissioning Authority, Owner's and the Architect's representatives on approval of the TAB strategies and procedures plan to develop a mutual understanding of the details. Ensure the participation of TAB team members, equipment manufacturers' authorized service representatives, HVAC controls Installer, and other support personnel. Provide 7 days advance notice of scheduled meeting time and location.
a. Agenda Items: Include at least the following:
1) Submittal distribution requirements.
2) Contract Documents examination report.
3) TAB plan.
4) Work schedule and Project site access requirements.
5) Coordination and cooperation of trades and subcontractors.
6) Coordination of documentation and communication flow.
10. Certification of TAB Reports: This certification includes the following:
a. Review field data reports to validate accuracy of data and to prepare certified TAB reports.
b. Certify that the TAB team complied with the approved TAB plan and the procedures specified and referenced in this Specification.
11. TAB Reports: Use standard forms from NEBB or AABC.
12. Instrumentation Type, Quantity, and Accuracy: As described in NEBB or AABC.
13. Instrumentation Calibration: Calibrate instruments at least every 6 months or more frequently if required by the instrument manufacturer.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. TAB Agency provides warranty for a period of 90 days following submission of completed report, during which time, Owner may request a recheck of up to 10 percent of total number of terminals, or resetting of outlet, coil, or device listed in the final TAB report.
2. Guarantee: Meet the requirements of the following programs:

a. Provide a guarantee on NEBB or AABC forms stating that the agency will assist in completing the requirements of the Contract Documents if the TAB Agent fails to comply with the Contract Documents. Guarantee includes the following provisions:
   1) The certified Agent has tested, adjusted, and balanced systems according to the Contract Documents.
   2) Systems are balanced to optimum performance capabilities within design and installation limits.

1.7 DEFINITIONS

A. Adjust: To regulate fluid flow rate and air patterns at the terminal equipment, such as to reduce fan speed or adjust a damper.

B. Balance: To proportion flows within the distribution system, including submains, branches, and terminals, according to design quantities.

C. Draft: A current of air, when referring to localized effect caused by one or more factors of high air velocity, low ambient temperature, or direction of airflow, whereby more heat is withdrawn from a person's skin than is normally dissipated.

D. Procedure: An approach to and execution of a sequence of work operations to yield repeatable results.

E. Report Forms: Test data sheets for recording test data in logical order.

F. Static Head: The pressure due to the weight of the fluid above the point of measurement. In a closed system, static head is equal on both sides of the pump.

G. Suction Head: The height of fluid surface above the centerline of the pump on the suction side.

H. System Effect: A phenomenon that can create undesired or unpredicted conditions that cause reduced capacities in all or part of a system.

I. System Effect Factors: Allowances used to calculate a reduction of the performance ratings of a fan when installed under conditions different from those presented when the fan was performance tested.

J. TAB: Testing, Adjusting, and Balancing.

K. Terminal: A point where the controlled medium, such as fluid or energy, enters or leaves the distribution system.

L. Test: A procedure to determine quantitative performance of a system or equipment.

M. Testing, Adjusting, and Balancing (TAB) Agent: The entity responsible for performing and reporting the TAB procedures.

N. AABC: Associated Air Balance Council.

O. NEBB: National Environmental Balancing Bureau.

P. AMCA: Air Movement and Control Association.

Q. CTI: Cooling Tower Institute.

R. SMACNA: Sheet Metal and Air Conditioning Contractors' National Association.

1.8 COORDINATION

A. Coordinate the efforts of factory-authorized service representatives for systems and equipment, HVAC controls installers, and other mechanics to operate HVAC systems and equipment to support and assist TAB activities.

B. Notice: Provide 7 days advance notice for each test. Include scheduled test dates and times.

C. Witness leakage and pressure tests carried out by Section 23 31 00, HVAC Ducts and Casings.

D. Perform TAB after leakage and pressure tests on air and water distribution systems have been satisfactorily completed.

PART 2 - PRODUCTS - NOT USED

PART 3 - EXECUTION

3.1 GENERAL REQUIREMENTS AND PROCEDURES

A. Project Conditions:

1. Non-Owner Occupancy: Complete balancing of building systems prior to Substantial Completion and owner occupancy.

B. General Requirements:

1. Where HVAC systems and/or components interface with life safety systems, including fire and smoke detection, alarm, and controls, coordinate scheduling and testing and inspection procedures with authorities having jurisdiction.
2. Perform TAB work with doors, closed windows, and ceilings installed etc., to obtain simulated or project operating conditions. Do not proceed until systems scheduled for TAB are clean and free from debris, dirt and discarded building materials.
3. Where Owner occupies building during the testing period, cooperate with Owner to minimize conflicts with Owner's operations.

C. Examination:

1. Examine Contract Documents to become familiar with project requirements and existing building record documents (if available) to discover conditions in systems' designs that may preclude proper TAB of systems and equipment.
    a. Contract Documents are defined in the General and Supplementary Conditions of the Contract.
    b. Verify that balancing devices, such as test ports, gauge cocks, thermometer wells, flow-control devices, balancing valves and fittings, and manual volume dampers, are required by the Contract Documents. Verify that quantities and locations of these balancing devices are accessible and appropriate for effective balancing and for efficient system and equipment operation.
2. Examine approved submittal data of HVAC systems and equipment.
3. Examine Project record documents described in Division 01, General Requirements.

4. Examine Architect's and Engineer's design data, including Basis of Design, HVAC system descriptions, statements of design assumptions for environmental conditions and systems' output, and statements of philosophies and assumptions about HVAC system and equipment controls.
5. Examine equipment performance data, including fan and pump curves. Relate performance data to Project conditions and requirements, including system effects that can create undesired or unpredicted conditions that cause reduced capacities in all or part of a system. Calculate system effect factors to reduce the performance ratings of HVAC equipment when installed under conditions different from those presented when the equipment was performance tested at the factory. To calculate system effects for air systems, use tables and charts found in AMCA 201, "Fans and Systems," Sections 7 through 10; or in SMACNA's "HVAC Systems--Duct Design," Sections 5 and 6. Compare this data with the design data and installed conditions.
6. Coordinate requirements in system and equipment with this Section.
7. Examine system and equipment installations to verify that they are complete and that testing, cleaning, adjusting, and commissioning specified in individual Specification Sections have been performed.
8. Examine system and equipment test reports.
9. Examine HVAC system and equipment installations to verify that indicated balancing devices, such as test ports, gauge cocks, thermometer wells, flow-control devices, balancing valves and fittings, and manual volume dampers, are properly installed, and their locations are accessible and appropriate for effective balancing and for efficient system and equipment operation.
10. Examine systems for functional deficiencies that cannot be corrected by adjusting and balancing.
11. Examine equipment for installation and for properly operating safety interlocks and controls.
12. Report deficiencies discovered before and during performance of TAB procedures.

D. Preparation:

1. Prepare a TAB plan that includes strategies and step-by-step procedures.
2. Complete system readiness checks and prepare system readiness reports. Verify the following:
    a. Permanent electrical power wiring is complete.
    b. Hydronic systems are filled, clean, and free of air.
    c. Automatic temperature-control systems are operational.
    d. Equipment and duct access doors are securely closed.
    e. Balance, smoke, and fire dampers are open.
    f. Isolating and balancing valves are open and control valves are operational.
    g. Ceilings are installed in critical areas where air-pattern adjustments are required and access to balancing devices is provided.
    h. Windows, doors and other portions of the building envelope can be closed so design conditions for system operations can be met.
3. Hold a pre-balancing meeting at least one week prior to starting TAB work.
    a. Attendance is required by installers whose work will be tested, adjusted, or balanced.
4. Provide instruments required for TAB operations. Make instruments available to Architect to facilitate spot checks during testing.

E. General TAB Procedures:

1. Perform TAB procedures on each system according to the procedures contained in NEBB or AABC and this Section.

2. Coordinate location of test probes prior to start of TAB procedures and make test probes available for Owner's tests after start of occupancy. Where required, cut insulation, ducts, pipes, and equipment cabinets for installation of test probes to the minimum extent necessary to allow adequate performance of procedures. After testing and balancing, close probe holes and patch insulation with new materials identical to those removed. Restore vapor barrier and finish according to the insulation Specifications for this Project.
3. Mark equipment settings with paint or other suitable, permanent identification material, including damper-control positions, valve indicators, fan-speed-control levers, and similar controls and devices, to show final settings.

F. Adjustment Tolerances:

1. Air Handling Systems: Adjust to within plus or minus 5 percent of design for supply systems and plus or minus 5 percent of design for return and exhaust systems.
2. Air Outlets and Inlets: Adjust total to within plus 10 percent and minus 5 percent of design. Adjust outlets and inlets in space to within plus or minus 10 percent of design.
3. Hydronic Systems: Adjust to within plus or minus 10 percent of design at coils and plus or minus 5 percent at system pumps and equipment.
4. Adjust supply, return, and exhaust air quantities to maintain pressurization in spaces indicated on Drawings. Note and document room-to-room pressurization and maintain these relationships. Adjust pressure controlled spaces to within plus or minus 0.01 in WC.

G. Recording and Adjusting:

1. Field Logs: Maintain written logs including:
   a. Running log of events and issues.
   b. Discrepancies, deficient or uncompleted work by others.
   c. Contract interpretation requests.
   d. Lists of completed tests.
2. Ensure recorded data represents actual measured or observed conditions.
3. Permanently mark settings of valves, dampers, and other adjustment devices allowing settings to be restored. Set and lock memory stops.
4. Mark on drawings locations where traverse and other critical measurements were taken and cross reference location in final report.
5. After adjustment, take measurements to verify balance has not been disrupted or that such disruption has been rectified.
6. Leave systems in proper working order, replacing belt guards, closing access doors, closing doors to electrical switch boxes, and restoring thermostats to specified settings.
7. At final inspection, recheck random selections of data recorded in report. Recheck points or areas as selected and witnessed by Owner's Authorized Representative, or Commissioning Agent.

3.2 FUNDAMENTAL AIR SYSTEMS BALANCING PROCEDURES

A. Examine air-handling equipment to ensure clean filters have been installed, bearings are greased, belts are aligned and tight, and equipment with functioning controls is ready for operation.

B. Examine terminal units, such as variable-air-volume boxes and mixing boxes, to verify that they are accessible and their controls are connected and functioning.

C. Examine heat-transfer coils for correct piping connections and for clean and straight fins.

D. Prepare test reports for both fans and inlets and outlets. Obtain manufacturer's outlet factors and recommended testing procedures. Cross check the summation of required outlet volumes with required fan volumes.

E. Prepare schematic diagrams of systems' "as-built" duct layouts.

F. Determine the best locations in main and branch ducts for accurate duct airflow measurements.

G. Check the airflow patterns from the outside-air louvers and dampers and the return-air and exhaust-air dampers, through the supply-fan discharge and mixing dampers.

H. Locate start-stop and disconnect switches, electrical interlocks, and motor starters.

I. Verify that motor starters are equipped with thermal protection, sized for the connected load.

J. Check dampers for proper position to achieve desired airflow path.

K. Check for airflow blockages.

L. Check that condensate drains are installed, trapped and primed and routed to drain.

M. Check for readily observable leaks in air-handling unit components and ductwork.

N. Use sheaves and pulleys to adjust the speed of belt drive fans to achieve design flow with motors running at 60 Hertz unless noted otherwise.

3.3 TEMPERATURE CONTROL VERIFICATION

A. Examine automatic temperature system components to verify the following:

1. Dampers, valves, and other controlled devices operate by the intended controller.
2. Dampers and valves are in the position indicated by the controller.
3. Integrity of valves and dampers for free and full operation and for tightness of fully closed and fully open positions. This includes dampers in multizone units, mixing boxes, and variable-air-volume terminals.
4. Automatic modulating and shutoff valves, including 2-way valves and 3-way mixing and diverting valves, are properly connected.
5. Thermostats and humidistats are located to avoid adverse effects of sunlight, equipment, drafts, and cold walls.
6. Sensors are located to sense only the intended conditions.
7. Sequence of operation for control modes is according to the Contract Documents.
8. Controller set points are set at design values. Observe and record system reactions to changes in conditions. Record default set points if different from design values.
9. Interlocked systems are operating.
10. Changeover from heating to cooling mode occurs according to design values.

B. Verify that controllers are calibrated and commissioned.

C. Check transmitter and controller locations and note conditions that would adversely affect control functions.

D. Record controller settings and note variances between set points and actual measurements.

E. Verify operation of limiting controllers (i.e., high- and low-temperature controllers).

F. Verify free travel and proper operation of control devices such as damper and valve operators.

G. Verify sequence of operation of control devices. Note air pressures and device positions and correlate with airflow and water-flow measurements. Note the speed of response to input changes.

H. Confirm interaction of electrically operated switch transducers.

I. Confirm interaction of interlock and lockout systems.

J. Verify main control supply-air pressure and observe compressor and dryer operations.

K. Note operation of electric actuators using spring return for proper fail-safe operations.

3.4 CONSTANT VOLUME AIR SYSTEMS BALANCING PROCEDURES

A. Adjust fans to deliver total design airflows within the maximum allowable rpm listed by the fan manufacturer. Adjust fans to deliver design airflow at the lowest possible speed.

1. Measure fan static pressures to determine actual static pressure as follows:
    a. Measure outlet static pressure as far downstream from the fan as practicable and upstream from restrictions in ducts such as elbows and transitions.
    b. Measure static pressure directly at the fan outlet or through the flexible connection.
    c. Measure inlet static pressure of single-inlet fans in the inlet duct as near the fan as possible, upstream from flexible connection and downstream from duct restrictions.
    d. Measure inlet static pressure of double-inlet fans through the wall of the plenum that houses the fan.
2. Measure static pressure across each air-handling unit component under final balanced condition.
3. Compare design data with installed conditions to determine variations in design static pressures versus actual static pressures. Recommend corrective action to align design and actual conditions.
4. Make required adjustments to pulley sizes, motor sizes, and electrical connections to accommodate fan-speed changes.
5. Do not make fan-speed adjustments that result in motor loading greater than full load amps. Do not increase fan speed beyond fan class rating. Modulate dampers and measure fan-motor amperage to ensure no overload will occur. Measure amperage in full cooling, full heating, and economizer modes to determine the maximum required brake horsepower.
6. Adjust volume dampers for main duct, submain ducts, and major branch ducts to design airflows within specified tolerances.
7. Calibrate airflow measuring stations.

3.5 FUNDAMENTAL PROCEDURES FOR HYDRONIC SYSTEMS

A. Examine strainers for clean screens and proper perforations.

B. Examine 3-way valves for proper installation for their intended function of diverting or mixing fluid flows.

C. Examine open-piping-system pumps to ensure absence of entrained air in the suction piping.

D. Prepare test reports with pertinent design data and number in sequence starting at pump to end of system. Check the sum of branch-circuit flows against approved pump flow rate. Correct variations that exceed plus or minus 5 percent.

E. Prepare schematic diagrams of systems' "as-built" piping layouts.

F. Prepare hydronic systems for TAB according to the following, in addition to the general preparation procedures specified above:

1. Open manual valves for maximum flow.
2. Check expansion tank liquid level, or air charge if bladder type.
3. Check makeup-water-station pressure gauge for adequate pressure for highest vent.
4. Check flow-control valves for specified sequence of operation and set at design flow.
5. Set differential-pressure control valves at the specified differential pressure.
6. Set system controls so automatic valves are wide open to heat exchangers and coils.
7. Check pump-motor load. If motor is overloaded, throttle main flow-balancing device so motor nameplate rating is not exceeded.
8. Check air vents for a forceful liquid flow exiting from vents when manually operated.

G. Calibrate waterflow measuring stations.

3.6 PUMP BALANCING PROCEDURES

A. Determine water flow at pumps. Use the following procedures:

1. Verify impeller size by operating the pump with the discharge valve closed. Read pressure differential across the pump. Convert pressure to head and correct for differences in gauge heights. Note the point on the manufacturer's pump curve at zero flow and confirm that the pump has the intended impeller size.
2. Check system resistance. With valves open, read pressure differential across the pump and mark the pump manufacturer's head-capacity curve. Adjust pump discharge valve until design water flow is achieved. Report flow rates that are not within plus or minus 5 percent of design.
3. Verify pump-motor amperage. Report conditions where actual amperage exceeds motor nameplate amperage.
4. Set calibrated balancing valves, if installed, at calculated presettings.
5. Measure flow at stations and adjust, where necessary, to obtain first balance. System components that have Cv rating or an accurately cataloged flow-pressure-drop relationship may be used as a flow-indicating device.
6. Measure flow at main balancing station and set main balancing device or adjust pump speed to achieve flow that is 5 percent greater than design flow.
7. Adjust balancing stations to within specified tolerances of design flow rate as follows:
    a. Determine the balancing station with the highest percentage over design flow.
    b. Adjust each station in turn, beginning with the station with the highest percentage over design flow and proceeding to the station with the lowest percentage over design flow.
    c. Record settings and mark balancing devices.
8. Measure pump flow rate and make final measurements of pump amperage, voltage, rpm, pump heads, and systems' pressures and temperatures, including outdoor-air temperature.
9. Measure the differential-pressure control valve settings existing at the conclusions of balancing.

3.7 VARIABLE FLOW HYDRONIC SYSTEMS ADDITIONAL PROCEDURES

A. Balance systems with automatic 2- and 3-way control valves by setting systems at maximum flow through heat-exchange terminals and proceed as specified above for hydronic systems.

B. Balance system to achieve the lowest required differential pressure for the system to minimize pump brake horsepower.

3.8 PRIMARY-SECONDARY-FLOW HYDRONIC SYSTEMS' ADDITIONAL PROCEDURES

A. Balance the primary system crossover flow first, then balance the secondary system.

3.9 HEAT EXCHANGERS

A. Adjust water flow to within specified tolerances.

B. Measure inlet and outlet water temperatures.

C. Measure inlet steam pressure. Check the setting and operation of automatic temperature-control valves, self-contained control valves, and pressure-reducing valves.

D. Measure hot and cold side pressure drops.

E. Record safety valve settings.

F. Verify operation of steam traps.

3.10 PRE-BALANCE REPORTING

A. Pre-Construction Phase Report:

1. Provide a pre-construction phase TAB Plan at least 2 weeks prior to the commencement of TAB work. This report is to include:
    a. A complete set of report forms intended for use on the Project, with all data filled in except for the field readings. Forms to be Project-specific.
    b. Marked up shop drawings identifying all HVAC equipment to be balanced, and associated outlets and terminal devices.
    c. Identification of the type, manufacturer, and model of actual instruments to be used, and clear indication of which instrument will be used to take each type of reading. Calibration certifications are to be included.
    d. A narrative of Project-specific and/or non-standard TAB procedures to be used, and the equipment or systems they apply to.

B. Initial Construction-Phase Report: Based on examination of the Contract Documents as specified in "Examination" Article above, prepare a report on the adequacy of design for systems' balancing devices. Recommend changes and additions to systems' balancing devices to facilitate proper performance measuring and balancing. Recommend changes and additions to HVAC systems and general construction to allow access for performance measuring and balancing devices.

C. Status Reports: As Work progresses, prepare reports to describe completed procedures, procedures in progress, and scheduled procedures. Include a list of deficiencies and problems found in systems being tested and balanced.

3.11 FINAL REPORTS

A. Report Requirements:

1. General:
   a. Computer generated in PDF format and tabulated, divided, and bookmarked into sections by tested and balanced systems.
   b. Include a certification sheet in front of binder signed and sealed by the certified TAB engineer.
      1) Include a list of the instruments used for procedures, along with proof of calibration.
   c. Final Report Contents: In addition to the certified field report data, include the following:
      1) Pump curves
      2) Fan Curves
      3) Manufacturers Test Data
      4) Field test reports prepared by system and equipment installers
      5) Other information relative to equipment performance, but do not include approved Shop Drawings and Product Data

B. General Report Data:

1. In addition to the form titles and entries, include the following data in the final report, as applicable:
   a. Title Page
   b. Name and Address of TAB Agent
   c. Project Name
   d. Project Location
   e. Architect's Name and Address
   f. Engineer's Name and Address
   g. Contractor's Name and Address
   h. Report Date
   i. Signature of TAB Agent who Certifies the Report
   j. Summary of Contents, Including the Following:
      1) Design versus Final Performance
      2) Notable Characteristics of Systems
      3) Description of System Operation Sequence if it varies from the Contract Documents
   k. Nomenclature Sheets for Each Item of Equipment
   l. Data for Terminal Units, including Manufacturer, Type Size, and Fittings
   m. Notes to explain why certain final data in the body of reports vary from design values.
   n. Test Conditions for Fans and Pump Performance Forms, Including the Following:
      1) Settings for Outside-, Return-, and Exhaust-Air Dampers
      2) Conditions of Filters
      3) Cooling Coil, Wet- and Dry-bulb Conditions
      4) Face and Bypass Damper Settings at Coils
      5) Fan Drive Settings, including Settings and Percentage of Maximum Pitch Diameter
      6) Inlet Vane Settings for Variable-Air-Volume Systems
      7) Settings for Supply-air, Static-pressure Controller
      8) Other System Operating Conditions that affect Performance

C. System Diagrams:

1. Include schematic layouts of air and hydronic distribution systems. Present with single-line diagrams and include the following:
   a. Quantities of Outside, Supply, Return, and Exhaust Airflows
   b. Water and Steam Flow Rates
   c. Duct, Outlet, and Inlet Sizes
   d. Pipe and Valve Sizes and Locations
   e. Terminal Units
   f. Balancing Stations

D. Air Handling Units:

1. For air-handling units, split systems, fan coils, pumps, and evaporator units with coils, include the following:
   a. Unit Data: Include the following:
      1) Unit Identification
      2) Location
      3) Make and Type
      4) Model Number and Unit Size
      5) Manufacturer's Serial Number
      6) Unit Arrangement and Class
      7) Discharge Arrangement
      8) Sheave Make, Size in inches, and Bore
      9) Sheave Dimensions, Center-to-center and Amount of Adjustments in Inches
      10) Number of Belts, Make, and Size
      11) Number of Filters, Type, and Size
   b. Motor Data: Include the following:
      1) Make and Frame Type and Size
      2) Horsepower and rpm
      3) Volts, Phase, and Hertz
      4) Full-load Amperage and Service Factor
      5) Sheave Make, Size in Inches, and Bore
      6) Sheave Dimensions, Center-to-center and Amount of Adjustments in Inches
   c. Test Data: Include design and actual values for the following:
      1) Total Airflow Rate in cfm (L/s)
      2) Total System Static Pressure in Inches wg (Pa)
      3) Fan rpm
      4) Discharge Static Pressure in Inches wg (Pa)
      5) Filter Static-pressure Differential in Inches wg (Pa)
      6) Preheat Coil Static-pressure Differential in Inches wg (Pa)
      7) Cooling Coil Static-pressure Differential in Inches wg (Pa)
      8) Heating Coil Static-pressure Differential in Inches wg (Pa)
      9) Outside Airflow in cfm (L/s)
      10) Return Airflow in cfm (L/s)
      11) Outside-air Damper Position
      12) Return-air Damper Position
      13) Vortex Damper Position

E. Hydronic Coils:

1. For hydronic coils in all equipment with coils, include the following:
   a. Coil Data: Include the following:
      1) System Identification
      2) Location and Zone
      3) Room or Riser Served

4) Coil Type
5) Number of Rows
6) Fin Spacing in Fins per Inch o.c.
7) Make and Model Number
8) Face Area in SF
9) Tube Size in NPS (DN)
10) Tube and fin Materials
11) Circuiting Arrangement

b. Test Data: Include design and actual values for the following:
1) Airflow Rate in cfm
2) Average Face Velocity in fpm
3) Air Pressure Drop in Inches wg
4) Outside-air, Wet- and Dry-bulb Temperatures in Degrees F
5) Return-air, Wet- and Dry-bulb Temperatures in Degrees F
6) Entering-air, Wet- and Dry-bulb Temperatures in Degrees F
7) Leaving-air, Wet- and Dry-bulb Temperatures in Degrees F
8) Water Flow Rate in gpm
9) Water Pressure Differential in Feet of Head or PSIG
10) Entering-water Temperature in Degrees F
11) Leaving-water Temperature in Degrees F

F. Fans:

1. Fan Test Reports: For supply, return, and exhaust fans, include the following:
a. Fan Data: Include the following:
1) System Identification
2) Location
3) Make and Type
4) Model Number and Size
5) Manufacturer's Serial Number
6) Arrangement and Class
7) Sheave Make, Size in Inches, and Bore
8) Sheave Dimensions, Center-to-center and Amount of Adjustments in Inches
b. Motor Data: Include the following:
1) Make and Frame Type and Size
2) Horsepower and rpm
3) Volts, Phase, and Hertz
4) Full-load Amperage and Service Factor
5) Sheave Make, Size in Inches, and Bore
6) Sheave Dimensions, Center-to-center and Amount of Adjustments in Inches
7) Number of Belts, Make, and Size
c. Test Data: Include design and actual values for the following:
1) Total Airflow Rate in cfm
2) Total System Static Pressure in Inches wg
3) Fan rpm
4) Discharge Static Pressure in Inches wg
5) Suction Static Pressure in Inches wg

G. Duct Traverses:

1. Include a diagram with a grid representing the duct cross-section and record the following:
a. Report Data: Include the following:
1) System and Air-handling Unit Number

2) Location and Zone
3) Duct Static Pressure in Inches wg
4) Duct Size in Inches
5) Duct Area in SF
6) Design Airflow Rate in cfm
7) Design Velocity in fpm
8) Actual Airflow Rate in cfm
9) Actual Average Velocity in fpm

H. Diffusers/Registers/Grilles:

1. For diffusers, registers and grilles, include the following:
   a. Unit Data: Include the following:
      1) System and Air-handling Unit Identification
      2) Location and Zone
      3) Test Apparatus Used
      4) Area Served
      5) Air-terminal-device Make
      6) Air-terminal-device Number from System Diagram
      7) Air-terminal-device Type and Model Number
      8) Air-terminal-device Size
      9) Air-terminal-device Effective Area in SF
   b. Test Data: Include design and actual values for the following:
      1) Airflow Rate in cfm
      2) Air Velocity in fpm
      3) Final Airflow Rate in cfm
      4) Final Velocity in fpm
      5) Space Temperature in Degrees F

I. Heat Exchangers:

1. For heat exchangers, include the following:
   a. Unit Data: Include the following:
      1) Unit Identification
      2) Location
      3) Service
      4) Make and Type
      5) Model and Serial Numbers
      6) Ratings
   b. Primary Water Test Data: Include design and actual values for the following:
      1) Entering-water Temperature in Degrees F
      2) Leaving-water Temperature in Degrees F
      3) Entering-water Pressure in Feet of Head or PSIG
      4) Water Pressure Differential in Feet of Head or PSIG
      5) Water Flow Rate in gpm
   c. Secondary Water Test Data: Include design and actual values for the following:
      1) Entering-water Temperature in Degrees F
      2) Leaving-water Temperature in Degrees F
      3) Entering-water Pressure in Feet of Head or PSIG
      4) Water Pressure Differential in Feet of Head or PSIG
      5) Water Flow Rate in gpm

J. Pumps:

1. For pumps, include the following data. Calculate impeller size by plotting the shutoff head on pump curves.
   a. Unit Data: Include the following:
      1) Unit Identification
      2) Location
      3) Service
      4) Make and Size
      5) Model and Serial Numbers
      6) Water Flow Rate in gpm
      7) Water Pressure Differential in Feet of Head or PSIG
      8) Required Net Positive Suction Head in Feet of Head or PSIG
      9) Pump rpm
      10) Impeller Diameter in Inches
      11) Motor Make and Frame Size
      12) Motor Horsepower and rpm
      13) Voltage at Each Connection
      14) Amperage for Each Phase
      15) Full-load Amperage and Service Factor
      16) Seal Type
   b. Test Data: Include design and actual values for the following:
      1) Static Head in Feet of Head or PSIG
      2) Pump Shutoff Pressure in Feet of Head or PSIG
      3) Actual Iimpeller Size in Inches
      4) Full-open Flow Rate in gpm
      5) Full-open Pressure in Feet of Head or PSIG
      6) Final Discharge Pressure in Feet of Head or PSIG
      7) Final Suction Pressure in Feet of Head or PSIG
      8) Final Total Pressure in Feet of Head or PSIG
      9) Final Water Flow Rate in gpm
      10) Voltage at Each Connection
      11) Amperage for Each Phase

K. Boilers:

1. For boilers, include the following:
   a. Unit Data: Include the following:
      1) Unit Identification
      2) Location
      3) Service
      4) Make and Type
      5) Model and Serial Numbers
      6) Fuel Type and Input in Btuh
      7) Number of Passes
      8) Ignition Type
      9) Burner-control Types
      10) Voltage at Each Connection
      11) Amperage for Each Phase
   b. Test Data: Include design and actual values for the following:
      1) Operating Pressure in PSIG
      2) Operating Temperature in Degrees F
      3) Entering-water Temperature in Degrees F
      4) Leaving-water Temperature in Degrees F
      5) Number of Safety Valves and Sizes in NPS (DN)
      6) Safety Valve Settings in PSIG

7) High-limit Setting in PSIG
8) Operating-control Setting
9) High-fire Set Point
10) Low-fire Set Point
11) Voltage at Each Connection
12) Amperage for Each Phase
13) Draft Fan Voltage at Each Connection
14) Draft Fan Amperage for Each Phase
15) Manifold Pressure in PSIG

L. Instrument Calibration:

1. For instrument calibration, include the following:
   a. Report Data: Include the following:
      1) Instrument Type and Make
      2) Serial Number
      3) Application
      4) Dates of Use
   b. Dates of Calibration

3.12 ADDITIONAL TESTS

A. Within 90 days of completing TAB, perform additional testing and balancing to verify that balanced conditions are being maintained throughout and to correct unusual conditions.

B. Seasonal Periods: If initial TAB procedures were not performed during near-peak summer and winter conditions, perform additional inspections, testing, and adjusting during near-peak summer and winter conditions.

END OF SECTION 23 05 93

SECTION 23 07 00 - HVAC INSULATION

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Type A, Flexible Glass Wool Blanket
2. Type B, Duct Liner
3. Type F, Closed-Cell Polyisocyanurate Rigid Foam Board
4. Type 1, Glass Wool Pipe Insulation
5. Type 2, Flexible Elastomeric Pipe Insulation
6. Jacketing
7. Accessories
8. Duct Insulation Accessories
9. Duct Insulation Compounds
10. Outdoor Ducting Cover

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. Piping and duct insulation products to contain less than 0.1 percent by weight PBDE in all insulating materials.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Installer qualifications.
2. Product Data: Identify thermal conductivity, thickness, and jackets (both factory and field applied, if any) for each type of product indicated.
   a. Where indicated R-values/ratings cannot be achieved by a single layer of insulation, describe how performance requirements will be achieved.
3. Material Test Reports: From a qualified testing agency acceptable to authorities having jurisdiction indicating, interpreting, and certifying test results for compliance of insulation materials, sealers, attachments, cements, and jackets with requirements indicated. Include dates of tests.
4. Installer Certificates: Signed by the Contractor certifying that installers comply with requirements.
5. Submit manufacturer's installation instructions.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. Formaldehyde Free: Should be third-party certified with UL Environment Validation.
2. Recycled Content: A minimum of 40 percent post-consumer recycled glass content certified and UL validated.
3. Low Emitting Materials: For all thermal and acoustical applications of Glass Mineral Wool Insulation products, provide materials complying with the testing and products requirements of UL GREENGUARD Gold Certification.
4. Installer to have minimum 5 years' experience in the business of installing insulation.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.7 FIRE HAZARD CLASSIFICATION

A. Maximum fire hazard classification of the composite insulation construction as installed to be not more than a Flame Spread Index (FSI) of 25 and Smoke Developed Index (SDI) of 50 as tested by current edition of ASTM E84 (NFPA 255) method.

B. Test pipe insulation in accordance with the requirements of current edition of UL "Pipe and Equipment Coverings R5583 400 8.15."

C. Test duct insulation in accordance with current edition of ASTM E84, UL 723, NFPA 255, NFPA 90A and NFPA 90B.

PART 2 - PRODUCTS

2.1 TYPE A, FLEXIBLE GLASS WOOL BLANKET

A. Acceptable Manufacturers:

1. Certainteed
2. Johns Manville
3. Knauf
4. Owens-Corning

B. ASTM C553, Type 1, Class B-2; flexible blanket.

C. 'K' Value: 0.27 BTU*in/(hr*sf*F) at 75 degrees F installed, maximum service temperature: 250 degrees F.

D. Density: 0.75 pounds per cubic foot.

E. DBDE-free. UL/E validated to be formaldehyde-free.

F. Vapor Barrier Jacket: FSK aluminum foil reinforced with glass wool yarn and laminated to fire resistant Kraft, secured with UL listed pressure sensitive tape or outward clinched expanded staples and vapor barrier mastic as needed.

2.2 TYPE B, DUCT LINER

A. Acceptable Manufacturers:

1. Certainteed
2. Johns Manville
3. Knauf
4. Owens-Corning

B. ASTM C1071; flexible blanket.

C. 'K' Value: ASTM C518, 0.25 BTU*in/(hr*sf*F) at 75 degrees F, maximum service temperature: 250 degrees F.

D. Noise Reduction Coefficient: 0.65 or higher based on ASTM C 423 "Type A mounting."

E. Maximum Velocity on Mat or Coated Air Side: 5,000 FPM.

F. Adhesive: UL listed waterproof type.

G. Fasteners: Duct liner galvanized steel pins, welded or mechanically fastened.

H. Erosion-Resistant Surfaces: UL 181.

I. ASTM G21 and ASTM G22 Microbial Growth Resistance.

J. UL GREENGUARD Certified does not support the growth of mold, fungi, or bacteria per ASTM C 1338 and meets UL Environment GREENGUARD Microbial Resistance Listing per UL 2824 - “GREENGUARD Certification Program Method for Measuring Microbial Resistance.” DBDE-free. UL/E validated to be formaldehyde-free.

2.3 TYPE F, CLOSED-CELL POLYISOCYANURATE RIGID FOAM BOARD

A. Acceptable Manufacturers:

1. Johns Manville
2. Certainteed
3. Knauf
4. RMax

B. ASTM C1289, Type 1, Class 1.

C. Thermal Conductivity: 0.16 BTU*in/(hr*sf*F).

D. Service Temperature: -100 degrees F to 250 degrees F.

E. Jacketing: 0.016-inch thick multi-layered laminate with minimum tensile strength of 149-lb/inch, minimum puncture resistance of 49 pounds per ASTM D1000, maximum emittance of 0.03 per ASTM C1371, maximum WVTR of 0.00 perm per ASTM E96, and min/max service temperature of -40 degrees F to 300 degrees F, as manufactured by 3M, VentureClad1579GCW-E.

2.4 TYPE 1, GLASS WOOL PIPE INSULATION

A. Acceptable Manufacturers:

1. Certainteed
2. Johns Manville
3. Knauf
4. Owens-Corning

B. Glass Wool: ASTM C547 Type I and IV; rigid molded, noncombustible.

1. Thermal Conductivity Value: As indicated in the insulation tables below.
2. Maximum Service Temperature: 850 degrees F to 1000 degrees F.

C. Vapor Retarder Jacket: White Kraft paper reinforced with glass wool and bonded to aluminum foil, secure with self-sealing longitudinal laps and butt strips or vapor barrier mastic.

2.5 TYPE 2, FLEXIBLE ELASTOMERIC PIPE INSULATION

A. Acceptable Manufacturers:

1. Insulation:
   a. Armacell LLC Armaflex
   b. K-Flex
   c. Or approved equivalent.
2. Glue:
   a. Armacell LLC Armaflex Low VOC Adhesive
   b. K-Flex
   c. Or approved equivalent.
3. Paint:
   a. Armacell LLC Armaflex
   b. K-Flex
   c. Or approved equivalent.

B. Elastomeric Foam: ASTM C534; flexible, cellular elastomeric, molded or sheet.

1. Thermal Conductivity Value: As indicated in the insulation tables below.
2. Maximum Service Temperature of 220 degrees F.
3. Maximum Flame Spread: 25.
4. Maximum Smoke Developed: 50 (1-inch thick and below).
5. Vapor Retarder Jacket, for over 1-inch insulation thickness: White Kraft paper reinforced with glass wool and bonded to aluminum foil, secure with self-sealing longitudinal laps and butt strips or vapor barrier mastic.
6. Connection: Waterproof vapor retarder adhesive as needed.
7. UV Protection: UV outdoor protective coating per manufacturer's requirements.

C. Glue: Contact adhesive specifically manufactured for cementing flexible elastomeric foam.

D. Paint (for exterior insulation only): Nonhardening high elasticity type, specifically manufactured as protective covering of flexible elastomeric foam insulation for prevention of degradation due to exposure to sunlight and weather.

2.6 JACKETING

A. Acceptable Manufacturers:

1. ITW Insulation Systems
2. General Insulation Company
3. Johns Manville
4. 3M
5. Or approved equivalent.

B. Insulation Jacketing Tape: 0.016-inch thick multi-layered laminate with minimum tensile strength of 149-lb/inch, minimum puncture resistance of 49 pounds per ASTM D1000, maximum emittance of 0.03 per ASTM C1371, maximum WVTR of 0.00 perm per ASTM E96, and min/max service temperature of -40 degrees F to 300 degrees F, as manufactured by 3M, VentureClad1579GCW-E.

C. PVC preformed molded insulation covers, for piping. Zeston or approved equivalent.

D. Aluminum Jacket: 0.016-inch-thick sheet, (smooth/embossed) finish, with longitudinal slip joints and 2-inch laps, die-shaped fitting covers with factory attached protective liner.

E. Stainless Steel Jacket: Type 304 stainless steel, 0.010-inch, smooth or corrugated finish.

F. Canvas Jacket: UL listed fabric, 6 ounce/sq.yd., plain weave cotton treated with dilute fire retardant lagging adhesive.

2.7 ACCESSORIES

A. Acceptable Manufacturers:

1. ITW Insulation Systems
2. Or approved equivalent.

B. Equipment Insulation Jacketing: Presized glass cloth, not less than 7.8 ounces/sq.yd., except as otherwise indicated. Coat with gypsum based cement.

C. Equipment Insulation Compounds: Provide adhesives, cement, sealers, mastics and protective finishes as recommended by insulation manufacturer for applications indicated.

D. General: Provide staples, bands, wire, wire netting, tape corner angles, anchors, stud pins and metal covers as recommended by insulation manufacturer for applications indicated. Accessories, i.e., adhesives, mastics, cements and tape to have the same flame and smoke component ratings as the insulation materials with which they are used. Shipping cartons to bear a label indicating that flame and smoke ratings do not exceed those listed above. Provide permanent treatment of jackets or facings to impart flame and smoke safety. Provide non-water-soluble treatments. Provide UV protection recommended by manufacturer for outdoor installation.

2.8 DUCT INSULATION ACCESSORIES

A. Acceptable Manufacturers:

1. Certainteed
2. Johns Manville

3. Owens-Corning

B. Staples, bands, wires, tape, anchors, corner angles and similar accessories as recommended by insulation manufacturer for applications indicated.

2.9 DUCT INSULATION COMPOUNDS

A. Acceptable Manufacturers:

1. Certainteed
2. Johns Manville
3. Owens-Corning

B. Cements, adhesives, coatings, sealers, protective finishes and similar accessories as recommended by insulation manufacturer for applications indicated. Comply with South Coast Air Quality Management District (SCAQMD) Rule #1168 in accordance with LLE EQ 4.1.

2.10 OUTDOOR DUCTING COVER

A. Acceptable Manufacturers:

1. 3M
2. Certainteed
3. Johns Manville
4. Owens-Corning

B. Aluminum Jacket: 0.016-inch-thick sheet, (smooth/embossed) finish, with longitudinal slip joints and 2-inch laps, die-shaped fitting covers with factory attached protective liner.

C. Insulation Jacketing Tape: 0.016-inch thick multi-layered laminate with minimum tensile strength of 149-lb/inch, minimum puncture resistance of 49 pounds per ASTM D1000, maximum emittance of 0.03 per ASTM C1371, maximum WVTR of 0.00 perm per ASTM E96, and min/max service temperature of -40 degrees F to 300 degrees F, as manufactured by 3M, VentureClad1579GCW-E.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS

A. Verification of Conditions:

1. Do not apply insulation until pressure testing and inspection of ducts and piping has been completed. Do not apply insulation over heat tracing temperature maintenance until system has been tested.
2. Examine areas and conditions under which duct and pipe insulation will be installed. Do not proceed with work until unsatisfactory conditions have been corrected.

B. Preparation: Clean and dry surfaces to be insulated.

C. Installation:

1. Insulation: Continuous through walls, floors and partitions except where noted otherwise.
2. Piping and Equipment:

a. Install insulation over clean, dry surfaces with adjoining sections firmly butted together and covering surfaces. Fill voids and holes. Seal raw edges. Install insulation in a manner such that insulation may be split, removed, and reinstalled with vapor barrier tape on strainer caps and unions. Do not install insulation until piping has been leak tested and has passed such tests. Do not insulate manholes, equipment manufacturer's nameplates, handholes, and ASME stamps. Provide beveled edge at such insulation interruptions. Repair voids or tears.

D. Cover insulation on exposed refrigerant piping above ground, outside of building with heavy duty multi-layered laminated jacketing tape. Position seams on bottom of pipe. Use 3M VentureClad Plus 1579GCW-E or approved equal.

E. Provide accessories as required. See Part 2 Article "Accessories" above.

F. Protection and Replacement: Installed insulation during construction. Replace damaged insulation which cannot be repaired satisfactorily, including units with vapor barrier damage and moisture saturated units.

G. Labeling and Marking: Provide labels, arrows and color on piping and ductwork. Attach labels and flow direction arrows to the jacketing per Section 23 05 53, Identification for HVAC Piping, Ductwork and Equipment.

H. Ductwork:

1. Install insulation in conformance with manufacturer's recommendations to completely cover duct.
2. Butt insulation joints firmly together and install jackets and tapes smoothly and securely.
3. Apply duct insulation continuously through sleeves and prepared openings, except as otherwise specified. Apply vapor barrier materials to form complete unbroken vapor seal over insulation.
4. Coat staples and seals with vapor barrier coating.
5. Cover breaks in jacket materials with patches of same material as vapor barrier. Extend patches not less than 3-inches beyond break or penetration on all directions and secure with adhesive and staples. Seal staples and joints with vapor barrier coating.
6. Fill jacket penetrations, i.e., hangers, thermometers and damper operating rods, and other voids in insulation, with vapor barrier coating. Seal penetration with vapor barrier coating. Insulate hangers and supports for cold duct in un-conditioned spaces to extent to prevent condensation on surfaces.
7. Seal and flash insulation terminations and pin punctures with reinforced vapor barrier coating.
8. Continue insulation at fire dampers and fire/smoke dampers up to and including those portions of damper frame visible at outside of the rated fire barrier. Insulating terminations at fire dampers in accordance with this Section.
9. Do not conceal duct access doors with insulation. Install insulation terminations at access door in accordance with this Section.

I. Insulated Pipe Exposed to Weather: Where piping is exposed to weather, cover insulation with aluminum jacketing or stainless steel jacketing. Seal jacketing watertight per manufacturer's recommendations. Install metal jacketing with 2-inch overlap at longitudinal and butt joints with exposed lap pointing down. Secure jacketing with stainless-steel draw bands 12-inches on center and at butt joints. Provide heat tracing on piping subject to freezing. See Section 23 05 33, Heat Tracing for HVAC Piping.

J. Insulation Shields: Provide hangers and shields (18 gauge minimum) outside of insulation for cold piping (<60 degrees F). Hot water piping hangers may penetrate insulation to contact pipe directly. Provide 18-inch long, noncompressible insulation section at insulation shields for lines 2-inches and larger (hot and cold) piping.

K. Ductwork Surfaces to be Insulated: Washington Climate Zone 4

Item to be Insulated	System Insulation Type	Duct Size	Minimum Installed R-Value
Supply ductwork inside building thermal envelope, where duct is not specified to be lined.	A	All	R-4
Return ductwork inside building thermal envelope, where duct is not specified to be lined.	--	All	None
Supply ductwork routed exposed within conditioned space where duct conveys air between 55°F and 105°F.	--	All	None
Supply and return ductwork located outside building thermal envelope (exposed to weather, above insulated ceilings, in crawl spaces, in parking garages).	A (for round ductwork) F (for rectangular ductwork)	All	R-8
Supply and return ductwork routed through unconditioned space outside building thermal envelope or buried below grade.	A (for round ductwork) F (for rectangular ductwork)	All	R-6
Outside air ducts inside building thermal envelope	A, F	Airflow greater than or equal to	R-16

and upstream of automatic shutoff damper.		2800 cfm	
Outside air ducts inside building thermal envelope and downstream of automatic shutoff damper.	A	Airflow greater than or equal to 2800 cfm	R-8
Outside air ducts inside building thermal envelope and upstream of automatic shutoff damper.	A	Airflow less than 2800 cfm	R-8
Combustion air ducts inside building thermal envelope.	A	All	R-8
Built up HVAC equipment plenums and unit housings not preinsulated.	B	All	R-6
Exhaust ducts within building thermal envelope, between energy recovery media, and automatic shutoff damper.	A	All	R-8
Exhaust ducts within building thermal envelope between exterior and automatic shutoff damper.	A	All	R-16

1. Note: Insulation R-value shown is a minimum. If state codes require higher R-value, then provide insulation per code requirements.

L. Piping Surfaces to be Insulated:

Item to be Insulated	System Insulation Type	Conductivity Range (Btu-inch per hour per SF per degrees	Pipe Size (Inches)	Insulation Thickness (Inches)

		F)		
Heating, Steam, and Steam Condensate (above 350F)	1	0.32-0.34 at a mean rating temperature of 250 degrees F	<1 1 to <1.5 1.5 to <4 4 to <8 >= 8	4.5 5.0 5.0 5.0 5.0
Heating, Steam, and Steam Condensate (251F to 350F)	1	0.29-0.32 at a mean rating temperature of 200 degrees F	<1 1 to <1.5 1.5 to <4 4 to <8 >= 8	3.0 4.0 4.5 4.5 4.5
Heating, Steam, and Condensate (201F to 250F)	1	0.27-0.30 at a mean rating temperature of 150 degrees F	<1 1 to <1.5 1.5 to <4 4 to <8 >= 8	2.5 2.5 2.5 3.0 3.0
Heating, Steam, and Steam Condensate (141F to 200F)	1	0.25-0.29 at a mean rating temperature of 125 degrees F	<1 1 to <1.5 1.5 to <4 4 to <8 >= 8	1.5 1.5 2.0 2.0 2.0
Heating, Steam, and Steam Condensate (105F to 140F)	1	0.21-0.28 at a mean rating temperature of 100 degrees F	<1 1 to <1.5 1.5 to <4 4 to <8 >= 8	1.0 1.0 1.5 1.5 1.5

Chilled Water (40F to 60F)	1	0.21-0.27 at a mean rating temperature of 75 degrees F	<1 1 to <1.5 1.5 to <4 4 to <8 >= 8	0.5 0.5 1.0 1.0 1.0
Chilled Water (<40F)	1	0.20-0.26 at a mean rating temperature of 75 degrees F	<1 1 to <1.5 1.5 to <4 4 to <8 >= 8	0.5 0.5 1.0 1.0 1.0
Refrigerant Suction and Liquid Piping (40F to 60F)	2	0.21-0.27 at a mean rating temperature of 75 degrees F	<1 1 to <1.5 1.5 to <4 4 to <8 >= 8	0.5 0.5 1.0 1.0 1.0
Refrigerant Suction and Liquid Piping (<=40F)	2	0.20-0.26 at a mean rating temperature of 75 degrees F	<1 1 to <1.5 1.5 to <4 4 to <8 >= 8	0.5 1.0 1.0 1.0 1.5
Heating Water Storage and Air Separation Tanks	2	0.24-0.28 at a mean rating temperature of 75 degrees F	N/A	2.0
Heat Exchangers (Hydronic)	2	0.24-0.28 at a mean rating temperature of 75	N/A	2.0

		degrees F		
Condenser Water (Exterior)	1, 2	0.21-0.27 at a mean rating temperature of 75 degrees F	1 to 6 >=8	1.0 1.5

1. Note: Insulation thickness shown is a minimum. If state code requires additional thickness, then provide insulation thickness per code requirements.

3.2 TYPE A, FLEXIBLE GLASS WOOL BLANKET

A. Install insulation in conformance with manufacturer's recommendations and requirements.

B. Duct Wrap: Cover air ducts per insulation table except ducts internally lined where internal duct lining is adequate to achieve adequate insulating values to meet local Energy Codes (indicate on shop drawings, locations where duct wrap is planned to be omitted and indicate internal duct lining insulating values to confirm they will meet the Energy Code). Wrap tightly with circumferential joints butted and longitudinal joints overlapped minimum of 2-inches. On ducts over 24-inches wide, additionally secure insulation with suitable mechanical fasteners at 18-inches on center. Circumferential and longitudinal joints stapled with flare staples 6-inches on center and covered with 3-inch wide, foil reinforced tape.

3.3 TYPE B, DUCT LINER

A. Install insulation in conformance with manufacturer's recommendations and requirements.

B. Duct Liners: Mat finish surface on air stream side. Secure insulation to cleaned sheet metal duct with continuous (minimum 90) percent coat of adhesive. Secure liner with mechanical fasteners 15-inches on center or per manufacturer requirements. Accurately cut liner and thoroughly coat ends with adhesive. Butt joints tightly. Top and bottom sections of insulation overlap sides. Factory/field coat exposed edges. Metal nosing for exposed leading or transverse edges and when velocity exceeds 3500 FPM or manufacturer rating on exposed edges. Keep duct liner clean and free from dust. At completion of Project, vacuum duct liner if it is dirty or dusty. Do not use small pieces. If insulation is installed without horizontal, longitudinal, and end joints butted together, installation will be rejected and work removed and replaced with work that conforms to this Specification.

3.4 TYPE F, CLOSED-CELL POLYISOCYANURATE RIGID FOAM BOARD

A. Install insulation in conformance with manufacturer's recommendations and requirements.

3.5 TYPE 1, GLASS WOOL PIPE INSULATION

A. See General Installation Requirements above.

B. Install insulation in conformance with manufacturer's recommendations and requirements.

C. Lap seal insulation with waterproof adhesive. Do not use staples or other methods of attachment which would penetrate vapor barrier. Apply fitting covers with seated tacks and vapor barrier tape.

D. Apply insulation to pipe and seal with self-sealing lap. Use self-sealing butt strips to seal butt joints. Insulate fittings, valves and unions with single or multiple layers of insulation and cover to match pipe or use preformed PVC molded insulation covers.

3.6 TYPE 2, FLEXIBLE ELASTOMERIC PIPE INSULATION

A. Flexible Elastomeric Insulation:

1. Slip insulation on pipe prior to connection. Butt joints sealed with manufacturer's adhesive. Insulate fitting with miter-cut pieces. Cover insulation exposed to weather and below grade with two coats of finish as recommended by manufacturer.

B. Flexible Elastomeric Tubing:

1. Flexible Elastomeric Tubing: Slip insulation over piping or, if piping is already installed, slit insulation and snap over piping. Joints and butt ends must be adhered with 520 adhesive.

C. See General Installation Requirements above.

D. Install insulation in conformance with manufacturer's recommendations and requirements.

E. Slip insulation on pipe prior to connection. Butt joints sealed with manufacturer's adhesive. Insulate fitting with miter-cut pieces. Cover insulation exposed to weather and undergrade with two coats of finish as recommended by manufacturer.

F. Install in accordance with manufacturer's instructions for below grade installation.

3.7 JACKETING

A. See General Installation Requirements above.

B. Install in accordance with manufacturer's instructions.

3.8 ACCESSORIES

A. Install insulation in conformance with manufacturer's instructions, recommendations and requirements.

B. See General Installation Requirements above.

C. Furnish and install accessories for all insulation types listed in this Section.

3.9 DUCT INSULATION ACCESSORIES

A. Install insulation in conformance with manufacturer's recommendations and requirements.

3.10 DUCT INSULATION COMPOUNDS

A. Install insulation in conformance with manufacturer's recommendations and requirements.

3.11 OUTDOOR DUCTING COVER

A. Install insulation in conformance with manufacturer's recommendations and requirements.

B. Outdoor Duct Exposed to Weather:

1. Install jacket with brakes/slope to prevent standing water on duct. Use weatherable components.
2. Weatherproof seal at joints and seams. Minimum 3-inch overlap.
3. Label jacket every 6-feet and within 2-feet of building penetrations and equipment connections: "Do not stand or place equipment on duct."

END OF SECTION 23 07 00

SECTION 23 08 00 - COMMISSIONING OF HVAC

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Definitions, warranties, test equipment requirements, and mechanical commissioning requirements.

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

B. In addition, reference the following:

1. Section 01 91 13, General Commissioning Requirements.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. Current edition of ASHRAE Guideline 0, The Commissioning Process.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Certificates of readiness.
2. Certificates of completion of installation, prestart, and startup activities.
3. Operation and Maintenance Manuals.
4. Test reports.
5. Control Drawings Submittal
    a. Provide a key to abbreviations.
    b. Provide graphic schematic depictions of the systems and each component.
    c. Include the system and component layout of any equipment that the control system monitors, enables or controls, even if the equipment is primarily controlled by packaged or integral controls.
    d. Provide a full points list with at least the following included for each point:
        1) Controlled system
        2) Point abbreviation
        3) Point description
        4) Display unit
        5) Control point or set point (Yes / No)
        6) Monitoring point (Yes / No)
        7) Intermediate point (Yes / No)

8) Calculated point (Yes / No)

6. Architect forwards one set of submittals for systems to be commissioned to Commissioning Agent at same time as design team.
7. Commissioning Agent forwards comments to design team for consideration in their submittal response.
8. Design team sends consolidated response to submittals and copies to Commissioning Agent.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. Test Equipment Calibration Requirements: Contractors will comply with test manufacturer's calibration procedures and intervals. Recalibrate test instruments immediately after instruments have been repaired resulting from being dropped or damaged. Affix calibration tags to test instruments. Furnish calibration records to Commissioning Authority upon request.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Commissioning, inspecting, and testing will not modify terms or time periods of mechanical equipment, systems, and controls warranties including related equipment and systems, and adjacent work.
2. Control system warranty period starts from date of Commissioning Agent acceptance.

1.7 COORDINATION

A. Reference Section 01 91 13, General Commissioning Requirements, for requirements pertaining to coordination during the commissioning process.

1.8 PURPOSE

A. Purpose of commissioning process is to provide Owner assurance that systems have been installed in prescribed manner and will operate within performance guidelines. Commissioning is intended to enhance quality of system startup and aid in orderly transfer of systems to beneficial use by Owner.

B. Commissioning procedures and results will be observed by Commissioning Authority or Owner's staff. Contractor is expected to verify functional readiness of systems to be tested prior to performing the tests in presence of Owner's witness. A high rate of test failure will indicate that Contractor has not adequately verified readiness of systems.

PART 2 - PRODUCTS

2.1 TEST EQUIPMENT

A. Provide standard testing equipment required to perform startup, initial checkout and functional performance testing for the equipment being tested. For example, the mechanical contractor of Division 23, HVAC will ultimately be responsible for standard testing equipment for the HVAC&R system and controls system in Division 23, HVAC, except for the equipment specific to and used by TAB in their commissioning responsibilities. Provide a sufficient quantity of two-way radios by each subcontractor.

B. Include special equipment, tools and instruments (specific to a piece of equipment and only available from vendor) required for testing in the base bid price to the Owner and leave on site, except for stand-alone data logging equipment that may be used by the Commissioning Authority.

C. Manufacturer of equipment to provide proprietary test equipment and software required for programming and/or start-up, whether specified or not. Manufacturer provides the test equipment, demonstrates its use, and assists in the commissioning process as needed. Proprietary test equipment (and software)become the property of the Owner upon completion of the commissioning process.

D. Data logging equipment and software required to test equipment will be provided by the Commissioning Authority, and will not become the property of the Owner.

E. Use only testing equipment of sufficient quality and accuracy to test and/or measure system performance with the tolerances specified in the specifications. If not otherwise noted, the following minimum requirements apply: Temperature sensors and digital thermometers have a certified calibration within the past year to an accuracy of 0.5 degree F and a resolution of plus or minus 0.1 degree F. Pressure sensors have an accuracy of plus or minus 2.0 percent of the value range being measured (not full range of meter) and have been calibrated within the last year.

PART 3 - EXECUTION

3.1 GENERAL DOCUMENTATION REQUIREMENTS

A. With assistance from the installing contractors, the Commissioning Authority will prepare prefunctional checklists for commissioned components, equipment, and systems

B. Red-Lined Drawings:

1. Verify equipment, systems, instrumentation, wiring and components are shown correctly on red-lined drawings.
2. Preliminary red-lined drawings must be made available to the Commissioning Team for use prior to the start of Functional Performance Testing.
3. Changes, as a result of Functional Testing, must be incorporated into the final as-built drawings, which will be created from the red-lined drawings.
4. The contracted party, as defined in the Contract Documents will create the as-built drawings.

C. Operation and Maintenance (O&M) Data:

1. Contractor will provide a copy of O&M literature within 45 days of each submittal acceptance for use during the commissioning process for commissioned equipment and systems.
2. The Commissioning Authority will review the O&M literature once for conformance to project requirements.
3. The Commissioning Authority will receive a copy of the final approved O&M literature once corrections have been made by the Contractor.

D. Demonstration and Training:

1. Contractor will provide demonstration and training as required by the specifications.
2. A complete training plan and schedule must be submitted by the contractor to the Commissioning Authority four weeks prior to any training.
3. A training agenda for each training session must be submitted to the Commissioning Authority one week prior the training session.
4. Notify the Commissioning Authority at least 72 hours in advance of scheduled tests so that testing may be observed by the Commissioning Authority and Owner's Authorized Representative. Provide a copy of the test record to the Commissioning Authority, Owner, and Architect.
5. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain specific equipment.
6. Train Owner's maintenance personnel on procedures and schedules for starting and stopping, trouble shooting, servicing, and maintaining equipment.
7. Review data in O&M Manuals.

E. Systems Manual Requirements:

1. The Systems Manual is intended to be a usable information resource containing the information related to the systems, assemblies, and Commissioning Process in one place with indexes and cross references.
2. Include final approved versions of the following information for the Systems Manual:
   a. Facility Description.
   b. Basis of Design (A/E).
   c. A list of contractors, subcontractors, suppliers, architects, and engineers involved in the project along with their contact information.
   d. Overview of each commissioned system including operational schedules and sequence of operations.
   e. General maintenance recommendations and procedures.
   f. Recommendations for recalibration frequency of sensors and actuators
   g. Recommended best practices for keeping the system running efficiently.
   h. Blank Functional Performance Tests so the Owner can recommission the facility at a later date.
3. Organize and arrange information by building system, such as fire alarm, chilled water, heating hot water, etc.
4. Provide Information in an electronic version to the extent possible. Legible, scanned images are acceptable for non-electronic documentation to facilitate this deliverable.

3.2 CONTRACTOR'S RESPONSIBILITIES

A. Mechanical, Controls and TAB Contractors. The commissioning responsibilities applicable to each of the mechanical, controls and TAB contractors of Division 23, HVAC are as follows (references apply to commissioned equipment only):

1. Perform commissioning tests at the direction of the Commissioning Authority.

2. Attend construction phase controls coordination meetings.
3. Attend testing, adjusting, and balancing review and coordination meetings.
4. Participate in HVAC&R systems, assemblies, equipment, and component maintenance orientation and inspection as directed by the Commissioning Authority.
5. Provide information requested by the Commissioning Authority for final commissioning documentation.
6. Include requirements for submittal data, operation and maintenance data, and training in each purchase order or subcontract written.
7. Prepare preliminary schedule for mechanical system orientations and inspections, operation and maintenance manual submissions, training sessions, pipe and duct system testing, flushing and cleaning, equipment start-up, testing and balancing and task completion for owner. Distribute preliminary schedule to commissioning team members.
8. Update schedule as required throughout the construction period.
9. During the startup and initial checkout process, execute the related portions of the prefunctional checklists for commissioned equipment.
10. Contractor to participate and complete checklists using the Commissioning Authority's web based commissioning software Facility Grid. A desktop, laptop, tablet, or iPad will be required.
11. Assist the Commissioning Authority in verification and functional performance tests.
12. Gather operation and maintenance literature on equipment, and assemble in binders as required by the specifications. Submit to Commissioning Authority 45 days after submittal acceptance.

B. Coordinate with the Commissioning Authority to provide 48 hour advance notice so that the witnessing of equipment and system start-up and testing can begin.

C. Notify the Commissioning Authority a minimum of two weeks in advance of the time for start of the testing and balancing work. Attend the initial testing and balancing meeting for review of the official testing and balancing procedures.

D. Participate in, and schedule vendors and contractors to participate in the training sessions.

E. Provide written notification to the Construction Manager/General Contractor (CM/GC) and Commissioning Authority that the following work has been completed in accordance with the Contract Documents, and that the equipment, systems, and sub-system are operating as required.

1. HVAC&R equipment including fans, air handling units, ductwork, dampers, terminals, and other equipment furnished under this Division.
2. Fire stopping in the fire rated construction, including fire and smoke damper installation, caulking, gasketing and sealing of smoke barriers.
3. Fire detection and smoke detection devices furnished under other divisions of the specification.

F. Equipment supplier to document the performance of his equipment.

G. Test, Adjust and Balance Contractor:

1. Attend initial commissioning coordination meeting scheduled by the Commissioning Authority.
2. Participate in verification of the testing and balancing report, which will consist of repeating measurements contained in the testing and balancing reports. Assist in diagnostic purposes when directed.

H. Provide training of the Owner's operating staff using expert qualified personnel, as specified.

I. Equipment Suppliers:

1. Provide requested submittal data, including detailed start-up procedures and specific responsibilities of the Owner, to keep warranties in force.
2. Assist in equipment testing per agreements with contractors.
3. Provide information requested by Commissioning Authority regarding equipment sequence of operation and testing procedures.

J. Reference Section 01 91 13, General Commissioning Requirements for additional contractor responsibilities.

3.3 OWNER'S RESPONSIBILITIES

A. Reference Section 01 91 13, General Commissioning Requirements for Owner's Responsibilities.

3.4 DESIGN PROFESSIONAL'S RESPONSIBILITIES

A. Reference Section 01 91 13, General Commissioning Requirements for Design Professional's Responsibilities.

3.5 COMMISSIONING AUTHORITY'S RESPONSIBILITIES

A. Reference Section 01 91 13, General Commissioning Requirements for Commissioning Authority's Responsibilities.

3.6 TESTING PREPARATION

A. Certify in writing to the Commissioning Authority that HVAC&R systems, subsystems, and equipment have been installed, calibrated, and started and are operating according to the Contract Documents.

B. Certify in writing to the Commissioning Authority that HVAC&R instrumentation and control systems have been completed and calibrated, that they are operating according to the Contract Documents, and that pretest set points have been recorded.

C. Certify in writing that testing, adjusting, and balancing procedures have been completed and that testing, adjusting, and balancing reports have been submitted, discrepancies corrected, and corrective work approved.

D. Place systems, subsystems, and equipment into operating mode to be tested (e.g., normal shutdown, normal auto position, normal manual position, unoccupied cycle, emergency power, and alarm conditions).

E. Inspect and verify the position of each device and interlock identified on checklists.

F. Check safety cutouts, alarms, and interlocks with smoke control and life-safety systems during each mode of operation.

G. Testing Instrumentation: Install measuring instruments and logging devices to record test data as directed by the Commissioning Authority.

3.7 TESTING, ADJUSTING AND BALANCING VERIFICATION

A. Prior to performance of Testing, Adjusting and Balancing work, provide copies of reports, sample forms, checklists, and certificates to the Commissioning Authority.

B. Notify the Commissioning Authority at least 10 days in advance of testing and balancing Work, and provide access for the Commissioning Authority to witness testing and balancing Work.

C. Provide technicians, instrumentation, and tools to verify testing and balancing of HVAC&R systems at the direction of the Commissioning Authority.

1. The Commissioning Authority will notify testing and balancing subcontractor 10 days in advance of the date of field verification. Notice will not include data points to be verified.
2. Testing and balancing subcontractor to use the same instruments (by model and serial number) that were used when original data were collected.
3. Failure of an item includes, other than sound, a deviation of more than 10 percent. Failure of more than 10 percent of selected items to result in rejection of final testing, adjusting, and balancing report. For sound pressure readings, a deviation of 3 dB to result in rejection of final testing. Variations in background noise must be considered.
4. Remedy the deficiency and notify the Commissioning Authority so verification of failed portions can be performed.

3.8 GENERAL TESTING REQUIREMENTS

A. Provide technicians, instrumentation, and tools to perform commissioning test at the direction of the Commissioning Authority.

B. Scope of HVAC&R testing to include entire HVAC&R installation, from central equipment for heat generation and refrigeration through distribution systems to each conditioned space. Testing to include measuring capacities and effectiveness of operational and control functions.

C. Test operating modes, interlocks, control responses, and responses to abnormal or emergency conditions, and verify proper response of building automation system controllers and sensors.

D. The Commissioning Authority along with the HVAC&R contractor, testing and balancing Subcontractor, and HVAC&R Instrumentation and Control Subcontractor to prepare detailed testing plans, procedures, and checklists for HVAC&R systems, subsystems, and equipment.

E. Tests will be performed using design conditions whenever possible.

F. Simulated conditions may need to be imposed using an artificial load when it is not practical to test under design conditions. Before simulating conditions, calibrate testing instruments. Provide equipment to simulate loads. Set simulated conditions as directed by the Commissioning Authority and document simulated conditions and methods of simulation. After tests, return settings to normal operating conditions.

G. The Commissioning Authority may direct that set points be altered when simulating conditions is not practical.

H. The Commissioning Authority may direct that sensor values be altered with a signal generator when design or simulating conditions and altering set points are not practical.

I. If tests cannot be completed because of a deficiency outside the scope of the HVAC&R system, document the deficiency and report it to the Owner. After deficiencies are resolved, reschedule tests.

J. If the testing plan indicates specific seasonal testing, complete appropriate initial performance tests and documentation and schedule seasonal tests.

3.9 HVAC&R SYSTEMS, SUBSYSTEMS, AND EQUIPMENT TESTING PROCEDURES

A. Equipment Testing and Acceptance Procedures: Testing requirements are specified in individual Division 23, HVAC Sections. Provide submittals, test data, inspector record, and certifications to the Commissioning Authority.

B. HVAC&R Instrumentation and Control System Testing: Field testing plans and testing requirements are specified in Division 23, HVAC Sections "Instrumentation and Control for HVAC" and "Sequence of Operations for HVAC Controls." Assist the Commissioning Authority with preparation of testing plans.

C. Pipe System Cleaning, Flushing, Hydrostatic Tests, and Chemical Treatment: Test requirements are specified in Division 23, HVAC Piping Sections. HVAC&R Contractor to prepare a pipe system cleaning, flushing, and hydrostatic testing plan. Provide cleaning, flushing, testing, and treating plan and final reports to the Commissioning Authority. Plan to include the following:

1. Sequence of testing and testing procedures for each section of pipe to be tested, identified by pipe zone or sector identification marker. Markers keyed to Drawings for each pipe sector, showing the physical location of each designated pipe test section. Provide drawings keyed to pipe zones or sectors formatted to allow each section of piping to be physically located and identified when referred to in pipe system cleaning, flushing, hydrostatic testing, and chemical treatment plan.
2. Description of equipment for flushing operations.
3. Minimum flushing water velocity.
4. Tracking checklist for managing and ensuring that pipe sections have been cleaned, flushed, hydrostatically tested, and chemically treated.

D. The work included in the commissioning process involves a complete and thorough evaluation of the operation and performance of components, systems and sub-systems. Evaluate the following equipment and systems:

1. HVAC Equipment and Systems (all)
2. Boiler
3. Building Automation System
4. Chilled Water System
5. Computer Room AC
6. Domestic Hot Water Systems
7. Renewable Energy Systems
8. Pumps
9. VFDs

3.10 DEFICIENCIES/NONCONFORMANCE, COST OF RETESTING, FAILURE DUE TO MANUFACTURER DEFECT

A. Reference Division 01, General Requirements for requirements pertaining to deficiencies/nonconformance, cost of retesting, or failure due to manufacturer defect.

3.11 OPERATION AND MAINTENANCE MANUALS

A. The Operation and Maintenance Manuals to conform to Contract Documents requirements as stated in Division 23, HVAC.

B. Provide an updated as-built version of the control drawings and sequences of operation in the final controls O&M manual submittal.

3.12 TRAINING OF OWNER PERSONNEL

A. Mechanical Contractor's Training Responsibilities:

1. Provide the Commissioning Authority with a training plan two weeks before the planned training.
2. Provide designated Owner personnel with comprehensive orientation and training in the understanding of the systems and the operation and maintenance of each piece of HVAC equipment including, but not limited to, HVAC equipment (i.e., pumps, heat exchangers, chillers, heat rejection equipment, air conditioning units, air handling units, fans, terminal units, controls and water treatment systems, etc.).
3. Training starts with classroom sessions followed by hands-on training on each piece of equipment to illustrate the various modes of operation, including startup, shutdown, fire/smoke alarm, power failure, etc.
4. During any demonstration, should the system fail to perform in accordance with the requirements of the O&M manual or sequence of operations, the system will be repaired or adjusted as necessary and the demonstration repeated.
5. The appropriate trade or manufacturer's representative provides the instructions on each major piece of equipment. This person may be the start-up technician for the piece of equipment, the installing contractor or manufacturer's representative. Practical building operating expertise as well as in-depth knowledge of modes of operation of the specific piece of equipment are required. More than one party may be required to execute the training.
6. Controls contractor to attend sessions other than the controls training, as requested, to discuss the interaction of the controls system as it relates to the equipment being discussed.
7. The training sessions follow the outline in the Table of Contents of the operation and maintenance manual and illustrate whenever possible the use of the O&M manuals for reference.
8. Training Includes:
    a. Use of the printed installation, operation and maintenance instruction material included in the O&M manuals.
    b. A review of the written O&M instructions emphasizing safe and proper operating requirements, preventative maintenance, special tools needed and spare parts inventory suggestions. Training to include start-up, operation in all modes possible, shut-down, seasonal changeover and any emergency procedures.
    c. Discussion of relevant health and safety issues and concerns.
    d. Discussion of warranties and guarantees.
    e. Common troubleshooting problems and solutions.
    f. Explanatory information included in the O&M manuals and the location of plans and manuals in the facility.
    g. Discussion of any peculiarities of equipment installation or operation.
9. Schedule training after functional testing is complete, unless approved otherwise by the Owner.

B. Controls Contractor's Training Responsibilities:

1. Provide the Commissioning Authority and A/E with a training plan four weeks before the planned training.
2. Provide designated Owner personnel training on the control system in this facility. The intent is to clearly and completely instruct the Owner on the capabilities of the control system.
3. Training manuals. The standard operating manual for the system and any special training manuals will be provided for each trainee, with three extra copies left for the O&M manuals. In addition, copies of the system technical manual will be demonstrated during training and three copies submitted with the O&M manuals. Manuals include detailed description of the subject matter for each session. Manuals to cover control sequences and have a definitions section that fully describes relevant words used in the manuals and in software displays. Manuals will be approved by the Commissioning Authority and A/E. Deliver copies of audiovisuals to the Owner.
4. The trainings will be tailored to the needs and skill-level of the trainees.
5. The trainers will be knowledgeable on the system and its use in buildings. For the on-site sessions, the most qualified trainer(s) will be used. Owner to approve the instructor prior to scheduling the training.
6. During any demonstration, should the system fail to perform in accordance with the requirements of the O&M manual or sequence of operations, the system will be repaired or adjusted as necessary and the demonstration repeated.
7. Attend sessions other than the controls training, as requested, to discuss the interaction of the controls system as it relates to the equipment being discussed.
8. Three Training Sessions, as Follows:
    a. Training I - Control System. The first training consists of eight hours of actual training. This training may be held on-site or in the supplier's facility. If held off-site, the training may occur prior to final completion of the system installation. Upon completion, each student, using appropriate documentation, should be able to perform elementary operations and describe general hardware architecture and functionality of the system.
    b. Training II - Building Systems. The second session held on-site for a period of eight hours of actual hands-on training after the completion of system commissioning. The session includes instruction on:
        1) Specific hardware configuration of installed systems in this building and specific instruction for operating the installed system, including HVAC systems, lighting controls and any interface with security and communication systems.
        2) Security levels, alarms, system start-up, shut-down, power outage and restart routines, changing set points and alarms and other typical changed parameters, overrides, freeze protection, manual operation of equipment, optional control strategies that can be considered, energy savings strategies and set points that if changed will adversely affect energy consumption, energy accounting, procedures for obtaining vendor assistance, etc.
        3) Trending and monitoring features (values, change of state, totalization, etc.), including setting up, executing, downloading, viewing both tabular and graphically and printing trends. Trainees will actually set-up trends in the presence of the trainer.
        4) Completely discuss every screen, allowing time for questions.
        5) Use of keypad or plug-in laptop computer at the zone level.
        6) Use of remote access to the system via phone lines or networks.
        7) Setting up and changing an air terminal unit controller.
        8) Graphics generation.
        9) Point database entry and modifications.
        10) Understanding DDC field panel operating programming (when applicable).

c. Training III - The third training will be conducted on-site six months after occupancy and consist of eight hours of training. The session will be structured to address specific topics that trainees need to discuss and to answer questions concerning operation of the system.

END OF SECTION 23 08 00

SECTION 23 09 00 - INSTRUMENTATION AND CONTROL PERFORMANCE SPECIFICATIONS

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Communications
2. Operator Interface
3. Controller Software
4. Web Based Access
5. BAS Graphics
6. Building Controllers
7. Application Specific Controllers
8. Advanced Application Controllers
9. Input/Output Interface
10. Power Supplies and Line Filtering
11. Control Panels
12. Auxiliary Control Devices
13. Wiring and Raceways
14. Smoke Detection for Projects with a Building Fire Alarm System

B. This is a performance specification and Contractor is responsible for design tasks and engineering.

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. Current edition of ANSI/ASHRAE Standard 135 and addendum, BACnet.
2. Current edition of UL 916 Underwriters Laboratories Standard for Energy Management Equipment, Canada and the US.
3. Current edition of FCC Part 15, Subpart J, Class A.
4. Current edition of BACnet Testing Laboratories (BTL).

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Prepare and submit a detailed schedule of work. Schedule to identify milestones such as equipment submittals, control panel diagrams, color graphic panel displays, Interlock.

2. Wiring diagrams, control program sequence software flow chart diagrams, conduit layout diagrams, device location diagrams, equipment and component deliveries, installation sequencing, controller startup, point to point startup, control programming, sequence testing, commissioning/acceptance testing and training.
3. Submit design drawings, sequences of operation, program listings, software flow charts and details for each typical piece of equipment and system being controlled. No work to be initiated or fabrication of any equipment started prior to the Owner's Authorized Representatives return of REVIEWED submittals.
    a. Sequence of Operation: The sequence of operation included in the design documents is intended only to communicate the Engineers' general control intent and is not to be used as a direct reference for programming of the EMS system. Verbatim duplication of the Engineer's Sequence of Operation on the submittals is discouraged and may result in non-approval of the submittal. Sequence of operation on submittals to accurately detail the system's intended programming, and include details of enhancements, adjustments, or deviations from the Engineer's sequence of operation. Submitted sequence of operation to be written with a logical and organized format and flow. Provide detailed, clear and unambiguous sequence of operation language. Point descriptors and point nomenclature referenced in the submitted sequence of operation to match those (to be) actually programmed. As-built submittal Sequence of Operation to include modifications to the programming made as a result of any addendum, bulletins, RFI's, change orders, and commissioning.
4. Format: Make each submittal in one complete and contiguous package. Partial or unmarked submittals will be rejected without review.
5. Submit Manufacturers Data as Follows:
    a. Complete materials list of items proposed to be furnished and installed. A complete Bill of Materials, listing materials, components, devices, wire and equipment are required for this work. The Bill of Materials to be separate for each controller on its own page(s) and to contain the following information for each item listed:
        1) Manufacturer's Name and Model number with furnished options highlighted.
        2) Quantity of each by controller location.
        3) Description of product (generic).
        4) Specified item.
        5) Operating range or span.
        6) Operating point or setpoint.
    b. Manufacturer's specifications and other data required demonstrating compliance with the specified requirements, including but not limited to: Catalog cuts, technical data and descriptive literature on hardware, software, and system components to be furnished.
    c. The data to be clearly marked and noted to identify specific ranges, model numbers, sizes, and other pertinent data. Submit printed manufacturer's technical product data for each control device furnished, indicating dimensions, capacities, performance characteristics, electrical characteristics, finishes of materials and including printed installation instructions and start-up instructions.
    d. Unless specifically called for otherwise, provide bound copies of catalog cuts for standard products, not requiring specifically prepared Shop Drawings, for the following:
        1) Wire and Cable, Class II
        2) Face Plates for Devices
        3) Disconnect Switches for Power Control
    e. Where more than one item, size, rating or other variations appear on a catalog cut sheet, clearly identify items to be provided. These items to be properly indexed and referenced to identification numbers, designations and/or details on the Drawings.

6. Shop Drawings: Submit shop drawings for each controlled system, depicting the following information:
    a. Schematic flow diagram of system showing fans, pumps, coils, dampers, valves and other control/monitoring devices.
    b. Label each control device with initial setting or adjustable range of control. Label points in schematic diagrams with termination at corresponding controller.
    c. Electrical Wiring: Clearly differentiate between portions of wiring that are factory installed and portions of be field-installed.
    d. Details of control panel faces, including controls, instruments, and labeling.
    e. Interfaces to equipment furnished under other Specification Sections identifying numbers of wires, termination location, voltages and pertinent details. Responsibility for each end of the interfaces to be noted on these drawings whether or not they are a part of this Section.
    f. System architecture diagram showing the global connectivity of new controllers and any existing systems that will be connected to.
7. Equipment locations, wiring and piping schematics, details, panel configurations, sizes, damper motor mounting details, valve schedules, and a points list keyed to specific hardware submittals. Control wiring depicted as fully annotated ladder diagrams with terminations identified, completely configured as to the exact panel, wiring, relay, switch, and component configuration.
8. Tag Number Lists: Develop instruments tag number system and submit list for approval. Coordinate methods and number block with the Owner's Authorized Representative.
9. Format the Shop and Field Drawings to Include:
    a. A Title Sheet containing a drawing list, abbreviations list, symbols list, site and vicinity maps for project location and schedules.
    b. Floor Plans showing proposed device locations and device nomenclatures.
    c. A Riser Diagram illustrating conduit relationships between devices shown on the Floor Plans. Show device nomenclatures.
    d. A Single-Line Diagram for each system showing signal relationships of devices within the system. Show device nomenclatures.
    e. A Wiring Diagram for each assembly, enclosure or free standing device, showing:
        1) The Devices Within
        2) Wiring Connections
        3) Wire Identification
        4) Voltage Levels
        5) Fuse Ratings
    f. Operations and Maintenance Manuals:
        1) Following approval of Shop Drawings of control equipment and prior to acceptance of control work, prepare Operating and Maintenance manuals describing operating, servicing, and maintenance requirements of control systems and equipment installed under this Section, in accordance with the General and Special Conditions of these Specifications.
        2) Information contained in the manual for the above equipment to include the following:
            a) Manufacturer's catalog cuts and printed descriptive bulletins.
            b) Manufacturer's installation, operating, and maintenance instruction booklets. Complete instructions regarding the operation and maintenance of equipment involved.
            c) Instrument calibration certificates.
            d) Parts list and costs.
            e) Complete nomenclature of replaceable parts, list of recommended spare parts for 12 months operation, their part numbers, current cost and name and address of the nearest vendor of replacement parts.

f) Name, address and telephone number for closest source of spare parts.
g) Wiring and schematic diagrams.
h) Include final record copies of shop drawings.
i) Copy of guarantees and warranties issued for the various items of equipment, showing dates of expiration.
j) Reduced plans, diagrams, and control schematics.
k) Copies of test results.
l) Control System Operating Manual including: point of summary and point data base; complete printout of program listings; magnetic tape CD or DVD backup of Field Control Cabinet programs; cabinet layout; hard copy of graphic screens; hard copy of specified reports.

g. A final Bill of Quantities including a separate schedule for portable equipment, if delivered as part of this work.
h. Performance, Test and Adjustment Data: Comprehensive documentation of performance verification according to parameters specified in these specifications.
i. Record Drawings: Comply with Division 01, General Requirements and Section 23 00 00, HVAC Basic Requirements. Provide complete as-built submittals including "as-programmed" sequence of operation as well as final occupancy schedules.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. Installer Qualifications: Company specializing in performing work of the type specified in this Section with minimum five years' experience in the local area. Installers required to have successfully completed manufacturer's control system factory training.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.7 SYSTEM DESCRIPTION

A. Control system referenced throughout specifications and drawings as Building Automation System (BAS), Building Management System (BMS), or Energy Management System (EMS) interchangeably consists of high-speed, peer-to-peer network of DDC controllers, control system server, and operator workstation.

B. System software based on server/thin-client architecture, designed around open standards of web technology. Control system server accessed using a web browser over control system network, Owner's local area network, and remotely over Internet (through Owner's LAN). Intent of thin-client architecture is to provide operators complete access to control system via web browser. No special software other than web browser required to access graphics, point displays, and trends.

C. Local Area Network (LAN) either 10 or 100 Mpbs Ethernet network.

D. System will consist of open architecture that is capable of:

1. High speed Ethernet communication using TCP/IP protocol.
2. Native BACnet communications according to ANSI / ASHRAE Standard 135, latest edition. Provide necessary BACnet-compliant hardware and software to meet the system's functional specifications. Controller devices must be BTL tested and listed by an official BACnet Testing Laboratory and have the BTL mark issued.

E. Complete temperature control system to be DDC with electronic sensors and electronic/electric actuation valves and dampers.

F. Prepare individual hardware layouts, interconnection drawings, building riser/architecture diagram and sequence of control from the project design data. Any architecture diagrams on design drawings have been included as schematics only and are not meant to portray quantity of devices or power/data requirements.

G. Design, furnish, and install equipment cabinets, panels, data communication network infrastructure (including cables, conduits, outlets, connections, etc.) needed, and associated hardware.

H. Provide complete manufacturer's specifications for items that are supplied. Include vendor name and model number of every item supplied.

I. Provide a comprehensive operator and technician training program as described in these Specifications.

J. Provide as-built documentation, operator's terminal software, diagrams, and other associated project operational documentation (such as technical manuals) on approved media, the sum total of which accurately represents the final system.

K. Provide 120V power, low voltage power, transformers, etc. for control panels, transformer panels, and BAS devices. Install per Division 26, Electrical Specifications. Power for devices within this Specification Section is solely the responsibility of the BAS Contractor.

L. Conduit and raceway systems. Provide per Division 26, Electrical Specifications.

M. Devices, components, controllers, and software to be manufacturer's most current version at the time of installation.

1.8 SYSTEM PERFORMANCE

A. Performance Standards - System conforms to following minimum standards over network connections:

1. Graphic Display: Graphic with 20 dynamic points display with current data within 10 seconds.
2. Graphic Refresh: Graphic with 20 dynamic points update with current data within 8 seconds.
3. Object Command: Devices react to command of binary object within 2 seconds. Devices begin reacting to command of analog object within 2 seconds.
4. Object Scan: Data used or displayed at controller or workstation have been current within previous 6 seconds.
5. Alarm Response Time: Object that goes into alarm is annunciated at workstation within 45 seconds.

6. Program Execution Frequency: Custom and standard applications are capable of running as often as once every 5 seconds. Select execution times consistent with mechanical process under control.
7. Performance: Programmable controllers are able to completely execute DDC PID control loops at frequency adjustable down to once per second. Select execution times consistent with mechanical process under control.
8. Multiple Alarm Annunciation: Each workstation on network receive alarms within 5 seconds of other workstations.

B. Reporting Accuracy: System reports values with minimum end-to-end accuracy listed in Reporting Accuracy Table below.

1. Reporting Accuracy Table:

Measure Variable	**Reported Accuracy**
Space Temperature	Plus or Minus 1 degree F
Ducted Air	Plus or Minus 1 degrees F
Outside Air	Plus or Minus 2 degrees F
Dew Point	Plus or Minus 3 degrees F
Water Temperature	Plus or Minus 1 degree F
Delta-T	Plus or Minus 0.25 degree F
Relative Humidity	Plus or Minus 5 percent RH
Water Flow	Plus or Minus 2 percent of full scale

2. Note 1: Accuracy applies to 10 percent-100 percent of scale
3. Note 2: For both absolute and differential pressure
4. Note 3: Not including utility-supplied meters

C. Control Stability and Accuracy. Control loops maintain measured variable at setpoint within tolerances listed in Control Stability and Accuracy Table below.

1. Control Stability and Accuracy Table:

Controlled Variable	**Control Accuracy**	**Range of Medium**
Air Pressure	Plus or minus 0.2 inch wg	0-6 inch wg
	Plus or minus 0.01 inch wg	-0.1 to 0.1 inch wg
Airflow	Plus or minus 10 percent of full scale	
Space Temperature	Plus or minus 2.00 degrees F	
Duct Temperature	Plus or minus 3.0 degrees F	
Humidity	Plus or minus 5 percent RH	
Fluid Pressure	Plus or minus 1.5 PSI	1-150 PSI
	Plus or minus 1.0 inch wg	0-50 inch wg differential

PART 2 - PRODUCTS

2.1 WASHINGTON MANUFACTURERS

A. Distech Controls

B. ATS Automation

C. Delta Controls/Ainsworth

D. Duct/Spot-Type Smoke Detectors (Project with Fire Alarm System):

1. See Division 28 for Products.

2.2 COMMUNICATIONS

A. Each controller to have communication port for connection to operator interface.

1. Internetwork operator interface and value passing to be transparent to internetwork architecture.
2. Operator interface connected to controller to allow operator to interface with each internetwork controller as if directly connected. Controller information such as data, status, reports, system software, and custom programs to be viewable and editable from each internetwork controller.

B. Inputs, outputs, and control variables used to integrate control strategies across multiple controllers to be readable by each controller on internetwork.

C. Operator Workstation to be capable of simultaneous direct connection and communication with BACnet/IP, OPC and TCP/IP networks without use of interposing devices such as PC or gateway with hard drive.

D. Workstations, Building Control Panels and Controllers with real-time clocks use time synchronization service. System automatically synchronizes system clocks daily from operator-designated device via internetwork. System automatically adjusts for daylight saving and standard time as applicable.

E. Wireless Network Communications:

1. Wireless communications take place using modular wireless transceivers at each device, which eliminates need for communication cabling.
2. Wireless transceiver utilizes 2.4 GHz in license free global Industrial Scientific and Medical (ISM) band.
3. Wireless transceiver is encased in plenum-rated enclosure. If application dictates, wireless transceiver is able to be installed in metal enclosure utilizing remote mounted antenna.
4. Wireless transceiver channel is factory set and capable of being field set to different channel if interference with IEEE 802.11 devices or other 2.4 GHz products is encountered.
5. Wireless transceiver is 24 VAC powered.
6. Wireless transceiver gives a visual indication that it is powered and communicating.
7. Wireless transceiver has a field-settable network identifier that allows multiple networks to occupy same channel for maximum scalability.

2.3 OPERATOR INTERFACE

A. Operator Interface: PC-based workstations reside on high-speed network with building controllers. Each workstation or each standard browser connected to server is able to access system information.

B. Hardware: Each operator workstation or web server consists of the following:

1. Computer: Hardware meets or exceeds DDC system manufacturer's recommended specifications and meet response times specified elsewhere in this document. Following hardware requirements also apply:
   a. Hard disk have sufficient memory to store:
      1) Required operator workstation software.
      2) One year of trend data based on points specified to be trended at specified trend intervals.
   b. Minimum hardware configuration includes:
      1) Intel i7 Processor
      2) 22-in LCD Monitor with at least 1024 x 768 Resolution
      3) 8 GB of RAM
      4) 48x CD-RW/DVD Optical Drive
      5) 1 TB Hard Disk Drive Providing Data at 3 GB/sec
      6) Ethernet 10/100 Network Interface Card
      7) High Performance Graphics Card
      8) Keyboard and Mouse
      9) Color Inkjet Printer
      10) UPS (uninterruptible power supply) installed at server, sized with sufficient capacity to allow full operation for 10 minutes or more.
2. Portable Operator's Terminal: Portable Operator's Terminal capable of accessing system data. This device may be connected to any point on system network or to any controller for programming, setup, and troubleshooting. Portable Operator's Terminal is IBM-compatible notebook-style PC including software and hardware required. PC contains at minimum:
   a. Intel i5 Processor
   b. 15-in LCD Monitor with at least 1024 x 768 Resolution
   c. 8 GB of RAM
   d. 1 TB Hard Drive
   e. Touch-Pad or Other Internal Pointing Device
   f. High-Performance Graphics Adapter
   g. Ethernet 10/100 Network Interface Card
   h. Integrated Wireless 802.11 b/g/n
   i. Serial Port and CD/RW-ROM

C. System Software:

1. Operating System: Furnish concurrent multi-tasking operating system. Operating system also supports use of and includes other common software applications such as Microsoft Excel, Word, Microsoft Access and Adobe Acrobat. Acceptable operating systems are Windows 10 and Windows 11.
2. Dynamic Color Graphics:
   a. Real-time color graphic displays dynamic and able to update displays.
   b. Provide operator ability to change values (setpoints) and states in system controlled equipment directly from graphic display.
   c. Custom Graphics. Provide custom graphics generation package.

d. Graphics Library. Furnish library of standard HVAC equipment graphics and include standard symbols for fans, pumps, coils, valves, piping, dampers, and ductwork.

3. Software to be manufacturer's most current version at the time of installation.

D. System Applications: Each workstation provides operator interface and offline storage of system information. Provide following applications at each workstation:

1. Automatic System Database Save and Restore: Each workstation stores on hard disk copy of current database of each Building Controller. This database automatically updated whenever change is made in any system panel.
2. Manual Database Save and Restore: System operator able to manually save or clear database and initiate download of specified database from/to any panel.
3. System Configuration: Workstation software provides method of configuring system to allow for changes or additions by users and performs following tasks:
   a. Create, delete or modify control strategies.
   b. Add/delete objects to system.
   c. Tune control loops through adjustment of control loop parameters.
   d. Enable or disable control strategies.
   e. Generate hard copy records of control strategies on printer.
   f. Select points to be alarmed and define alarm state.
   g. Select points to be trended and initiate automatic recording of values.
   h. Start/Stop binary objects and adjust analog objects.
4. Security: Operator required to log on to system with user name and password in order to view, edit, add, or delete data. System security selectable for each operator.
5. System Diagnostics: System automatically monitor operation of workstations, printers, modems, network connections, building management panels, and controllers. Failure of any device to be annunciated.
6. Alarm Indication and Handling:
   a. Workstation provides visual means of alarm indication. Alarm indication becomes highest priority regardless of application(s) running.
   b. System provides and archive log of alarm messages to hard drive. Alarm messages to include description of event-initiating object, source, location and time/date of alarm.
7. Trend Logs: Operator able to define custom trend log for any data object and include interval, start time, and stop time. Trend data sampled and stored on building controller panel, is archived on hard disk, and is retrievable for use in spreadsheets and standard database programs.
   a. System server to periodically gather historically recorded data stored in the building controllers and archive the information. Archived files to be appended with new sample data, allowing samples to be accumulated.
   b. Software to be included that is capable of graphing the trend logged object data. Software capable of creating two-axis (x,y) graphs that display object values relative to time.
   c. Operator able to change trend log setup information. This includes the information to be logged as well as the interval at which it is to be logged. Input, output, and value object types in the system may be logged. Provide operations password protected. Setup and viewing may be accessed directly from any graphics on which object is displayed.

d. BAS Contractor to enable trending for any system points (physical or virtual) as directed by the Engineer, Owner or Cx Authority (Commissioning Authority). There will be no limit on the number of trended points the BAS Contractor is to set up. BAS Contractor will modify trend setup parameters as directed by the Commissioning Authority during testing. BAS Contractor to be proactive and enable trending for major system points during system startup/programming. BAS Contractor is not to wait for direction to begin trending points. Trend data for each point to be archived on the main server for a minimum of one year. Trend data archiving to be enabled immediately upon trend setup, or as soon as communication between the field panel and sever is established. Trend data uploads from field panel to server set up to be automatically performed with sufficient frequency to ensure no data gaps or loss of trend data.
e. Trend points as identified in the points list. Provide system specific trend data in two-axis (x,y) graphs that display object values relative to time to Engineer, Owner, or Commissioning Authority.

8. Standard Reports: Standard system reports provided for this project. Provide ability for Owner to readily customize these reports for this project:
   a. Objects: System (or subsystem) objects and their current values.
   b. Logs:
      1) Alarm History
      2) System Messages
      3) System Events
      4) Trends
9. Electrical and Weather Report:
   a. System server capable of periodically gathering energy log data stored in the field equipment and archive the information. Archive files appended with new data, allowing data to be accumulated.
   b. Operator able to change the energy log setup information as well. This includes the meters to be logged, meter pulse value, and the type of energy units to be logged. Meters monitored by the system may be logged.
   c. System to display archived data in tabular format form for both consumption and peak values. Data shown in hourly, daily, weekly, monthly and yearly formats. In each format the user shall be able to select a specific period of data to view.
   d. Electrical Meter Report: Provide monthly report showing daily electrical consumption and peak electrical demand with time and date stamp for each building meter and for each electrical sub-meter on individual building panels, circuits, equipment (such as chillers), and variable frequency drives. Provide an annual (12-month) report showing monthly electrical consumption and peak electrical demand with time and date stamp for each individual meter.
   e. Weather Data Report: Provide monthly report showing daily minimum, maximum, and average outdoor air temperature (dry bulb, wet bulb) and humidity. Provide annual (12-month) report showing minimum, maximum, and average outdoor air temperature for month.

E. Interfaces to Third Party Systems: BAS connects to third party systems (VFDs, heat pumps, emergency generators, rooftop AC units, etc.). Communication protocol specified for third party system, and BAS provides compatible protocol to assure proper two way communication. Points, alarms, and commands displayed on BAS as indicated.

F. Workstation Applications Editors: Each PC workstation supports editing of system applications, which downloaded and executed at one or more controller panels.

2.4 CONTROLLER SOFTWARE

A. Furnish following applications software for building and energy management. Software applications reside and operate in system controllers. Software to be manufacturer's most current version at the time of installation. Software and associated functions (scheduling, optimum start/stop, etc.) noted in this specification are to be configured and enabled for this project. Incorporate into sequence of operation submittals for review prior to installation.

B. System Security:

1. User access secured using individual security passwords and user names.
2. Restrict user passwords to objects, applications, and system functions as assigned by system manager. Provide monitoring only access to Engineer of Record and Commissioning Authority for period of one year for trouble shooting purposes.
3. Record user Log On/Log Off attempts.
4. Provide passwords, user names, and access assignments adjustable at the operator's terminal. Each user to have a set security level, which defines access to displays and individual objects the user may control. System to include ten separate and distinct security levels for assignment to users.
5. System to include an Auto Logout Feature that will automatically logout user when there has been no keyboard or mouse activity for a set period of time. Time period to be adjustable by System Administrator. Auto Logout may be enabled and disabled by System Administrator. Operator terminal to display message on screen that user is logged out after Auto Logout occurs.

C. Scheduling: Provide capability to schedule each object or group of objects in system. Coordinate schedule with Owner and program accordingly. Each schedule consists of:

1. Operator's workstation to show information in easy-to-read daily format. Priority for scheduling: Events, holidays and daily with events being the highest.
2. Holiday and special event schedules to display data in calendar format. Operator able to schedule holidays and special events directly from these calendars.
3. Operator able to change information for a given weekly or exception schedule if logged on with the appropriate security access.

D. Optimum Start/Stop: Provide software and program system to start equipment on sliding schedule based upon indoor and outdoor conditions. Determine minimum time of HVAC system operation needed to satisfy space environmental requirements and also determine earliest possible time to stop mechanical systems (i.e. shut down cooling/heating and only provide ventilation one hour prior to scheduled unoccupied period). Optimum start/stop program operates in conjunction with scheduled start/stop and night setback programs.

E. Alarms:

1. Operator's workstation to provide visual means of alarm indication. The alarm dialog box to always become the top dialog box regardless of the application(s), currently running.
2. System to provide log of alarm messages. Alarm log to be archived to the hard disk of the system operator's terminal. Each entry to include a description of the event-initiating object generating the alarm. Entry to include time and date of alarm occurrence.
3. Alarm messages in user-definable text and entered either at the operator's terminal or via remote communication.
4. Each binary object set to alarm based on operator-specified state.
5. Each analog object is to have both high and low alarm limits.

6. Alarms must be able to be automatically and manually disabled.
7. Alarms are routed to appropriate workstations based on time and other conditions. An alarm is able to start programs, print, be logged in event log, generate custom messages, and display graphics.
8. System have ability to dial out in event of alarm.
9. Alarm Levels:
    a. Provide 5 levels of alarm as follows, and program alarm levels for every required and specified alarm:
        1) Level 1: Critical/life safety.
        2) Level 2: Significant equipment failure.
        3) Level 3: Non-critical equipment failure/operation.
        4) Level 4: Energy conservation monitor.
        5) Level 5: Maintenance indication, notification.
    b. Prior to training of Owner's Authorized Representative, submit the complete Points List and suggested Alarm Levels to the Owner.
    c. During training of Owner's Authorized Representative(s):
        1) Discuss Alarm Levels and the alarms currently included in the BAS.
        2) Provide additional alarms without addition of new hardware points, as required by Owner's Authorized Representative.
        3) Agree with the Owner's Authorized Representative on action(s) to be taken for each alarm level and implement same for each alarm. Said action to include visual and/or audible alarm(s) at the Operator workstation including whether Operator acknowledgement is required or not, email messages, and text messages.

F. Demand Limiting:

1. System to include demand limiting program that includes two types of load shedding. One type of load shedding to shed/restore equipment in binary fashion based on energy usage when compared to shed and restore settings. The other type of shedding to adjust operator selected control setpoints in an analog fashion based on energy usage when compared to shed and restore settings. Shedding may be implemented independently on each and every zone or piece of equipment connected to system.
2. Status of each and every load shed program capable of being displayed on every operator terminal connected to system. Status of each load assigned to an individual shed program displayed along with the description of each load.
3. Demand-limiting program monitor building power consumption from signals generated by pulse generator (provided by BAS contractor) mounted at building power meter or from watt transducer or current transformer attached to building feeder lines.
4. Demand-limiting program predicts probable power demand so that when demand exceeds demand limit, action will be taken to reduce loads in predetermined manner. When demand limit will not be exceeded, action will be taken to restore loads in predetermined manner.

G. Maintenance Management: System monitors equipment status and generate maintenance messages based upon user-designated run-time, starts, and/or calendar date limits. Coordinate settings with Owner.

H. Sequencing: Provide application software based upon sequences of operation specified to properly sequence designated systems. Provide points to achieve specified sequences.

I. Staggered Start: This application prevents controlled equipment from simultaneously restarting after a power outage. Order in which equipment (or groups of equipment) is started, along with time delay between starts to be user-selectable.

J. Energy Calculations: Provide software to allow instantaneous power (e.g. kW) or flow rates (e.g. L/s (gpm)) to be accumulated and converted to energy usage data.

K. Anti-Short Cycling: Binary output objects protected from short cycling by allowing minimum on-time and off-time to be selected.

L. On/Off Control with Differential: Provide algorithm that allows binary output to be cycled based on controlled variable and setpoint. Algorithm direct-acting or reverse-acting and incorporate adjustable differential.

M. Run-Time Totalization: Provide software to totalize run-times for binary input objects.

2.5 WEB BASED ACCESS

A. General Description: BAS supplier to provide web-based access to the system as part of standard installation. Provide access to user of displays of real-time data that are part of the BAS via a standard web browser. Web browser to tie into the network via Ethernet network connection. Provide web-page host that resides on the BAS network. Web page software not to require a per user licensing fee or annual fees. The web page host must be able to support at least 50 simultaneous users with the ability to expand the system to accommodate an unlimited number of users. Software to be manufacturer's most current version at time of installation.

B. Browser Technology: Browser to be standard version of Microsoft Edge (latest edition). No special vendor-supplied software needed on computers running browser. Displays viewable and the web page host to directly access real-time data from the BAS network. Data displayed in real time and update automatically without user interaction. User able to change data on displays if logged in with the appropriate user name and password.

C. Display of Data: Webpage graphics shown on browser to be replicas of the BAS displays. User is to need no additional training to understand information presented on Web pages when compared to what is shown on BAS displays. Web page displays to include animation just as BAS displays. Fans to turn, pilot lights to blink, and coils to change colors, and so on. Real-time data shown on browser web pages. This data must be directly gathered via the BACnet network and automatically updated on browser webpage displays without any user action. Data on the browser to automatically refresh as changes are detected without re-drawing the complete display. User to be able to change data from browser web page to if the user is logged on with the appropriate password. Clicking on a button or typing in a new value to change digital data. Using pull-down menus or typing in a new value to change analog data. Data displays navigated using pushbuttons on the displays that are simply clicked on with the mouse to select a new display. Alternatively, the standard back and forward buttons of the browser can be used for display navigation.

D. Web Page Generation: Web pages generated automatically from the BAS displays that reside on the BAS server. User to access web page host via the network and initiate a web page generation utility that automatically takes the BAS displays and turns them into web pages. The web pages generated are automatically installed on the web page host for access via any computer's standard browser. Any system that requires use of an HTML editor for generation of web pages will not be considered.

E. Password Security and Activity Log: Access via web browser to utilize the same hierarchical security scheme as BAS system. User asked to log in once the browser makes connection to web page host. Once the user logs in, any changes that are made are to be tracked by the BAS system. User shall be able to change only those items that the user has authority to change. A user activity report to show any activity of the users that have logged in to the system regardless of whether those changes were made using a browser or via the BAS workstation.

F. Communication: Web-page host to communicate using the specified protocol standard to devices on the BAS network.

2.6 BAS GRAPHICS

A. Develop customized graphics showing the project building(s) and their floor plans, mechanical and electrical equipment, flow and control diagrams, and other relevant features on Workstation graphic screens. Associated input, output, and virtual objects (e.g., temperature and pressure setpoints) listed in the Sequence of Operation, and shown on the Input/Output Objects List included in the graphic screens and bound to the database. Real-time value of objects updated on the display of each graphic automatically. For projects where existing campus and/or building controls systems exist, replicate graphics used in the existing BAS graphics screens.

B. Graphics to have links to the Print function and to display a Standard Legend in the corner of the graphic. Graphics, except pop-ups, to have the date and time displayed in the upper corner of the graphic. Each graphic titled.

C. Weather: Graphics, except pop-ups, to have the outdoor temperature and humidity in the upper corner of the graphic.

D. Alarms: System and component summary alarms located near the top of each relevant graphic screen. Provide links to the associated system/component as part of these tags to assist trouble shooting. Other alarms placed near the associated system/device as depicted in the graphic. Provide text and color of information tags that describe each object and alarm value consistent with a graphics color legend.

E. The following graphics provided as a minimum:

1. A building graphic, typically a photograph of the building, with links to each floor plan and other links as defined below.
2. A central plant graphic with equipment (chillers, boilers, pumps, heat exchangers, storage tanks, etc.), temperature sensors, pressure sensors, flow sensors and refrigeration leak detectors. The central plant graphic to have links to each building on the campus.
3. Central equipment such as air handler, package rooftop equipment, supply fans, exhaust fans, and smoke control systems.
4. Floor plans of each floor, with temperature sensors, pressure sensors, temperature control zones, heating/cooling zones, ventilation zones, and supply air zones identified. Rooms grouped on a graphic only to the extent that detailed and complete sensing information can be comfortably viewed by an operator and the bound points updated in less than 10 seconds. Each zone to have a temperature symbol that changes color over the range from low (blue) through normal (green) to high (red) and indicate an alarm (flashing red). The zone temperature and or pressure symbol(s) to be a link to a zone control pop-up graphic. Individual floor plan graphics to provide links to related mechanical systems. The mechanical room plan graphics to show the relative location of, and provide links to, either the equipment pop-up or flow and control graphic for mechanical equipment monitored or controlled by the BAS.

5. Pop-up graphics provided for each zone control system showing a flow diagram and related monitoring and control points and system parameters. Pop-up graphics provided for each piece of equipment that is not shown on a flow and control graphic.
6. Flow and control diagrams for each system including but not limited to fan coils, generators, packaged equipment, heating hot water systems, heat exchangers, pumps, storage tanks, combination fire and smoke damper status, and ventilation systems. The flow and control graphics to have parameters grouped in the lower portion of the graphics. Standard equipment graphics used. Pumps, fans, dampers and other elements to dynamically indicate their state (i.e. pumps and fans to rotate when on and damper positions to dynamically adjust and be shown in their current position, etc.). System flow and control graphics displayed in a general left to right flow or loop arrangement. Return and exhaust air flow shown on top and return water shown on the bottom of the graphic.
7. Individual equipment/component screens showing sensing and control information available for each device provided.

F. Penetration: The graphic interface to consistently apply a convention whereby a left-click to always penetrate to more detailed information. The text windows to represent the deepest level of penetration. A right-click to always produce a menu of options that are specific to the item selected.

G. Navigation: Graphics organized to provide a "branching structure" that allows an operator to move from a "macro view" to a "micro view" and return. These links to other associated graphics, or allow a return to a previous macro view, provided and arranged horizontally along the bottom of each graphic screen. From left to right, the graphic links as follows: site/building map, building/trailer floor plans, and major mechanical systems at each building. Pop-up right click menus provided as needed on the lower button bar to allow for uncluttered navigation.

H. Clutter Minimization: Each graphic to have separate check boxes in the lower right corner that show/hide setpoints, alarms/safeties, and devices/equipment.

I. Templates: To the maximum extent possible, use standard graphics as templates to provide a consistent look throughout the interface.

J. Color Scheme: The graphics to use dynamic color changes to communicate equipment type, or object status consistent with the graphics color legend.

K. Symbols and Animations: Fans, pumps, dampers, coils, and generation equipment to be dynamic symbols indicating rotation, state, or position, movement, flow, etc.

L. Macros: When macros are used to add functionality to the graphics, detailed documentation provided.

M. Configure Mode: Access to “Configure Mode” for editing of the graphics password protected to prevent unauthorized changes to the graphics. This password supplied to the appropriate personnel.

N. Graphics Version: Graphics provided in the most current format available at time of control system programming.

O. Points and graphics checked for the proper binding and graphic programming, settings to ensure that the correct system, location, point values and dynamics are shown in the proper location and rotate in the proper directions.

P. After graphics have been accepted, provide, on a CD ROM in an agreed upon file structure. If the graphics have active-x controls or other files that must be placed outside the graphics folder structure a set-up program provided on the disk to place the files in the correct locations.

2.7 BUILDING CONTROLLERS

A. General: Provide adequate number of building controllers to achieve performance specified. Panels to meet the following requirements.

1. Building Automation System (BAS) to be composed of one or more independent, stand-alone, microprocessor-based building controllers to manage global strategies described in Controller Software article.
2. Provide sufficient memory to support operating system, database, and programming requirements.
3. Share data between networked building controllers.
4. Distributed controllers to share real and virtual object information and allow for central monitoring and alarms.
5. Controllers that perform scheduling have real-time clock.
6. Continually check status of its processor and memory circuits and if abnormal operation is detected, controller:
   a. Assume predetermined failure mode.
   b. Generate alarm notification.
7. Building Controller communicates with other devices on internetwork including BACnet communications according to specified protocol.

B. Communication:

1. Each building controller resides on network using ISO 8802-3 (Ethernet) Data Link/Physical layer protocol and performs routing to network of custom application and application specific controllers.
2. Controller provides a service communication port for connection to a portable operator's terminal.

C. Environment:

1. Controllers used outdoors and/or in wet ambient conditions mounted within NEMA waterproof enclosures and rated for operation at 0 degrees F to 150 degrees F.
2. Controllers used in conditioned space are mounted in NEMA dust-proof enclosures and rated for operation at 32 degrees F to 120 degrees F.

D. Keypad: Local keypad and display to be provided for each controller. Security password to be available to prevent unauthorized use of keypad and display.

E. Serviceability: Provide diagnostic LEDs for power, communication, and processor. Wiring connections are made to modular terminal strips or to termination card connected by ribbon cable.

F. Memory: Building controller maintains BIOS and programming information in event of power loss for at least 72 hours.

G. Immunity to power and noise: Controller able to operate at 90 percent to 110 percent of nominal voltage rating and performs an orderly shutdown below 80 percent nominal voltage. Operation protected against electrical noise of 5 to 120 Hz and from keyed radios up to 5 W at 3-feet.

H. Controller to have a battery to provide power for orderly shutdown of controller and storage of data in nonvolatile flash memory. Battery backup to maintain real-time clock functions for a minimum of 10 days.

2.8 APPLICATION SPECIFIC CONTROLLERS

A. Application specific controllers (ASCs) are microprocessor-based DDC controllers, which through hardware or firmware design, are dedicated to control a specific piece of equipment. Controllers to be fully programmable using graphical programming blocks.

1. ASC controllers communicate with other devices on internetwork.
2. Each ASC capable of stand-alone operation without being connected to network.
3. Each ASC will contain sufficient I/O capacity to control target system.
4. Application controllers to include universal inputs with minimum 10-bit resolution that accept thermistors, 0-10VDC, 0-5 VDC, 4-20 mA and dry contact signals. Any input on a controller may be either analog or digital with at least 1 input that accepts pulses. Controller to also include support and modifiable programming for interface to intelligent room sensor with digital display. Controller to include binary and analog outputs on board. Provide analog outputs switch selectable as either 0-10VDC or 0-20mA. Software to include scaling features for analog outputs. Application controller to include 24VDC voltage supply for use as power supply to external sensors.
5. Program sequences stored on board application controller in EEPROM. No batteries needed to retain logic program. Program sequences executed by controller 10 times per second and capable of multiple PI and PID loops for control of multiple devices. Calculations completed using floating-point math and system to support display of information in floating-point nomenclature at operator's terminal. Programming of application controller completely modifiable in the field over installed BAS LANs or remotely via modem interface. Operator to program logic sequences by graphically moving function blocks on screen and tying blocks together on screen.
6. Application controller to include support for room sensor. Display on room sensor programmable at application controller and include an operating mode and a field service mode. Provide button functions and display data programmable to show specific controller data in each mode based on which button is pressed on the sensor. See sequence of operation for specific display requirements at intelligent room sensor.

B. Communication:

1. Controller resides on network using MS/TP Data Link/Physical layer protocol.
2. Each controller connected to building controller.
3. Each controller capable of connection to laptop computer or portable operator's tool.

C. Environment:

1. Controllers used outdoors and/or in wet ambient conditions mounted within NEMA waterproof enclosures and rated for operation at 0 degrees F to 150 degrees F.
2. Controllers used in conditioned space mounted in NEMA dust-proof enclosures and rated for operation at 32 degrees F to 120 degrees F.

D. Serviceability: Provide diagnostic LEDs for power, communication, and processor.

E. Memory: ASC use nonvolatile memory and maintains BIOS and programming information in event of power loss.

2.9 ADVANCED APPLICATION CONTROLLERS

A. General:

1. Expandable application controller capable of providing control strategies for the system based on information from any connected inputs. Provide program implementing these strategies completely flexible and user definable. Provide program execution of controller a minimum of once per second.
2. Programming: Object-oriented using control program blocks. Controller to support a minimum of 500 Analog Values and 500 Binary Values. Each and every analog and binary value to support standard specified protocol priority arrays.
3. Provide means to graphically view inputs and outputs to each program block in real-time as program is executing. This function may be performed via the operator's terminal or field computer.
4. Controller to have adequate data storage to ensure high performance and data reliability. Battery to retain static RAM memory and real-time clock functions for a minimum of 1.5 years (cumulative). Provide field-replaceable battery (non-rechargeable) lithium type. Unused battery life: 10 years.
5. The onboard, battery-backed real time clock must support schedule operations and trend logs.
6. Global control algorithms and automated control functions should execute via 32-bit processor.
7. Controller to include both on-board Ethernet specified protocol communication over twisted pair cable (UTP) and to include specified protocol IP communication. In addition, controller to include specified protocol PTP connection port.
8. The base unit of the controller to host up to 8 expansion modules with various I/O combinations. These inputs and outputs to include universal 12-bit inputs, binary triac outputs, and 8-bit switch selectable analog outputs (0-10V or 0-20 mA). Inputs to support thermistors, 0-5VDC, 0-10VDC, 4-20mA, dry contacts and pulse inputs directly.
9. Outputs must have onboard Hand-Off-Auto switches and a status indicator light. HOA switch position to be monitored. Each analog output to include a potentiometer for manually adjusting the output when the HOA switch is in the Hand position.
10. The position of each and every HOA switch to be available system wide as a specified protocol object. Expandable Controller to provide up to 176 discreet inputs/outputs per base unit.

B. Schedules: Each controller to support a minimum of 50 Schedule Objects.

C. Logging Capabilities: Each controller to support a minimum of 200 trend logs. Any object in the system (real or calculated) may be logged. Sample time interval adjustable at the operator's workstation.

D. Alarm Generation:

1. Alarms may be generated within the system for any object change of value or state either real or calculated. This includes things such as analog object value changes, binary object state changes, and various controller communication failures.
2. Alarm log provided for alarm viewing. Log may be viewed on-site at the operator's terminal or off-site via remote communications.
3. Controller must be able to handle up to 200 alarm setups stored as event enrollment objects - system destination and actions individually configurable.

2.10 INPUT/OUTPUT INTERFACE

A. Input/output points protected such that shorting of point to itself, to another point, or to ground will cause no damage to controller. Input and output points protected from voltage up to 24 V.

B. Binary inputs (BI or DI) allow monitoring of On/Off signals from remote devices. Binary inputs sense “dry contact” closure without external power (other than that provided by controller) being applied.

C. Pulse accumulation input objects accept up to 10 pulses per second for pulse accumulation.

D. Analog inputs (AI) allow monitoring of low-voltage (0 to 10 VDC), current (4 to 20 mA), or resistance signals (thermistor, RTD).

E. Binary outputs (BO or DO) provide for On/Off operation or pulsed low-voltage signal for pulse width modulation control. Binary outputs on building and custom application controllers have three-position (On/Off/Auto) override switches and status lights. Outputs selectable for either normally open or normally closed operation.

F. Analog outputs (AO) provide a modulating signal for control of end devices. Outputs provide either a 0 to 10 VDC or a 4 to 20 mA signal as required to provide proper control of the output device. Analog outputs on building controllers have status lights and two-position (AUTO/MANUAL) switch and adjustable potentiometer for manual override. Analog outputs not exhibit drift of greater than 0.4 percent of range per year.

G. Tri-State Outputs. Provide tri-state outputs (two coordinated binary outputs) for control of three-point floating type electronic actuators without feedback. Use of three-point floating devices limited to zone control and terminal unit control applications (VAV terminal units, duct-mounted heating coils, zone dampers, radiation, etc.). Control algorithms run zone actuator to one end of its stroke once every 24 hours for verification of operator tracking.

2.11 POWER SUPPLIES AND LINE FILTERING

A. Control transformers UL listed. Furnish Class 2 current-limiting type or furnish over-current protection in both primary and secondary circuits. Limit connected loads to 80 percent of rated capacity.

B. DC power supply output match output current and voltage requirements. Unit operates between 32 degrees F and 120 degrees F.

C. Line voltage units UL listed and CSA approved.

D. Power line filtering. Provide transient voltage and surge suppression for workstations and controllers.

2.12 CONTROL PANELS

A. Control Panels:

1. Enclosures may be NEMA 1 when located in a clean, dry, indoor environment. Indoor enclosures to be NEMA 12 when installed in other than a clean environment. Outdoor enclosures must be NEMA 3R. Provide (hinged door) key-lock latch and removable subpanels. Single key common to field panels and subpanels. In existing campus or building settings, key lock to match existing keys.
2. Interconnections between internal and face-mounted devices prewired with color-coded stranded conductors neatly installed in plastic troughs and/or tie-wrapped. Terminals for field connections UL listed for 600 volt service, individually identified per control/ interlock drawings, with adequate clearance for field wiring. Control terminations for field connection individually identified per control drawings.
3. Provide ON/OFF power switch with overcurrent protection for control power sources to each local panel.
4. Provide laminated plastic nameplates for enclosures in any mechanical room or electrical room labeled with TCP number. Laminated plastic to be 1/8-inch thick sized appropriately to make label easy to read.

2.13 AUXILIARY CONTROL DEVICES

A. Temperature Instruments:

1. Low-voltage or Line-voltage Thermostats: Bimetal-actuated, snap acting SPDT contact, enclosed, UL listed for electrical rating, exposed setpoint adjustment on cover with heat anticipator. Thermostat operates within 55 degrees F to 85 degrees F setpoint range, with 2 degrees F maximum differential.
2. Room Thermostats:
   a. For packaged equipment, including direct expansion split and VRF units, provide thermostats/controllers as manufactured by packaged equipment manufacturer.
   b. Electronic BACnet Thermostat/Controller: Wall mounted, 24 VAC, LED display, up to three universal inputs, up to four outputs, dedicated temperature sensor, up to four pre-programmed control strategies, CO2, RH, temp display, and occupancy override.
3. Room Temperature Sensors: Thermistor or platinum RTD type with accuracy of plus or minus 0.5 degrees F at 70 degrees F; operating range 30-120 degrees F; linear signal; single point sensing element in wall-mounted ventilated enclosure with insulating back plate if mounted on exterior wall; plug-in portable operators terminal port.
4. Room Temperature Sensor: Thermistor or platinum RTD type with accuracy of plus or minus 0.5 degrees F at 70 degrees F; operating range 30-120 degrees F; linear signal; single point sensing element in wall-mounted ventilated enclosure with insulating back plate if mounted on exterior wall; push button for occupancy override; digital setpoint adjustment plus or minus 2 degrees F in both directions; LCD temperature display indicating setpoint only. Setpoint adjustment to revert to building programmed standard temperature upon next building occupancy schedule change (user adjustable). Room temperature sensor may have integral space carbon dioxide sensor with minimum performance characteristics identified within this specification.
5. Averaging Duct Temperature Sensors: Thermistor or platinum RTD element with accuracy of plus or minus 0.5 degrees F at 32 degrees F, consisting of array of single point sensing elements, securely mounted in duct or plenum; operating range 20-120 degrees F; linear signal; 1-foot element per 2 SF of duct cross-sectional area. Use when duct is 9 SF or larger or where air is subject to temperature stratification.
6. Probe Duct Temperature Sensors: Thermistor or platinum RTD element with accuracy of plus or minus 0.5 degrees F at 32 degrees F, consisting of single point sensing elements, securely mounted in duct or plenum; operating range 20-120 degrees F; linear signal; 24-inch rigid probe. Use where duct is less than 9 SF cross-sectional area.

7. Outside Air Temperature Sensor: Thermistor or platinum RTD element with accuracy of plus or minus 0.5 degrees F at 32 degrees F; Range -58 to 120 degrees F, single element, linear, with weather and sun shield for exterior mounting.
8. Low Temperature Limit Thermostat: Minimum 20-foot capillary sensing element, triggering on low temperature as sensed by any 12-inch segment; snap acting, normally open contacts, manual reset, line voltage.
9. Liquid Immersion Temperature Sensor: Thermistor or platinum RTD element, with accuracy of plus or minus 0.5 degrees F at 32 degrees F, stainless steel well and assembly, range 30 to 250 degrees F.

B. Humidity Sensors:

1. Space Humidity Sensors: Operating range 10 to 95 percent relative humidity, accuracy plus or minus percent RH, surface mounted ventilated enclosure for wall mounting.
2. Duct Humidity Transmitter: Capacitive type sensor and transmitter, linear output signal; automatic temperature compensating; air filter; plus or minus 2 percent RH accuracy from 0 to 100 percent RH.
3. Humidity sensor's drift not exceed 1 percent of full scale per year.

C. Dewpoint Transmitter:

1. Uninterrupted, accurate and stable dewpoint measurement in condensing environments. Provide with integral temperature sensor.
2. Calculate:
    a. Relative Humidity
    b. Absolute Humidity
    c. Difference between ambient and dewpoint temperature.
    d. Mixing Ratio of Air
    e. Wet Bulb Temperature of Air
3. Provide hand held field calibration.
4. Provide with local display and connection to BAS (analog output signal from device to BAS 4-20 mA signal).
5. Dust and Chemical Resistant.
6. NEMA 4 Housing.
7. NIST Traceable with Certificate.
8. Specifications:
    a. Dewpoint Measurement Range: -40 degrees F to 212 degrees F
    b. Response Time: 15 seconds
    c. Temperature Measurement Range: 40 degrees F to 356 degrees F
    d. Accuracy: 0.18 degrees F
    e. Typical Ranges:
        1) Relative Humidity: 0 to 100 percent
        2) Dewpoint Difference: 0 to 90 degrees F
        3) Mixing Ration: 0 to 3500 gr/lb
        4) Absolute Humidity: 0 to 262 gr/ft^3
        5) Wet Bulb Temperature: 32 degrees F to 212 degrees F
9. Manufacturers:
    a. Vaisala HMP243 with HMK41 field calibrator.
    b. Or approved equivalent.

D. Pressure Transmitters and Transducers:

1. Transducer have linear output signal; field adjustable zero and span. Sensing elements withstand continuous operating conditions of positive or negative pressure 50 percent greater than calibrated span without damage.
2. Differential Pressure Switch: Setpoint adjustable with operating range of 0.5 to 12-inch WG for fans, and 5- to 30-feet WC for pumps. Switches UL listed; SPDT snap-acting; pilot duty rated (125 VA minimum); NEMA 1 enclosure; scale range and differential suitable for intended application.
3. Filter Differential Pressure Switch: Setpoint adjustable with operating range of 0.1- to 5-inch WG; auto reset. Contactor to close when pressure differential setting is met or exceeded. Provide mounting bracket, metallic tubing and appropriate fittings for connection to duct or air-handling unit.
4. Duct Static Differential Pressure Transducer: Operating range 0- to 5-inch WC for duct mounted transmitter; ceramic capacitive sensing element with probe securely mounted in duct; digital input terminal and push button to zero output. Accuracy plus or minus 1 percent of full scale; maximum response time 2 seconds.
5. Building Static Pressure Transducer: Operating range of -0.1- to 0.1-inch WC, linear signal. Sensing tubes located inside and outside building use shielding and/or surge tanks to minimize effects of wind. Accuracy plus or minus 1 percent of full scale.
6. Piping Pressure Transmitter: Operating range 0 to 50 PSIG, linear signal; stainless steel diaphragm; digital input terminal and push button to zero output. Accuracy plus or minus 1 percent of full scale.

E. Motorized Control Dampers:

1. Performance: Maximum leakage of 3 CFM/SF at 1-inch WG differential pressure, AMCA Class 1A, maximum pressure rating of 13-inch WG differential pressure, maximum velocity of 6,000 fpm, -72 degrees F to 275 degrees F temperature rating.
2. Multi-blade type, except where either dimension is less than 10-inch single blade may be used. Maximum blade length to be 48-inch.
3. Provide parallel blades for modulating mixing service and opposed blades for throttling service.
4. Blades to be interlocking; minimum 16 gauge galvanized steel; compression type edge seals and side seating stops. In copper, aluminum and stainless steel duct work, damper material matches duct work material.
5. Damper blades are reinforced, have continuous full length axle shafts, axle to axle linkage, and/or operating “jackshafts” as required to provide coordinated tracking of blades.
6. Bearings: Self-lubricating stainless steel sleeve or Celcon bearing.
7. Dampers over 25 SF in area to be in two or more sections, with interconnected blades.
8. Provide remote damper blade position status with binary input.
9. Tested in accordance with AMCA Standard No. 500.

F. Motorized Control Valves:

1. Body pressure rating and connection type construction conforms to pipe, fitting and valve schedules.
2. Fluid valve close-off ratings and spring ranges operate at maximum flows and maximum available pump heads scheduled without leakage.
3. Screwed ends except 2-1/2-inch and larger valves with flanged ends.
4. Motorized Control Valves (Pressure Independent Control Valves):
    a. Description: Valve consists of pressure compensating cartridge, actuated ball or Y pattern globe valve, and multiple pressure/temperature test ports in a single valve housing.

b. Construction: Rated for no less than 125 PSI and 250 degrees F. 2-inch and Smaller: brass with threaded connections. 2-1/2-inch and larger: cast iron with flanged connections.
c. Performance: Flow rate controlled linearly to within 5 percent of target flow rate, for any actuator position (0 to 100 percent), over an operating differential pressure range of 6 to 50 PSI across the valve. Provide valve with integral test ports to verify pressure differential.
d. Manufacturers: Belimo, Danfoss, Flow Control Industries, Griswold, Tour and Andersson, or approved equivalent.

5. Fluid three-way valves globe valves with linear plug with composition disc for tight shutoff.
6. Pressure drop equal to twice pressure drop through heat exchanger (load), 50 percent of pressure difference between supply and return mains, or 5 PSI, whichever is greater, except two-position valves to be line size.
7. Bubble-tight line size butterfly valves acceptable on 2-1/2-inch lines and above for two-position action only; cast iron body; aluminum bronze disc; EPDM seat, 200 PSI wg.
8. For modulating service that require valve sizes above 6-inch, butterfly or v-port ball valves are allowed.

G. Electronic Pressure Independent Control Valves:

1. General: Assembly consisting of electric control valve, flow measuring station and control to provide constant flow regardless of varying pressure differentials. Flow setpoint electronically adjustable.
2. Communication: BACnet MS/TP.
3. Control Type: Modulating.
4. Fluid: Chilled or hot water, up to 60 percent glycol.
5. Materials:
   a. Valve body: Nickel plated brass (1/2-inch to 2-inch), cast iron (2-1/2-inch to 6-inch).
   b. Sensor housing: Nickel plated forged brass (1/2-inch to 2-inch), ductile iron (2-1/2-inch to 6-inch).
   c. Ball: Stainless steel.
   d. Stem: Stainless steel.
   e. Characterized disc: Tefzel (1/2-inch to 2-inch), stainless steel (2-1/2-inch to 6-inch).
6. Fluid Temperature Range: 14F to 250F.
7. Pressure Rating: 360 PSIG (1/2-inch to 2-inch), ANSI 125, Class B (2-1/2-inch to 6-inch.
8. Close-off Pressure: 200 PSID (1/2-inch to 2-inch), 100 PSID (2-1/2-inch to 6-inch).
9. Leakage: 0 percent.
10. Rangeability: 100:1.
11. Flow control tolerance: +/-5 percent.
12. Flow measurement tolerance: +/-2 percent.
13. Connections: Flanged or threaded to match piping.
14. Power Loss Fail Position: Last position.
15. Actuator: Manual override, electrically reversable.
16. Listing: UL or CSA.
17. Communication feedback: Actual flow, valve position.
18. Manufacturer: Belimo ePIV or approved equivalent.

H. Electric Damper/Valve Actuators:

1. Provide mechanical or electronic stall protection for each actuator.

2. Where indicated provide internal mechanical, spring-return mechanism or provide uninterruptible power supply (UPS). Non-spring-return actuators have external manual gear release to position damper/valve when actuator is not powered.
3. Proportional actuators accepts 0 to 10 VDC or 0 to 20 mA control signal and provide 2 to 10 VDC or 4 to 20 mA operating range.
4. Actuator sized for torque required plus 25 percent; UL or CSA listed; electronic current overload protection.
5. For system differential pressure control valves, provide fast acting valve actuator with valve open or close time of 30 to 60 seconds.
6. VAV Actuators: Actuators proportional 24 VAC actuators using a 4 to 20 mA range of control signals; stops automatically at end of travel; include permanently lubricated gear train.
7. Actuators for emergency generator damper control rated for 350 degree F. maximum operating temperature and capable to drive fully open and close within 15 seconds.

I. Room Pressure Monitor: Active room pressure monitor and alarm which provides local audio alarm and analog and alarm signals to DDC system. Wall mounted panel with LED differential pressure readout; audible and visual alarm; mute button; range of -0.05 to +0.05-inch WC; accurate to 1 percent of full scale; repeatability plus or minus 1.0 percent of full scale per year, alarm delay ability between 0-30 seconds. Provide door switch to deactivate alarm when space door(s) are open. Input status from BAS to deactivate alarm in unoccupied or shutdown modes. Phoenix Controls APM100.

J. Duct Mounted Carbon Dioxide Sensor:

1. Duct mounted CO2 sensor consists of infrared sensing element with heated stannic dioxide semiconductor. Operating range 0-2000 ppm plus 50 ppm plus 2 percent of measured value; maximum duct velocity of 1500 fpm; duct mounting kit.

K. Wall Mounted Space Carbon Dioxide Sensor:

1. Sensor to employ non-dispersive infrared technology (N.D.I.R.).
2. Sensor Repeatability: Plus or minus 20 ppm. 0-2000.
3. Sensor Accuracy: Less than or equal to 75 ppm over 0-1500 ppm range.
4. Sensor Response Time: Less than 1 minute.
5. Sensor to employ reference channel design for long-term stability.
6. Sensor to have field selectable 0-10VDC, or 4-20mA outputs.
7. Sensor power requirement less than 3W.
8. Sensor Input Voltage: 20 to 30VAC/DC.
9. Sensor Operating Temperature Range: 0 degrees C to 50 degrees C.
10. Sensor to have models for wall mounting or duct mounting.
11. Sensor to provide at least a 1-year factory warranty from date of purchase.
12. Sensor to match cover in color and look to temperature sensor.
13. Sensor to have display.
14. Manufacturers:
    a. Telaire
    b. Vaisala
    c. Veris

L. Occupancy Sensor: Dual technology infrared and ultrasonic sensing device, ceiling or wall mounted, built-in self-adjusting settings, timer settings of 30 seconds to 30 minutes, with manual and automatic modes. Provide multiple devices in parallel when area served is greater than a single device sensing capability. Provide integral power pack, 120 VAC input, 24 VDC output, with manual override switch. Leviton OSC-MOW series.

M. Paddle Type Flow Switches: Paddle type switches (water service only) UL listed, SPDT snap-acting with pilot duty rating (125 VA minimum) and have adjustable sensitivity with NEMA 1 enclosure.

N. Relays:

1. Control relays UL listed plug-in type with dust cover and LED “energized” indicator. Contact rating, configuration, and coil voltage to be suitable for application.
2. Time delay relays UL listed solid-state plug-in type with adjustable time delay. Delay adjustable plus or minus 200 percent (minimum) from setpoint or as indicated. Contact rating, configuration, and coil voltage to be suitable for application. Provide NEMA 1 enclosure when not installed in local control panel.

O. Override Timers: Override timers spring-wound line voltage, UL Listed, with contact rating and configuration as required by application. Provide 0-to-6-hour calibrated dial unless otherwise specified. Timer suitable for flush mounting on control panel face and located on local control panels or where shown.

P. Current Transmitters:

1. AC current transmitters are self-powered, combination split-core current transformer type with built-in rectifier and high-gain servo amplifier with 4 to 20 mA two-wire output. Unit range compatible with actual applied span of current value, with internal zero and span adjustment and plus or minus 1 percent full-scale accuracy at 500 ohm maximum burden.
2. Transmitter meets or exceeds ANSI/ISA S50.1 requirements and UL/CSA recognized.
3. Unit split-core type for clamp-on installation on existing wiring.

Q. Current Transformers: AC current transformers UL/CSA recognized and completely encased (except for terminals) in approved plastic material; plus or minus 1 percent accuracy at 5 A full-scale.

R. Voltage Transmitters: AC voltage; self-powered single-loop (two-wire) type; 4 to 20 mA output with zero and span adjustment; UL/CSA recognized at 600 VAC rating and meet or exceed ANSI/ISA S50.1. Ranges include 100 to 130 VAC, 200 to 250 VAC, 250 to 330 VAC, and 400 to 600 VAC full-scale, adjustable, with plus or minus 1 percent full-scale accuracy with 500 ohm maximum burden.

S. Voltage Transformers: AC voltage transformers UL/CSA recognized, 600 VAC rated; built-in fuse protection; suitable for ambient temperatures of 40 degrees F to 130 degrees F; plus or minus 0.5 percent accuracy at 24 VAC and a 5 VA load.

T. Power Monitors: Selectable rate pulse output for kWh reading; 4-20 mA output for kW reading; N.O. alarm contact; ability to operate with 5.0 amp current inputs or 0-0.33 volt inputs; plus 1.0 percent full-scale true RMS power accuracy; plus 0.5 Hz, voltage input range 120-600 V, and auto range select; NEMA 1 enclosure. Current transformers having a 0.5 percent FS accuracy, 600 VAC isolation voltage with 0-0.33 V output. If 0-5 A current transformers are provided, a three-phase disconnect/shorting switch assembly is required.

U. Overflow Switch: Insertion flow sensor, brass, impeller flow design with analog transmitter unit. Data Industrial Model 220BR.

V. Pressure-Electric (PE) Switches: Metal or neoprene diaphragm actuated; operating pressure rated 0-25 PSIG; calibrated scale setpoint range of 2-18 PSIG minimum; UL listed. Provide one- or two-stage switch action SPDT, DPST, or DPDT, as required by application. Electrically rated for pilot duty service (125 VA minimum) and/or for motor control. Permanent indicating gauge on each pneumatic signal line to PE switches.

2.14 WIRING AND RACEWAYS

A. General: Provide copper wiring, plenum cable, and raceways as specified in applicable Sections of Division 26, Electrical.

B. Insulated wire to be copper conductors, UL labeled for 90 degrees C minimum service.

C. Field panels and controllers to be supplied by building emergency power system where systems being monitored or controlled are on emergency power.

D. Run control wiring as follows:

1. Mechanical Rooms: In conduit.
2. Exposed in Building Spaces: In conduit.
3. Concealed in Building Walls and Ceilings: Plenum rated cable.
4. Concealed in Building Ceilings: Plenum rated cable in cable tray.

E. Field and Subfield Panels: Voltage in panels not-to-exceed 120 volts.

F. Motor Control Centers: Responsibility for correct voltage of holding coils and starter wiring in pre-wired motor control centers interfacing with automatic controls is included hereunder.

G. Wiring for BAS systems communications buses two conductor minimum 18 gauge foil-shielded, stranded twisted pair cable rated at 300 VDC or more than 80 degrees C.

2.15 SMOKE DETECTION (FOR PROJECTS WITH A FIRE ALARM SYSTEM)

A. See Division 28 for Products.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Prior to starting work, carefully inspect installed work of other trades and verify that such work is complete to the point where work of this Section may properly commence.

B. Notify the Owner's Authorized Representative in writing of conditions detrimental to the proper and timely completion of the work.

C. Do not begin work until unsatisfactory conditions are resolved.

3.2 CONTROL SYSTEM CHECKOUT AND TESTING

A. Testing completed before Owner's Authorized Representative is notified of system demonstration.

B. Calibrate and prepare for service of instruments, controls, and accessory equipment furnished under this specification.

C. Verify that control wiring is properly connected and free of shorts and ground faults.

D. Enable control systems and verify calibration and operation of input and output devices.

E. Verify that system operation adheres to sequences of operation.

F. Commissioning and Verification: In addition to commissioning requirements specified elsewhere, provide the following commissioning on the HVAC instrumentation and controls system:

1. Control systems completely commissioned to ensure aspects of the system are operating as intended and at optimum tuning.
2. Wiring connections verified and traced from field device to panel to ensure proper connections.
3. Measured values verified by a hand held calibrated device to validate that value indicated by the control system is in fact the actual measured value.
4. Loops properly tuned to obtain the desired control value. Each loop to be "upset" and put back in control to demonstrate its ability to stabilize quickly.
5. Provide a final point-by-point report submitted that indicates the date of each verification, the results, and initialed on each page by the person performing the reading.

3.3 ACCEPTANCE TESTING AND TRAINING

A. Site Testing:

1. Contractor provides personnel, equipment, instrumentation, and supplies necessary to perform testing. Owner or Owner's Authorized Representative will witness and sign off on acceptance testing.
2. Contractor demonstrates compliance of completed control system with Contract Documents. Using approved test plan, physical and functional requirements of project demonstrated.

B. Training:

1. General: Contractor conducts training courses for up to three other designated personnel in operation and maintenance of system. Training manuals provided for each trainee, with two additional copies provided for archival at project site. Manuals include detailed description of subject matter for each lesson. Copies of audiovisuals delivered to Owner. Training day is defined as 8 hours of classroom instruction, including two 15-minute breaks and excluding lunch time, Monday through Friday, during normal first shift in effect at training facility. Notification of any planned training given to Owner's Authorized Representative at least 15 days prior to training.

2. Operator's Training I: First course taught at supplier's facility for period of two consecutive training days. Upon completion, each student should be able to perform elementary operations with guidance and describe general hardware architecture and functionality of system.
3. Operator's Training II: Second course taught at project site for a period of one training day after completion of contractor's field testing. Course includes instruction on specific hardware configuration of installed system and specific instructions for operating installed system. Upon completion, each student should be able to start system, operate the system, recover system after failure, and describe specific hardware architecture and operation of system.
4. Operator's Training III: Third course taught at project site for period of one training day no later than six months after completion of the acceptance test. Course will be structured to address specific topics that students need to discuss and to answer questions concerning operation of system. Upon completion, students should be fully proficient in system operation and have no unanswered questions regarding operation of installed system.

3.4 COMMUNICATION WIRING

A. Follow manufacturer's installation recommendations for communication cabling.

B. Verify integrity of network following cable installation.

C. Communication wiring unspliced length when that length is commercially available; labeled to indicate origination and destination data.

D. Grounding of coaxial cable in accordance with NEC regulations article on “Communications Circuits, Cable, and Protector Grounding.”

3.5 WIRING AND RACEWAYS

A. Provide electrical wiring required to control systems specified in this Section. Control and interlock wiring complies with national, state and local electrical codes and Division 26, Electrical of this specification.

B. Power wiring required for building control panel(s) to be dedicated circuit(s).

C. Verify location of operator work station with Owner prior to installation.

D. NEC Class 1 (line voltage) wiring UL Listed in approved raceway according to NEC and Division 26, Electrical requirements.

E. Low-voltage wiring meets NEC Class 2 requirements. (Low-voltage power circuits subfused when required to meet Class 2 current limit.)

F. Where NEC Class 2 (current-limited) wires are in concealed and accessible locations, including ceiling return air plenums, approved cables not in raceway may be used provided that cables are UL listed for intended application.

G. Do not install Class 2 wiring in raceway containing Class 1 wiring. Boxes and panels containing high-voltage wiring and equipment may not be used for low-voltage wiring except for purpose of interfacing (e.g., relays and transformers).

H. Where Class 2 wiring is run exposed, wiring run parallel along surface or perpendicular to it and tied at 10 foot intervals.

I. Where plenum cables are used without raceway, support from structural members. Do not support cables with ductwork, electrical raceways, piping, or ceiling suspension systems.

J. Make wire-to-device connections at terminal block or terminal strip. Make wire-to-wire connections at terminal block.

K. Maximum allowable voltage for control wiring 24 V. If only higher voltages are available, provide step-down transformers.

L. Wiring installed as continuous lengths, with no splices permitted between termination points.

M. Install plenum wiring in sleeves where it passes through walls and floors. Maintain fire rating at penetrations.

N. Include one pull string in each raceway 1-inch or larger.

O. Control and status relays are to be located in designated enclosures. Enclosures include packaged equipment control panels unless they also contain Class 1 starters.

P. Install raceway to maintain a minimum clearance of 6-inches from high-temperature equipment (e.g., steam pipes or flues).

Q. Secure raceways with raceway clamps fastened to structure and spaced according to code requirements. Raceways and pull boxes may not be hung on flexible duct strap or tie rods. Raceways may not be run on or attached to ductwork.

R. Install insulated bushings on raceway ends and openings to enclosures. Seal top end of vertical raceways.

S. Flexible metal raceways and liquid-tight, flexible metal raceways not-to-exceed 3-feet in length and be supported at each end. In areas exposed to moisture, including chiller and boiler rooms, liquid-tight, flexible metal raceways to be used.

T. Raceway must be rigidly installed, adequately supported, properly reamed at both ends, and left clean and free of obstructions. Raceway sections joined with couplings. Terminations made with fittings at boxes.

U. Input and output terminations to be labeled at the controller to identify if they are AI, DI, AO, DO, and function (i.e. pump start, OM Sensor).

3.6 INSTALLATION OF AUXILIARY CONTROL DEVICES

A. General:

1. Install sensors and thermostats in accordance with manufacturer's recommendations.
2. Room sensors and thermostats installed at 48-inches AFF to top of sensor on concealed junction boxes properly supported by wall framing at the locations shown on the Drawings.
3. Low-limit sensors used in mixing plenums installed in a serpentine manner horizontally across duct.

4. Pipe-mounted temperature sensors installed in wells with heat-conducting fluid in thermal wells.
5. Install outdoor air temperature sensors on north facing wall or screen, complete with sun shield at designated location.
6. Chiller or Heat Pump differential pressure sensor: Locate immediately at the chiller or heat pump piping connections, before any fittings or accessories.

B. Flow Switch: Use correct paddle for pipe diameter. Adjust flow switch in accordance with manufacturer's instructions.

C. Actuators:

1. General:
   a. Mount and link control damper actuators according to manufacturer's instructions.
   b. Check operation of damper/actuator combination to confirm that actuator modulates damper smoothly throughout stroke to both open and closed positions.
2. Actuator Mounting for Damper and Valve Arrangements to Comply with the Following:
   a. Damper Actuators: Do not install in the air stream.
   b. Use a weather proof enclosure (clear and see through) if actuators are located outside.
   c. Damper or valve actuator ambient temperature not-to-exceed 122 degrees F through any combination of medium temperature or surrounding air. Provide appropriate air gaps, thermal isolation washers or spacers, standoff legs, or insulation as necessary. Mount per manufacturer's recommendations.
   d. Actuator cords or conduit to incorporate a drip leg if condensation is possible. Do not allow water to contact actuator or internal parts. Location of conduits in temperatures dropping below dew point to be avoided to prevent water from condensing in conduit and running into actuator.
   e. Damper mounting arrangements to comply with the following:
      1) Furnish and install damper channel supports and sheet metal collars.
      2) Jack shafting of damper sections not allowed.
      3) Multi-section dampers arranged so that each damper section operates individually. Provide one electronic actuator direct shaft mounted per section.
   f. Size damper sections based on actuator manufacturers specific recommendations for face velocity, differential pressure and damper type. In general: Damper section not-to-exceed 24 ft-sq. with face velocity 1500 FPM.
   g. Multiple section dampers of two or more arranged to allow actuators to be direct shaft mounted on the outside of the duct.
   h. Multiple section dampers of three or more sections wide arranged with a 3-sided vertical channel (8-inch wide by 6-inch deep) within the duct or fan housing and between adjacent damper sections. Vertical channel anchored at the top and bottom to the fan housing or building structure for support. Connect sides of each damper frame to the channels. Holes in the channel to allow damper drive blade shafts to pass through channel for direct shaft mounting of actuators. Face open side of channel downstream of the airflow, except for exhaust air dampers.
   i. Multiple section dampers to be mounted flush within a wall or housing opening to receive either vertical channel supports as described above or sheet metal standout collars. Sheet metal collars (12-inch minimum) to bring each damper section out of the wall to allow direct shaft mounting of the actuator on the side of the collar.

D. Control Valve:

1. Valves installed in accordance with manufacturer's recommendations.
2. Slip-stem control valves installed so that stem position is not more than 60 degrees from vertical up position. Ball type control valves installed with stem in horizontal position.
3. Control valves accessible and serviceable.
4. Install isolation valves so that control valve may be serviced without draining supply/return side piping system. Install unions at connections to screw-type control valves.
5. Valve Sizing for Water Coil:
    a. On/Off Control Valves: Line size.
    b. Modulating control valve body size may be reduced, at most, two pipe sizes from the line size or not less than 1/2 the pipe size. BAS contractor to size water coil control valves for the application as follows:
        1) Booster-heat valves sized not-to-exceed 4-9 PSI differential pressure. Size valve for 50 percent valve authority. Valve design pressure drop is equal to the sum of coil drop plus the balance valve drop.
        2) Primary valves sized not-to-exceed 5-15 PSI differential pressure. Size valve for 50 percent valve authority. Valve design pressure drop is equal to the sum of coil drop plus the balance valve drop.
        3) Butterfly valves sized for modulating service at 60 to 70 degree rotation. Design velocity 12-feet per second or less when used with standard EPDM seats.
    c. Valve Mounting Arrangements to Comply with the Following:
        1) Provide unions on ports of two-way and three-way valves.
        2) Install three-way equal percentage Characterized Control valves in a mixing configuration with the “A” port piped to the coil.
        3) Install 2-1/2-inch and above, three-way globe valves, as manufactured for mixing or diverting service to the coil.

E. Control Damper:

1. Dampers installed in accordance with manufacturer's instructions. Unless specifically designed for vertical blade application, dampers must be mounted with blade axis horizontal.
2. After installation of low-leakage dampers with seals, caulk between frame and duct or opening to prevent leakage around perimeter of damper.

3.7 SMOKE DETECTION (FOR PROJECTS WITH A FIRE ALARM SYSTEM)

A. Smoke detector furnished and powered/wired under Division 28, Electronic Safety and Security. Coordinate with fire alarm equipment supplier. Installation of duct smoke detector housing and sampling tube under Division 23, HVAC.

B. Install smoke detectors in supply air systems greater than 2000 CFM.

C. Install smoke detectors at each story prior to connection to return air riser in systems greater than 15,000 CFM and serving more than one story.

3.8 SEQUENCES OF OPERATION AND POINTS LISTS

A. Where local energy code dictates certain sequences (such as night setback, night flush, pressure and temperature reset, terminal unit sequences, etc.), the sequences are not necessarily repeated in the documents. It is not the intent of this specification or documentation to reiterate the energy code. Provide energy code mandated sequences and document in sequence of operations submittals at no additional cost to the Owner. Provide required points to achieve the appropriate sequences.

B. See control diagrams and sequences on drawings in addition to sequences below.

C. Variable Frequency Drives: For a VFD dependent on an external input for its output setting (e.g., the VFD gets “Frequency” as an input), loss of that external input to result in the VFD holding its last value. If the VFD is running its own PID loop and the external input to the VFD is a setpoint (e.g. duct static pressure setpoint), the VFD to hold the last setpoint. If the VFD loses its process variable (e.g. duct static pressure), the VFD to go to its minimum speed setting.

D. Except as specified otherwise, throttling ranges, proportional bands, and cycle differentials to be centered on the associated setpoint. Modulating feedback control loops to include the capability of having proportional, integral, and derivative action. Unless the loop is specified “proportional only” or “P+I”, Contractor to apply appropriate elements of integral and derivative gain to each control loop to result in stable operation, minimum settling time and maintain the primary variable within the specified maximum allowable variance.

E. Provide a real time clock and schedule controller with sufficient scheduling capability to schedule required controllers and sequences. Schedule functionality may reside in a controller. If a controller is used, document scheduling functionality including names and types on controller points list submittal. Set up initial schedules in coordination with Owner.

F. Scheduling Terminology: When air handlers are scheduled throughout the day, the following defines the terminology used:

1. Occupied Period: Period of time when the building is in use and occupied. Confirm schedule with Owner. Exclude all national holidays. Generally systems will be fully operational throughout this period and ventilation air to be continuously introduced. Space temperature setpoints will generally be in the “normal” range of 68 degrees to 78 degrees F.
2. Unoccupied period: Period of time when the building or zone is not in use and unoccupied. Ventilation air not to be introduced.
3. Preoccupancy Period: Time prior to the Occupied period when the systems are returning the space temperatures from setback to “normal” or occupied setpoints (warm-up and cool-down). Ventilation air shall not be introduced unless outside air conditions permit free-cooling or to support a pre-occupancy purge sequence. Time period to be determined by an optimum start strategy unless otherwise specified.
4. Setback Period: Setback will typically start with the end of the occupied period and end with the start of the preoccupancy period, however it shall be provided with its own schedule. Generally systems will be off except to maintain a “setback” temperature, economization may be enabled to maintain “setback” cooling setpoint when applicable.

G. Where any sequence or occupancy schedule calls for more than one motorized unit to start simultaneously, the BAS start commands to be staggered by 5 second (adj.) intervals to minimize inrush current.

H. Wherever a value is indicated as adjustable (adj.), it shall be modifiable, with the proper password level. For these points, it is unacceptable to have to modify programming statements to change the setpoint.

I. When a power failure is detected in any phase, the BAS start commands to be retracted immediately from electrically powered units served by the failed power source. If the associated controller is powered by normal or emergency power, it may monitor its own power source as an indication of power status. If the controller is powered by uninterruptible power supply (UPS), or if it is not capable of monitoring its own power for use in sequences, provide at least one voltage monitor (three phase when applicable) per building. When the BAS detects that normal or emergency power has been restored, all equipment for which the BAS start command had been retracted to be automatically restarted in an orderly manner on staggered 5 second intervals to minimize inrush current.

J. Where reset action is specified in a sequence of operation, but a reset schedule is not indicated on the drawings, employ one of the following methods:

1. Determine a fixed reset schedule to result in stable operation and maintain the primary variable within the specified maximum allowable variance.
2. Use a floating reset algorithm which increments the secondary variable setpoint (setpoint of control loop being reset) on a periodic basis to maintain primary variable setpoint. The recalculation time and reset increment to be chosen to maintain the primary variable within the specified maximum allowable variance.
3. Primary variable to control the devices directly using a PID feedback control loop without resetting the secondary variable. However, the control devices to still modulate as necessary to maintain upper and lower limits on the secondary variable. Proportional band, integral gain, and derivative term to be selected to maintain the primary variable within the specified maximum allowable tolerance while minimizing overshoot and settling time. Gain prior approval for implementing this method of reset.

K. BAS to provide for adjustable maximum rates of change for increasing and decreasing output from the following analog output points:

1. Speed control of variable speed drives
2. Control Reset Loop
3. Valve Travel Limit

L. Wherever a value is indicated to be dependent on another value (i.e., setpoint plus 5 degrees F) BAS to use that equation to determine the value. Simply providing a virtual point that the operator must set is unacceptable. In this case three virtual points to be provided. One to store the parameter (5 degrees F), one to store the setpoint, and one to store the value which is the result of the equation.

M. Trend points as identified in the points list. Trends to be grouped system specific and setup in two-axis (x,y) graphical format that display object values relative to time. Setup trends to record data in 5 minute increments.

N. **Heating Water Primary Pumps (HWP-1,2), Constant Speed Lead-Standby:**

1. When ASHP is commanded on, lead heating water pump operates at flow as set by balancer (VFD speed set by balancer).
2. Current transformer signals controller which generates alarm when lead pump/controller fails to operate and start standby pump.

3. Controller switch lead and standby pumps on operator defined schedule to allow for even wear.
4. Heating Water Primary Pumps (HWP-1,2), Constant Speed Lead-Standby Points List:

Points List	Analog In	Analog Out	Digital In	Digital Out	Alarms	Trend
Lead Pump Start/Stop				X		
Lead Pump Status (current transformer)			X		Fail	X
Lead Pump VFD Speed Feedback (Hz)	X					X
Lead Pump VFD Speed		X				
Lead Pump VFD Error/Failure			X		Fail	
Standby Pump Start/Stop				X		
Standby Pump Status (current transformer)			X		Fail	X
Standby Pump VFD Speed Feedback (Hz)	X					
Standby Pump VFD Speed		X				
Standby Pump VFD Error/Failure			X		Fail	
Supply Hot Water Temp	X					X
Return Hot Water Temp	X					X
Differential Pressure Sensor	X					X

O. **Heating Water Pumps (HWP-1,2), Variable Speed Lead-Standby:**

1. Pump controller receives signal from building controller commanded on whenever any heating valve is modulated open and calling for heat.
2. Pump Operation:
   a. When pumps operate, differential pressure sensor, located at most remote heating valve signals controller, which varies speed of lead pump to maintain setpoint (as set by balancer).
3. Controller switches lead and standby pumps on operator defined schedule to allow for even wear.
4. Current transformer signals controller which generates alarm when lead pump/controller fails to operate and start standby pump.
5. Controller receives RPM signal from pumps variable frequency drives.
6. Each variable frequency drive signals controller to generate alarm in event of drive/control failure.
7. Heating Water Pumps (HWP-1,2), Variable Speed Lead-Standby Points List:

Points List	**Analog In**	**Analog Out**	**Digital In**	**Digital Out**	**Alarms**	**Trend**
Lead Pump Start/Stop				X		
Lead Pump Status (Current Transformer)			X		Fail	X
Lead Pump VFD Speed		X				
Lead Pump VFD Speed Feedback (Hz)	X					X
Lead Pump VFD error/failure			X		Fail	
Lag Pump Start/Stop				X		
Lag Pump Status (Current Transformer)			X		Fail	X
Lag Pump VFD Speed		X				
Lag Pump VFD Speed Feedback (Hz)	X					X
Lag Pump VFD Error/Failure			X		Fail	

Differential Pressure Sensor	X					X
Supply Hot Water Temp	X					X
Return Hot Water Temp	X					X

P. **Recirculating Domestic Hot Water Pump:**

1. Pump controller receives signal from building controller, which initiates occupied or unoccupied mode. During occupied mode pump will run continuously. During unoccupied mode pump will be off.
2. Current transformer signals controller which generates alarm when pump/controller fails to operate.
3. Recirculating Domestic Hot Water Pump Points List:

Points List	Analog In	Analog Out	Digital In	Digital Out	Alarms	Trend
Pump Start/Stop	X			X		
Pump Status (current transformer)			X		Fail	X

Q. **Electric Boiler (EB-1) and Boiler Circulating Pumps (BCP-1):**

1. Summary: Boiler act as supplement/backup heat to the central heating ASHP. Boiler loop is positioned downstream of primary ASHP loop and acts to boost heat delivered to the building loop. The boiler is matched with an associated circulator pump. DDC connected through BACnet allowing building system control, monitoring, and collection of logged data from the boiler controller.
2. When building loop supply water temperature drops below setpoint (120F) minus 10F (adj.) for 10 minutes (adj.), command on boiler circulator and boiler. Boiler to energize heating stages in a cascading sequence until return temperature reaches setpoint. Boiler is then commanded of and delayed operation for 10 minutes (adj.) before permitted to be recommended on, to prevent temperature above setpoint form being delivered back to the ASHP, and permit ASHP to take lead heating operation.
3. Provide full graphic user interface for monitor and control setpoint adjustments in unit.
4. Electric Boiler (EB-1) and Boiler Circulating Pumps (BCP-1) Points List:

Points List	Analog In	Analog Out	Digital In	Digital Out	Alarms	Trend
Start/Stop				X		
System Return Water Temperature	X					X
System Supply Water Temperature	X					X

Heating Water Setpoint		X				
Status			X			X
Boiler Return Water Temperature	X					
Boiler Supply Water Temperature	X					

R. **Pool and Spa Heat Exchangers (HX-1,2,3):**

1. Pool Water Heating (refer to pool consultant design package for pool water and space temperature setpoints):
   a. Pool Return Water Sensor: Sense pool temperature. If pool is 0.5 degrees F below setpoint (adj.), modulate open associated heating valve.
   b. Spa Return Water Sensor: Sense spa return water temperature. If spa is 1 degree F below setpoint (adj.), enable heat modulation.

S. **General Exhaust Fans (EF-1 through 6):**

1. EF-1 and EF-6: Fan controller receives signal from building controller, which initiates occupied or unoccupied mode. During occupied mode open isolation damper and run fan continuously. During unoccupied mode close isolation damper and fan off.
2. EF-2 through 5: Fans operate continuously 24/7.
3. Current transformer signals controller which generates alarm when fan/controller fails to operate.
4. General Exhaust Fans (EF-1 through 6) Points List:

Points List	Analog In	Analog Out	Digital In	Digital Out	Alarms	Trend
Exhaust Fan Start/Stop				X		
Exhaust Fan Status (Current Transformer)			X		Fail	X
Damper Open/Close				X		

T. **Variable Frequency Drives (VFD):**

1. Variable speed drives monitored by controller though LAN communications port on each drive. Reference Section 23 09 13, Variable Frequency Drives. As a minimum, monitor the following points:
   a. Frequency output - Hz
   b. Speed - RPM
   c. Current - Amps
   d. Power - Percentage
   e. Runtime - Hours
   f. System Fault

g. Input speed setpoint - RPM

U. **Air Source Heat Pump (ASHP-1):**

1. Refer to unit's specification, Section 23 81 43, Air Source Heat Pumps. Unit to include factory microprocessor controller and control sequence. The unit's controls are to be hard contact and BACnet tied into the BAS via BACnet interface.
2. Provide full graphic user interface for monitor and control setpoint adjustments in unit.
3. Summary: Each heat pump module contains an integrated microprocessor control system with full BACnet connection for building automation system control, monitoring, and data logging. ASHP modules are linked together to operate in an internally programmed energy optimized "cascading" sequence. In general, the building automation system determined heating water set-points, relays the setpoints to the microprocessor control system, and the unit operates using internal optimized sequence to meet heating water set-point temperature based on demand.
4. Air Source Heat Pump (ASHP-1) Points List: Map points via BACnet interface and/or hard contact (coordinate with unit manufacturer).

Points List	Analog In	Analog Out	Digital In	Digital Out	Alarms	Trend
Start/Stop				X	X	
System Heating Water Return Temperature	X					X
System Heating Water Supply Temperature	X					X
Heating Water Setpoint		X				
Status/Alarm			X			X
Electrical Power Current	X					X
Electrical Power Voltage	X					X
General Alarm	X				Fail	X

V. **Ducted and Ductless Heat Pump and Fan Coils (HP-1 through 10, and FCU-1 through 10):**

1. Refer the unit's specification, Section 23 81 26, Small Split System and Unitary HVAC Equipment.

2. Ductless and ducted split heat pump equipment supplier to provide a standalone manufacturer central controller to integrate all split systems fan coils into a single control platform. Central BAS controller to act as programmable time clock/calendar and control on/off function on schedule determined by the BAS time schedule. The unit's controls are to be hard contact and BACnet tied into the BAS.
3. Provide full graphic user interface for monitor and control setpoint adjustments in unit.
4. Occupied Mode Operation: Indoor fan coil units operate to maintain space temperature set point.
5. Unoccupied Mode Operation: Indoor fan coil units operate to maintain unoccupied space temperature set point.
6. Ducted and Ductless Heat Pump and Fan Coils (HP-1 through 10, and FCU-1 through 10) Points List: Map points via BACnet interface and/or hard contact (coordinate with unit manufacturer).

Points List	Analog In	Analog Out	Digital In	Digital Out	Alarms	Trend
Unit Start/Stop				X		
Zone Temp	X					X
Occupancy Override			X			X
Condensate Pump	X				High	

W. **Energy Recovery Units (ERV-1 through 3):**

1. Refer the unit's specification section. Unit to include factory controller and control sequence. The unit's controls are to be hard contact and BACnet tied into the BAS.
2. Provide full graphic user interface for monitor and control setpoint adjustments in unit.
3. Units controller to receive signal from building controller, which initiates occupied or unoccupied mode.
4. Occupied Mode:
   a. Isolation dampers open.
   b. Fans run continuously.
   c. Discharge Air Temperature sensor signals controller. Factory controller aux heating to maintain DAT no lower than 60F.
   d. Frost control: Supply air blower shuts down and outside air damper closes. Warm exhaust air defrosts the core for a predetermined duration.
5. Shutdown Mode:
   a. Supply fan and exhaust fan are not operating.
   b. Dampers in normal closed positions.
6. Unoccupied Mode:
   a. System remains off.
7. General Alarm Dry Contact: When the unit goes into alarm mode, a dry contact (NO) is closed. BAS to indicate alarm.
8. Energy Recovery Units (ERV-1 through 3) Points List: Map points via BACnet interface and/or hard contact (coordinate with unit manufacturer).

Points List	Analog In	Analog Out	Digital In	Digital Out	Alarms	Trend
Supply Fan Start/Stop				X		

Supply Fan VFD Error/Fail	X				Fail	
Exhaust Fan Start/Stop				X		
Exhaust Fan VFD Error/Fail	X				Fail	
OA Damper Position		X				X
Relief Air Damper Position		X				X
Discharge Air Temp	X					X
OA Temp	X					X
Return Air Temp	X					X
Aux Heat Coil Operation		X				X
General Alarm	X				Fail	
Defrost Operation	X					

X. **Packaged Heat Pump Rooftop Units (RTU-1 through 5) DX Cooling/Heating, Aux Electric Heating, Dehumidifying, and Heat Recovery up to 100 Percent Outside Air:**

1. Refer the unit's specification section. Unit to include factory controller and control sequence. The unit's controls are to be hard contact and BACnet tied into the BAS.
2. Provide full graphic user interface for monitor and control setpoint adjustments in unit.
3. Units controller to receive signal from building controller, which initiates occupied or unoccupied mode.
4. RTU-3 serving locker rooms to be set for continuous "occupied" operation 24/7 to control high humidity environment. RTU 3 supply and exhaust set to track to maintain space at 0.05" WC negative pressure relative to surrounding spaces. (All others set to 0.05" positive pressure)
5. Occupied Mode:
   a. Isolation dampers open.
   b. Fans run continuously.
   c. BAS Room temperature and humidity sensor signals controller. Factory controller modulates DX cooling, heating, economizer, and aux heating to maintain space setpoint temperature and humidity.
   d. CO2: Monitors space CO2.
   e. Heat Recovery Wheel operates during Occupied Mode unless in full economizing bypass mode. Upon detection of frost conditions, factory controller system internal defrost cycle until the ice/moisture dissipates.

6. Shutdown Mode:
   a. Supply fan and exhaust fan are not operating.
   b. Dampers in normal closed positions.
7. Unoccupied Mode:
   a. System remains off unless night setback temperatures are exceeded, upon which unit operates in recirc mode to maintain setback temperatures. (78F summer, 68 winter).
8. Morning warmup
   a. Winter operations shall set a 2 hr (adj) warmup period before reaching full occupied mode.
9. Unoccupied Mode:
   a. Night Purge Control: Night purge initiated whenever outdoor air temperature is 65 degrees F or below and any space temperature is 75 degrees F or above. Supply and exhaust fans operate during night purge. During night purge outdoor air dampers open, relief dampers open, bypass dampers open, heating cooling are disabled. When spaces are 70 degrees F or below for 30 minutes, switch to shutdown mode.
   b. Unoccupied Mode Override: Upon receiving an “override” signal from designated space temperature sensors, controller changes zone to occupied mode for a period of 2 hours (adjustable). When supply and return fans operate in unoccupied mode, they operate as described for occupied mode.
10. Alarms and Safeties:
    a. Smoke detectors located in return air ducts signal controller which initiates shutdown mode upon detection of smoke in airstream and generate alarm.
    b. Low limit detection thermostat signal warning at 35F and below.
    c. Each variable frequency drive signals controller to generate alarm in event of drive/control failure.
11. Packaged Heat Pump Rooftop Units (RTU-1 through 5) DX Cooling/Heating, Aux Electric Heating, Dehumidifying, and Heat Recovery up to 100 Percent Outside Air Points List: Map points via BACnet interface and/or hard contact (coordinate with unit manufacturer).

Points List	**Analog In**	**Analog Out**	**Digital In**	**Digital Out**	**Alarms**	**Trend**
Supply Fan Start/Stop				X		
Supply Fan VFD Error/Fail	X				Fail	
Exhaust Fan Start/Stop				X

Freeze/Low Temp	X				X	
Heating / Cooling Operation		X				X
Aux Heat Coil Operation		X				X
Space Temp/RH	X					X
Space CO2	X				High 1300 ppm (adj)	X
Heat Wheel Operation	X					

Y. **Air Handling Temperature and Dehumidification Unit for Pool Environments (DHU-1), HW Heating, OA Cooling and Dehumidifying, up to 100 Percent Outside Air Purge:**

1. Refer the unit's specification for sequence, Section 23 84 00, Humidity Control Equipment. The unit’s controls are to be hard contact and BACnet tied into the BAS.
2. Provide full graphic user interface for monitor and control setpoint adjustments in unit.
3. The following set points shall be accessible and adjustable from the operator panel, and mapped to BAS for monitoring and adjustability.
   a. Space temperature
   b. Space relative humidity
4. The following sensors shall be unit-mounted and monitored at the operator panel, remote panel, and mapped to BAS for monitoring. All information from these items shall be actively used in the system control and operation strategies:
   a. Return air temperature

b. Supply air temperature
c. Return air relative humidity
d. Outdoor air temperature
e. Outdoor air humidity

5. System Fault: Shall indicate via text message to the display and mapped to BAS graphic interface what systems require attention or servicing. Built-in monitoring and diagnostics shall allow the user to view the following:
   a. Power failure
   b. Dirty air filter
   c. System off
6. Sequence of Operation copied here for quick reference only:
   a. System Startup:
      1) Power is turned on or the system is started
      2) After a short initial delay to allow the sensors to stabilize, the blowers start and operate continuously.
      3) Based on sensor feedback, the system shall begin, or resume operation based on the sequence below.
   b. Airside Configuration:
      1) The system continuously delivers the specified supply air volume to the natatorium to achieve minimum 6ACH.
      2) The minimum exhaust air volume is set to meet the engineer's schedule, and as set by balance to achieve and maintain ASHRAE recommended 0.05-0.15” WC negative pressure relative to surrounding spaces. NOTE: exhaust fan dedicated to exhaust behind the spa is also operating continuously and must be operating when determining fan speed settings to maintain negative space pressure.
      3) Unit Microprocessor will control modulation of dampers and exhaust fan(s) to exhaust a set % offset more than introduced outside air to maintain a negative space pressure. (As determined by balancer)
   c. Dehumidification Mode:
      1) The return air relative humidity is above the humidity setpoint: 50% RH (adj.)
      2) Return air dewpoint is above dewpoint setpoint: 59.7F (adj.) based on space temp set at 80F (adj.)
      3) The microprocessor sends an output signal to modulate the dampers and fan speeds to increase OA percentage based on return air temperature, relative humidity, and dewpoint.
      4) The microprocessor heating output signal (0-10 volts) is sent to the heating coil controller if needed based on return air temperature, relative humidity, and dewpoint.
   d. Space Cooling Mode:
      1) The return air temperature is above the room temperature setpoint 82F (adj.)
      2) The microprocessor sends an output signal to modulate the dampers and fan speeds to increase OA percentage based on return air temperature,
   e. Space Heating Mode:
      1) The return air temperature is below the room temperature setpoint 80F (adj.)
      2) The microprocessor space heating output signal (0-10 volts) is sent to the heating coil controller. The signal output will regulate based on the return air temperature.
   f. Exhaust Air Heat Recovery Mode:
      1) The minimum outdoor air damper and minimum exhaust fan(s) and will operate as continuously as programmed, minimum OA occupied and setback by 50% OA unoccupied.

2) Outdoor air temperature is compared with the return air temperature, if the differential is greater or equal to10°F(Adjustable), the glycol pump shall circulate a glycol mixture between the exhaust air and the outdoor air heat recovery coils to precool or preheat the incoming outside air.

g. Purge Mode:
   1) This mode is triggered automatically if cooling mode or dehumidification mode requires up to 100% OA; Or this mode is manually triggered by an operator when super-chlorinating the pool. It can be manually triggered at the unit-mounted,remote operator panel, through the online WebSentry interface, or by the BACnet interface controller on the BAS graphic user interface.
   2) Manual triggered Purge Mode has an adjustable timed duration (3hr adj.) after which the system automatically resumes normal operation.
   3) Once manually triggered by the operator:
   4) A signal from the microprocessor sets the exhaust fan(s) to their maximum CFM.
   5) The unit-mounted outdoor air dampers open fully and the return air dampers close
   6) The system stays in 100% outdoor air ventilation mode.
   7) After the timed period expires, all dampers and fans return to normal operating settings and the system resumes normal operation.
   8) During Purge Mode, the system will control heating based on supply air temperature

h. Economizer Cooling Mode:
   1) Same as cooling mode above since system uses outside air as primary cooling and dehumidifying.

i. Economizer Dehumidification Mode:
   1) Same as dehumidification mode above since system uses outside air as primary cooling and dehumidifying.

j. Freeze Protection:
   1) The supply air temperature falls below the freezestat setpoint.
   2) Exhaust fan(s) are stopped and outdoor air damper(s) are fully closed.
   3) When the freezestat alarm is tripped, it must be manually cleared by the operator.

Z. **Electric Wall Heaters (WH-1 through 5):**

1. Operate via integral thermostat to maintain space setpoint temperature.

AA. **High Volume Low Speed Ceiling Fans (HVLS-1,2):**

1. Large Ceiling Fans
   a. Dedicated manual on/off, speed, and direction control located in space near fans. Confirm location with Owner.

END OF SECTION 23 09 00

SECTION 23 09 13 - VARIABLE FREQUENCY DRIVES

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Variable Frequency Drive
2. Protection Circuits
3. Display and Control Interface
4. Adjustments

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. Current edition of IEEE Standard 519, Recommended Practices and Requirements for Harmonic Control in Electrical Power Systems.
2. Current edition of UL 508, Industrial Control Equipment.
3. Current edition of NEMA ICS 7, Industrial Control and Systems: Adjustable-Speed Drives; National Electrical Manufacturers Association, latest edition.
4. Current edition of IEC 16800 parts 1, 2 and 3.
5. Current edition of NEC 430.120, Adjustable-Speed Drive Systems.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Product Data: Indicate voltage, controller size, ratings and size of switching and overcurrent protection devices, short circuit ratings, dimensions, weights and enclosure detains.
2. Shop Drawings: Indicate front and side views of enclosures with overall dimensions and weights shown; conduit entrance locations and requirements; and name plate legends.
3. Test Reports: Subject VFD to preliminary functional test, and final test at 104 degrees F, at full rated load. Indicate field test and inspection procedures and test results.
4. Manufacturer's Instructions: Include installation instructions for starting and operating controllers, and describe operating limits that may result in hazardous or unsafe conditions.
5. Maintenance Data: Include routine preventive maintenance schedule.
6. Rated input: Maximum electric load rating in amperes and line reactor impedance.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet following:

1. Qualifications:
   a. Provide VFDs and options UL listed as a complete assembly. Base VFD UL listed for 100 KAIC without the need for input fuses.
   b. CE Mark: VFD to meet product standard EN 61800-3 for the First Environment restricted level. (RFI/EMI Filter specification.)
   c. Entire VFD enclosure, including the bypass, seismically certified and labeled in accordance with the International Building Code:
      1) VFD manufacturer to provide Seismic Certification and Installation requirements at time of submittal.
      2) Seismic importance factor of 1.5 rating is required, and based upon actual shake test data as defined by International Code Council AC-156.
      3) Seismic ratings based upon calculations alone are not acceptable. Certification of Seismic rating must be based on testing done in all three axis of motion by a certified lab.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. ABB

B. Allen Bradley

C. Cerus

D. Danfoss

E. Eaton

F. Emerson

G. General Electric

H. Siemens

I. Schneider Electric/Square D

J. Toshiba

K. Yaskawa

2.2 VARIABLE FREQUENCY DRIVE

A. Description:

1. Variable Frequency Drive: Solid state, with Pulse Width Modulated (PWM) output waveform in a UL listed enclosure (enclosures with only NEMA ratings are not acceptable), completely assembled and tested by manufacturer. Employ full wave rectifier, AC or DC Line Reactor, capacitors, and Insulated Gate Bipolar Transistors (IGBTs) as output switching device.
2. Enclosure: UL rated and UL listed as a plenum rated VFD with NEMA 1 enclosure (indoors), NEMA 3R (outdoors), NEMA 12 (for indoor dusty locations), NEMA 8 (hazardous, Class I, Div I) and NEMA 9 (Class II, Div I). Manufacturer's standard enamel.
3. Drive manufacturer to supply the drive and necessary options specified. VFDs that are manufactured by a third party and "brand labeled" are not acceptable. Provide VFDs installed on this project from the same manufacturer.

B. Operating Requirements:

1. Rated Input Voltage: VAC as scheduled on Drawings, plus or minus 10 percent, 3 phase, 48 to 63 Hz.
2. Rated Output Voltage: 0 to input voltage, 3 phase, 0 to 120 Hz.
3. Fundamental Power Factor: Between 1.0 and 0.97, lagging, over entire range of operating speed and load.
4. Minimum Efficiency at Full Speed and Full Load: 97 percent or better.
5. Volts Per Hertz Adjustment: Plus or minus 10 percent.
6. Current Adjustment: 60 to 110 percent or rated.
7. Acceleration Rate Adjustment: 0.5 to 300 seconds.
8. Deceleration Rate Adjustment: 1 to 300 seconds.
9. Transient protection against normal transients and surges in incoming power line.
10. Environmental Conditions: 32 degrees F to 104 degrees F at 4kHz switching frequency, 0 to 3000-feet above sea level, less than 95 percent RH, noncondensing. Circuit boards to have conformal coating.
11. Seismic Testing: Tested to ICC AS-156. Submit certificate of compliance.

C. Standard Features:

1. VFDs to have the same customer interface, including digital display and keypad, regardless of horsepower rating. Provide removable keypad, capable of remote mounting and allow for uploading and downloading of parameter settings as an aid for start-up of multiple VFDs.
2. Fault Mode on Loss of Input:
   a. Display fault.
   b. Run at programmable preset speed as selected by user.
3. Utilize English digital display (code numbers are not acceptable). Digital Display: Three configurable lines of LCD display, backlit, adjustable contrast. Set up parameters, indications, faults, warnings, status indicators and other information in words without use of manual or cross reference table.
4. Automatic restart after overcurrent, overvoltage, undervoltage, or loss of input signal protective trip. Programmable number of restart attempts, trial time, and time between reset attempts.
5. Capable of starting into rotating load (forward or reverse) and accelerate or decelerate to setpoint without safety tripping or component damage (flying start).
6. Automatic extended power loss ride-through circuit.
7. Customer terminal strip isolated from line and ground.

8. Keypad Hand-Off-Auto Switch: When in "Off" VFD will be stopped. When in "Auto" VFD will start via external contact closure and its speed will be controlled via external speed reference. When in “Hand” VFD will be controlled via keypad up and down arrows.
9. Safety Interlocks: Furnish terminals for remote contact to inhibit starting under both manual and automatic mode.
10. Input Line Reactor or DC Line Choke: Five percent impedance AC or DC, to reduce harmonics to power line and to add protection from AC line transients.
11. Output filters for VFDs located more than 350 conductor feet from motor served.
12. Optimized for 4 kHz carrier frequency to reduce motor noise.
13. Disconnecting Means: Include door interlocked, UL 508C listed circuit breaker or fused disconnect switch.
14. Control circuit transformer with fused primary and secondary circuits.
15. Motor overload protection: Fused disconnects and thermal overloads for each motor when serving multiple motors from one drive.
16. Input current rating of the VFD to be no more than 3 percent greater than the output current rating. VFDs with higher input current ratings require the upstream wiring, protection devices, and source transformers to be oversized per NEC 430.120.
17. VFD to provide a programmable loss-of-load (broken belt/broken coupling) Form-C relay output. Provide programmable drive to signal the loss-of-load condition via a keypad warning, Form-C relay output, and/or over the serial communications bus.

2.3 PROTECTION CIRCUITS

A. Overload Rating: 110 percent of its variable torque current rating for 1 minute every 10 minutes at 104 degrees F, and 140 percent of its H torque current rating for 2 seconds every 15 seconds.

B. 350 percent instantaneous overcurrent trip.

C. 130 percent to 65 percent over and under voltage trip.

D. Over temperature trip at 115 degrees F.

E. Short circuit protection, either running or at start, for phase to phase and phase to ground faults, phase rotation insensitive.

F. Adaptable Electronic Motor Overload (I2t).

G. EMI/RFI Filters: VFDs to include EMI/RFI filters. Onboard filters to allow the entire VFD assembly to be CE Marked and the VFD to meet product standard EN 61800-3 for the First Environment restricted. No Exceptions.

H. Orderly Shutdown: In event of any of above conditions, shutdown drive safely without component failure.

2.4 DISPLAY AND CONTROL INTERFACE

A. Serial Communications:

1. VFD to have an EIA-485 port as standard. Standard protocols: Modbus, Johnson Controls N2, Siemens Building Technologies FLN, and BACnet MS/TP. The use of third party gateways and multiplexers is not acceptable. Protocols “certified” by the governing authority (i.e. BTL Listing for BACnet).

B. Display operating information at VFD and provide separate interface signal for Building Automation System (BAS) via communications port to display and control following:

1. Frequency Output - Hz
2. Output voltage - Volts
3. Current - Amps
4. Speed - RPM
5. Runtime - Hours
6. System Fault
7. Input Speed Setpoint - RPM
8. On/Off Control Signal
9. Calculated Motor Power - percentage or kW
10. kWh meter

2.5 ADJUSTMENTS

A. Three programmable critical frequency lockout ranges.

B. Two programmable analog inputs. Analog inputs to include filters programmable from 0.01 to 10 seconds to remove any oscillation in input signal.

C. Six programmable digital inputs for maximum flexibility in interfacing with external devices.

D. Three remote contacts for fault including on/off status, fault, and future configuration.

E. Two programmable analog outputs proportional to frequency, motor speed, output voltage, output current, or scalable parameter selected by Owner.

F. Run permissive circuit: Provide a run permissive circuit for damper or valve control. Regardless of the source of a run command (keypad command, input contact closure, time-clock control, or serial communications), the VFD is to provide a dry contact closure that will signal the damper to open (VFD motor does not operate). When the damper is fully open, a normally open dry contact (end-switch) to close. The closed end-switch is wired to a VFD digital input and allows VFD motor operation. Provide a minimum of two separate safety interlock inputs. When any safety is opened, the motor commanded to coast to stop and the damper commanded to close.

G. The VFD control is to include a programmable time delay for VFD start and a keypad indication that this time delay is active. A Form C relay output provides a contact closure to signal the VAV boxes open. This will allow VAV boxes to be driven open before the motor operates.

H. The VFD is to include a fireman's override input. Mode to override other inputs (analog/digital, serial communication, and keypad commands), except customer defined safety run interlocks, and force the motor to run at a preset speed or in a separate PID mode.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS

A. Install in accordance with manufacturer's installation instructions. Maintain manufacturer's and NEC service clearances.

B. Install on strut support stand and brace for seismic.

C. Select and install overload heater elements in motor controllers to match installed motor characteristics.

D. Power wiring completed by the contractor, to NEC code 430.122 wiring requirements based on the VFD input current.

E. Factory certified service representative to supervise start-up in accordance with manufacturer's instructions.

F. Make final adjustments to assure proper operation of load system. Demonstrate final set-up and programming to Owner.

G. Test unit in modes of operation and demonstrate compliance with requirements. Replace damaged or malfunctioning controls and equipment.

H. Adjust ramp times to provide stable control during the balancing and commissioning process.

I. Program drive to limit speed when current rating is exceeded.

END OF SECTION 23 09 13

SECTION 23 21 13 - HVAC PIPING

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Hydronic Piping, Above Grade
2. Equipment Drains and Overflows
3. Unions
4. Refrigerant Piping

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Welding Certificates: Copies of certificates for welding procedures and personnel.
2. Field Test Reports: Written reports of tests specified in Part 3 of this Section. Include the following:
   a. Test procedures used.
   b. Test results that comply with requirements.
   c. Failed test results and corrective action taken to achieve requirements.
3. Water Analysis: Submit a copy of the water analysis to illustrate water quality available at project site.
4. Grooved couplings, fittings, valves, and specialties: Show grooved joint couplings and fittings on Shop Drawings and product submittals, and specifically identify with the applicable coupling style number.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. Installer Qualifications: Company specializing in performing work of the type specified in this Section, with documented experience.
2. Welder Qualifications: Certify in accordance with ASME (BPV IX).

3. ASME Compliance: Comply with ASME B31.9 "Building Services Piping" for materials, products, and installation. Provide safety valves and pressure vessels with the appropriate ASME label. Fabricate and stamp air separators and expansion tanks to comply with the ASME Boiler and Pressure Vessel Code, Section VIII, Division 01.
4. Grooved couplings, fittings, valves, and specialties: Provide all grooved couplings, fittings, valves, and specialty products from a single manufacturer. Utilize only grooving tools from the same manufacturer as the grooved components. Date-stamp all castings used for couplings housings, fittings, or valve and specialty bodies for quality assurance and traceability.
5. Refrigerant Piping:
    a. Welding: Qualify procedures and personnel according to ASME Boiler and Pressure Vessel Code: Section IX "Welding and Brazing Qualifications."
    b. ASHRAE Standard: Comply with ASHRAE 15, "Safety Code for Mechanical Refrigeration."
    c. ASME Standard: Comply with ASME B31.5, "Refrigeration Piping."
    d. UL Standard: Provide products complying with UL 207, "Refrigerant-Containing Components and Accessories, Nonelectrical" or UL 429 "Electrically Operated Valves."

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

PART 2 - PRODUCTS

2.1 HYDRONIC PIPING, ABOVE GRADE

A. Steel Pipe:

1. Sizes 10-inches and Under: ASTM A 53/A 53M, Schedule 40, black, Type E (electric resistance welded), Grade B.
    a. Fittings: ASME B16.3, malleable iron or ASTM A 234/A 234M, wrought steel welding type.
    b. Wrought Cast and Forged Steel Flanges and Flanged Fittings: ASME B16.5 including bolts, nuts, and gaskets of the following material group, end connections, and facings:
        1) Material Group: 1.1.
        2) End Connections: Butt welding.
        3) Facings: Raised face.
    c. Joints: Threaded or AWS D1.1 welded.

B. Copper Tube: ASTM B 88 (ASTM B 88M), Type L, hard drawn.

1. Fittings: ASME B16.18, cast brass, or ASME B16.22, solder wrought copper.
2. Joints: Solder, lead free ASTM B32, HB alloy (95-5 tin antimony), or tin and silver.
3. Joints: Brazed, AWS A5.8, Classification BAg-36, non-cadmium silver alloy. Pipes 2-1/2-inches or larger or piping routed over computer rooms, telecommunications rooms, or electrical rooms.

C. Polypropylene Random (PPR):

1. Manufacturers:
    a. Aquatherm Blue Pipe. SDR 11 standard dimension ratio.

b. Nupi Niron Pipe PP-RCT SDR11.
2. Heat fusion connections with corrosion resistant properties.
3. Valves: Polypropylene.
4. Accessories and insert wells, stainless steel.

D. Stainless Steel:

1. Type 316L Stainless Steel, ASTM A-312/ASME SA-312, Wrought joints/fittings ANSI B16.9 OR ANSI B16.28 welded. Valves stainless steel.

2.2 EQUIPMENT DRAINS AND OVERFLOWS

A. Copper Tube: ASTM B 88 (ASTM B 88M), Type L (B), drawn.

1. Fittings: ASME B16.18, cast brass, or ASME B16.22 solder wrought copper.
2. Joints: Solder, lead free, ASTM B 32, HB alloy (95-5 tin-antimony), or tin and silver.
3. Joints: Brazed, AWS A5.8, Classification BAg-36, non-cadmium silver alloy. Pipes 2-1/2-inch or larger or piping routed over computer rooms, telecommunications rooms, and electrical rooms.

2.3 UNIONS

A. Unions for Pipe 2-inches and Under:

1. Ferrous Piping: 150, 250, and 300 PSIG malleable iron, threaded, ASME B16.39.
2. Copper Pipe: Bronze, soldered joints, ASME B16.22.

B. Dielectric Connections: Provide dielectric waterway or brass nipple fitting with threaded ends. Dielectric unions are not allowed.

2.4 REFRIGERANT PIPING

A. Piping:

1. Copper Tube: ASTM B 280, Type ACR, annealed-temper tube, clean, dry and capped.
   a. Fittings: ASME B16.22 wrought copper.
   b. Joints: Braze, AWS A5.8 Classification BCuP-5, 15 percent silver alloy.

B. Valves:

1. Manufacturers:
   a. Hansen Technologies Corporation
   b. Henry Technologies
   c. Danfoss Flomatic
   d. Substitutions: See Section 23 00 00, HVAC Basic Requirements, Division 00, Procurement and Contracting Requirements and Division 01, General Requirements.
2. Packaged Ball Valves:
   a. Two piece bolted forged brass body with Teflon ball seals and copper tube extensions, brass seal cap, chrome plated ball, stem with neoprene ring stem seals; for maximum working pressure of and maximum temperature of 300 degrees F.

C. Flexible Connectors:

1. Manufacturers:
   a. Metraflex, VRF Flex, model VAV-RF8
   b. Or approved equivalent.
2. Provide stainless steel refrigerant flexible connector with copper ends, operating at 700 psi, cleaned and bagged per PRAXAIR 99.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS

A. Install per manufacturer's written instructions and requirements.

B. Install hydronic piping in accordance with the following:

	Above Grade			Below Grade Preinsulated Pipe					Below Grade Uninsulated Piping			
Service	W/S	GC	Cu	Stl	Cu	PEX	PVC	HDPE	Stl	Cu	PVC	HDPE
Heating Hot Water	X		X	X			N/A		N/A	N/A	N/A	N/A

1. Key:
   a. W/S = Welded/Screwed Steel
   b. GC = Grooved Coupling Steel
   c. Cu = Copper
   d. Stl = Steel

C. Preparation:

1. Ream pipe and tube ends. Remove burrs. Bevel plain end ferrous pipe.
2. Remove scale and dirt on inside and outside before assembly.
3. Prepare piping connections to equipment with flanges or unions.
4. Keep open ends of pipe free from scale and dirt. Protect open ends with temporary plugs or caps.

D. Above Grade Piping Installation:

1. Install per manufacturer's written instructions and requirements.
2. Install heating water and glycol piping to ASME B31.9 requirements.
3. Route piping in orderly manner, parallel to building structure, and maintain gradient.
4. Install piping to conserve building space and to avoid interference with use of space.
5. Install groups of pipes parallel to each other, spaced to permit applying insulation and servicing of valves.
6. Sleeve pipe passing through partitions, walls and floors allowing adequate space for pipe insulation.
7. Slope piping at 0.2 percent upward in direction of flow and arrange to drain at low points.
8. Install piping to allow for expansion and contraction without stressing pipe, joints, or connected equipment.
9. Install drains, consisting of a tee fitting, NPS 3/4 ball valve, and short NPS 3/4 threaded nipple with cap, at low points in piping system mains and elsewhere as required for system drainage.

10. Drawings are diagrammatic and do not necessarily show top connections in all cases. Install branch connections to mains using tee fittings in main, with takeoff coming out of the top unless trade coordination conditions preclude it.
11. Anchor piping for proper direction of expansion and contraction.
12. Inserts:
    a. Provide inserts for placement in concrete formwork.
    b. Provide inserts for suspending hangers from reinforced concrete slabs and sides of reinforced concrete beams.
    c. Provide hooked rod to concrete reinforcement section for inserts carrying pipe over 4-inches.
    d. Where concrete slabs form finished ceiling, locate inserts flush with slab surface.
    e. Where inserts are omitted, drill through concrete slab from below and provide through-bolt with recessed square steel plate and nut flush with top of slab.
13. Pipe Hangers and Supports:
    a. Install in accordance with Section 23 05 29, Hangers and Supports for HVAC Piping, Ductwork and Equipment.
    b. Install hangers to provide minimum 1/2-inch space between finished covering and adjacent work.
    c. Place hangers within 12-inches of each horizontal elbow.
    d. Use hangers with 1-1/2-inch minimum vertical adjustment. Design hangers for pipe movement without disengagement of supported pipe.
    e. Support vertical piping at top, bottom, and not less than every other floor. Support riser piping independently of connected horizontal piping.
    f. Where several pipes can be installed in parallel and at same elevation, provide multiple or trapeze hangers.
    g. Prepare unfinished pipe, fittings, supports, and accessories, ready for finish painting.
    h. Provide copper plated hangers and supports for copper piping.
    i. Prime coat exposed steel hangers and supports. Hangers and supports located in crawl spaces, pipe shafts, and suspended ceiling spaces are not considered exposed.
14. Provide clearance in hangers and from structure and other equipment for installation of insulation and access to valves and fittings.
15. Provide access where valves and fittings are not exposed.
16. Use eccentric reducers to maintain top of pipe level.
17. Where pipe support members are welded to structural building framing, scrape, brush clean, and apply one coat of zinc rich primer to welds.
18. Prepare unfinished pipe, fittings, supports, and accessories, ready for finish painting.

E. Field Quality Control:

1. Leave joints, including welds, uninsulated and exposed for examination during test.
2. Provide temporary restraints for expansion joints that cannot sustain reactions due to test pressure. If temporary restraints are impractical, isolate expansion joints from testing.
3. Flush system with clean water. Clean strainers.
4. Isolate equipment from piping. If a valve is used to isolate equipment, provide closure capable of sealing against test pressure without damage to valve. Install blinds in flanged joints to isolate equipment.
5. Install safety valve, set at a pressure no more than one-third higher than test pressure, to protect against damage by expanding liquid or other source of overpressure during test.
6. Perform the following tests on hydronic piping:
    a. Use ambient temperature water as a testing medium unless there is risk of damage due to freezing. Another liquid that is safe for workers and compatible with piping may be used.

b. While filling system, use vents installed at high points of system to release trapped air. Use drains installed at low points for complete draining of liquid.
c. Check expansion tanks to determine that they are not air bound and that system is full of water.
d. Subject piping system to hydrostatic test pressure that is not less than 1.5 times the design pressure. Test pressure not-to-exceed maximum pressure for any vessel, pump, valve, or other component in system under test. Verify that stress due to pressure at bottom of vertical runs does not exceed either 90 percent of specified minimum yield strength or 1.7 times "SE" value in Appendix A of ASME B31.9, "Building Services Piping."
e. After hydrostatic test pressure has been applied for at least four hours, examine piping, joints and connections for leakage. Eliminate leaks by tightening, repairing, or replacing components, and repeat hydrostatic test until there are no leaks.
f. Prepare written report of testing.

F. Flushing and Cleaning of Piping Systems:

1. Clean piping systems thoroughly. Purge pipe of construction debris and contamination before placing the piping systems in service. Provide temporary connections for cleaning, purging, and circulating fluids through the piping system.
2. Use temporary strainers and temporary pumps that can create a minimum fluid velocity of 6-feet per second and maximum of 10-feet per second to flush and clean the piping systems. Do not use Owner's permanent strainers to trap debris during pipe flushing operations. Fit the temporary construction strainers with a line size blowoff valve.
3. Install bypass piping or hoses at the supply and return piping connections at heat exchangers, chillers, cooling towers, pumps, and cooling coils, etc., to prevent debris from being caught or causing damage to equipment which will be connected to the piping system.
4. Circulate a chemical cleaner in heating water piping systems to remove mill scale, grease, oil, and silt. Cleaner to be selected by chemical treatment vendor on project. Circulate for 48 hours, flush system and replace with clean water. Dispose of chemical solution in accordance with local codes. The heating water system should then be treated with chemicals and inhibitors to be selected by chemical treatment vendor on project. When the chemical cleaning is complete, remove, clean, and reinstall all permanent screens. Notify Owner so that the reinstallation of clean strainer screens may be witnessed.

G. Pipe Painting Requirements:

1. Paint all ferrous metal pipe including flanges. Do not paint flange bolts, washers and nuts. At flexible coupling the only the flanges are to be painted. All rubber portions are to remain unpainted.
2. Paint exterior uninsulated steel piping with exterior latex, semi-gloss (AE), Master Painters Institute MPI 11, suitable for metallic surfaces B, Haze Gray color.
3. Use ready-mixed (including colors) paint. Prime paint with pigment and vehicle, compatible with substrate and finish coats specified. Volatile Organic Compounds (VOC) content of paint materials shall not exceed 50g/l for exterior latex paints and primers. Lead-based paint is not permitted.
4. Do not apply coating when air or substrate conditions are:
   a. Less than 5 degrees F above dew point.
   b. Below 50 degrees F or over 95 degrees F, unless specifically pre-approved by the product manufacturer.
5. Do no exterior painting when it is windy and dusty. Do not paint in direct sunlight or on surfaces that the sun will soon warm.

6. Apply only on clean, dry and frost-free surface. Remove all materials the will affect the ability of the paint to adhere to the pipe including painted pipe identification labels.
7. Remove oil, grease, soil, drawing and cutting compounds, flux and other detrimental foreign. Remove loose mill scale, rust, and paint, by hand or power tool cleaning. All surfaces are to be dry at the time paint is applied.
8. Apply paint in two coats; prime, and finish. Apply each coat evenly and cover substrate completely. Allow not less than 48 hours between application of succeeding coats, except as allowed by manufacturer's printed instructions.
9. Finish surfaces to show solid even color, free from runs, lumps, brushmarks, laps, holidays, or other defects. Apply by brush, roller or spray.

3.2 REFRIGERANT PIPING INSTALLATION

A. Install systems in accordance with ASHRAE Standard 15.

B. Group piping whenever practical at common elevations and locations. Slope piping one percent in direction of oil return.

C. Arrange piping to return oil to compressor. Provide traps and loops in piping, and provide double risers as required. Slope horizontal piping 0.40 percent in direction of flow.

D. Flood piping system with nitrogen when brazing.

E. Follow ASHRAE Standard 15 procedures for charging and purging of systems and for disposal of refrigerant.

F. Provide replaceable cartridge filter-driers, with isolation valves and valved bypass.

G. Locate expansion valve sensing bulb immediately downstream of evaporator on suction line.

H. Fully charge completed system with refrigerant after testing.

I. Install flexible connectors at connection to equipment with compressors or at fan coil units installed with a vibration isolator.

J. Field Quality Control:

1. Test refrigeration system in accordance with ASME B31.5.
2. Pressure test system with dry nitrogen to 200 PSI. Perform final tests at 27-inches vacuum and 200 PSI using electronic leak detector. Test to no leakage.

END OF SECTION 23 21 13

SECTION 23 21 16 - HYDRONIC PIPING SPECIALTIES

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Bladder Type Expansion Tanks
2. Buffer Tanks
3. Air Vents
4. Coalescing Type Air and Dirt Separator
5. Pressure Reducing Valves
6. Liquid Flow Switches
7. Differential Pressure Regulator
8. Differential Pressure Switches
9. Instrument Probe Fittings
10. Strainers
11. Relief Valves

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. ASME (BPV VIII, 1) - Boiler and Pressure Vessel Code, Section VIII, Division 01 - Rules for Construction of Pressure Vessels; The American Society of Mechanical Engineers.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Product Data: Provide product data for manufactured products and assemblies required for this project. Include component sizes, rough-in requirements, service sizes, and finishes. Include product description, model and dimensions.
2. Certificates: Inspection certificates for pressure vessels from Authority Having Jurisdiction (AHJ).
3. Manufacturer's Installation Instructions: Indicate hanging and support methods, joining procedures.
4. Project Record Documents: Record actual locations of flow controls.
    a. Maintenance Data: Include installation instructions, assembly views, lubrication instructions, and replacement parts list.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. Manufacturer Qualifications: Company specializing in manufacturing the type of products specified in this Section, with minimum three years of documented experience.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Accept valves on site in shipping containers with labeling in place. Inspect for damage.

B. Provide temporary protective coating on cast iron and steel valves.

C. Provide temporary end caps and closures on piping and fittings. Maintain in place until installation.

D. Protect piping systems from entry of foreign materials by temporary covers, completing sections of the work, and isolating parts of completed system.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Bladder Type Expansion Tanks:

1. Amtrol Inc.
2. ITT Bell & Gossett
3. Taco, Inc.
4. Armstrong
5. Wessels
6. John Wood JAER Series

B. Buffer Tanks:

1. Taco
2. Armstrong
3. Wessels
4. Or approved equivalent.

C. Air Vents:

1. Armstrong International, Inc.
2. ITT Bell & Gossett
3. Taco, Inc.
4. Hoffman
5. Amtrol

6. Metraflex

D. Coalescing Type Air and Dirt Separator:

1. Spirovent VDNT
2. Caleffi
3. Aurora

E. Pressure Reducing Valves:

1. Armstrong
2. ITT Bell & Gossett
3. Taco, Inc.
4. Amtrol
5. Kunkle

F. Liquid Flow Switches:

1. McDonnell & Miller
2. Dwyer
3. Or approved equivalent.

G. Differential Pressure Regulator:

1. Clayton
2. Jordan
3. Hoffman

H. Differential Pressure Switches:

1. Dwyer Instruments
2. Or approved equivalent.

I. Instrument Probe Fittings:

1. Pete's Plug
2. Or approved equivalent.

J. Strainers:

1. Armstrong International
2. Mueller
3. Keckley
4. Hoffman

K. Relief Valves:

1. Armstrong
2. ITT Bell & Gossett
3. Taco, Inc.
4. Amtrol

2.2 BLADDER TYPE EXPANSION TANKS

A. High pre-charged steel expansion tank with replaceable heavy duty butyl rubber bladder. The tank is to have a system and drain NPT connection. The tank is to also have a standard Schrader valve to facilitate on-site charging of the tank to meet system requirements. The tank is to be constructed in accordance with Section VIII of the ASME Boiler and Pressure Vessel Code and stamped 125 PSI working pressure. Provide steel support stand.

2.3 BUFFER TANKS

A. Construction: Carbon steel, ASME Code Section VIII, Division 1, registered with the National Board of Pressure Vessel Manufacturers.

B. Design Pressure: 150 PSIG.

C. Capacity: As scheduled.

D. Connections: Flanged or grooved inlet and outlets to match piping system. Provide threaded Weldolet drain and air vent taps. Locate connections as shown on Drawings. Vertical or horizontal orientation as shown on Drawings.

E. Baffle: Provide solid internal steel baffle designed to maximize flow path length and minimize short circuiting of inlet water to the outlet.

F. Mounting: Provide saddle (for horizontal tanks) or base ring (for vertical tanks) engineered for anchorage to floor to resist seismic and gravity forces. Importance Factor = 1.5.

G. Exterior Coating: Manufacturer’s standard primer paint.

H. Insulation: Provide factory installed thermal insulation suitable for exterior use.

1. Insulation type and thickness: See Section 23 07 00, HVAC Insulation.
2. Provide insulation around supports sufficient to prevent condensation.
3. Jacket: Aluminum with seams sealed to prevent moisture entry.
4. Provide access hole with removable plug for access to tank nameplate or provide metal standoff equal to insulation thickness.

2.4 AIR VENTS

A. Manual Type: Short vertical sections of pipe to form air chamber, with 1/8-inch brass needle valve at top of chamber.

B. Automatic Float Type: Brass or semi-steel body, copper, polypropylene, or solid non-metallic float, drain connection, stainless steel valve and valve seat; suitable for system operating temperature and pressure; with isolating valve.

2.5 COALESCING TYPE AIR AND DIRT SEPARATOR

A. Description: Fabricated steel tank stamped in accordance with Section VIII of ASME Boiler and Pressure Vessel Code for Unfired Vessels, stamped for 150 PSI, with tangential inlet and outlet connections, integral copper tube bundle to fill internal area and venting chamber with float actuated automatic air vent. Separator shell include valved side tap to flush floating dirt for bleed. Internal medium to force dirt and sediment to fall from flow path to collection chamber for blow down. Provide steel support stand.

2.6 PRESSURE REDUCING VALVES

A. Brass body, adjustable range, inlet check valves, removable inlet strainer, noncorrosive valve seat and stem, 3/4-inch size unless otherwise shown, factory set at fill pressure as indicated on drawings.

2.7 LIQUID FLOW SWITCHES

A. Description: Brass for wetted parts with packless construction, paddle with removable segments for pipe size and flow velocity, vapor proof electrical compartment for switches mounted on cold hydronic piping systems, switches for 115V, 60 Hz, 1-phase with 7.4A rating.

2.8 DIFFERENTIAL PRESSURE REGULATOR

A. Description: Externally piloted differential pressure regulating valve. Ductile iron construction, stainless steel and bronze trim and 316 SS seats.

2.9 DIFFERENTIAL PRESSURE SWITCHES

A. Sensing Range: 0- to 1.0-inch water column. Diaphragm operated with switching accomplished by photocell controlled relays, adjustable switch setpoints that close contacts on the relay if the differential pressure sensed raised above the setpoint, incorporate a pointer type gauge with divisions of 0.02-inch WC.

2.10 INSTRUMENT PROBE FITTINGS

A. Brass or stainless steel body and cap, high pressure rated, valve material neoprene, Nordal or Viton to suit temperature range, 1/4-inch or 1/2-inch NPT tailpiece.

2.11 STRAINERS

A. Size 2-inches and Under: Screwed brass or iron body for 175 PSI working pressure, Y pattern with 1/16-inch stainless steel perforated screen.

B. Size 2-1/2-inches and Larger: Flanged or grooved and above: iron body for 175 PSI working pressure, Y pattern with 1/16 stainless steel perforated screen.

C. Basket Pattern: Flanged iron body for 175 PSI working pressure, basket pattern with 1/8-inch stainless steel perforated screen, clamped or bolted cover.

2.12 RELIEF VALVES

A. Size and capacity as selected by installer for proper relieving capacity, in accordance with ASME Boiler and Pressure Vessel Code.

B. Combined Pressure-Temperature Relief Valves: Bronze body, test lever, thermostat, complying with ANSI Z21.22 listing requirements for temperature discharge capacity. Provide temperature relief at 210 degrees F, and pressure relief at 125 PSI.

C. Pressure Relief Valves: Bronze body, test lever, ASME rated. Provide pressure relief as indicated on Drawings.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS

A. Install specialties in accordance with manufacturer's instructions.

B. Support pump fittings with floor mounted pipe and flange supports. Provide vibration isolation, same as pump, to avoid short circuiting.

3.2 BLADDER TYPE EXPANSION TANKS INSTALLATION

A. Install tank in accordance with manufacturer's instructions. Charge tank with air per manufacturer's instructions. Prior to making connection from the tank to the system, check the air charge. Valve is to be opened to the system when it is determined that the air pressure is equal to the minimum system pressure at the tank location.

3.3 BUFFER TANKS INSTALLATION

A. Mount tank level. Secure to slab per Section 23 05 48, Vibration and Seismic Controls for HVAC Equipment.

B. Support piping so that tank does not carry weight of piping.

C. Insulate piping at connection to tank.

D. Provide full size ball valve drain and cap with hose connection.

E. Provide automatic air vent with discharge piped to nearest sanitary drain. Slope air vent discharge piping continuously downward to drain.

3.4 AIR VENTS INSTALLATION

A. Where large air quantities can accumulate, provide enlarged air collection standpipes.

B. Automatic: Furnish and install automatic air vents in mechanical equipment rooms and outdoors only. Install at high points of system piping, at heat transfer coils, and elsewhere as required for system air venting. Vents: 3/4-inch with 1/2-inch IPS drain piping to the nearest floor drain or other approved location. Provide a ball valve and union ahead of all automatic air vents. Do not install above ceilings or locations where discharge may occur and cause damage.

C. Manual Vents: Provide at high points of system piping, at heat transfer coils, and elsewhere as required for system venting where automatic air vents are not to be installed. Provide 10-inch length of 1/4-inch copper tube with 180 degree bend down to discharge into hand-held bucket.

3.5 COALESCING TYPE AIR AND DIRT SEPARATOR INSTALLATION

A. Install in pump suction lines and as indicated. Run piping to expansion tank with 1/4-inch per foot (2 percent) upward slope towards tank. Install drain valve on units 2 inches and over.

3.6 PRESSURE REDUCING VALVES INSTALLATION

A. Install as indicated, and in accordance with manufacturer's instructions with three valve bypass.

3.7 LIQUID FLOW SWITCHES INSTALLATION

A. Install on inlet to heat pump chiller and on other equipment as indicated. Install in horizontal pipe with switch mounted in tee on top of pipe with minimum of 24 inches of straight pipe with no fitting both upstream and downstream of switch. Remove segments of paddle to fit in accordance with manufacturer's instructions.

3.8 DIFFERENTIAL PRESSURE REGULATOR INSTALLATION

A. Install per manufacturer's recommendations.

3.9 DIFFERENTIAL PRESSURE SWITCHES INSTALLATION

A. Install per manufacturer's recommendations.

3.10 INSTRUMENT PROBE FITTINGS INSTALLATION

A. Test Plugs: Install where indicated and in accordance with the manufacturer's recommendations.

3.11 STRAINERS INSTALLATION

A. Provide valved drain and hose connection on strainer blow down connection.

3.12 RELIEF VALVES INSTALLATION

A. Select system relief valve capacity so that it is greater than make-up pressure reducing valve capacity. Select equipment relief valve capacity to exceed rating of connected equipment.

B. Pipe relief valve outlet to nearest floor drain.

C. Where one line vents several relief valves, make cross-sectional area equal to sum of individual vent areas.

D. Water Relief Valves: Install as indicated, and on expansion tanks, hot water tanks and pressure vessels. Pipe discharge to floor drain. Comply with ASME Boiler and Pressure Vessel Code.

END OF SECTION 23 21 16

SECTION 23 21 23 - HYDRONIC PUMPS

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. General Pump Requirements
2. In-Line Circulators
3. Vertical In-Line Pumps

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. NEMA MG 1 - Motors and Generators; National Electrical Manufacturers Association, current edition.
2. NEMA OS 1 - Sheet Steel Outlet Boxes, Device Boxes, Covers, and Box Supports; National Electrical Manufacturers Association, current edition.
3. NFPA 70 - National Electrical Code; National Fire Protection Association, current edition.
4. UL 778 - Standard for Motor-Operated Water Pumps; Underwriters Laboratories Inc., current edition.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Product Data: Provide certified pump curves showing performance characteristics with pump and system operating point plotted. Include NPSH curve when applicable. Include electrical characteristics and connection requirements.
2. Manufacturer's Installation Instructions: Indicate hanging and support requirements and recommendations.
3. Millwright's Certificate: Certify that base mounted pumps have been aligned.
4. Operation and Maintenance Data: Include installation instructions, assembly views, lubrication instructions, and replacement parts list.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirement.

B. In addition, meet the following:

1. Manufacturer Qualifications: Company specializing in manufacture, assembly, and field performance of pumps, with minimum three years of documented experience.
2. Alignment: Base mounted pumps will be aligned by qualified millwright.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Manufacturer's Preparation for Shipping: Clean flanges and exposed machined metal surfaces and treat with anticorrosion compound after assembly and testing. Protect flanges, pipe openings, and nozzles with wooden flange covers or with screwed-in plugs.

B. Store pumps in dry location.

C. Retain protective covers for flanges and protective coatings during storage.

D. Protect bearings and couplings against damage from sand, grit, and other foreign matter.

E. Comply with pump manufacturer's written rigging instructions.

1.8 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases.

1.9 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

B. Mechanical Seals: One mechanical seal for each pump.

1.10 PERFORMANCE REQUIREMENTS

A. Ensure pumps operate at specified system fluid temperatures without vapor binding and cavitation, are non-overloading in parallel or individual operation, and operate within 25 percent of midpoint of published maximum efficiency curve.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Armstrong Pumps, Inc.

B. ITT Bell & Gossett

C. Taco

D. Paco

E. Grundfos

F. Wilo

G. Weil

H. Xylem

I. Or approved equivalent.

2.2 GENERAL PUMP REQUIREMENTS

A. Pump Units: Factory assembled and tested.

B. Motors: Include built-in, thermal-overload protection and grease-lubricated ball bearings. Select each motor to be nonoverloading over full range of pump performance curve.

C. Motors Indicated to Be Energy Efficient: Minimum efficiency as indicated according to IEEE 112, Test Method B. Provide premium efficiency motors according to IEEE 112, Test Method.

2.3 IN-LINE CIRCULATORS

A. Type: Horizontal shaft, single stage, direct connected, with resiliently mounted motor for in-line mounting, oil lubricated, for 125 PSI maximum working pressure.

B. Casing: Cast iron, with threaded companion flanges for piping connections, and threaded gauge tappings at inlet and outlet connections.

C. Impeller: Cast bronze keyed to shaft, statically and dynamically balanced, closed, overhung, single suction, and keyed to shaft.

D. Motor Bearings: Oil-lubricated bronze sleeve.

E. Pump Bearings: Oil-lubricated, bronze journal and thrust type.

F. Shaft: Alloy steel with copper sleeve, integral thrust collar.

G. Seal: Mechanical seal maximum continuous operating temperature. Include carbon-steel rotating ring, stainless-steel spring, ceramic seat, and flexible bellows and gasket.

H. Drive: Flexible coupling, capable of absorbing torsional vibration and shaft misalignment.

I. Motor: Resiliently mounted to pump casing.

J. Performance Electrical Characteristics:

1. As Scheduled. 1750 RPM motors unless specified otherwise; reference Section 23 05 13, Common Motor Requirements for HVAC Equipment.
2. Wiring Terminations: Provide terminal lugs to match branch circuit conductor quantities, sizes and materials indicated. Enclose terminal lugs in terminal box sized to NFPA 70.

K. Variable Flow Controller: Provide integral pump speed controller. Pump control based on:

1. Pressure.

2.4 VERTICAL IN-LINE PUMPS

A. Type: Vertical in-line, centrifugal, single stage, flexible coupled, radially split casing, for in-line mounting, for 125 psi working pressure.

B. Casing: Cast iron, with suction and discharge gauge port, casing wear ring, seal flush connection, drain plug at low point of volute, flanged suction and discharge.

C. Impeller: ASTM B584 cast bronze, fully enclosed, keyed directly to motor shaft or extension, statically and dynamically balanced, closed, overhung, single suction.

D. Shaft: Stainless steel with stainless steel impeller cap screw or nut and stainless steel sleeve.

E. Wear Rings: Replaceable, bronze casing ring.

F. Seal: Mechanical seal, 225 degrees F maximum continuous operating temperature, with carbon-steel rotating ring, stainless-steel spring, ceramic seat, and flexible bellows and gasket.

G. Seal: Packing gland with minimum four rings graphite impregnated packing and bronze lantern rings, 250 degrees F maximum continuous operating temperature.

H. Motor: Directly mounted to pump casing and with lifting and supporting lugs in top of motor enclosure.

I. Performance Electrical Characteristics:

1. As Scheduled. 1750 RPM motors unless specified otherwise; reference Section 23 05 13, Common Motor Requirements for HVAC Equipment.
2. Wiring Terminations: Provide terminal lugs to match branch circuit conductor quantities, sizes, and materials indicated. Enclose terminal lugs in terminal box sized to NFPA 70.

J. Variable Flow Controller: Provide integral pump speed controller. Pump control based on:

1. Pressure.

PART 3 - EXECUTION

3.1 GENERAL PUMP INSTALLATION

A. Install in accordance with manufacturer's instructions according to ANSI/HI 1.1-1.5 "Centrifugal Pumps for Nomenclature, Definitions, Application and Operation."

B. Provide access space around pumps for service including removing motors, impellers, couplings, and accessories. Provide no less than minimum space recommended by manufacturer.

C. Decrease from line size with long radius reducing elbows or reducers. Eccentric reducers where necessary to prevent air entrapment. Support piping adjacent to pump such that no weight is carried on pump casings. For close coupled or base mounted pumps, provide supports under elbows on pump suction and discharge line sizes 4-inches and over. Provide vibration isolation to ensure there is no short circuiting of pump vibration isolator. Refer to Section 23 05 48, Vibration and Seismic Controls for HVAC Equipment.

D. Unless indicated otherwise on Drawings, provide line sized shut-off valve and strainer on pump suction, and line sized soft seat check valve and balancing valve and shut off valve on pump discharge. Triple duty valves not allowed.

E. Provide totally enclosed fan cooled motors when motor is located outdoors, whether under a cover or not, or exposed to moisture. Provide protective covering for electronically commutated motors located in outdoor or wet/wash-down locations.

F. Lubricate pumps before start-up.

G. Piping installation requirements are specified in other Division 23, HVAC Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

H. Install piping adjacent to pumps to allow service and maintenance.

I. Connect piping to pumps. Install valves that are the same size as piping connected to pumps.

J. Install suction and discharge pipe sizes equal to or greater than diameter of pump nozzles.

K. Install flexible connectors on suction and discharge sides of base-mounted pumps between pump casing and valves.

L. Install pressure gauges on pump suction and discharge. Install at integral pressure-gauge tappings where provided.

M. Install temperature and pressure-gauge connector plugs in suction and discharge piping around each pump.

N. Install electrical connections for power, controls, and devices.

O. Electrical power and control wiring and connections are specified in Division 26, Electrical Sections.

P. Ground equipment.

Q. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

R. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain hydronic pumps as specified below:

1. Train Owner's maintenance personnel on procedures and schedules for starting and stopping, troubleshooting, servicing, and maintaining pumps.
2. Review data in maintenance manuals. Reference Division 01, General Requirements.
3. Schedule training with Owner, through Architect, with at least seven days' advance notice.

S. Examine equipment foundations and anchor -bolt locations for compliance with requirements for installation.

1. Examine roughing-in for piping systems to verify actual locations of piping connections before pump installation.

2. Examine foundations and inertia bases for suitable conditions where pumps are to be installed.

T. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 IN-LINE CIRCULATORS INSTALLATION

A. Install per manufacturer's written instructions and requirements.

3.3 VERTICAL IN-LINE PUMPS INSTALLATION

A. Install per manufacturer's written instructions and requirements.

END OF SECTION 23 21 23

SECTION 23 25 00 - HVAC WATER TREATMENT

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Chemical Feed Description
2. Chemical Feeding Equipment
3. Chemical Treatment Test Equipment
4. Chemicals
5. Glycol-Water System
6. Supplemental Services/Components

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Product Data: Include rated capacities; water-pressure drops; shipping, installed, and operating weights; and furnished products listed below:
   a. Pumps
   b. Chemical Solution Tanks
   c. Agitators
   d. Control Equipment and Devices
   e. Test Equipment
   f. Chemicals
   g. Filters
   h. Chemical Feeders
   i. Shop Drawings: Detail equipment assemblies indicating dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   j. Wiring Diagrams: Detail power and control wiring and differentiate between manufacturer-installed and field-installed wiring.
   k. Water Analysis: Submit a copy of the water analysis to illustrate water quality available at Project site.
   l. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.
   m. Maintenance Data: For pumps, agitators, filters, system controls, and accessories to include in maintenance manuals specified in Division 01, General Requirements.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. Qualifications: Firms regularly engaged in manufacture of components of types and sizes required.
2. Installer Qualifications: An experienced installer who is an authorized representative of the chemical treatment manufacturer for both installation and maintenance of chemical treatment equipment required for this Project.
3. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.7 PERFORMANCE REQUIREMENTS

A. Maintain water quality for HVAC systems that controls corrosion and build-up of scale and biological growth for maximum efficiency of installed equipment without posing a hazard to operating personnel or the environment.

B. Base chemical treatment performance requirements on quality of water available at Project site, HVAC system equipment material characteristics and functional performance characteristics, operating personnel capabilities, and requirements and guidelines of authorities having jurisdiction. Consult equipment manufacturer prior to acceptance of values noted below.

1. Closed System: Maintain system essentially free of scale, corrosion, and fouling to sustain the following water characteristics:
   a. pH: Maintain a value within 9.0 to 10.5.
   b. "P" Alkalinity: Maintain a value within 100 to 500 ppm.
   c. Boron: Maintain a value within 100 to 200 ppm.
   d. Chemical Oxygen Demand: Maintain a maximum value of 100 ppm.
   e. Soluble Copper: Maintain a maximum value of 0.20 ppm.
   f. TDS: Maintain a maximum value of 10 ppm.
   g. Ammonia: Maintain a maximum value of 20 ppm.
   h. Free Caustic Alkalinity: Maintain a maximum value of 20 ppm.
   i. Microbiological Limits:
      1) Total Aerobic Plate Count: Maintain a maximum value of 1000 organisms/ml.
      2) Total Anaerobic Plate Count: Maintain a maximum value of 100 organisms/ml.
      3) Nitrate Reducers: Maintain a maximum value of 100 organisms/ml.
      4) Sulfate Reducers: Maintain a maximum value of 0 organisms/ml.
      5) Iron Bacteria: Maintain a maximum value of 0 organisms/ml.
2. Passivation for Galvanized Steel (for the first 60 days of operation):
   a. pH: Maintain a value within 7 to 8.
   b. Calcium Carbonate Hardness: Maintain a value within 100 to 300 ppm.
   c. Calcium Carbonate Alkalinity: Maintain a value within 100 to 300 ppm.

1.8 MAINTENANCE

A. Scope of Service: Provide chemicals and service program for maintaining optimum conditions in the circulating water for inhibiting corrosion, scale, and organic growths in the heating hot-water piping and equipment. Services and chemicals provided for a period of one year from date of Substantial Completion, including the following:

1. Initial water analysis and recommendations.
2. Startup assistance.
3. Periodic field service and consultation.
4. Customer report charts and log sheets.
5. Laboratory technical assistance.
6. Analyses and reports of chemical items concerning safety and compliance with government regulations.

1.9 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Chemicals: Furnish quantity equal to 50 percent of amount initially installed.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Aqua-Chem, Inc.; Cleaver-Brooks Div.

B. Betz Dearborn, Inc.

C. Calgon Corp., ECC International

D. ITOH2 Industrial Treatment of Water

E. Nalco Chemical Co.

F. US Water Services

G. Chemcoa

H. Cleaver-Brooks

I. Sarco

J. Or approved equivalent.

2.2 CHEMICAL FEED DESCRIPTION

A. Closed-Loop System: One bypass feeder on each system with isolating and drain valves downstream from circulating pumps, unless otherwise indicated.

1. Introduce chemical treatment through bypass feeder when required or indicated by test.

B. Closed-Loop, Heating Steam and Condensate Piping: Lead-lag switch controls the sequence of boilers and introduces the chemical to the boiler through a bypass feeder.

1. Chemical feed pump introduces sequestering agent and base from solution tank into boiler or feedwater line close to boiler, with minimum of one pump per boiler. Use agitator as required.
2. Activate chemical solution pump when feedwater pumps are running.
3. Activate chemical solution pump from meter on makeup water line only when one boiler is used.
4. Continuously run pump for feeding chemical when multiple boilers are used.
5. Liquid-level switch, in each solution tank, deactivates chemical solution pump and signals alarm.
6. Conductivity controller samples boiler water on timed cycle and operates solenoid blowdown valve.

2.3 CHEMICAL FEEDING EQUIPMENT

A. Bypass Feeders: Cast iron or steel, for introducing chemicals into system; with funnel shutoff valve on top, air-release valve on top, drain valve on bottom, and recirculating shutoff valves on sides.

1. Capacity: 1.8 gallon for systems with less than 1,000 gallon volume and 5 gallon for systems with more than 1,000 gallon volume.
2. Working Pressure: 125 PSIG or 175 PSIG.

2.4 CHEMICAL TREATMENT TEST EQUIPMENT

A. Test Kit: Manufacturer recommended equipment and chemicals, in a carrying case, for testing pH, total dissolved solids, dissolved oxygen, biocount, chloride, and total alkalinity and for calcium hardness field tests.

B. Corrosion Test Coupon Assembly: Constructed of corrosion material, complete with piping, valves, and mild steel and copper coupons. Locate copper coupon downstream from mild steel coupon in the test coupon assembly.

1. Three station rack for closed-loop system.
2. Four station rack for open condenser water systems.

2.5 CHEMICALS

A. Furnish chemicals recommended by water-treatment system manufacturer that are compatible with piping system components and connected equipment.

B. System Cleaner: Liquid alkaline compound with emulsifying agents and detergents to remove grease and petroleum products.

C. Biocide: Chlorine release agents or microbiocides.

D. Closed-Loop, Water Piping Chemicals: Sequestering agent to reduce deposits and adjust pH, corrosion inhibitors, and conductivity enhancers.

2.6 GLYCOL-WATER SYSTEM

A. Propylene glycol to be inhibited with 1.75 percent dipotassium phosphate. Do not use automotive anti-freeze because the inhibitors used are not needed and can cause sludge precipitate that interferes with heat transfer.

B. Provide required amount of glycol to obtain the percent by volume for glycol-water systems as follows and to provide one-half tank reserve supply: 25 percent for hydronic system.

C. Glycol-Water Make-up System:

1. Glycol-Water Storage Tank: Self supporting polyethylene, minimum 90 mil thickness, with removable cover or black steel with 90 mil polyethylene insert. Capacity to be 55 gallons, with approximate diameter of 23-inches and height of 36-inches. Reinforced threaded pipe connections to be provided for connections. Provide identification for tank showing name of the contents.
2. Glycol-Water Make-up Pump: Bronze fitted, self priming, high head type suitable for pumping a 33 percent to 50 percent glycol-water solution in intermittent service. The pump to be provided with a mechanical shaft seal and be flange connected to a 1750 rpm NEMA Type C motor. The pump capacity to be 3 gpm or 50 PSIG discharge pressure with a suction lift capability of 5-inches of mercury, with a 1/3 horsepower drip proof motor. The pump may be a "gear-within-a-gear" positive displacement type with built-in relief valve set for 43 PSIG, or the pump may be a regenerative turbine type providing self-priming with built-in relief valve set for 43 PSIG, or the pump may be a regenerative turbine type providing self-priming with built-in external relief valve set for design head of the pump.
3. Back Pressure Regulating Valve: Spring loaded, diaphragm actuated type with bronze or steel body, stainless steel trim with capacity to relieve 100 percent of pump flow with an allowable rise in the regulated pressure of 10 PSIG above the set point. Set point to be 15 PSIG above system PRV setting.
4. Low Water Level Control: Steel or plastic float housing, stainless steel or plastic float, positive snap acting SPST switch mechanism, rated 10 amps-120 volt AC, in General Purpose (NEMA 1) enclosure. the control to be rated for pressures to 150 PSIG and make alarm circuit on low water level. The alarm circuit to be wired to an alarm light on the nearest local Temperature Control panel (LTCP). Provide remote output relay to indicate alarm condition at the Building Control System.

2.7 SUPPLEMENTAL SERVICES/COMPONENTS

A. Drain and makeup water piping to comply with the requirements of Division 22, Plumbing. Drains which connect to sanitary sewer systems to be connected by means of an indirect waste.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS

A. Water Analysis:

1. Perform an analysis of supply water to determine the type and quantities of chemical treatment needed to maintain the water quality as specified in "Performance Requirements" Article.

B. Installation:

1. Install treatment equipment level and plumb. Provide power to all system devices.
2. Add cleaning chemicals as recommended by manufacturer.
3. To prevent dirt and solids from lodging the coils, before adding cleaning chemical to the closed system, air handling coils and fan coil units to be isolated by closing the inlet and outlet valves and opening the bypass valves Do not valve in or operate system pumps until after system has been cleaned.
4. After chemical cleaning is satisfactorily completed, open the inlet and outlet valves to each coil and close the by-pass valves. Also, clean strainers.

C. Connections:

1. Piping installation requirements are specified in other Division 23, HVAC Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
2. Provide a by-pass line around water meters and bleed off piping assembly. Provide ball valves to allow for bypassing, isolation, and servicing of components.
3. Bleed off water piping with bleed off piping assembly to be piped from pressure side of circulating water piping to a convenient drain. Bleed off connection to main circulating water piping to be upstream of chemical injection nozzles.
4. Provide piping for the flow assembly piping to the main control panel and accessories.
    a. The inlet piping to connect to the discharge side of the circulating water pump.
    b. Piping to connect to the water piping service the cooling tower downstream of the heat source.
    c. Provide inlet Y-strainer and ball valves to isolate and service main control panel and accessories.
    d. Install injection nozzles with corporation stops in the water piping service the cooling tower downstream of the heat source.
    e. Provide piping for corrosion monitor rack per manufacturers installation instructions. Provide ball valves to isolate and service rack.
    f. Provide piping for erosion chemical feeder per manufacturer's installation instructions. Provide ball valves to isolate and service feeder.
5. Install piping adjacent to equipment to allow service and maintenance.
6. Confirm applicable electrical requirements in Division 26, Electrical Sections for connecting electrical equipment.
7. Ground equipment.
    a. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

D. Field Quality Control:

1. Inspect field-assembled components and equipment installation, including piping and electrical connections. Report results in writing.
    a. Inspect piping and equipment to determine that systems and equipment have been cleaned, flushed, and filled with water, and are fully operational before introducing chemicals for water-treatment system.
    b. Place HVAC water-treatment system into operation and calibrate controls during the preliminary phase of HVAC systems' startup procedures.
2. Test chemical feed piping as follows:
    a. Do not enclose, cover, or put piping into operation until it is tested and satisfactory test results are achieved.
    b. Test for leaks and defects. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.

c. Leave uncovered and unconcealed new, altered, extended, and replaced water piping until it has been tested and approved. Expose work that has been covered or concealed before it has been tested and approved.
d. Cap and subject piping to static water pressure of 50 PSIG (345 kPa) above operating pressure, without exceeding pressure rating of piping system materials. Isolate test source and allow test pressure to stand for four hours. Leaks and loss in test pressure constitute defects.
e. Repair leaks and defects with new materials and retest piping until satisfactory results are obtained.
f. Prepare test reports, including required corrective action.

E. Adjusting:

1. Sample boiler water at one-week intervals after boiler startup for a period of five weeks, and prepare certified test report for each required water performance characteristic. Where applicable, comply with ASTM D 3370 and the following standards:
   a. Silica: ASTM D 859.
   b. Steam System: ASTM D 1066.
   c. Acidity and Alkalinity: ASTM D 1067.
   d. Iron: ASTM D 1068.
   e. Water Hardness: ASTM D 1126.
2. Occupancy Adjustments: Within 12 months of Substantial Completion, perform two separate water analyses to prove that automatic chemical feed systems are maintaining water quality within performance requirements specified in this Section. Perform analyses at least 60 days apart. Submit written reports of water analysis.

F. Gauge Adjusting and Cleaning:

1. Adjust faces of meters and gauges to proper angle for best visibility.
2. Clean windows of meters and gauges and factory finished surfaces. Replace cracked or broken windows, repair scratched or marred surfaces with manufacturer's touch-up paint.

G. Demonstration:

1. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain HVAC water-treatment systems and equipment.
   a. Train Owner's maintenance personnel on procedures and schedules for starting and stopping, troubleshooting, servicing, and maintaining equipment and schedules.
2. Review manufacturer's safety data sheets for handling of chemicals.
3. Review data in maintenance manuals, especially data on recommended parts inventory and supply sources and on availability of parts and service.
4. Schedule at least four hours of training with Owner, through Architect, with at least seven days' advance notice.

END OF SECTION 23 25 00

SECTION 23 31 00 - HVAC DUCTS AND CASINGS

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Ductwork, Joints, and Fittings
2. Laundry Clothes Dryer Vent
3. Insulated Flexible Duct
4. Textile Air Dispersion System
5. Fiberglass Reinforced Ductwork
6. Ductwork Joint Sealers and Sealants

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

B. In addition, reference the following:

1. Section 23 05 29, Hangers and Supports for HVAC Piping, Ductwork and Equipment.
2. Section 23 05 93, Testing, Adjusting, and Balancing for HVAC.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Welding Certificates.
2. Field Quality Control Reports.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. NFPA Compliance:
   a. NFPA 90A, Installation of Air Conditioning and Ventilating Systems.
   b. NFPA 90B, Installation of Warm Air Heating and Air Conditioning Systems.
2. Comply with SMACNA's HVAC Duct Construction Standards - Metal and Flexible for acceptable materials, material thicknesses, and duct construction methods, unless otherwise indicated. Provide sheet metal materials free of pitting, seam marks, roller marks, stains, discolorations, and other imperfections.

3. Provide ductwork pressure testing and leakage testing per Section 23 05 93, Testing, Adjusting, and Balancing for HVAC.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.7 SYSTEM DESCRIPTION

A. Duct system design, as indicated, has been used to select size and type of air-moving and distribution equipment and other air system components. Duct design is generally diagrammatic and is not meant to be scaled. Major changes to layout or configuration of duct system must be specifically approved in writing by Architect. Accompany requests for layout modifications with calculations showing that proposed layout will provide original design results without increasing system total pressure.

PART 2 - PRODUCTS

2.1 DUCTWORK, JOINTS, AND FITTINGS

A. Materials:

1. Galvanized Steel Ducts: Hot-dipped galvanized steel sheet, lock-forming quality, ASTM A 653/A 653M FS Type B, with G90/Z275 coating, minimum 26 gauge except where heavier material is specified. Ducts to have mill phosphatized finish for surfaces exposed to view.
2. Aluminum Ducts: ASTM B 209 (ASTM B 209M); aluminum sheet, alloy 3003-H14. Aluminum Connectors and Bar Stock: Minimum 24 gauge except where heavier matieral is specified; alloy 6061-T651 or of equivalent strength with mill finish for concealed ducts and standard, 1-side bright finish for exposed ducts with liquid-tight joints when containing condensate vapor or liquids in suspension.
3. Stainless Steel: Fabricated in accordance with ASTM A167 and A480 with liquid-tight joints when containing condensate vapor or liquids in suspension.

B. Fabricate ducts, elbows, transitions, offsets, branch connections, and other construction according to SMACNA's HVAC Duct Construction Standards - Metal and Flexible and complying with requirements for metal thickness, reinforcing types and intervals, tie-rod applications, and joint types and intervals.

1. Lengths: Fabricate rectangular ducts in lengths appropriate to reinforcement and rigidity class required for pressure class.
2. Deflection: Duct systems not-to-exceed deflection limits according to SMACNA's HVAC Duct Construction Standards - Metal and Flexible.
3. Transverse Joints: Prefabricated slide-on joints and components constructed using manufacturer's guidelines for material thickness, reinforcement size and spacing, and joint reinforcement.

C. Formed-On Flanges: construct according to SMACNA's HVAC Duct Construction Standards - Metal and Flexible, Figure 1-4, using corner, bolt, cleat, and gasket details.

1. Duct Size: Maximum 30-inches wide and up to 2-inch wg pressure class.
2. Longitudinal Seams: Pittsburgh lock sealed with noncuring polymer sealant.

3. Cross Breaking or Cross Beading: Cross break or cross bead duct sides 19-inches and larger and 0.0359-inch thick or less, with more than 10 SF of nonbraced panel area unless ducts are lined.

D. Round, Spiral Lock-Seam Ducts: Fabricate supply ducts of material specified in this Section according to SMACNA's HVAC Duct Construction Standards - Metal and Flexible.

1. Ducts up to 20-inches in Diameter: Interior, center-beaded slip coupling, sealed before and after fastening, attached with sheet metal screws.
2. Ducts 21- to 72-inches in Diameter: Three-piece, gasketed, flanged joint consisting of two internal flanges with sealant and one external closure band with gasket.
3. Ducts Larger than 72-inches in Diameter: Companion angle flanged joints per SMACNA HVAC Duct Construction Standards-Metal and Flexible, Figure 3-2.
4. Round Ducts: Prefabricated connection system consisting of double-lipped, EPDM rubber gasket. Manufacture ducts according to connection system manufacturer's tolerances.

E. 90-Degree Tees and Laterals and Conical Tees: Fabricate to comply with SMACNA's HVAC Duct Construction Standards-Metal and Flexible, with metal thicknesses specified for longitudinal-seam straight ducts.

F. Diverging-Flow Fittings: Fabricate with reduced entrance to branch taps and with no excess material projecting from fitting onto branch tap entrance.

G. Fabricate elbows using die-formed, gored, pleated, or mitered construction. Bend radius of die-formed, gored, and pleated elbows to be 1.5 times duct diameter. Unless elbow construction type is indicated, fabricate elbows as follows:

1. Mitered-Elbow Radius and Number of Pieces: Welded construction complying with SMACNA's HVAC Duct Construction Standards-Metal and flexible, unless otherwise indicated.
2. Round Mitered Elbows: Welded construction with the following metal thickness for pressure classes from minus 2- to plus 2-inch wg (minus 500 to plus 500 Pa):
    a. Ducts 3- to 36-inches in Diameter: 0.034-inch.
    b. Ducts 37- to 50-inches in Diameter: 0.040-inch.
    c. Ducts 52- to 60-inches in Diameter: 0.052-inch.
    d. Ducts 62- to 84-inches in Diameter: 0.064-inch.
3. Round Mitered Elbows: Welded construction with the following metal thickness for pressure classes from 2- to 10-inch wg:
    a. Ducts 3- to 26-inches in Diameter: 0.034-inch.
    b. Ducts 27- to 50-inches in Diameter: 0.040-inch.
    c. Ducts 52- to 60-inches in Diameter: 0.052-inch.
    d. Ducts 62- to 84-inches in Diameter: 0.064-inch.
4. 90-Degree, Two-Piece, Mitered Elbows: Use only for supply systems or for material-handling Class A or B exhaust systems and only where space restrictions do not permit using radius elbows. Fabricate with single-thickness turning vanes.
5. Round Elbows:
    a. 8-inches and Less in Diameter: Fabricate die-formed elbows for 45 and 90-degree elbows and pleated elbows for 30, 45, 60 and 90 degrees only. Fabricate nonstandard bend-angle configurations or non-standard diameter elbows with gored construction.
    b. 9 through 14-inches in Diameter: Fabricate gored or pleated elbows for 30, 45, 60 and 90 degrees unless space restrictions require mitered elbows. Fabricate nonstandard bend-angle configurations or nonstandard diameter elbows with gored construction.

c. Larger than 14-inches in Diameter and All Flat-Oval Elbows: Fabricate gored elbows unless space restrictions require mitered elbows.

6. Die-Formed Elbows for Sizes through 8-inches in Diameter and Pressures 0.040-inch thick with two-piece welded construction.
7. Round Gored-Elbow Metal Thickness: Same as non-elbow fittings specified above.
8. Pleated Elbows for Sizes through 14-inches in Diameter and Pressures through 10-inch wg (2500 Pa): 0.022-inch.
9. Not acceptable:
   a. Corrugated or flexible metal duct.
   b. Adjustable elbows.

2.2 LAUNDRY CLOTHES DRYER VENT

A. Aluminum sheet metal, minimum 24 gauge. Substantially airtight duct except for openings required for operation and maintenance. Duct to have smooth interior surface. Do not assemble with sheet metal screens or other devices that extend into the airstream.

2.3 INSULATED FLEXIBLE DUCT

A. Manufacturers:

1. ATCO
2. Flexmaster
3. J.P. Lamborn Co.
4. Hart and Cooley

B. Construction: Standard factory fabricated product. Inner wall: Impervious vinyl or chlorinated polyethylene, permanently bonded to a vinyl or zinc-coated spring steel helix.

C. Insulation: Fiberglass blanket insulation covered by an outer wall of vinyl or fiberglass-reinforced metalized vapor barrier.

D. Listing: UL 181 listed Class 1 flexible air duct material. Overall thermal transmission: No more than 0.25 BTU/in or hr/sq. degrees F at 75 degrees F differential, per ASTM C335.

E. Vapor transmission value no more than 0.10 perm, per ASTM E96.

F. Pressure Rating: 4-inch wg positive pressure and 1-inch wg negative pressure.

G. Performance Air Friction Correction Factor: 1.3 maximum at 95 percent extension. Working air velocity: Minimum 2000 FPM.

H. Flame Spread Rating: No more than 25.

I. Smoke Development Rating: No more than 50 as tested per ASTM E84.

J. Insertion Loss: Minimum attenuation of 29 DB for 10-foot straight length at 8-inch diameter at 500 Hz.

2.4 TEXTILE AIR DISPERSION SYSTEM

A. Manufacturers:

1. FabricAir (Basis of Design)

2. Duct Sox
3. Durkee Nanosox

B. General: Air dispersion system of a woven fire retardant fabric.

C. Construction:

1. Permeable polyester or non-permeable polyester with airflow orifices.
2. Color: To be determined by Architect.
3. Fire Retardancy: Classified by Underwriters Laboratories in accordance with the requirements of NFPA 90-A.
4. Refer to drawings for nozzle locations and directions for airflow pattern to wash interior wall and ceiling surfaces.

D. Accessories:

1. Inlet connection to metal duct via fabric draw band with anchor patches. Anchor patches to be secured to metal duct via zip screw fastener.
2. Zipper at inlet connection for easy removal and maintenance.
3. All required zippers as specified by manufacturer.
4. Connectors to accommodate suspension system.

E. Suspension System:

1. Tension cable system including multiple runs of cable attached to structure.
2. Provide cable, eye bolts, thimbles, cable clamps, glides, track and turnbuckles as required.
3. Track system. All stainless steel track, suspension rods, connectors, and any ancillary components.

2.5 FIBERGLASS REINFORCED DUCTWORK

A. Manufacturers:

1. ATS
2. Spunstrand
3. Or approved equivalent.

B. General: Provide fume exhaust ducts (except for flammable vapor exhaust) listed for use without necessity for internal fire protection sprinklers, or any devices relied on to cut off air flow (including collapse or close off of duct) in event of fire, by the following.

1. Factory Mutual Research
2. International Conference of Building Officials
3. State Fire Marshal
4. Test ducts to ASTM-E-84 standard on both inside and outside surfaces and in thicknesses up to 3/8-inch. Ducts listed by Factory Mutual as having flame spread ratings of 5 and smoke developed ratings of 5.

C. Duct and fitting thicknesses as follows:

1. 2 to 20-inches diameter: 1/8-inch
2. 22 to 36-inches diameter: 3/16-inch
3. 42 to 60-inches diameter: 1/4-inch

D. Fittings: Branch taps to be at 45 degree entry to mains at horizontal centerlines occurring on main ducts after transitions located upstream. Factory apply taps above 5-inches diameter with inside surfaces of tap joints finished with one layer of glass mat and veil thoroughly impregnated with resin. In addition to that required on exterior of connection for structural strength. Provide transitions with tapers at 150 maximum variation. Round elbows up to 36-inches diameter constructed of a single piece smooth flow type. Elbows above 36-inch three piece gored elbows. Elbows with a centerline radius of 1.5 times their diameter.

E. Construct duct and fittings to be seamless longitudinally; materials may not be cut from molds and rebonded. Elbows may not be shipped to job with their throats slit for field bonding. If necessary to use a two-piece mitered 90 degree elbow. Airfoil shaped turning vanes must be installed at miter.

F. Provide dampers with locking quadrants with blades and shafts which drop out in the event of fire. Blades have a minimum open area of 5 percent when fully closed.

2.6 DUCTWORK JOINT SEALERS AND SEALANTS

A. Manufacturers:

1. Ductmate
2. Duro Dyne
3. Hardcast
4. United McGill Corporation
5. Vulkem
6. Foster
7. Childer

B. Joint Sealers and Sealants: Non-hardening, water resistant, mildew and mold resistant.

C. Low Emitting Materials Requirement: Adhesives, sealants and sealant primers must comply with South Coast Air Quality Management District (SCAQMD) Rule #1168.

D. Type: Heavy mastic or liquid, suitable for joint configuration and compatible with substrates, and recommended by manufacturer for pressure and leakage class of ducts.

E. Surface Burning Characteristics: Flame spread of zero, smoke developed of zero, when tested in accordance with ASTM E 84.

F. Water Based Sealant for Brush-On Application: Flexible, adhesive sealant, resistant to UV light, UL-181A, and UL-181-B listed, complying with NFPA requirements for Class 1 ducts. Min. 69 percent solids, nonflammable. Hardcast Versa-Grip 181; Childers CP-146; Foster 32-19 for SMACNA 1/2, 1, 2, 3, 4, 6, and 10-inch WG duct classes, and SMACNA Seal Class A, B, or C.

G. Flanged Joint Mastic: One-part, acid-curing, silicone, elastomeric joint sealant complying with ASTM C920, Type S, Grade NS, Class 25, Use O.

H. Flange Gaskets: Butyl rubber or EPDM polymer with polyisobutylene plasticizer.

I. Polyurethane Sealant: General-purpose, exterior use, non-brittle sealant for gunned application. Vulkem 616 or equal.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS

A. General: Use the following pressure seal, and leakage class(es) in design of ductwork specified in this section unless otherwise noted on Drawings.

SYSTEM	PRESSURE CLASS (Inches of Water)	SEAL CLASS	LEAKAGE CLASS ROUND DUCTS	LEAKAGE CLASS RECTANGULAR DUCTS
Low Pressure (downstream of terminal unit)	+ 1-inch	A	2	4
Return and Exhaust	0.5-inch more negative than return/exhaust fan pressure or -2-inch pressure class, whichever is more negative.	A	2	4
Hazardous Exhaust	-6-inch	A	2	4

B. Ductwork Installation:

1. General: Install entire duct system in accordance with drawings, Specifications, and latest issues of local Mechanical Code, NFPA 90A, and SMACNA Duct Construction Manual. At Contractor's option, rectangular ductwork may be resized to maintain an equivalent air velocity and friction rate, while maintaining a maximum aspect ratio of 3. Remove markings and tagging from ductwork exterior surface in mechanical rooms and other locations where ductwork is exposed.
2. The duct layout shown on the Contract Drawings is diagrammatic in nature. Coordinate the ductwork routing and layout, and make alterations to the ductwork routing and layout to eliminate physical interferences. Where deviations in the ductwork routing as shown in the Contract Drawings are required, alterations may be made so as not to compromise the air flow, pressure drop, and sound characteristics of the duct fitting or duct run as shown on the Contract Drawings. In the event Architect determines that the installed ductwork is inconsistent with the above mentioned criteria, remove and replace at no additional cost to the Owner.
3. Install ducts with fewest possible joints.
4. Install fabricated fittings for changes in directions, size, shape, and for connections.
5. Install couplings tight to duct wall surface with a minimum of projections into duct. Secure couplings with sheet metal screws. Install screws at intervals of 12-inches, with a minimum of 3 screws in each coupling.
6. Install ducts, unless otherwise indicated, vertically and horizontally and parallel and perpendicular to building lines; avoid diagonal runs.
7. Install ducts close to walls, overhead construction, columns, and other structural and permanent enclosure elements of building.
8. Install ducts with a clearance of 1-inch, plus allowance for insulation thickness. Allow for easy removal of ceiling tile.

9. Conceal ducts from view in finished spaces. Do not encase horizontal runs in solid partitions unless specifically indicated.
10. Coordinate layout with suspended ceiling, air duct accessories, lighting layouts, and similar finish work.
11. Electrical and IT Equipment Spaces: Route ducts to avoid passing through transformer vaults, electrical equipment spaces, IDF/MPOE rooms, and enclosures.
12. Boiler Rooms and Refrigeration Machinery Rooms: Only route ducts serving these rooms through these rooms.
13. Non-Fire-Rated Partition Penetrations: Where ducts pass through interior partitions and exterior walls and are exposed to view, conceal spaces between construction openings and ducts or duct insulation with sheet metal flanges of same metal thickness as ducts. Overlap openings on 4 sides by at least 1-1/2-inches.
14. Fire- and Smoke-Rated Partition Penetrations: Where ducts pass through interior partitions and exterior walls, install appropriately rated fire, smoke or combination fire and smoke dampers as governed by Building Code and AHJ, including sleeves, and firestopping sealant.
15. Install ducts with hangers and braces designed to withstand, without damage to equipment, seismic force required by applicable building codes. Reference SMACNA's Seismic Restraint Manual: Guidelines for Mechanical Systems, Mason Seismic Restraint and Support Systems.
16. Protect duct interiors from the elements and foreign materials until building is enclosed. Follow SMACNA's Duct Cleanliness for New Construction Advanced Level.
17. Paint interiors of metal ducts, that do not have duct liner, for 24-inches upstream of registers and grilles. Apply one coat of flat, black, latex finish coat over a compatible duct material.
18. Install ductwork in the location and manner shown and detailed. Review deviations required by job conditions with Architect prior to any fabrication. Provide fittings for construction per SMACNA.
19. Install flexible ductwork to limit sag between support hangers to 1/2-inch per foot of spacing support.
20. Humidifier Duct:
    a. Supply duct section 15-feet downstream from humidifier.
        1) Seams water tight.

C. Flanged Take-Offs:

1. Install at branch takeoffs to outlets using round or flex duct.
2. Flanged take-offs secured with minimum 8-inch screw spacing (three screws minimum).
3. Provide ductwork taps and branches off of main ducts at 45 degrees whether shown on Drawings or not (drawings are diagrammatic).

D. Cleaning:

1. Clean duct systems with high power vacuum machines. Protect equipment that could be harmed by excessive dirt with filters, or bypass during cleaning. Provide adequate access into ductwork for cleaning purposes.
2. Grille and Exposed Duct Cleaning:
    a. After completion of ductwork installation, operate each fan system (excluding exhaust fans) for a minimum of 30 minutes prior to installation of ceiling grilles and diffusers. After grilles and diffusers are installed, clean out accumulation of particles from grilles and diffusers prior to acceptance.
    b. Clean exterior surface of ducts exposed to public view of chalk, pencil and pen marks, labels, sizing tags, dirt, dust, etc., so that upon completion of installation, ducts are left in clean and unblemished manufactured conditions.

c. Exposed duct and grilles to remain free of dust entrained streaks due to leakage at joints and grille connections during warranty period. Clean leaks, seal and refinish to match existing if visible streaks develop.

3.2 DUCTWORK, JOINTS, AND FITTINGS INSTALLATION

A. Duct Materials - Applied Locations:

1. General: Use the following materials in design of ductwork specified in this Section unless otherwise noted on the Drawings.

Location or Application	Material
Supply, Return, Transfer, and Exhaust - Low Pressure (downstream of terminal units)	Single Wall, Galvanized Steel
General Exhaust Branch Serving Air Inlet in Shower Room or Toilet Room with Shower	Single Wall, Aluminum or Type 304 Stainless Steel
Supply, Return, Exhaust serving Natatorium, Pool, or Spa Area	Single Wall, Aluminum or Type 304 Stainless Steel
Ductwork for the First 15-feet Downstream of Humidifier	Single Wall, Type 316 Stainless Steel

B. Ductwork Installation:

1. Fabricate radius elbows with centerline radius not less than 1-1/2 duct diameters.
2. Do not install duct size transition pitch angles which exceed 30 degrees for reductions in duct size in the direction of airflow, and 15 degrees for expansions in duct size in the direction of airflow.
3. Install fixed turning vanes in square throat rectangular elbows and in tees.
4. Fabricate duct turns with the inside (smallest) radius at least equal to the duct width (supply ducts) and 1.5 times radius (return and exhaust ducts). Where necessary, square elbows may be used, with maximum available inside radius and with fixed turning vanes. In healthcare settings such as hospitals and medical office buildings, square elbows and turning vanes allowed on supply ductwork only.

3.3 LAUNDRY CLOTHES DRYER VENT INSTALLATION

A. Install vent in accordance with manufacturer's instructions and recommendations.

3.4 INSULATED FLEXIBLE DUCT INSTALLATION

A. Provide sheet metal plenum or rigid elbow and connect to diffusers and grilles with ductwork connections. Refer to Drawings for more information. Provide straight section of flexible duct with minimum length of 2-feet and maximum length of 5-feet and connect to sheet metal plenums and rigid elbows connected to diffusers and grilles, unless noted otherwise.

1. Provide round neck grilles/diffusers or square-to-round transitions. Flexible duct connections directly to diffuser and grilles is not allowed.
2. Flexible duct allowed in concealed spaces above lay-in ceilings only.

3.5 TEXTILE AIR DISPERSION SYSTEM INSTALLATION

A. Install per manufacturer's requirements.

3.6 FIBERGLASS REINFORCED DUCTWORK INSTALLATION

A. For under slab installations, excavate required trenches evenly. Backfill with pea gravel, sand, or excavated material.

3.7 DUCTWORK JOINT SEALERS AND SEALANTS INSTALLATION

A. Joints and Seam Joint Sealing:

1. Seal duct seams and joints according to SMACNA's HVAC Duct Construction Standards - Metal and Flexible, for duct pressure class indicated.
2. Seal transverse joints, longitudinal seams and duct wall penetrations including screw, fastener, pipe, rod, and wire.
3. Seal ducts before external insulation is applied.
4. Tape joints of PVC coated metal ductwork with PVC tape.
5. Fasteners such as sheet-metal screws, machine screws or rivets to be cadmium plated.
6. Rectangular Ductwork: Where intermediate joint reinforcement is required for duct of negative pressure class, pre-drill stiffening flange and provide fastener maximum 8-inches on center. Where retaining flanges are welded to duct wall, paint welds with zinc coating.
7. Single Wall Round Ductwork: Joint to incorporate beaded slip collar with minimum #8 sheet metal screws 8-inches on center. Seal ductwork as specified in this Section.
8. Seal joints and seams. Apply sealant to make end connectors before insertion, and afterward to cover entire joint and sheet metal screws.
9. Double Wall Round Ductwork: Joint to incorporate beaded slip collar or flanged connection, with minimum #8 sheet metal screws 8-inches on center. Seal ductwork as specified in this Section.
10. Duct sizes indicated are inside clear dimensions. For lined ducts, maintain sizes inside lining.
11. Provide openings in ductwork where required to accommodate thermometers and control devices. Provide pitot tube openings where required for testing of systems, complete with metal can with spring device or screw to ensure against air leakage. Where openings are provided in insulated ductwork, install insulation material inside a metal ring.
12. Locate ducts with sufficient space around equipment to allow normal operating and maintenance activities as well as Code required clearances.

END OF SECTION 23 31 00

SECTION 23 33 00 - AIR DUCT ACCESSORIES

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Sheet Metal Materials
2. Backdraft Dampers
3. Dampers
4. Concealed Damper Hardware
5. Access Doors
6. Duct Test Holes
7. Control Dampers
8. Duct Silencers
9. Turning Vanes
10. Flexible Connectors
11. Air Flow Measuring Station (Hot Wire Anemometer Type)

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Manufacturer's catalog data and fabrication/installation drawings for each factory fabricated duct accessory. Include leakage, pressure drop and maximum back pressure data.
2. Shop Drawings: Indicate air duct accessories.
3. Manufacturer's installation instructions: Provide instructions for each factory fabricated duct accessory.
4. Maintenance Materials: Furnish the following for Owner's use in maintenance of project.
    a. See Division 01, General Requirements, Product Requirements for additional provisions.
    b. Extra Fusible Links: One of each type and size.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. Manufacturer Qualifications: Company specializing in manufacturing the type of products specified in this Section, with minimum five years of documented experience.
2. Products Requiring Electrical Connection: Listed and classified by Underwriters Laboratories Inc. as suitable for the purpose specified and indicated.
3. AMCA 500 - Test Methods for Louvers, Dampers and Shutters.
4. AMCA 511 - Certified Ratings Program for Air Control Devices.
5. AMCA 611, latest edition - Certified Ratings Program - Product Rating Manual for Airflow Measurement Stations.
6. AMCA 610, latest edition - Laboratory Methods of Testing Airflow Measurement Stations for Performance Rating.
7. NFPA 90A - Installation of Air Conditioning and Ventilating Systems.
8. NFPA 92A - Smoke-Control Systems.
9. NFPA 92B - Smoke Control Systems in Atria, Covered Malls and Large Areas.
10. NFPA 101 - Life Safety Code.
11. UL 555 - Standard for Safety; Fire Dampers.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

PART 2 - PRODUCTS

2.1 SHEET METAL MATERIALS

A. Comply with SMACNA's "HVAC Duct Construction Standards--Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods, unless otherwise indicated.

B. Galvanized Sheet Steel: Lock-forming quality; complying with ASTM A 653/A 653M. Galvanizing: 1-1/4 ounces per square foot total both sides; ducts to have mill-phosphatized finish for surfaces exposed to view.

C. Stainless Steel: ASTM A 480/A 480M.

D. Reinforcement Shapes and Plates: Galvanized-steel reinforcement where installed on galvanized sheet metal ducts; compatible materials for aluminum and stainless-steel ducts.

E. Tie Rods: Galvanized steel, 1/4-inch minimum diameter for lengths 36-inches or less; 3/8-inch minimum diameter for lengths longer than 36-inches.

2.2 BACKDRAFT DAMPERS

A. Manufacturers:

1. Air Balance
2. Cesco
3. Greenheck
4. Nailor
5. Ruskin

B. Basis-of-Design: Ruskin CB D6.

C. Description: Multiple-blade gravity balanced with center pivoted blades with sealed edges, assembled in rattle free manner with 90-degree stop, adjustment device to permit setting for varying differential static pressure.

D. Frame: 0.125-inch thick 6063-T5 extruded aluminum channel with galvanized steel braces at mitered corners. Provide mounting flange.

E. Blades: Single piece, overlap frame, parallel action, horizontal orientation, minimum 0.07-inch 6063-T5 extruded aluminum material, maximum 6-inch width.

F. Bearings: Corrosion-resistant synthetic, formed as single piece with axles.

G. Blade Seals: Extruded vinyl, mechanically attached to blade edge.

H. Blade Axles: Corrosion-resistant, synthetic formed as single piece with bearings, locked to blade.

I. Tie Bars and Brackets: Galvanized steel.

J. Return Spring: Adjustable tension.

K. Damper Capacity:

1. Closed Position: Maximum back pressure of 16-inches water gauge.
2. Open Position: Maximum air velocity of 2,500-feet per minute.

L. Counterbalances: Adjustable zinc plated steel weights mechanically attached to blade. Must be capable of operating over wide range of pressures.

M. Finish: Mill aluminum.

N. Temperature Rating: -40 degrees F to 200 degrees F.

O. Operation of Blade:

1. Start to Open: 0.01-inch wg
2. Fully Open: 0.05-inch.

P. Pressure Drop: Maximum 0.15-inch wg at 1,500-feet per minute through 24-inch by 24-inch damper.

Q. Factory Sleeve: Minimum 20 gauge thickness, 12-inches in length.

R. Screen: At outdoor intake or discharge. 1/4-inch aluminum.

2.3 DAMPERS

A. Manufacturers:

1. Air Balance
2. Cesco
3. Greenheck
4. Nailor
5. Ruskin

B. Basis-of-Design:

1. Rectangular ductwork for velocities and pressures up to 1,500 fpm and 2.5-inch wg, respectively: Ruskin MD-35.
2. Rectangular ductwork for velocities and pressures up to 3,000 fpm and 4-inch wg, respectively: Ruskin CD-60.
3. Round ductwork for velocities and pressures up to 3,000 fpm and 4-inch wg, respectively: Ruskin CDSR-15.

C. General Description: Factory fabricated, with required hardware and accessories. Stiffen damper blades for stability. Include locking device to hold single-blade dampers in a fixed position without vibration. Close duct penetrations for damper components to seal duct consistent with pressure class.

1. Pressure Classes of 3-Inch wg (750 Pa) or Higher: End bearings or other seals for ducts with axles full length of damper blades and bearings at both ends of operating shaft.

D. Rectangular Volume Dampers: Multiple- or single-blade, parallel- or opposed-blade design with linkage concealed in frame and suitable for horizontal or vertical applications.

1. Steel Frames: Hat-shaped, galvanized sheet steel channels, minimum 16 gauge thick, with mitered and welded corners; frames with flanges where indicated for attaching to walls and flangeless frames where indicated for installing in ducts.
    a. Roll-Formed Steel Blades: Galvanized sheet steel, 16 gauge thick for velocities up to 1,500 fpm, and 14 gauge thick for velocities up to 3,000 fpm.
    b. Blade Axles: Minimum 1/2-inch diameter, plated steel, hex shaped, mechanically attached to blade.
    c. Bearings: Molded synthetic sleeve, turning in extruded hole in frame.
    d. Tie Bars and Brackets: Galvanized steel.
    e. Mill galvanized.

E. Round Volume Dampers: Single-blade suitable for horizontal or vertical applications.

1. Steel Frames: Galvanized, roll formed, minimum of 20 gauge thick with beads at each end.
2. Blades: Minimum 14 gauge thick, galvanized sheet steel, round, single-piece.
3. Blade Axles: Minimum 1/2-inch square, plated steel, mechanically attached to blade.
4. Bearings: Molded synthetic sleeve, turning in hole in frame.
5. Finish: Mill galvanized.
6. Capacity:
    a. Closed Position: Maximum pressure of 4-inches wg.
    b. Open Position: Maximum air velocity of 3,000-feet per minute.
7. Leakage: Maximum 20 cfm at 4-inches wg.
8. Pressure Drop: Maximum 0.02-inch wg at 1,500-feet per minute through 20-inch diameter dampers.

F. Jackshaft: 1-inch diameter, galvanized-steel pipe rotating within pipe-bearing assembly mounted on supports at each mullion and at each end of multiple-damper assemblies.

1. Length and Number of Mountings: Appropriate to connect linkage of each damper in multiple-damper assembly.
2. Damper Hardware: Zinc-plated, die-cast core with dial and handle made of 3/32-inch thick zinc-plated steel, and a 3/4-inch hexagon locking nut. Include center hole to suit damper operating-rod size. Include 2-inch elevated platform for insulated duct mounting.

2.4 CONCEALED DAMPER HARDWARE

A. Manufacturers:

1. Young Regulator Company

B. Concealed Damper Hardware: For dampers above non-removable ceilings (gyp, plaster, decorative, etc.) where access panels have not been shown on Architectural drawings or in locations where dampers are more than 2-feet above the ceiling, provide:

1. Concealed Damper Regulator: Young Regulator Company Model 315 or approved equivalent.
2. Cable System: Young Regulator Company or approved equivalent.
3. Controller: Young Regulator Company 270-275 or approved equivalent.
4. Control wrenches, wire stops, casing nuts, and stainless steel wire.
5. Paint cover plate to match ceiling color or as directed by Architect.

2.5 ACCESS DOORS

A. Manufacturers:

1. Ductmate
2. Cesco
3. Ruskin
4. Nailor
5. Outdoor Installation: Karp MX insulated exterior access door.

B. Duct Pressure Class 2-inch WC and Greater: Sandwich-type design with threaded locking bolt assembly. Closed cell neoprene gasket permanently bonded to inside panel. Zinc-coated steel wing nuts or polypropylene molded knobs with threaded metal inserts - zinc coated bolts sealed to inner panel.

C. Duct Pressure Class 1-1/2-inch WC and Less: Galvanized steel assembly incorporating frame, door, hinges, and latch(es). Frame tabbed for attachment to duct panel. Double wall door panel with 1-inch insulation. Open cell neoprene gasket attached to frame. Cam latches for tight closure.

D. Plenum Doors: Extruded aluminum frames with extruded santoprene seals. Double-wall 20 gauge galvanized steel door panel with fiberglass insulation.

E. Size: Maximum size available to fit rectangular duct panel dimension or round duct diameter. Plenum doors minimum 2-feet wide by 4-feet high.

F. For outdoor installation, only provide waterproof access doors installed vertically.

2.6 DUCT TEST HOLES

A. Manufacturers:

1. Ventlok

B. Temporary Test Holes: Cast iron or cast aluminum to suit duct material, including screw cap and gasket. Size to allow insertion of pitot tube and other testing instruments and of length to suit duct insulation thickness.

C. Permanent Test Holes (where shown on Drawings): Factory fabricated, air tight flanged fittings with screw cap. Provide extended neck fittings to clear insulation.

2.7 CONTROL DAMPERS

A. Manufacturers:

1. Ruskin
2. Greenheck
3. Cesco
4. Air Balance
5. Nailor

B. Basis-of-Design:

1. Ruskin Model CDR25, low leakage, for use in low pressure round ductwork up to 24-inch diameter.
2. Ruskin Model CDO25, low leakage, for use in low pressure oval ductwork.
3. Ruskin Model CD60, ultra low leakage, for rectangular ducts or round ductwork larger than 24-inch diameter. Provide duct transition between round and rectangular connections.

C. Fabrication:

1. Frame: 16 gauge roll formed, galvanized steel hat-shaped channel, reinforced at corners. Structurally equivalent to 13 gauge U-channel.
2. Blades (Low Leakage Dampers):
   a. Style: Single skin with 3 longitudinal grooves.
   b. Action: Opposed blade for modulating applications, parallel blade for two position application.
   c. Orientation: Horizontal or vertical with thrust washers.
   d. Material: Minimum 16 gauge equivalent thickness, galvanized steel.
   e. Width: Nominal 6-inches.
3. Blades (Ultra Low Leakage Dampers):
   a. Style: Airfoil-shaped, single-piece.
   b. Action: Opposed blade for modulating applications, parallel blade for two position applications.
   c. Orientation: Horizontal or vertical with thrust washers.
   d. Material: Minimum 14 gauge equivalent thickness, galvanized steel.
   e. Width: Nominal 6-inches.
4. Bearings: Molded synthetic sleeve, turning in extruded hole in frame.
5. Seals:
   a. Blade: Inflatable PVC coated fiberglass material and galvanized steel. Mechanically attached to blade edge.
   b. Jamb: Flexible metal compression type.
6. Linkage: Concealed in frame.
7. Axles: Minimum 1/2-inch diameter plated steel, hex-shaped, mechanically attached to blade.
8. Mounting: Vertical or horizontal.
9. Finish: Mill galvanized for installation in galvanized sheet metal and Type 304 stainless steel for installation in stainless steel ductwork.

D. Performance Data (Low Leakage Dampers):

1. Capacity: Demonstrate capacity of damper to withstand HVAC system operating conditions.
   a. Closed Position: Maximum pressure of 5-inches wg at a 12-inch blade length.
   b. Open Position: Maximum air velocity of 2,000-feet per minute.
2. Leakage: Maximum 3.7 cubic-feet per minute per square foot at 1-inch wg for sizes 36-inches wide and above.
3. Pressure Drop: Maximum 0.07-inch wg at 1,500-feet per minute across 24-inch by 24-inch damper.

E. Performance Data (Ultra Low Leakage Dampers):

1. Leakage: Damper to have a maximum leakage of 3 cfm per square foot at 1-inch wg and be AMCA licensed as Class 1A.
2. Differential Pressure:
   a. Damper to have a maximum differential pressure rating of 13-inch wg for a 12-inch blade.
3. Velocity: Damper to have a maximum velocity rating of 6,000-feet per minute.
4. Temperature: Damper rated for -72 degrees F to 275 degrees F.
5. Pressure Drop: Maximum 0.1-inch wg at 2,000-feet per minute across 24-inch by 24-inch damper.

F. Actuator: Provide actuator. See Specification Section 23 09 00, Instrumentation and Control for HVAC.

G. Factory flange frame.

H. Factory Sleeve: Minimum 20 gauge thickness.

I. Duct Transition Connection: Per Drawings.

J. Factory Tests: Factory cycle damper assembly to assure proper operation.

2.8 DUCT SILENCERS

A. Manufacturers:

1. IAC Acoustics
2. Ruskin Co.
3. Vibro-Acoustics
4. Price Industries

B. General Description: Factory-fabricated and -tested, round or rectangular silencers with performance characteristics and physical requirements as indicated.

C. Fire Performance: Adhesives, sealants, packing materials, and accessory materials to have fire ratings not exceeding 25 for flame-spread index and 50 for smoke-developed index when tested according to ASTM E 84.

D. Rectangular Units: Fabricate casings with a minimum of 0.034-inch-thick, solid galvanized sheet metal for outer casing and 0.022-inch thick, ASTM A 653/A 653M, G90 Z275, perforated galvanized sheet metal for inner casing. Provide stainless steel (type to match ductwork) solid liner.

E. Round Units:

1. Outer Casings:
   a. ASTM A 653/A 653M, G90 Z275, galvanized sheet steel.
   b. Up to 24-inches in Diameter: 0.034-inch thick.
   c. 26 through 40-inches in Diameter: 0.040-inch thick.
   d. 42 through 52-inches in Diameter: 0.052-inch thick.
   e. 54 through 60-inches in Diameter: 0.064-inch thick.
   f. Casings fabricated of spiral lock-seam duct may be one size thinner than that indicated.
2. Interior Casing, Partitions, and Baffles:
   a. ASTM A 653/A 653M, G90 Z275, galvanized sheet steel. Provide stainless steel (type to match ductwork).
   b. At least 0.034-inch thick and designed for minimum aerodynamic losses.

F. Sheet Metal Perforations: 1/8-inch diameter for inner casing and baffle sheet metal.

G. Fill Material: Inert and vermin-proof fibrous material, packed under not less than 5 percent compression.

1. Erosion Barrier: Polymer bag enclosing fill and heat-sealed before assembly.

H. Fabricate silencers to form rigid units that will not pulsate, vibrate, rattle, or otherwise react to system pressure variations.

1. Do not use nuts, bolts, or sheet metal screws for unit assemblies.
2. Lock form and seal or continuously weld joints.
3. Suspended Units: Factory-installed suspension hooks or lugs attached to frame in quantities and spaced to prevent deflection or distortion.
4. Reinforcement: Cross or trapeze angles for rigid suspension.

I. Source Quality Control:

1. Acoustic Performance: Test according to ASTM E 477.
2. Record acoustic ratings, including dynamic insertion loss and self-noise power levels with an airflow of at least 2000-feet per minute face velocity.
3. Leak Test: Test units for airtightness at 200 percent of associated fan static pressure or 6-inch wg static pressure, whichever is greater.

2.9 TURNING VANES

A. Manufacturers:

1. Aerodyne
2. Ductmate Industries
3. Duro Dyno Corp.
4. Metalaire Inc.

B. Fabricate to comply with SMACNA's "HVAC Duct Construction Standards--Metal and Flexible" for vanes and vane runners. Vane runners to automatically align vanes.

C. Manufactured Turning Vanes: For medium pressure ductwork, ductwork upstream of terminal units, and in ductwork with equal inlet width and height dimensions and outlet width and height dimension, provide double thickness airfoil turning vanes. Low pressure ductwork and ductwork downstream of terminal units use either single thickness or double thickness turning vanes. For mitered rectangular elbows with changes in size from inlet to outlet, only use single thickness turning vanes. Use 2-inch radius vanes spaced on centers of 1.5-inches for single thickness. Use 2-inch radius vanes spaced on centers of 2.125-inches for double thickness.

D. Acoustic Turning Vanes: Fabricate airfoil-shaped aluminum extrusions with perforated faces and fibrous-glass fill.

2.10 FLEXIBLE CONNECTORS

A. Manufacturers:

1. Duro Dyne Corp.
2. Ventfabrics Inc.
3. Ductmate Industries
4. Hardcast

B. General Description: Flame-retardant or noncombustible fabrics, coatings, and adhesives complying with UL 181, Class 1.

C. Metal-Edged Connectors: Factory fabricated with a fabric strip 4-inches wide attached to two strips of 2-3/4-inch wide, 0.028-inch thick, galvanized sheet steel or 0.032-inch thick aluminum sheets. Select metal compatible with ducts.

D. Provide a spring and bracket assembly to reinforce the fabric with sufficient tension to prevent connector collapse under negative or positive pressure. Number and positioning of spring-link fixture to be determined by the manufacturer to maintain straight axis and without kinks between two sections of duct, or between duct and the moving element. Hardcast Spring-Link SL-200, or equal.

E. Indoor System, Flexible Connector Fabric (FC-I): Glass fabric double coated with neoprene.

1. Minimum Weight: 30 ounces per square yard.
2. Tensile Strength: 395 pounds of force per inch in the warp and 255 pounds of force per inch in the filling.
3. Service Temperature: -40 degrees F to 200 degrees F.

F. Outdoor System, Flexible Connector Fabric (FC-O): Glass fabric double coated with Hypalon, resistant to UV rays and ozone.

1. Minimum Weight: 26 ounces per square yard.
2. Tensile Strength: 225 pounds of force per inch in the warp and 300 pounds of force per inch in the filling.
3. Service Temperature: -40 degrees F to 200 degrees F.

G. High-Corrosive-Environment System, Flexible Connectors (FC-HC): Glass fabric with chemical-resistant coating.

1. Minimum Weight: 14 ounces per square yard.
2. Tensile Strength: 450 pounds of force per inch in the warp and 340 pounds of force per inch in the filling.

3. Service Temperature: -67 degrees F to 500 degrees F.

2.11 AIR FLOW MEASURING STATION (HOT WIRE ANEMOMETER TYPE)

A. Manufacturers:

1. Ebtron
2. Air Monitor with Veltron II
3. Kurz Instruments
4. Ruskin
5. Greenheck

B. Hot wire anemometer probe airflow measuring station, with transmitter, factory calibrated, UL Standard 873 labeled, AMCA 610 certified.

C. Performance: System accuracy to be percent of reading over the sensor probe operating ranges. Installed accuracy to be better than plus or minus 2 percent of reading over the range of 0- to 5000-feet per minute for duct and plenum probes and plus or minus 3 percent for fan inlet probes.

D. Filters: Throwaway type, 1-inch thick fiberglass.

E. Provide electronic transmitter inputs and outputs fused and protected. Provide analog output signals user selectable (0 to 10 VDC or 4 to 20 mA).

F. Provide interface devices for communication to Building Automation System (BAS/BMS).

G. Ensure performance over entire operating range of airflow scheduled for each system.

PART 3 - EXECUTION

3.1 DUCT ACCESSORIES GENERAL INSTALLATION

A. Inspect areas to receive air duct accessories. Notify Engineer of conditions that would adversely affect the installation of the dampers. Do not proceed until conditions are corrected.

B. Install duct accessories according to applicable details in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for metal ducts.

C. Provide duct accessories of materials suited to duct materials; use galvanized-steel accessories in galvanized-steel, stainless-steel accessories in stainless-steel ducts, and aluminum accessories in aluminum ducts.

D. Do not compress or stretch damper frames into duct or opening.

E. Handle dampers using sleeve or frame. Do not lift dampers using blades, actuators, or jack shafts.

F. Adjust duct accessories for proper settings.

3.2 SHEET METAL MATERIALS INSTALLATION

A. Install bracing for multiple sections to support assembly weights and hold against system pressure. Install bracing as needed.

3.3 BACKDRAFT DAMPERS INSTALLATION

A. Install backdraft dampers on exhaust fans or exhaust ducts nearest to outside and where indicated. Provide at outside air intakes where motorized dampers are not shown on drawings.

3.4 DAMPERS INSTALLATION

A. Where installing volume dampers in ducts with liner, avoid damage to and erosion of duct liner.

B. Provide balancing dampers at points on supply, return, and exhaust systems where branches lead from larger ducts for air balancing. Install at a minimum of two duct widths from each branch takeoff. Provide balancing dampers for all air inlets and outlets.

C. Install dampers square and free from racking with blade running horizontally.

3.5 CONCEALED DAMPER HARDWARE INSTALLATION

A. Coordinate location in Reflected Ceiling Plan and color of concealed damper hardware with Architect prior to installation.

3.6 ACCESS DOORS INSTALLATION

A. Install duct access doors to allow for inspecting, adjusting, and maintaining accessories and terminal units as follows:

1. On both sides of duct coils.
2. Downstream from volume dampers, turning vanes and equipment.
3. Adjacent to fire or smoke dampers, providing access to reset or reinstall fusible links.
4. To interior of ducts for cleaning; before and after each change in direction, at maximum 50-foot (15-m) spacing.
5. Install the following sizes for duct-mounting, rectangular access doors:
    a. One-Hand or Inspection Access: 8-inches by 5-inches.
    b. Two-Hand Access: 12-inches by 6-inches.
    c. Head and Hand Access: 18-inches by 10-inches.
    d. Head and Shoulders Access: 21-inches by 14-inches.
    e. Body Access: 25-inches by 14-inches.
    f. Body Plus Ladder Access: 25-inches by 17-inches.
6. Install the following sizes for duct-mounting, round access doors:
    a. One-Hand or Inspection Access: 8-inches in diameter.
    b. Two-Hand Access: 10-inches in diameter.
    c. Head and Hand Access: 12-inches in diameter.
    d. Head and Shoulders Access: 18-inches in diameter.
    e. Body Access: 24-inches in diameter.
7. Label access doors.

3.7 DUCT TEST HOLES INSTALLATION

A. Provide test holes at fan inlets and outlets where indicated and where required for air testing and balancing.

3.8 CONTROL DAMPERS INSTALLATION

A. Handle dampers using sleeve or frame. Do not lift dampers using blades, actuators or jack shafts.

B. Install control dampers in accordance with manufacturer's written instructions.

3.9 DUCT SILENCERS INSTALLATION

A. Install duct silencers independent of ducts with flexible duct connectors, lagged with loaded vinyl sheet on inlets and outlets.

3.10 TURNING VANES INSTALLATION

A. Vanes must be installed, eliminating every other vane is not allowed.

B. Single thickness vanes cannot be over 36-inches long without intermediate vane runner.

C. Install per SMACNA and fasten/support to prevent vibration, noise, and to maintain proper alignment at design velocity.

3.11 FLEXIBLE CONNECTORS INSTALLATION

A. Install flexible connectors immediately adjacent to equipment in ducts associated with fans and motorized equipment supported by vibration isolators. Provide sheet metal weather cover over flexible connections located outdoors. Attach sheet metal to either equipment side or ductwork side, but not both.

B. Per NFPA, do not use flexible connectors on grease exhaust fans.

C. Securely attach spring-lock brackets to the metal strips of the connector collar using No. 8 sheet metal screws.

D. For fans developing static pressures of 5-inch wg and higher, cover flexible connectors with loaded vinyl sheet held in place with metal straps.

E. Adjust the following types in the following locations:

1. FC-I: Indoors.
2. FC-O: Outdoors.
3. FC-HC: High corrosive systems inclusive of all laboratory exhaust systems.

3.12 AIR FLOW MEASURING STATION (HOT WIRE ANEMOMETER TYPE) INSTALLATION

A. Provide in ductwork with minimum of 4 diameters of straight ductwork upstream, and 1 diameter of straight ductwork downstream, or as shown on Drawings, whichever is greater.

B. Control contractor to provide power and control interface wiring unless noted otherwise.

C. Where provided in equipment, install per manufacturer's installation requirements.

END OF SECTION 23 33 00

SECTION 23 34 00 - HVAC FANS

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Roof Exhaust Fans
2. In-Line Centrifugal Fans
3. Dryer Vent Exhaust Fans
4. High Volume Low Speed Fans

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Certified fan performance curves with system operating conditions indicated.
2. Certified fan sound-power ratings.
3. Motor ratings and electrical characteristics, plus motor and electrical accessories.
4. Material gauges and finishes, including color charts.
5. Dampers, including housings, linkages, and operators.
6. For belt-driven fans, indicate the number of belts provided for design duty.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. Motors: Premium efficiency per Section 23 05 13, Common Motor Requirements for HVAC Equipment. Electrically Commutated Motors (ECM) where scheduled on Drawings.
2. Sound power levels as scheduled on Drawings. If not scheduled, within 5 percent of Basis of Design at design flow.
3. Project Altitude: Base air ratings on sea-level conditions for project sites below 2,000 feet in elevation. Base air ratings on actual site elevations for project sites above 2,000 feet in elevation.
4. Operating Limits: Classify according to AMCA 99.

5. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
6. AMCA Compliance: Products are to comply with performance requirements and are to be licensed to use the AMCA-Certified Ratings Seal.
7. NEMA Compliance: Motors and electrical accessories are to comply with NEMA standards.
8. UL Standard: HVAC Fans are to comply with UL 705. Fans used in grease exhaust applications are to be UL 762 listed for grease exhaust. Fans used for smoke control applications are to be UL listed for Power Ventilators for Smoke Control.
9. Belt-driven fans used for smoke control applications are to have 1.5 times the number of belts required for the design duty, with the minimum number of belts being two.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Deliver fans as factory-assembled unit, to the extent allowable by shipping limitations, with protective crating and covering.

B. Disassemble and reassemble units, as required for moving to final location, according to manufacturer's written instructions.

C. Lift and support units with manufacturer's designated lifting or supporting points.

1.8 COORDINATION

A. Coordinate size and location of structural-steel support members.

B. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases.

C. Coordinate installation of roof curbs, equipment supports, and roof penetrations.

1.9 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents. Belts: One set for each belt-driven unit.

PART 2 - PRODUCTS

2.1 ROOF EXHAUST FANS

A. Manufacturers:

1. Greenheck
2. Cook
3. Twin City

B. Description: Belt-driven or direct-driven centrifugal fans consisting of housing, wheel, fan shaft, bearings, motor and disconnect switch, drive assembly, curb base, and accessories.

C. Wheel:

1. Single width, single inlet, backward inclined/airfoil blades.
2. Aluminum hub and wheel with steel inlet bell.
3. Statically and dynamically balanced with its own bearings.

D. Housing to match scheduled Basis of Design:

1. One piece heavy gauge spun aluminum dome, hinged for service.
2. Low silhouette type with arched heavy gauge galvanized hood.
3. Louvered type with heavy gauge extruded aluminum louvers.

E. Bearings and Drives:

1. Bearings: Heavy duty pillow block type, self greasing ball bearings with ABMA 9 L-10 life at 100,000 hours.
2. Shafts: Hot rolled steel, ground and polished, with keyway, protectively coated with lubricating oil.

F. Pulleys: Cast-iron, adjustable-pitch motor pulley.

G. Fan and motor isolated from exhaust airstream.

H. Curb: Prefabricated insulated roof curb, galvanized steel, mitered ad welded corners; 1-1/2-inch thick, rigid, fiberglass insulation adhered to inside walls; and 1-1/2-inch wood nailer, hinged with curb seal. Provide curb for flat, pitched or ridged roof as indicated.

1. Security grates in curb, 1/2-inch powder coated steel bars, 6- by 6-inch grid. Provide where scheduled.
2. Kitchen grease exhaust meeting NFPA-96 requirements with vented slots. Greenheck VPFV or equal.
3. Sound curb: Curb with sound-absorbing insulation matrix. Provide where scheduled.

I. Motor: Integrally mounted, 1800 RPM maximum, with pre-lubricated sealed ball bearings. ODP for motors located indoors and TEFC for motors exposed to moisture.

1. Inverter duty motor for use with variable frequency drive where indicated on Fan Schedule on Drawings.
2. Electrically Commutated Motor (ECM) where indicated on Fan Schedule on Drawings.

J. Accessories:

1. Inlet/Outlet Screens: Galvanized steel welded grid, removable.
2. Backdraft Damper: Parallel blade heavy duty steel or aluminum, where scheduled, damper assembly with blades constructed of two plates formed around and welded to shaft, channel frame, sealed ball bearings, with blades linked out of air stream to single control lever. Motorized where indicated and gravity actuated with counterweight, where motorized is not indicated.
3. AMCA 99 Type B spark proof construction where scheduled.
4. Protective coating on fan wheel and interior of fan housing where scheduled. Apply coating before balancing fans and repair any breaks in coating which occur during balancing. One 6-mil coat of white plastic #7122 and one 6-mil coat of black plastic #7122.

5. Variable-Speed Controller: Where scheduled on Drawings, provide solid-state control to reduce speed from 100 percent to less than 50 percent.
6. Disconnect Switch: Where not shown on Division 26, Electrical Drawings, provide nonfusible type, with thermal-overload protection mounted inside fan housing factory wired through an internal aluminum conduit.
7. Vibration Isolation: Wheel and motor mounted on integral double deflection neoprene isolators.

2.2 IN-LINE CENTRIFUGAL FANS

A. Manufacturers:

1. Greenheck
2. Cook
3. Twin City

B. Description: In-line centrifugal fans consisting of housing, wheel, outlet guide vanes, fan shaft, bearings, motor and disconnect switch, drive assembly, mounting brackets, and accessories.

C. Wheel: Cast aluminum backward inclined with inlet cone statically and dynamically balanced within its own bearings.

D. Housing:

1. Heavy gauge steel or aluminum housing, suitable for Fan Class, factory standard finish.
2. Removable panels for access to all interior components.
3. Horizontal or vertical configuration, as indicated.
4. Inlet and discharge duct collars.
5. 1-inch thick, 1.5 pounds per cubic foot density fiberglass liner.
6. Aluminum straightening vanes.
7. Support bracket adaptable to floor, sidewall, or ceiling mounting.

E. Bearings and Drives:

1. Bearings: Heavy duty pillow block type, self greasing ball bearings with ABMA 9 life at 50,000 hours.
2. Shafts: Hot rolled steel, ground and polished, with keyway, protectively coated with lubricating oil.
3. Drive: Cast iron or steel sheaves, dynamically balanced, keyed. Variable and adjustable pitch sheaves for motors 5 hp and under, selected so required rpm is obtained with sheaves set at mid-position. Fixed sheave for 7.5 hp and over, matched belts, and drive rated as recommended by manufacturer or minimum 1.5 times nameplate rating of motor. Motor mounted on adjustable base, with adjustable sheaves, enclosure around belts within fan housing, and lubricating tubes from fan bearings extended to outside of fan housing.
    a. Inverter duty motor for use with variable frequency drive where indicated on Fan Schedule on Drawings.
4. Drive: Direct drive matched to fan loads with speed controller. Motor encased in housing outside of airstream, factory wired to disconnect switch located on outside of fan housing.
    a. Electrically Commutated Motor (ECM) where indicated on Fan Schedule on Drawings.

F. Accessories:

1. Belt guard.
2. AMCA 99 Type B spark proof construction where scheduled.
3. Variable-Speed Controller: Provide solid-state control to reduce speed from 100 percent to less than 50 percent for motors 1/2 HP or smaller.
4. Discharge Dampers: Parallel blade for mixing or open/close applications and opposed blade for modulating . Heavy duty steel or aluminum, where scheduled. Damper assembly with blades constructed of two plates formed around and welded to shaft, channel frame, sealed ball bearings, with blades linked out of air stream to single control lever. Motorized where indicated and gravity actuated with counterweight, where motorized is not indicated.
5. Flat roof cap.
6. Hooded wall cap.
7. Pitched roof cap.
8. Elbow discharge with grille.
9. Louvered wall discharge with bird screen.

G. Inlet/Outlet Screens: Galvanized steel welded grid, removable.

H. Vibration Isolation: Wheel and motor mounted on integral double deflection neoprene isolators.

I. Vibration isolation as scheduled and specified. Reference Section 23 05 48, Vibration and Seismic Controls for HVAC Piping and Equipment.

1. Motor: Integrally mounted, 1800 RPM maximum, with pre-lubricated sealed ball bearings. ODP for motors located indoors and TEFC for motors exposed to moisture.

2.3 DRYER VENT EXHAUST FANS

A. Manufacturers:

1. Fantech Inc.
2. Tjernlund
3. Or approve equivalent.

B. Description: UL705-listed in-line dryer vent exhaust for suitable for high moisture, dust, and lint loadings. Suitable for temperatures up to 140 degrees F.

C. Housing constructed of galvanized steel.

D. Wheel: Backward curved impellers with venture inlet.

E. Suitable for gas dryers.

F. Accessories:

1. Secondary lint trap installed upstream of fan. Fantech DBLT4 or approved equivalent.
2. Automatic switch to turn on/off fan set at 0.05-inches WG with delay-on-break timer to maintain fan operation for up to 10 minutes after dryer is off.
3. Integral external electrical terminal box with Class B wiring and terminal strip.
4. Internally mounted capacitor.

2.4 HIGH VOLUME LOW SPEED FANS

A. Manufacturers:

1. Big Ass Fans
2. Kelley
3. MacroAir

B. General: Fan designed to move air for cooling, air movement, and destratification in large spaces. The fan and components designed specifically for high volume and low speed.

C. Comply with ANSI/AMCA 230-07.

D. Sound levels from the fan operating at maximum speed not to exceed 40dBA in accordance with ANSI/AMCA 230-07.

E. Fan blades: extruded aluminum, airfoil shape optimized for high airflow movement, winglets designed to direct outward airflow downward.

F. Motor: Constructed with permanent magnet brushless motor rated for continuous operation at maximum speed with capability of modulating the fan speed from 0 - 100 percent in 0 degrees F to 122 degrees F ambient conditions.

G. Mounting System: Designed for quick and secure installation from a structural support beam. All components in the mounting system to be stainless steel welded construction.

H. Provide stainless steel safety cables for additional means of securing the fan assembly to the building structure conditions.

I. Controller: Integral Variable Frequency Drive (VFD) pre-wired to the motor. The controller prewired to the motor.

J. Wall Control: Digital keypad device equipped with touchpad controls and an LCD for controlling the fan’s spin direction, operation, and speed. Communication between the fan drive and controller by standard CAT5 or higher Ethernet cable.

K. BAS/DDC Interface: Controller includes capability of monitoring and control by the BAS/DDC system, including control of fan on/off operation, speed, spin direction, status feedback, error reporting, and keypad lockout.

L. Provide corrosion resistant proofing on blades and frame, NEMA 4X controller enclosure.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS

A. Install in accordance with manufacturer's instructions.

B. Install power ventilators level and plumb.

C. Fans used for exhaust of kitchen grease hoods are to be UL 762 listed for grease exhaust. Provide fans with grease terminator. Pipe from grease terminator to Code approved location.

D. Fans used for exhaust of moist air are to be constructed of aluminum construction and be warranted for their application in moist conditions.

E. Fans used in welding, chemical, and/or fume exhaust applications are to be of spark-proof construction and are to be protected with coatings as required to protect parts in the air stream from the chemicals and materials the fan will be exposed to.

F. Install floor-mounting units on concrete bases.

G. Units using vibration isolation devices are scheduled on Drawings.

H. Support suspended units from structure threaded steel rods and vibration isolation device scheduled on Drawings.

I. In seismic zones, restrain support units.

J. Install units with clearances for service and maintenance.

K. Provide fixed sheaves required for final air balance.

L. Provide safety screen where inlet or outlet is exposed.

M. Pipe scroll drains to nearest floor drain.

N. Provide backdraft dampers on discharge of exhaust fans and as indicated on Drawings.

O. Duct installation and connection requirements are specified in other Division 23, HVAC Sections. Drawings indicate general arrangement of ducts and duct accessories. Make final duct connections with flexible connectors per Section 23 33 00, Air Duct Accessories.

P. Install ducts adjacent to power ventilators to allow service and maintenance.

Q. Ground equipment.

R. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

S. Equipment Startup Checks:

1. Verify that shipping, blocking, and bracing are removed.
2. Verify that unit is secure on mountings and supporting devices and that connections to ducts and electrical components are complete. Verify that proper thermal-overload protection is installed in motors, starters, and disconnect switches.
3. Verify that cleaning and adjusting are complete.
4. Disconnect fan drive from motor, verify proper motor rotation direction, and verify fan wheel free rotation and smooth bearing operation. Reconnect fan drive system, align and adjust belts, and install belt guards.
5. Verify lubrication from bearings and other moving parts.
6. Verify that manual and automatic volume control and fire and smoke dampers in connected ductwork systems are in fully open position.
7. Disable automatic temperature-control operators.

T. Starting Procedures:

1. Energize motor and adjust fan to indicated rpm.
2. Measure and record voltage and amperage.

U. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation. Remove malfunctioning units, replace with new units, and retest.

V. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

W. Shut unit down and reconnect automatic temperature-control operators.

X. Replace fan and motor pulleys as required to achieve design airflow.

Y. Provide totally enclosed fan cooled motors when motor is located outdoors, whether under a cover or not, or exposed to moisture. Provide protective covering for electronically commutated motors located in outdoor or wet/wash-down locations.

Z. Repair or replace malfunctioning units. Retest as specified above after repairs or replacements are made.

AA. Adjust damper linkages for proper damper operation.

BB. Adjust belt tension.

CC. Lubricate bearings.

DD. On completion of installation, internally clean fans according to manufacturer's written instructions. Remove foreign material and construction debris. Vacuum fan wheel and cabinet.

EE. After completing system installation, including outlet fitting and devices, inspect exposed finish. Remove burrs, dirt, and construction debris and repair damaged finishes.

FF. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain HVAC fans. Train Owner's maintenance personnel on procedures and schedules for starting and stopping, troubleshooting, servicing, and maintaining equipment and schedules.

3.2 ROOF EXHAUST FANS

A. Secure roof exhaust fans to roof curbs with cadmium-plated hardware.

3.3 HIGH VOLUME LOW SPEED FANS

A. Minimum distance above floor is 10-feet, in accordance with OSHA guidelines.

B. Minimum distance between fan and any obstructions such as lights, cables, conduit, piping, and building structure is 2-feet.

C. Minimum distance between fan and sprinkler deflectors is 3-feet.

D. All fans are to be interlocked to shut down immediately upon receiving a water flow signal from the alarm system, in accordance with the requirements of NFPA 72.

END OF SECTION 23 34 00

SECTION 23 37 00 - AIR OUTLETS AND INLETS

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Grilles, Registers, Diffusers
2. Louvers

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Data Sheet: For each type of air outlet and inlet, and accessory furnished; indicate construction, finish, and mounting details.
2. Performance Data: Include throw and drop, static-pressure drop, and noise ratings for each type of air outlet and inlet.
3. Schedule of diffusers, registers, and grilles indicating drawing designation, room location, quantity, model number, size and accessories furnished.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. Air Distribution Diffuser, Register, and Grille Schedule lists Basis of Design, with any specialty accessories, construction, finish or other criteria noted on schedule. Submitted air distribution must match criteria of Basis of Design:
    a. Construction materials and appearance.
    b. Frame/installation method.
    c. Isothermal throw plus or minus 5 percent at design flows shown on drawings.
    d. Noise Criteria: NC value plus or minus 1 at design flows shown on drawings.
    e. Accessories: Equal to Basis of Design.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. General: Manufacturer's standard products of categories and types required for each application as referenced in other Division 23, HVAC sections, where more than a single type is specified for the application, provide single selection for each product category.

B. Grilles, Registers, Diffusers:

1. Anemostat
2. Carnes
3. Environmental Air Products
4. Krueger
5. Metalaire
6. Nailor
7. Price Co.
8. Shoemaker
9. Titus
10. Tuttle & Bailey
11. Seiho
12. Or approved equivalent.

C. Louvers:

1. Ruskin Manufacturing
2. Pottorff
3. Carnes
4. Cesco
5. Greenheck
6. Or approved equivalent.

2.2 GRILLES, REGISTERS, DIFFUSERS

A. Diffuser, Register and Grille Schedule lists Basis of Design, with specialty accessories, construction, finish or other criteria noted on schedule. Submitted air distribution must match criteria of Basis of Design, including accessories and finish:

1. Matching construction materials and appearance. Equal installation method/frame.
2. Pressure drop equal to or less than Basis of Design at CFM on Drawings.
3. Throw: Isothermal jet throw plus or minus 5 percent of Basis of Design at CFM listed on Drawings.
4. Noise Criteria: Plus or minus 1 NC of Basis of Design at CFM listed on Drawings. If Basis of Design NC is below registered level, submitted must match. NC rating with 10 dB room factor or less.

B. Provide 1-, 2-, 3-, or 4-way deflection as indicated on Drawings.

C. Provide pattern controllers for linear supply air diffusers.

D. Register Dampers: Dampers utilized with grilles. Opposed blade dampers utilizing a side operated worm drive which provides external duct operation. Slot the end of the shaft to receive a screwdriver. Factory assembled side operator. Construct of the same material as the grille. Manufacturer same as grilles/diffuser.

E. Coordinate mounting frames with ceiling construction type. Verify per reflected ceiling plans.

2.3 LOUVERS

A. General: Frame and sill styles compatible with adjacent substrate, specifically manufactured to fit into construction openings with accurate fit and adequate support for weatherproof installation. Reference Drawings and Specifications for types of substrate which will contain each type of louver. Construct of aluminum extrusions, ASTM B221, Alloy 6063-T5. Weld units or use stainless steel fasteners. On inside face of exterior louvers, provide anodized aluminum wire bird screen mounted in removable extruded aluminum frames. AMCA licensed performance ratings.

B. Blades set 3 to 5-inches on center, 37.5 degree angle with rain hook on blade, minimum blade thickness 0.080-inch, drainable blade style. Minimum 57 percent free area for 48-by 48-inch unit. Maximum water penetration 0.01 ounce water psf free area at 1000 FPM. Maximum intake pressure drop of 0.10-inch wg at 750 FPM free velocity. Provide downspouts in jambs, designed to drain water from louver for minimum water cascade from blade to blade. Provide drain gutter in head frame and each blade.

C. Reference Drawings for free area required.

D. Provide access door in duct to clean birdscreen.

E. Finish: Factory Kynar 500 fluoropolymer spray finish; color to be selected by Architect. Conform to AAMA 605.2. Apply coating following cleaning, and pretreatment. Dry louvers before final finish application. 1.2 mils total dry film thickness when baked at 450 degrees F for ten minutes.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION

A. Install in accordance with manufacturer's instructions. Provide seismic supports, clips, and bracing per local code. Coordinate installation of framing. Provide complete coverage of rough openings by integral device flanges or auxiliary frames. Where above ceiling location is unconditioned space, caulk rough openings; repair and re-paint locations where dust entrainment streaks develop due to unsealed openings.

B. Damp locations, such as lockers, restrooms, showers, natatoriums, whirlpool/spas, to have aluminum construction even if scheduled otherwise; mounting hardware to be stainless steel.

C. Check location of outlets and inlets and make necessary adjustments in position to conform with architectural features, symmetry, and lighting arrangement.

D. Unless otherwise shown on drawings, for ceiling mounted air outlets with adjustable airflow pattern controllers mounted at a height of 12 feet or less, adjust the air outlets for horizontal air distribution, and adjust to vertical air distribution for ceiling height above 12 feet.

E. Exterior color of grilles per Architect. White finish if not otherwise scheduled or noted by Architect. Paint ductwork visible behind air outlets and inlets matte black.

F. Ceiling Membrane: Protect ceiling membrane per code. Fire caulk around openings. Provide listed radiation damper in rated roof/ceiling or floor/ceiling assemblies as required per code.

G. After installation of diffusers, registers, and grilles, inspect exposed finish. Clean exposed surfaces to remove burrs, dirt, and smudges. Replace diffusers, registers, and grilles that have damaged finishes.

3.2 GRILLES, REGISTERS, DIFFUSERS INSTALLATION

A. Coordinate with Architectural Reflected Ceiling Plan(s). Reflected ceiling plans determine final locations.

B. Install diffusers to ductwork with air tight connection. 18-inch straight duct section or acoustic plenum at connection. Provide square to round adapters where required for connection to round ducts.

C. Provide integral balancing dampers for diffusers, and grilles and registers where duct manual balancing dampers are not shown or specified.

D. Linear Slot Diffusers:

1. Coordinate connection plenum dimensions with linear slot final dimensions to conform with manufacturer's recommendations, or as indicated. Total and active lengths as noted on drawings. Blank off unused sections. Coordinate frame type with Architect.
2. Paint surfaces visible behind air outlets and inlets, including blank-off sections, matte black unless otherwise called for on drawings.

END OF SECTION 23 37 00

SECTION 23 52 00 - HEATING BOILERS

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Electric Boilers

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

B. In addition, reference the following:

1. Section 23 05 48, Vibration and Seismic Controls for HVAC Equipment
2. Section 23 09 00, Instrumentation and Control Performance Specifications
3. Section 23 21 16, Hydronic Piping Specialties

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Product Data: Provide data indicating general assembly, components, controls, safety controls, flue venting system, and wiring diagrams with electrical characteristics and connection requirements, and service connections.
2. Shop Drawings: Indicate general assembly, components, controls, flue venting, safety controls, and wiring diagrams with electrical characteristics and connection requirements, and service connections.
3. Manufacturer's Instructions: Indicate assembly, support details, connection requirements, and include start-up instructions.
4. Manufacturer's Field Reports: Indicate condition of equipment after start-up including control settings and performance chart of control system.
5. Warranty: Submit manufacturer warranty and ensure forms have been completed in Owner's name and registered with manufacturer.
6. Provide documentation indicating compliance with local air quality management district.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. Manufacturer Qualifications: Company specializing in manufacturing the type of products specified in this Section, with minimum three years of documented experience.
2. Installer Qualifications: Company specializing in installing and servicing the products specified in this Section, with minimum three years of documented experience and approved by manufacturer.
3. Air Quality: Provide documentation showing compliance with local Air Quality Management District.
4. Equipment must meet local air quality management district requirements. Do not bid equipment that does not comply.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Vertical Tubeless Boiler: 5-year material and workmanship on pressure vessel.
2. Warranty: Submit manufacturer warranty and ensure forms have been completed in Owner's name and registered with manufacturer.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Electric Boilers:

1. Bryan Steam LLC/Bryan Boiler
2. Cleaver-Brooks
3. INDEECO
4. Coates
5. Lochinvar
6. Aerco Benchmark E

2.2 ELECTRIC BOILERS

A. Manufactured Units:

1. Description: Electric hot water boiler completely packaged, factory assembled, ready for operation except for connections of piping and electrical connections.

B. Fabrication:

1. Assembly: Welded steel shell; heater support nipples or flanges; inspection handhole; necessary fittings to accept gauges, safety and operating controls; threaded or flanged inet and outlet connections; inlet diffuser; and lifting lugs, conforming to ASME (BPV IV) and ASME (BPV VIII, 1) requirements, and tested for maximum working pressure of 160 PSI.
2. Heating Elements: Threaded or flanged, incoloy sheathed, with maximum density of 75W/sq. in. suitable for operation at 160 PSIG. Attach each element to tube sheet by mechanical assembly permitting single elements to be replaced without replacing entire tube bundle.
3. Enclose in galvanized steel jacket with factory applied baked enamel, insulated with 2 inch thick fiberglass insulation.

C. Trim:

1. ASME rated pressure relief valve set at 45 PSI.
2. Assemble with pressure gauge, thermometer in brass separable well, automatic air vent, and drain valve.
3. Low water cut-off with manual reset and inlet flow switch to automatically prevent operation when water falls below safe level or on low flow through boiler.
4. Operating temperature controller with outdoor reset with remote bulb in brass separable well to control heating elements to maintain supply water temperature.
5. Electronic operating temperature controller with full cover for wall mounting, ambient temperature range minus 30 degrees F to 150 degrees F, adjustable reset ration of outside air temperature change to discharge control point change 1:2 to 100:1, integral set point adjustment 80 degrees F to 230 degrees F, electronic primary and outdoor sensors, for on-off switching of pilot duty relays.
6. High limit temperature controller with automatic reset to prevent boiler water temperature from exceeding safe system temperature.

D. Controls:

1. Provide pre-wired, factory assembled electric controls enclosed in NEMA 250, Type 1 cabinet, factory mounted integral with unit.
2. Controls include:
   a. Unfused disconnect switch with door interlock.
   b. Splitter arrangement and fused magnetic contactors for each element.
   c. Fused control circuit transformer with control circuit on/off switch.
   d. Proportioning step controller.
   e. Remote bulb operating thermostat complete with brass separable well.
   f. Remote bulb high limit thermostat complete with brass separable well.
   g. Pilot lights for each step of control.
3. Peak load control system.
   a. Pump motor starter auxiliary contact.
   b. Flow switch.
   c. Remote mounted three wire temperature controller.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS

A. Install boiler in accordance with manufacturer’s instructions.

B. Provide connection of natural gas service in accordance with requirements of NFPA 54 and applicable codes, and fuel oil tanks. Pipe gas vents to atmosphere.

C. Boilers Installed in Battery: Do not install boilers closer than 48-inches from each other, except boilers that operate at up to 2,000,000 BTU/hr, installed according to manufacturer's instructions.

D. Provide connection to fuel oil tanks and pumps as indicated.

E. Install boiler on concrete housekeeping base, sized minimum 4-inches larger than boiler base.

F. Provide piping connections and accessories as indicated. Reference Section 23 21 16, Hydronic Piping Specialties.

G. Pipe relief valves to nearest floor drains.

H. Pipe relief valves to outdoors.

I. Install circulator on boiler.

J. Provide for connection to electrical service.

K. Provide all wiring between control panels and devices and unit.

L. Mount thermometer in boiler breeching within 12-inches of flue nozzle.

M. Pipe boiler drains to nearest floor drains.

N. Provide boiler within pre-manufactured skid including: Outdoor enclosure, pumps, piping and appurtenances, meters and gauges, and vibration isolation devices.

O. System Start-Up:

1. Provide the services of manufacturer's field representative for starting and testing unit.
2. After installation and pipe flushing, boil out boilers using chemical and procedure as recommended and supervised by boiler manufacturer.
3. Manufacturer shall provide report verifying that boilers have been inspected, cleaned and tested according to their recommendations.

P. Closeout Activities:

1. Train operating personnel in operation and maintenance of units.
2. Provide the services of manufacturer's field representative to conduct training.

Q. Boiler Shutdown:

1. Remote switch: Install shutdown switch to disconnect power to the boiler burner controls and gas service in room. Install pushbutton under clear, impact-resistant flip lid. Provide red phenol label "Emergency Shutdown" locate label above pushbutton. Mount pushbutton by latch side of each boiler/mechanical room door within interior of the room, unless otherwise directed by AHJ. Provide electrical wiring and raceway as necessary for installation. Provide additional relays and wiring to cut power to gas solenoid valves in the room not integral to boilers. Reference Drawings for gas solenoid valve locations.
2. For gas fired boilers and/or water heaters located in a Refrigeration Machinery Room, shut down all gas fired equipment on refrigerant leakage.

END OF SECTION 23 52 00

SECTION 23 57 00 - HEAT EXCHANGERS FOR HVAC

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Plate and Frame Type Heat Exchangers

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. ASME Compliance: Fabricate and label heat exchangers to comply with ASME Boiler and Pressure Vessel Code: Section VIII, "Pressure Vessels."
2. AHRI Standard 400 for liquid to liquid heat exchangers.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Product Data: Provide data with dimensions, locations, and size of tappings and performance data.
2. Shop Drawings: Indicate dimensions, locations, and size of tappings and performance data.
3. Design Data: Indicate in sufficient detail to verify that heat exchangers meet or exceed specified requirements.
4. Test Reports: Indicate tube bundle pressure tests.
5. Certificates - Heat Exchangers: ASME Compliance: Fabricate and label heat exchangers to comply with ASME Boiler and Pressure Vessel Code: Section VIII, "Pressure Vessels."
6. Manufacturer's Instructions: Indicate installation and support requirements.
7. Operation and Maintenance Data: Include start up and shut down instructions, assembly drawings, and spare parts lists.
8. Warranty: Submit manufacturer's warranty and ensure forms have been completed in Owner's name and registered with manufacturer.
9. Maintenance Materials: Furnish the following for Owner's use in maintenance of project.
10. See Division 01, General Requirements, Product Requirements, for additional provisions.
11. Plate Type Heat Exchanger Specialty Tools: One set of wrenches for disassembly.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Warranty: Submit manufacturer's warranty and ensure forms have been completed in Owner's name and registered with manufacturer.

PART 2 - PRODUCTS

2.1 PLATE AND FRAME TYPE HEAT EXCHANGERS

A. Manufacturers:

1. Tranter
2. Alfa Laval
3. Armstrong Fluid Technology
4. Bell & Gossett
5. Taco
6. APV
7. Triangle Tube

B. General: Plate and frame heat exchanger to consist of frame, plates, piping connections, compression bolts and gaskets. Provide heat exchanger rated in accordance with ASME Section VIII, Division 01 for 150 PSIG working pressure.

C. Frames: Carbon steel with baked epoxy enamel paint, ASTM A666 Type 316 stainless steel side bolts and shroud. Provide frame sized for addition of 15 percent more plates. Piping connections suitable for grooved plate piping fittings where grooved piping is specified.

D. Plates: Titanium or Hastelloy C22.

E. Gaskets: EPDM.

F. Nozzles: Rated for 150 percent of maximum system operating pressure, rated lined flange type.

G. Piping connections to be flanged whole assembly to be rated to 150 PSIG working pressure. Connections equal to or less than 2-inches to be stainless steel NPT type.

H. Provide insulated closure panel complying with OSHA requirements.

I. Provide lifting lugs and ball bearing assemblies for tightening and untightening of unit.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS

A. Install per manufacturer's written instructions and requirements and seismic requirements.

B. See articles below for specific requirements.

3.2 PLATE AND FRAME TYPE HEAT EXCHANGERS INSTALLATION

A. Install to permit removal of plates with minimum disturbance to installed equipment and piping. Provide unions, pipe offsets, etc. to allow for isolation of unit and repairs/replacement without cutting/welding of piping.

B. Support heat exchangers from structure.

C. Pipe drain valves to nearest floor drain.

D. Water Inlets and Outlets: Per piping diagram on Drawings. Thermometer and sensor wells, pressure gauge tappings, strainer on inlet piping.

E. Heated Water Outlet: Thermometer well for temperature regulator sensor, ASME rated pressure and temperature relief valve, valved drain.

F. Clean and flush heat exchanger before final fill. After completing system installation, including outlet fitting and devices, inspect ex-posed finish. Remove burrs, dirt, and construction debris and repair damaged finishes.

G. Make piping connections so that unit does not support pipe weight and piping does not interfere with plate removal and maintenance.

END OF SECTION 23 57 00

SECTION 23 72 23 - PACKAGED AIR-TO-AIR ENERGY RECOVERY UNITS

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Outdoor Packaged Energy Recovery Units
    a. Shipping and Handling
    b. Factory Testing
    c. Cabinet, Casing and Frame
    d. Supply and Exhaust Fans
    e. Variable Frequency Drives
    f. Electrical
    g. Fixed Plate Recovery Core
    h. Electric Heating
    i. Filters
    j. Dampers
    k. Outside Air Intake Hood
    l. Roof Curb
    m. Packaged Controls
2. Indoor Packaged Energy Recovery Ventilators
    a. Cabinet
    b. Blowers
    c. Fixed Plate Heat Exchanger
    d. Isolation Dampers
    e. Filter
    f. Electrical
    g. Controls

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. AHRI 270 - Sound Performance Rating of Outdoor Unitary Equipment (with Addendum 1).
2. AHRI 410 - Forced-Circulation Air-Cooling and Air-Heating Coils (with Addenda 1, 2 & 3).
3. ANSI/AHRI Standard 340/360 - Performance Rating of Commercial and Industrial Unitary Air-Conditioning and Heat Pump Equipment.
4. AHRI 1060 I-P - Performance Rating of Air-to-Air Exchangers for Energy Recovery Ventilation Equipment.
5. ASHRAE Standard 84 - Method of Testing Air-to-Air Heat/Energy Exchangers.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Product Literature: Indicate dimensions, weights, capacities, ratings, gauges and finishes of materials, electrical characteristics and connection requirements.
2. Certified fan performance curves with system operating conditions indicated.
3. Certified fan sound-power ratings.
4. Filters: Data for filter media, filter performance data.
5. Electrical Requirements: Power supply wiring including wiring diagrams for interlock and control wiring, clearly indicating factory-installed and field-installed wiring.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. Interior surfaces of units meet erosion and growth resistance requirements of ASHRAE 62.1, latest edition, as well as construction requirements for equipment.
2. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
3. AHRI Certification: Provide AHRI certified and listed units.
4. Sound Power Level Ratings: Comply with AHRI 270, Sound Performance Rating of Outdoor Unitary Equipment (with Addendum 1).
5. Entire unit to be ETL Certified per UL Standard 1995 and bear an ETL sticker.
6. Energy wheel to be AHRI 1060 I-P certified.
7. Performance: Scheduled capacities and face areas are minimum accepted values. Scheduled amps, kW, and HP are maximum accepted values that allow scheduled capacity to be met.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Provide total 5 years manufacturer's warranty for compressor(s) parts only.
2. Provide minimum 10 year manufacturer warranty on energy core.

1.7 EXTRA MATERIAL

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Fan Belts: One set for each belt-driven fan.
2. Filters: One set of filters for each unit.

PART 2 - PRODUCTS

2.1 OUTDOOR PACKAGED ENERGY RECOVERY UNITS

A. The following manufacturers will be considered provided they comply with Contract Documents:

1. American Aldes
2. Greenheck
3. AAON
4. Semco
5. Renewaire
6. Valent ERC (ERV-2 only)

B. Shipping and Handling:

1. Provide each unit completely factory assembled and shipped in one piece.
2. Ship packaged units fully charged with refrigerant as scheduled.
3. Units to have decals and tags to indicate caution areas and aid unit service.
4. Provide unit nameplates fixed to the main control panel door.
5. Provide electrical wiring diagrams attached to the control panels.
6. Provide installation, operating and maintenance bulletins and start-up forms supplied with each unit.

C. Factory Testing:

1. The unit to undergo a complete factory run test prior to shipment. Factory test sheets to be shipped with unit.

D. Cabinet, Casing, and Frame:

1. Provide specifically designed for outdoor rooftop application with weatherproof cabinet.
2. Standard double-wall construction for sidewall access doors and floor areas to be provided with 22 gauge solid galvanized steel inner liners to protect insulation during service and maintenance. Provide a minimum of 2-inch thick, 3/4-pound density Insulation, neoprene coated glass fiber or foam injected insulation with a minimum density of 2 pounds per cu.ft. Design unit cabinet to operate at total static pressures up to 6.5-inches wg. Insulation on ceiling and end panels secured with adhesive and mechanical fasteners.
3. Exterior surfaces constructed of pre-painted galvanized steel for aesthetics and long term durability. Paint finish to include a base primer with a high quality, polyester resin topcoat. Finished surface to withstand a minimum 1000-hour salt spray test in accordance with ASTM B117 standard for salt spray resistance.
4. Provide service doors for access to all unit components. Service doors constructed of heavy gauge galvanized steel with a galvanized steel interior liner. Service doors mounted on multiple, stainless steel hinges and secured by a latch system that is operated by quarter turn handles.
5. Provide lifting brackets with lifting holes to accept cable or chain hooks.

E. Supply and Exhaust Fans:

1. Provide fan assemblies statically and dynamically balanced at the factory, including a final trim balance, prior to shipment. Provide fan assemblies to employ solid steel fan shafts. . Provide bearings sized to provide an L-50 life at 200,000 hours. Entire fan assembly to be isolated from the fan bulkhead and mounted on isolators.
2. Provide heavy-duty premium efficiency fan motors, 1800 rpm open drip-proof (ODP) type with grease lubricated ball bearings with external lubrication points.
3. Provide supply and exhaust air fans with an expanded metal belt guard if belt-driven fan.

F. Variable Frequency Drives:

1. Provide independent variable frequency drive for the supply and exhaust air fan.
2. Line reactors or DC bus choke to be factory installed for each drive.

G. Electrical:

1. Unit wiring to comply with NEC requirements and with applicable UL standards. Electrical components to be UL recognized where applicable. Wiring and electrical components provided with unit to be number and color-coded and labeled according to the electrical diagram provided for easy identification. Provide unit with a factory wired weatherproof control panel. Unit to have a single point power terminal block for main power connection. Provide terminal board for low voltage control wiring. Supply and return fan motors to have contactors and external overload protection.
2. Phase failure and under voltage protection on three-phase motors provided to prevent damage from single phasing, phase reversal, and low voltage conditions.
3. The unit manufacturer to install power and control wiring.
4. Provide ground fault protection to protect against arcing ground faults.
5. Provide the following accessories:
   a. Provide single factory wired non-fused disconnect switch for disconnecting electrical power at the unit.

H. Fixed Plate Recovery Core:

1. Fixed plate recovery coreexchanger constructed with aluminum.

I. Electric Heating:

1. Provide factory installed staged electric heating coils.
2. Safety controls to include automatic reset high temperature limit control.
3. Provide electric heat elements controlled by the factory installed main unit control system.

J. Filters:

1. Provide 2-inch thick pleated panel filters with efficiency or MERV 13 rating as scheduled. Provide filters frame mounted and to slide into galvanized steel racks contained within the unit. Provide filter racks to protect both sides of energy recovery device.
2. Provide filters with antimicrobial treatment.

K. Dampers:

1. Provide outside air dampers sized to handle 100 percent of the supply air volume. Provide low leak dampers. Provide damper blades with rubber edge and end seals. Damper leakage to be less than 0.2 percent at 1.5-inches static pressure differential. Low leak damper to be Class 2 per AMCA Standard 511.

2. Control of the dampers by a factory installed actuator.

L. Outside Air Intake Hood:

1. Provide unit with a 100 percent outdoor air hood. Factory install outdoor air hood and construct from galvanized steel finished with the same durable paint finish as the main unit. Hood to include a bird screen to prevent infiltration of foreign materials and a rain lip to drain water away from the entering air stream.

M. Roof Curb:

1. A prefabricated 12 gauge galvanized steel, mounting curb, designed and manufactured by the unit manufacturer, provided for field assembly on the roof decking prior to unit shipment. Roof curb to be a full perimeter type with complete perimeter support of the air handling section and rail support of the condensing section. Provide supply and return opening duct frames as part of the curb structure allowing duct connections to be made directly to the curb prior to unit arrival. Curb to be a minimum of 16-inch high and include a nominal 2-inch by 4-inch wood nailing strip. Provide gasket for field mounting between the unit base and roof curb.
   a. Curb to include seismic vibration isolation with 2-inch static deflection.

N. Packaged Controls:

1. Equip each unit with a complete microprocessor based control system. Unit control system to include required temperature and pressure sensors, input/output boards, unit controller and operator interface. Unit control system to perform unit control functions including scheduling, unit diagnostics and safeties. Boards to be individually replaceable for ease of service. Microprocessors, boards, and sensors to be factory mounted, wired and tested.
2. Unit controller to be capable of stand-alone operation with unit configuration, set point adjustment, sensor status viewing, unit alarm viewing, and occupancy scheduling. Unit controller to maintain existing set points and operate stand alone if the unit loses remote communication. Protect unit controller from voltage fluctuations as well as any extended power failures with UPS battery backup. Factory and user set schedules and control points maintained in nonvolatile memory.
   a. Main microprocessor to support an RS-232 direct connection to a product service tool or a modem.
   b. Provide BACnet Ethernet communications port for direct communication into the BMS network. Each unit to have the ability to accept a time schedule via BMS network communications. The independent BMS system to have access to "read only" variables and "read and write" variables.
   c. Provide integral controls to prevent frost forming on energy core.
   d. Unit configuration, setpoint adjustment, sensor status viewing, unit alarm viewing, push button override, and occupancy scheduling to be accomplished with an interface module with LCD screen and input keypad.
   e. The display character format to be minimum 20 characters by 4 lines. Display to be liquid crystal display (LCD) providing high visibility. Display form to be in plain English coded formats.
3. Unit controller to include the following functions:
   a. Display supply, outdoor and space air temperature, current time and date.
   b. Control modes include manual on/off, auto, heat to prevent low temperature delivery, and fan only.

c. Provide occupied/unoccupied time schedules with allowances for holiday/event dates and duration.

2.2 INDOOR PACKAGED ENERGY RECOVERY VENTILATORS

A. The following manufacturers will be considered provided they comply with Contract Documents:

1. Daikin
2. Mitsubishi
3. LG
4. Renewaire

B. Unit Cabinet:

1. The cabinet will be fabricated of galvanized steel.
2. Insulated with 2-inch-thick, 3/4-pound density, neoprene-coated glass fiber or polyurethane foam insulation.

C. Blowers:

1. Furnish with direct drive centrifugal blowers for supply and exhaust.
2. Blower motors directly connected to the blower wheels and have permanently lubricated bearings.
3. Blowers and motors mounted on isolators for quiet operation.

D. Fixed Plate Heat Exchanger:

1. Heat exchanger element constructed of specially treated cellulose fiber membrane separated by corrugated layers or aluminum to allow sensible and latent energy recovery.

E. Isolation Dampers:

1. Provide low leak insulated dampers on exhaust and outside air with actuators interlocked with fan operation.

F. Filter:

1. The heat exchanger will have protective filters installed at both the supply and exhaust sides with an access cover to allow easy maintenance.
2. Provide MERV 8 filters.

G. Electrical:

1. Unit wiring to comply with NEC requirements and applicable UL standards. Unit to have single point power terminal block for main power connection.
2. The unit manufacturer to install power and control wiring.
3. Provide ground fault detection.

H. Controls:

1. Provide unit controller capable of stand-alone operation. Unit control system to perform unit control functions including scheduling, unit diagnostics and safeties. Unit controller, and sensors to be factory mounted, wired and tested.

2. Provide controller with display for unit configuration, set point adjustment, sensor status viewing, unit alarm viewing, and occupancy scheduling.
3. Provide external control from VRV centralized controller or BMS.
4. Controller provides the following functions:
    a. Heat recovery mode: Ventilation air and exhaust air pass through energy recovery core and bypasses are closed.
    b. Bypass mode: Outdoor air bypasses the core and is supplied from the unit.
    c. Auto mode; automatically changes between the bypass and heat recovery modes based on space and outside air temperature.
    d. Night purge.
    e. Adjustable fan speed control.
    f. Scheduling.

PART 3 - EXECUTION

3.1 OUTDOOR PACKAGED ENERGY RECOVERY UNITS

A. General Installation Requirements:

1. Install in accordance with manufacturer's instructions.
2. Use touch-up paint to repair scratches and minor damage to equipment prior to start-up.
3. Duct installation requirements are specified in other Division 23, HVAC sections. Drawings indicate the general arrangement of ducts. The following are specific connection requirements:
    a. Install ducts to termination in roof curb.
    b. Remove roof decking only as required for passage of ducts. Do not cut out decking under entire roof curb.
    c. Terminate exhaust-air duct through roof structure.
4. Supply and Exhaust Fans:
    a. Install in accordance with Construction Documents, manufacturer's written requirements and instructions.
5. Variable Frequency Drives:
    a. Install in accordance with Construction Documents, manufacturer's written requirements and instructions.
6. Electrical:
    a. Electrical System Connections: Comply with applicable requirements in Division 26, Electrical Sections for power wiring, switches, and motor controls.
    b. Ground equipment according to Division 26, Electrical.
    c. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.
7. Electric Heating:
    a. Remove debris and clean heating elements.
8. Filters:
    a. Provide access for filter installation.
    b. Install in accordance with Construction Documents, manufacturer's written requirements and instructions.
9. Dampers:
    a. Install in accordance with Construction Documents, manufacturer's written requirements and instructions.
10. Outside Air Intake Hood:
    a. Install in accordance with Construction Documents, manufacturer's written requirements and instructions.

11. Roof Curb:
    a. Roof curb to be mounted level on roof in accordance to NRCA manuals and details. Secure to structure per engineered/sealed seismic installation details.
    b. Unit to be secured to curb per seismic installation details.
    c. Provide to external vibration isolation or isolation curb to prevent transmission of unit-borne sound to building structure. Provide flexible connections for electrical power and fuel piping.
    d. Seal openings between curb and building interior.
    e. Protect the roof from damage during installation.
    f. Fill void between roof and bottom of unit with 3-pound density acoustic batt.
    g. Install normal-weight, 3000 PSI (20.7 MPa), compressive strength (28-day) concrete mix inside roof curb, 4-inches thick.
12. Packaged Controls:
    a. Control wiring from roof-mounted equipment must be routed in conduit from above roof to inside building or must be routed through roof curb inside unit. Control wiring must not be exposed to weather.
    b. Install factory provided control sensors and wire to unit controller.

B. Field Quality Control:

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test and adjust field-assembled components and equipment installation, including connections, and to assist in field testing. Report results in writing.
2. Perform the following field quality-control tests and inspection and prepare test reports:
    a. After installing rooftop air conditioners and after electrical circuitry has been energized, test units for compliance with requirements.
    b. Inspect for and remove shipping bolts, blocks, and tie-down straps.
    c. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
    d. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
3. Remove malfunctioning units, replace with new units, and retest as specified above.
4. Startup Service:
    a. Engage a factory-authorized service representative to perform startup service.
    b. Protect or remove energy recovery devices prior to starting the units to insure damage does not occur to the devices or media. Replace at no cost to Owner if devices/media get damaged.
    c. Complete installation and startup checks according to manufacturer's written instruction and do the following;
        1) Inspect for visible damage to unit casing.
        2) Inspect internal insulation.
        3) Verify that labels are clearly visible.
        4) Verify that clearances have been provided for servicing.
        5) Verify that controls are connected and operable.
        6) Verify that filters are installed.
        7) Adjust vibration isolators.
        8) Inspect operation of barometric dampers.
        9) Lubricate bearings on fan.
        10) Inspect fan-wheel rotation for movement in correct direction without vibration and binding.
        11) Adjust fan belts to proper alignment and tension.
        12) Start unit according to manufacturer's written instructions.
            a) Start refrigeration system in summer only.

b) Complete startup sheets and attach copy with Contractor's startup report.

13) Inspect and record performance of interlocks and protective devices; verify sequences.
14) Operate unit for an initial period as recommended or required by manufacturer.
15) Adjust and inspect low-temperature limits.
16) Inspect outside-air dampers for proper stroke and interlock with return-air dampers.
17) Inspect controls for correct sequencing of heating, mixing dampers, refrigeration, and normal and emergency shutdown.
18) After startup and performance testing, change filters, vacuum heat exchanger and cooling outside coils, lubricate bearings, adjust belt tension, and inspect operation of power vents.

5. Adjusting:
   a. Set field-adjustable switches and circuit-breaker trip ranges as indicated.
6. Demonstration:
   a. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain rooftop air conditioners. Reference Division 01, General Requirements.

3.2 INDOOR PACKAGED ENERGY RECOVERY VENTILATORS

A. General Installation Requirements:

1. Install in accordance with manufacturer’s instructions.
2. Use touch-up paint to repair scratches and minor damage to equipment prior to startup.
3. Provide seismic restraint, as necessary.
4. Install with required clearances and access for maintenance.
5. Install factory furnished devices for field installation.

B. Electrical:

1. Electrical System Connections: Comply with applicable requirements in Division 26, Electrical Sections for power wiring, switches, and motor controls.
2. Ground equipment according to Division 26, Electrical.
3. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

C. Controls:

1. Connect to BMS or VRV Controller.

D. Field Quality Control:

1. Inspect for and remove shipping bolts, block and tie-down straps.
2. After energizing units: Test units for proper fan rotation. Test and adjust controls and internal safeties.
3. Replace malfunctioning units and retest.
4. Thoroughly clean exposed portions of equipment. Install new filters prior to final test and balance and again prior to final acceptance.

END OF SECTION 23 72 23

SECTION 23 74 00 - ROOFTOP PACKAGED AIR CONDITIONING UNITS

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included: Materials, installation and testing of roof-mounted, packaged direct expansion air conditioning units in the following configuration:

1. Rooftop Packaged Air Conditioning Units, Constant Volume (up to 20 tons).

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. AHRI 210/240 - Performance Rating of Unitary Air-Conditioning and Air-Source Heat Pump Equipment.
2. AHRI 270 - Sound Performance Rating of Outdoor Unitary Equipment (with Addendum 1).
3. AHRI 340/360 - Performance Rating of Commercial and Industrial Unitary Air-Conditioning and Heat Pump Equipment.
4. AHRI 410 - Forced-Circulation Air-Cooling and Air-Heating Coils (with Addenda 1, 2 & 3).
5. AHRI 1060 I-P - Performance Rating of Air-to-Air Exchangers for Energy Recovery Ventilation Equipment.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following

1. Interior surfaces of units to meet erosion and growth resistance requirements as well as construction requirements for equipment of ASHRAE 62.1, latest edition.
2. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
3. Fabricate and label refrigeration system to comply with ASHRAE 15, Safety Code for Mechanical Refrigeration.
4. Energy-Efficiency Ratio: Meet minimum requirements shown on Drawings.
5. Coefficient of Performance: Meet minimum requirements shown on Drawings.

6. Comply with NFPA 54 for gas-fired furnace section. Classified in accordance with ANSI Z 21.47.
7. AHRI Certification: Provide AHRI certified and listed units.
8. AHRI Compliance for Units with Capacities Less Than 135,000 Btuh (39.6 kW): Rate rooftop air-conditioner capacity according to AHRI 210/240, Performance Rating of Unitary Air-Conditioning and Air-Source Heat Pump Equipment.
9. AHRI Compliance for Units with Capacities 135,000 Btuh (39.6 kW) and More: Rate rooftop air-conditioner capacity according to AHRI 340/360, Performance Rating of Commercial and Industrial Unitary Air-Conditioning and Heat Pump Equipment.
10. Sound Power Level Ratings: Comply with AHRI 270, Sound Performance Rating of Outdoor Unitary Equipment (with Addendum 1).

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Provide total 5 years manufacturer's warranty for compressor(s), including parts and labor.
2. Provide 5 year manufacturer warranty on heat exchanger.

1.7 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Fan Belts: One set for each belt-drive fan.
2. Filters: One set of filters for each unit.

PART 2 - PRODUCTS

2.1 ROOFTOP PACKAGED AIR CONDITIONING UNITS, CONSTANT VOLUME (UP TO 20 TONS)

A. Manufacturers:

1. Trane Company
2. York/JCI
3. Daikin Applied
4. AAON
5. Valent
6. FloAire

B. Description: Factory assembled and tested; designed for outdoor installation; consisting of compressor, indoor and outside refrigerant coils, indoor fan and outside coil fan, refrigeration and temperature controls, electric auxiliary heating coil, filters, dampers and other accessories/devices listed in this specification and the drawings.

C. Provide marine environment construction including cabinet and coil coatings.

D. Casing: Galvanized steel construction with enamel paint finish, removable panels or access doors with neoprene gaskets for inspection and access to internal parts, minimum 3/4-inch thick thermal insulation, knockouts for electrical and piping connections, exterior condensate drain connection, and lifting lugs. Double wall construction. Finished panel surfaces to withstand a minimum 1000-hour salt spray test in accordance with ASTM B117 standard for salt spray resistance. Unit base to overhang the roof curb for positive water runoff and to seat on the roof curb gasket to provide a positive weather tight seal.

E. Indoor Fan:

1. Double width, double inlet (DWDI) forward curved or backward incline curved aluminum, centrifugal, directly driven by multispeed motor.
2. Fan assembly to have adjustable pitched sheaves on the motor. Bushings to be used on sheaves to allow for easy removal of the pulleys from the fan and motor shaft. Fixed bore pulleys fastened to the shaft by setscrews will not be allowed. Drives selected with a 1.2 service factor.
3. Fan assemblies statically and dynamically balanced at the factory, including a final trim balance, prior to shipment. Fan assemblies to employ solid steel fan shafts. Bearings sized to provide a L-50 life of 250,000 hours.
4. Provide fan motors heavy-duty, 1800 rpm, open drip-proof (ODP). Motors efficiencies to meet EPAct premium efficiencies. Motors mounted on an adjustable base that provides for proper alignment and belt tension adjustment.
5. Fan design to allow for the fan and motor assembly to slide out of the rooftop unit for ease of servicing the equipment.
6. VFD driven variable speed premium effieciency motors.

F. Outside Coil Fan: Condenser fans to be direct drive, axial type designed for low tip speed and vertical air discharge. Condenser fan rpm to be 1140 rpm maximum. Fan blades constructed of steel and riveted to a steel center hub. Condenser fan motors to be heavy-duty, non reversing type with permanently lubricated ball bearing and thermal protection. Motor design to be totally enclosed air over (TEAO).

G. Refrigerant Coils: Copper fin and seamless copper tube in steel casing with equalizing-type vertical distributor. Provide phenolic epoxy corrosion-protection coating to both coils. Coils factory leak tested with high pressure air under water. Provide condenser coils protected from incidental contact to coil fins by a coil guard.

H. Compressor: Number as scheduled. Hermetic scroll compressor with integral vibration isolators, internal overcurrent and overtemperature protection, internal pressure relief. Lead refrigeration circuit to use Digital Scroll compressor capable of 10:1 turndown. Lead refrigeration circuit to be provided with hot gas bypass.

I. Refrigeration System: Air conditioning and heat pump reversing primary heating.

1. Compressor with an automatic-reset control that shuts compressor off after five minutes.
2. Outside coil and fan.
3. Indoor coil and fan.
4. Four-way reversing valve and suction line accumulator.
5. Thermal expansion valve with replaceable thermostatic element and liquid line filter drier.
6. Refrigerant dryer.
7. High-pressure switch.
8. Low-pressure switch.
9. Thermostat for coil freeze-up protection during low-ambient temperature operation or loss of air.

10. Low-ambient switch.
11. Brass service valves installed in discharge and liquid lines.
12. Refrigerant gauge parts.
13. Charge of refrigerant (R-454) and oil.
14. Independent refrigerant circuits where unit has multiple compressors.
15. Variable capacity scroll type compressors.

J. Drain Pan: Stainless steel, positively sloped drain pan provided with the cooling coil. Drain pan to extend beyond the leaving side of the coil and underneath the cooling coil connections. Drain pan to have a minimum slope of 1/8-inch per foot to provide positive draining. The slope of the drain pan to be in two directions and comply with ASHRAE Standard 62.1. Drain pan to be connected to a threaded drain connection extending through the unit base.

K. Filters: 4-inch thick pleated MERV 13 and 2-inch thick pleated MERV 8.

L. Electric Heat: Helix-wound, nickel-chrome, electric-resistance elements, factory wired for single-point wiring connection; with time delay for element staging, and overcurrent and overheat protective devices. Modulating SCR electric backup heating.

M. Outdoor/Return Air Section: A return air plenum to be provided with an outdoor air hood. Hood to allow outdoor air to enter at the back of the return air plenum. Hood to include moisture eliminator filters to drain water away from the entering air stream. Return air plenum to allow return air to enter from the bottom of the unit. Upon unit shut down during unoccupied periods, the outdoor air damper to be power driven closed.

N. Outside-Air Damper: Linked damper blades, for 0 to 30 percent outside air, with fully modulating, spring return damper motor. Upon unit shut down during unoccupied periods, the outdoor air damper to be power driven closed. Damper blades to be gasketed with side seals and jamb seals to provide an air leakage rate of no more than 4 cfm/square foot of damper area at 1-inch differential pressure per ASHRAE 90.1 Energy Standard. Leakage rate to be tested tin accordance with AMCA standard 500.

O. Energy Recovery: Polymer Energy Recovery Wheel.

P. Economizer: Return- and outside-air dampers with neoprene seals, outside-air filter, and hood. Upon unit shut down during unoccupied periods, the outdoor air damper to be power driven closed. Damper blades to be gasketed with side seals and jamb seals to provide an air leakage rate of no more than 4 cfm/square foot of damper area at 1-inch differential pressure per ASHRAE 90.1 Energy Standard. Leakage rate to be tested tin accordance with AMCA standard 500.

1. Economizer + Energy Recovery + Bypass Damper.
2. Damper Motor: Fully modulating spring return with adjustable minimum position.
3. Control: Electronic-control system uses outside-air temperature or mixed-air temperature and selects beween outside-air and return-air enthalpy to adjust mixing dampers.
4. Power Exhau

Q. Power Connection: Provide for single connection of power to unit with unit-mounted disconnect switch accessible from outside unit and control-circuit transformer with built-in circuit breaker.

R. Electrical: Unit wiring to comply with NEC requirements and with applicable UL standards. Electrical components to be UL recognized where applicable. Wiring and electrical components provided with the unit to be number and color coded and labeled according to the electrical diagram provided for easy identification. The unit to be provided with a factory wired weatherproof control panel. Unit to have a single point power connection for main power connection. A terminal board to be provided for low voltage control wiring. Each compressor and condenser fan motor to be furnished with contactors and thermal overload protection. Supply fan motors to have a factory installed and wired control contactor. Knockouts to be provided in the bottom of the main control panels for field wiring entrance.

S. Unit Controls: Factory Controller Makeup Air Heat Pump - CV Cool + CV Heat. Solid-state control board and components contain at least the following features:

1. Indoor fan on/off relay.
2. Default control to ensure proper operation after power interruption.
3. Service relay output.
4. Unit diagnostics and diagnostic code storage.
5. Field-adjustable control parameters.
6. Defrost control.
7. Dehumidification control with dehumidistat.
8. Economizer control.
9. Electric heat SRC modulation.
10. Indoor-air quality control with carbon dioxide sensor.
11. Low-ambient control, allowing operation down to 0 degrees F (minus 18 deg C).
12. Minimum run time.
13. Night setback mode.
14. Return-air temperature limit.
15. Smoke alarm with smoke detector installed in supply and return air.
16. Low-refrigerant pressure control.
17. Digital display of outside temperature, supply-air temperature, return-air temperature, economizer damper position, indoor-air quality, and control parameters.

T. DDC: Install stand-alone control module providing link between unit controls and DDC system. Control module to be compatible with temperature-control system through BACnet interface for BMS connection, monitoring, temperature adjustment, and diagnosis.

U. Accessories:

1. Service Outlets: One, 115-V, ground-fault, circuit-interrupter type.
2. Condensate drain trap.
3. Dirty-filter switch.
4. Hail guards of steel, painted to match casing with matching corrosion protection.
5. Power Exhaust Fan: Centrifugal type. Direct drive with variable frequency drive.

V. Roof Curb:

1. Refer to Section 23 05 48, Vibration and Seismic Controls for HVAC Equipment for spring isolation curb.
2. 14 gauge galvanized steel with corrosion-protection coating, gasketing, and factory-installed wood nailer; complying with NRCA standards; minimum height of 14-inches.
3. Isolation Curb: Rigid upper and lower steel structure with vibration isolation springs having 2-inch static deflection and vertical and horizontal restraints; with elastomeric waterproof membrane.

4. Insulate interior of the curb with 2-inches of 1.5 pound neoprene coated fiberglass insulation.
5. Provide seismic restraints to secure the unit to the curb in accordance with Code.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS

A. Examine areas and conditions under which units are to be installed. Do not proceed with work until unsatisfactory conditions have been corrected.

B. Roof curb to be mounted level on roof in accordance to NRCA manuals and details. Secure to structure per engineered/sealed seismic installation details.

C. Unit to be secured to curb per seismic installation details.

D. Provide external vibration isolation or isolation curb to prevent transmission of unit-borne sound and vibration to building structure. Provide flexible connections for hot water piping, electrical power and fuel piping.

E. Seal openings between curb, roof opening, ducts, electrical conduits, piping, and building interior.

F. Protect the roof from damage during installation. Secure factory touch-up paint to repair scratches and minor damage to equipment prior to start-up. Comb evaporator and condenser coils to repair any minor fin damage.

G. Control wiring from roof-mounted equipment must be routed in conduit from above roof to inside building or must be routed through roof curb inside unit. Control wiring must not be exposed to weather.

H. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test and adjust field-assembled components and equipment installation, including connections, and to assist in field testing. Report results in writing.

I. Perform the following field quality-control tests and inspections and prepare test reports:

1. After installing rooftop air conditioners and after electrical circuitry has been energized, test units for compliance with requirements.
2. Inspect for and remove shipping bolts, blocks, and tie-down straps.
3. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

J. Remove malfunctioning units, replace with new units, and retest as specified above.

K. Engage a factory-authorized service representative to perform startup service.

L. Protect or remove energy recovery devices prior to starting the units to ensure damage does not occur to the devices or media. Replace at no cost to Owner if devices/media get damaged or are no longer in "as-new" condition.

M. Complete installation and startup checks according to manufacturer's written instructions and do the following:

1. Inspect for visible damage to unit casing.
2. Inspect for visible damage to furnace combustion chamber.
3. Inspect for visible damage to compressor, air-cooled outside coil, energy recovery devices, internal coils, and fans.
4. Inspect internal insulation.
5. Verify that labels are clearly visible.
6. Verify that clearances have been provided for servicing.
7. Verify that controls are connected and operable.
8. Verify that filters are installed.
9. Clean outside coil and inspect for construction debris.
10. Clean furnace flue and inspect for construction debris.
11. Connect and purge gas line.
12. Adjust vibration isolators.
13. Inspect operation of barometric dampers.
14. Lubricate bearings on fan.
15. Inspect fan-wheel rotation for movement in correct direction without vibration and binding.
16. Adjust fan belts to proper alignment and tension.
17. Start unit according to manufacturer's written instructions.
    a. Coordinate starting of refrigeration system during winter with manufacturer.
    b. Complete startup sheets and attach copy with Contractor's startup report.
18. Inspect and record performance of interlocks and protective devices; verify sequences.
19. Operate unit for an initial period as recommended or required by manufacturer.
20. Calibrate thermostats.
21. Adjust and inspect high-temperature limits.
22. Inspect outside-air dampers for proper stroke and interlock with return-air dampers.
23. Start refrigeration system and measure and record the following:
    a. Coil leaving-air, dry- and wet-bulb temperatures.
    b. Coil entering-air, dry- and wet-bulb temperatures.
    c. Outside-air, dry-bulb temperature.
    d. Outside-air-coil, discharge-air, dry-bulb temperature.
24. Inspect controls for correct sequencing of heating, mixing dampers, refrigeration, and normal and emergency shutdown.
25. Measure and record the following minimum and maximum airflows. Plot fan volumes on fan curve.
    a. Supply-air volume.
    b. Return-air volume.
    c. Relief-air volume.
    d. Outside-air intake volume.
26. Simulate maximum cooling and heating demand and inspect the following:
    a. Compressor refrigerant suction and hot-gas pressures.
    b. Short circuiting of air through outside coil or from outside coil to outside-air intake.
27. Verify operation of remote panel, including pilot-light operation and failure modes. Inspect the following:
    a. High-limit heat exchanger.
    b. Warm-up for morning cycle.
    c. Freezestat operation.
    d. Economizer to limited outside-air changeover.
    e. Alarms.
28. After startup and performance testing, change filters, vacuum heat exchanger and cooling and outside coils, lubricate bearings, adjust belt tension, and inspect operation of power vents.

N. Adjust initial temperature, humidity, and CO2 set points.

O. Set field-adjustable switches and circuit-breaker trip ranges as indicated.

P. Occupancy Adjustments: Within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to site outside normal occupancy hours for this purpose, without additional cost.

Q. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain rooftop air conditioners. Reference Division 01, General Requirements.

3.2 ROOFTOP PACKAGED AIR CONDITIONING UNITS, CONSTANT VOLUME (UP TO 20 TONS) INSTALLATION

A. Duct installation requirements are specified in other Division 23, HVAC Sections. Drawings indicate the general arrangement of ducts. The following are specific connection requirements:

1. Install ducts to termination in roof curb.
2. Remove roof decking only as required for passage of ducts. Do not cut out decking under entire roof curb.
3. Terminate return-air duct through roof structure.
4. Fill void between roof and bottom of unit with 3-pound density acoustic batt.
5. Install normal-weight, 3000 PSI (20.7 MPa), compressive strength (28-day) concrete mix inside roof curb, 4-inches thick.

B. Electrical System Connections: Comply with applicable requirements in Division 26, Electrical Sections for power wiring, switches, and motor controls.

C. Ground equipment according to Division 26, Electrical.

D. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

END OF SECTION 23 74 00

SECTION 23 81 26 - SMALL SPLIT SYSTEM AND UNITARY HVAC EQUIPMENT

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included: Materials, installation, and testing of:

1. Ducted and Ductless Split Systems - Heat Pumps

1.2 RELATED SECTIONS

A. Contents of Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. AHRI 210/240 - Performance Rating of Unitary Air-Conditioning and Air-Source Heat Pump Equipment.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. Efficiency ratings, cooling/heating performance, fan performance, sound performance to meet or exceed Basis of Design as scheduled on Drawings.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Refrigeration compressor(s): 5-year warranty.
2. Furnace heat exchanger: 5-year warranty.

PART 2 - PRODUCTS

2.1 DUCTED AND DUCTLESS SPLIT SYSTEMS - HEAT PUMPS

A. Manufacturers:

1. Mitsubishi
2. Sanyo
3. Daikin Applied
4. LG
5. Fujitsu
6. Samsung

B. Description: Self-contained, matched factory-engineered and assembled. Pre-wired indoor and outdoor units. UL/ETL listed.

C. Outdoor Unit:

1. Self contained, consisting of cabinet, compressor system, condenser fan matched to indoor unit.
2. Cabinet: Fabricated of galvanized steel, bonderized, and finished with powder coated baked enamel.
3. Refrigerant System:
   a. HFC refrigerant or other refrigerant with zero ozone depletion potential (ODP).
   b. Compressor: To be inverter driven, hermetic rotary type.
4. Air System:
   a. Fan: Propeller Type with one direct drive, inverter driven, variable speed motor.
   b. Motor: Premium efficiency with inherent protection, permanently lubricated bearings and variable speed drive compatible.
   c. Coil: Copper tubes and aluminum fins, coated for corrosion protection.
5. Controls: Single source for both indoor and outdoor units, with low/high pressure switch, capable of communicating to/from the building DDC control system.

D. Indoor Unit(s):

1. Self contained ducted, wall mounted, ceiling mounted or recessed ceiling mounted evaporator unit(s) as shown on Drawings, matched to outdoor unit.
2. Cabinet:
   a. Non-flammable, high impact polymer with a white finish.
   b. Power Source: To be a single point power connection or sub-fed from outdoor condensing unit.
3. Refrigeration System: HFC refrigerant or other refrigerant with zero ozone depletion potential (ODP).
4. Air System:
   a. Fan: An assembly with one or two inline fan(s) with a single direct drive motor.
   b. Filter: Polypropylene, furnished with the unit, removable and washable.
   c. Coil: Direct expansion type with copper tubes mechanically bonded into aluminum fins.
5. Condensate Drain:
   a. Provide drain pan sloped to drain away from unit. Drain pan with a single drain connection.
   b. Condensate pump kit provided with unit.

c. Secondary drain pan; Condensate overflow shut-off float switch or integral float switch on condensate pump and external alarm.

6. Controls: Wired thermostat. Control to be integral with unit. The unit to have PID controls provided by manufacturer to perform input functions necessary to operate the system. No third party building management system to be required; however, VRV/VRF or split heat pump systems to be provided with BACnet interface with third-party BMS/BAS system. Provide central command controller with graphic interface and link to BMS/BAS graphics user interface.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS

A. Install with required clearances and access for maintenance.

B. Install factory furnished devices for field installation.

C. Inspect for and remove shipping bolts, blocks and tie-down straps.

D. After energizing units: Test units for proper fan rotation. Test and adjust controls and internal safeties. Replace malfunctioning units and retest.

E. Thoroughly clean exposed portions of equipment. Install new filters prior to final test and balance and again prior to final acceptance.

F. Provide vibration isolation: As scheduled.

G. Provide seismic restraint.

H. Condensate drain per manufacturer's piping diagram.

I. Condensate piped to indirect waste connection; cleanouts at changes of direction; sized and sloped to drain per Code. Secondary drain routed to visible location.

J. Shut-off/hose kits for all hydronic connections.

END OF SECTION 23 81 26

SECTION 23 81 43 - AIR SOURCE HEAT PUMPS

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Air Source Modular Heat Pump Boiler

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, meet the following:

1. AHRI 210/240 - Performance Rating of Unitary Air-Conditioning and Air-Source Heat Pump Equipment.
2. AHRI 270 - Sound Performance Rating of Outdoor Unitary Equipment (with Addendum 1).
3. NRCA: Provide roof curbs in accordance with NRCA.

1.6 WARRANTY

A. Warranty of materials and workmanship as outlined in Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Refrigeration Compressor(s) - 5-year warranty.

1.7 PACKAGED TERMINAL HEAT PUMP MOCK-UP

A. Install one unit that includes inside cabinet, wall sleeve, and wall louver.

B. Locate where directed.

C. Mock-up may remain as part of work.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Air Source Modular Heat Pump Boiler:

1. ClimaCool
2. Or approved equivalent.

2.2 AIR SOURCE MODULAR HEAT PUMP BOILER

A. Features: Unit to be set-up for heating only.

1. Electrical service - 460/3/60.
2. Water isolation valves and flush ports for service or maintenance without module removal.
3. Motorized valves are provided for step-variable flow operation.
4. 300 PSI rated grooved coupling header piping connections, 6-inch.
5. Individual power supply to each module for true operational redundancy.
6. Each module is pre-charged with refrigerant R-454B and factory run tested.
7. Dual scroll compressors on each module for reliability/redundancy.
8. Dual independent refrigerant circuits per module for reliability/redundancy.
9. Highly efficient, 316 stainless steel, dual circuited, brazed plate evaporator.
10. Air cooled condenser coils with aluminum fins and copper tubes.
11. Ultra quiet, high efficient, EC condenser fan with variable speed motors and integral head pressure control.
12. Reversing valves.
13. Compressor on/off switches for maintenance.
14. Weatherproof NEMA 4 starter/control panel with compressor contactors, control transformer, relays, safety/operating controls and DDC microprocessor controller.
15. Adjustable high and low pressure cut-outs.
16. ASHRAE 90.1 energy efficiency compliance.
17. Two equally sized on/off scroll compressors each module.

B. Furnish and Install with factory representative assistance:

1. CoolLogic Touch Control System includes NEMA Type 1 enclosure, control transformer, surge protection, convenience outlet, three position selector switch, power and fault indication, 32 Bit microprocessor controller, and BACnet BAS interface.
2. Mounting hardware kit.
3. Header grooved coupling kit.
4. Sound attenuator end panel kit.
5. 4.5-inch temperature sensors, well assemblies, conduit box, two per water loop.
6. Strainers for field installation: Minimum 60 mesh first pass, one required per loop to protect heat exchangers from clogging and to maintain chiller-specified KW/ton.
7. Cooling Loop: Y strainer, 40-mesh.
8. Header Bank End Cap Kit: Two per bank.
9. 250 PSI Pressure Differential Flow Sensor: One per water loop, NOT for pump control.

C. Start-up and Warranty:

1. Provide factory authorized modular heat pump representative start-up, supervision, and training.
2. Provide one year parts warranty.
3. Provide five year compressor parts warranty.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS

A. Examine areas and conditions under which units are to be installed. Do not proceed with work until unsatisfactory conditions have been corrected.

B. Verify that ceiling system is ready to receive work and opening dimensions are as indicated on shop drawings.

C. Verify that electric power is available and of the correct characteristics.

D. Install in accordance with manufacturers written instructions and guidelines.

E. Coordinate installation of unit with building components to allow adequate airflow to/from the units and for maintenance clearances. Mount outdoor units on a built-up roofing curb flashed and sealed in accordance with roofing warranty requirements.

F. Provide adequate bracing and vibration isolation in accordance with seismic code requirements and acoustical engineers requirement.

G. Provide adequate drainage connections and routing for condensate piping to indirect waste receiver.

H. Provide shut off valves, site glasses, and routing pressure gauges, and all other appurtenances required for refrigerant system maintenance and operation.

I. Set initial temperature set points. Instruct operating personnel in adjustment of setpoints and controls.

J. See Division 01, General Requirements and Section 23 00 00, HVAC Basic Requirements for additional requirements.

K. Provide service and maintenance of units for one year from date of substantial completion.

END OF SECTION 23 81 43

SECTION 23 82 00 - TERMINAL HEAT TRANSFER EQUIPMENT

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Electric Wall Heaters

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.6 WARRANTY

A. Warranty of materials and workmanship as outlined in Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

PART 2 - PRODUCTS

2.1 ELECTRIC WALL HEATERS

A. Manufacturers:

1. Trane
2. Markel
3. Qmark
4. Chromalox
5. Indeeco

B. Description: Wall mounted forced air unit heater, including enclosure for surface mounting, fan and motor, heating elements and wall box. UL listed and wired per NEC.

C. Cabinet: 20 gauge zinc coated steel, 16 gauge painted exterior grille.

D. Fan and Motor: Propeller type fan, totally enclosed motor with permanently lubricated bearings and thermal overload protection, vandal proof.

E. Heating Element: Sealed tubular type with finned heating elements, manual reset thermal limit safety switch, fan purge limit to dissipate residual heat on heater shutdown.

F. Control:

1. Control specified in Section 23 09 00, Instrumentation and Control Performance Specifications.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS

A. Avoid interference with structure and with work of other trades, preserving adequate headroom and clearing doors and passageways. Check each piece of equipment for defects, verifying that items function properly and that adjustments have been made.

B. Prior to acceptance, thoroughly clean exposed portions of terminal heat transfer equipment, remove shipping labels and traces of foreign substance. Touch up scratched surfaces of radiant panels with factory matching paint.

3.2 ELECTRIC WALL HEATERS INSTALLATION

A. Damaged Coils: Make every effort to prevent damage to both built-up coils and coils of packaged equipment. Comb damaged coil fins to be straight.

B. Install per manufacturer's instructions. Comply with NEC and UL listings.

C. Install heaters in place with box trim flush with finished wall.

D. Install thermostat as shown on drawings. Provide control wiring from thermostat to unit.

END OF SECTION 23 82 00

SECTION 23 84 00 - HUMIDITY CONTROL EQUIPMENT

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included:

1. Dehumidification Unit

1.2 RELATED SECTIONS

A. Contents of Division 23, HVAC and Division 01, General Requirements apply to this Section.

B. In addition, reference the following:

1. Section 23 05 48, Vibration and Seismic Controls for HVAC Equipment
2. Section 23 05 93, Testing, Adjusting, and Balancing for HVAC
3. Section 23 09 00, Instrumentation and Control Performance Specifications
4. Section 23 21 13, HVAC Piping
5. Section 23 21 23, Hydronic Pumps
6. Section 23 31 00, HVAC Ducts and Casings

1.3 REFERENCES AND STANDARDS

A. References and Standards as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

1.4 SUBMITTALS

A. Submittals as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. In addition, provide:

1. Product Data: Provide catalog data indicating rated capacity, dimensions, duct and service connections, electric nameplate data and wiring diagrams.
2. Shop Drawings: Indicate rough-in dimensions, piping plans with details of components and steam dispersion tubes, duct and service connections, electric nameplate data and wiring diagrams.
3. Manufacturer's Instructions: Indicate assembly and installation instructions.
4. Operation and Maintenance Data: Include manufacturer's descriptive literature, operating instructions, installation instructions, maintenance and repair data, and parts listing.
5. Warranty: Submit manufacturer warranty and ensure forms have been completed in Owner's name and registered with manufacturer.

1.5 QUALITY ASSURANCE

A. Quality assurance as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. The unit to be ETL listed.

C. Unit to be completely factory assembled, wired, piped, and test run prior to shipping. All controls to be factory adjusted and preset to the design conditions. A factory test report to be available upon request.

1.6 WARRANTY

A. Warranty of materials and workmanship as required by Section 23 00 00, HVAC Basic Requirements and Division 01, General Requirements.

B. Warranty: The entire system to have a 24 month limited parts warranty from ship date.

1. 90 days from initial start-up, all parts and repairs related to factory defects or replacement parts are covered by manufacturer warranty.

PART 2 - PRODUCTS

2.1 DEHUMIDIFICATION UNIT MANUFACTURERS:

A. Desert Aire

B. Dectron

C. Or approved equivalent.

2.2

A. General: Provide self-contained, closed loop heat recovery unit, piped, wired, and factory tested.

1. Fully constructed custom system designed for natatorium environment control, including:
   a. Dehumidification.
   b. Unit mounted hot water coil for space heating.
   c. Unit mounted modulating exhaust system exhaust fan and 100% purge/economizer fans.
   d. Unit mounted outdoor air connections and dampers.
   e. Glycol heat recovery loop between the exhaust and outdoor air intake air streams.
   f. Single point factory wired power.
   g. Factory provided and sequence programmed controller with BAS interface.

B. Cabinet Construction: All cabinet 16, 20 and 24 gauge sheet metal to be galvanized G90 steel or GalvalumeTM alloy with mill-applied zinc phosphate primer followed by an exterior grade white silicone modified polyester top coat. The sheet metal is engineered to form a cabinet with maximum strength and rigidity. All seams shall be caulked with silicone to prevent air and water leakage or infiltration.

1. Base Rails: The cabinet to have a base frame comprised of 2 layers of 10 gauge mill galvanized G90 steel. Lifting lugs to be provided on the base frame for rigging the system.
2. The cabinet walls to be of double-wall construction using 20 gauge pre-painted steel with a fully painted inner metal liner and 2 inches of fiberglass insulation.
3. The cabinet floor to be comprised of a 16-gauge galvanized steel panel with a 20-gauge pre-painted steel inner liner, 2-inch double wall engineered with structural bending for maximum rigidity and be mechanically fastened to the base frame of the unit.

4. The cabinet roof to be 20-gauge pre-painted steel, 2-inch double wall engineered with structural bending for maximum rigidity and be mechanically fastened to the base walls of the unit.
5. The cabinets to be mechanically assembled with stainless steel 5/32-inch sealed blind rivets. Where bolts are required bright zinc plated bolts to be used.
6. Access doors to be supported on multiple hinges, held shut by compression latches for quick access. Doors to be provided for entrance to all sections housing components requiring routine maintenance. Full height access doors to have "hold back" latches to prevent door closure during the performance of service procedures.
7. The unit to have non-corroding protective mesh screens on all air intake openings.
8. The system to have non-corroding protective mesh screens covering internal fan blades, protective grates covering all floor access ports.

C. Outdoor Air Intake:

1. Purge /Economizer and Minimum Outdoor Air connections with motorized dampers and controls.

D. Insulation: The unit to be insulated per the following standards:

1. All exterior cabinet sections to be insulated with two (2) inch thick fiberglass inside the double walled cabinet.
2. Fire resistant rating to conform to NFPA Standard 90A and 90B.
3. Sound attenuation coefficient to not be less than 1.02 at a frequency of 1,000 Hz as per ASTM Standard C423.
4. Thermal conductivity to not exceed 0.26 Btu/hr-sqft-ft at 75°F.

E. Filters: Air filters to be standard sized, replaceable, off-the-shelf filters including:

1. Return Air: 2-inch MERV 13, 90% pleated filters with rust-free non-metallic structure on a slide-in or face-loading rack.
2. Exhaust Air: 2-inch MERV 8, 30% pleated filters with rust-free non-metallic structure.
3. Outside Air: 2-inch MERV 13, 90% pleated filters with rust-free non-metallic structure.
4. Dirty air filter switches included on the return air filter for indicating an alarm when pressure drop exceeds a set point.

F. Heating Coil: The packaged hot water coil to be sized to meet the scheduled heating capacity and have the following characteristics:

1. Modulating (0-10V) auxiliary air heat control by means of a factory mounted and wired three-way control valve.
2. Air heating coil tubes, fins, headers, casing, and end-plates to be fully protected by a polyester/enamel coating for maximum corrosion protection. The protective coating to comply with ASTM B117/D1654 and ASTM D2126 for corrosion resistance against common acids, salts, and gases.
3. Coil casing and end-plates to be made of galvanized steel.
4. Aluminum fin and copper tubes mechanically bonded to assure high heat transfer.
5. The maximum loop operating pressure to not be less than 250 psig.

G. Heat Recovery Coils:

1. The unit to have heat recovery between the minimum exhaust and outdoor air streams per specifications.
    a. The heat recovery coils to be sized for heat transfer between the two air streams.

b. The heat recovery fluid circulating between coils to be glycol. The module to be a complete package and independent circuit that includes a circulating pump, fill valves and expansion tank.

2. Coils to be fully dipped and coated with a polyester/enamel coating for maximum corrosion protection. Coating to comply with ASTM B117/D1654 and ASTM D2126 for corrosion resistance against common acids, salt, and gases.
3. Aluminum fin and copper tube joints mechanically bonded to assure high heat transfer.

H. Drain Pans:

1. Each chilled water coil to be provided with a positive draining, compound-sloped, baked powder paint coated aluminum drain pan with fully-welded corners to ensure zero water retention.

I. Blowers and Blower Motors:

1. Supply Blowers:
   a. Blower(s) to be a single width/single inlet airfoil plenum type, secured a machined, ground and polished solid steel shaft. The wheel to be G90 galvanized steel with baked powder paint coating. The shaft to be coated with a rust inhibitor.
   b. The complete blower assembly to be statically and dynamically balanced on precision electronic balancers.
   c. The blower assembly to be mounted on a 1-inch deflection spring isolated rack.
2. The fan inlets to be equipped with accidental contact protection screen.
   a. Motor(s) to be Premium Efficiency painted cast iron construction TEFC, NEMA MG1-PART 31 Inverter Duty 15:1 Constant Torque Severe Duty with a service factor 1.25. Motors to be 6 Pole 1200 RPM or 4 Pole 1800 RPM synchronous speed. Motors to have double lip seals on both ends with re-greaseable bearings 254T frame and larger with Polyurea grease.
   b. The motor(s) to be provided with a low motor noise and high starting torque VFD for air balancing purposes. The VFD to have a drive efficiency of 96 to 98% with displacement power factor of 0.98. The VFD to have protective features including: torque limit, heat sink over-temperature, current-limiting DC bus fuse, electronic motor overload with phase-to-phase and ground fault short circuit protection; current limit, over/under torque protection, over/under voltage protection, short circuit current rating of minimum 30kA rms symmetrical protected by recommended branch circuit protection devices.
3. Exhaust Blowers:
   a. The packaged exhaust blower (EF1) to be sized to maintain the negative pressure requirement in the space as set by balancer.
   b. The blower to be impeller plenum fan complete with backward curved, three-dimensional, profiled blades made of high performance composite material. The blower to be completely corrosion resistant and be maintenance free a direct drive via a direct current (DC) electronic commuted (EC) motor. The EC-Motor to have zero slippage design and have continuously variable speed control connected to the unit's controller.
   c. The fan assembly to be balanced in Class G 6.3 acc DIN ISO 1940, dynamic on two levels.
   d. The fan assembly to be suitable for ambient temperatures of -40°C to max. +70°C.
   e. Thermal contacts installed in the windings compliant with THCL 155.
   f. Drive motor in external rotor principle, sealed in protection class IP54 with moisture protection impregnation of the windings, topical protection.
   g. High corrosion resistance design with high quality and reliability.

h. The exhaust fan to be controlled from an end switch on the power open of the exhaust air damper. The exhaust dampers to be protected by louvers to divert rain from the face of the dampers.
i. To be packaged with the heat recovery module.

4. Purge Blowers:
   a. The ventilation/economizer/purge exhaust blowers (PEA) to be unit mounted and sized to provide full exhaust from the space when operating with EF1.
   b. The fans to be direct driven axial fan made of high-strength composite material in which the motor and controller are integrated. Include FE2owlet blades combined with guide vanes and EC commutated direct-current external rotor motors to provide maximum efficiency the quietest performance. The EC motor to have maintenance-free electronic circuitry, a rotor with permanent magnets, and an integral controller to provide the windings with electrical current so that, the motor rotates continuously and quietly. The fan is to be aerodynamically-optimized, sickle-blade profile, patterned with serrated trailing edge and winglets on the blade outer edge for energy and noise-optimized operation.
   c. The fan assembly to be balanced in Class G 6.3 acc DIN ISO 1940, dynamic on two levels.
   d. The fan assembly to be suitable for ambient temperatures of -40°C to max. +70°C.
   e. Thermal contacts installed in the windings compliant with THCL 155.
   f. Drive motor in external rotor principle, sealed in protection class IP54 with moisture protection impregnation of the windings, topical protection.
   g. High corrosion resistance design with high quality and reliability.
   h. The exhaust fan to be controlled from an end switch on the power open and spring return outside air damper. The gravity exhaust dampers to be protected by louvers to divert rain from the face of the dampers.
5. Dampers:
   a. Internal dampers to be made from extruded anodized aluminum with a parallel blade configuration and neoprene double-seal tips to minimize leakage. Damper blades to be mounted on steel rods which rotate on nylon bushings. All damper hardware to be corrosion resistant.
      1) The system to be provided with normally closed outside air and exhaust air dampers equipped with spring-return actuators The dampers modulate between 0% to 100% open position.
      2) The outdoor air and exhaust air dampers to be of opposed blade configuration. Dampers to have 0.750-inch insulated blades made from extruded anodized aluminum with neoprene double-seal tips to minimize leakage. Damper leakage to be less than 1% of maximum flow at 4-inch water column differential. Damper blades to be mounted on steel rods which rotate on nylon bushings. All damper hardware to be corrosion resistant.
6. Control Panel:
   a. The electrical contractor to be responsible for external power wiring and disconnect switch fusing. Power block terminals to be provided.
   b. The system to include a factory-installed fused disconnect.
   c. Main control panel to be mounted inside the service vestibule outside of the process air stream.
   d. Blower motors to be protected against overloads.
   e. The system to have a voltage monitor with phase protection.
   f. Available dry contacts to include:
      1) Alarm
      2) Blower interlock
      3) Modulating Heating
      4) Blower interlock
      5) Remote Exhaust

6) System on
7) Heat Recovery

g. All wiring to be installed in accordance with UL or CSA safety electrical code regulations and to be in accordance with the NFPA All components used in the system to be UL or CSA listed.

7. Wiring diagrams to be located near the electrical panel(s) on the system. These diagrams to provide color-coding and wire numbering for easy troubleshooting. All wires to be contained in a wire duct.
   a. An airflow switch and a dry contact for alarm(s) to be provided and factory-mounted.
   b. Convenience outlet and light included factory mounted in control cabinet, factory wired.
8. Microprocessor Control:
   a. A factory installed and programmed microprocessor controller with the following characteristics to be provided:
      1) All set points and parameter adjustments are pre-programmed at the factory during quality control testing.
      2) The microprocessor program to be stored on updatable FLASH memory.
      3) A minimum of 11 analogue inputs, 4 analogue outputs, 24 digital inputs and 16 digital outputs.
      4) Four serial interface ports including both RS232 and RS485 types.
      5) An Ethernet port with RJ-45 connector and LED activity indicator.
      6) A real time clock to time-stamp the system operation log and to enable a programmable 7-day occupation schedule.
      7) Two manual demand forced modes to allow the user to manually bypass the microprocessor in the event of controller failure.
      8) The local and remote operator panel(s) to have a backlit graphic liquid crystal display with touch controls. Mount remote panel near BAS graphic user interface. Include interface and map points for graphical display, monitoring, temperature and humidity setpoints, and timed purged exhaust controlled by user at BAS graphical interface.
      9) The system to monitor temperature and humidity and control modulations of outdoor air for cooling and dehumidification, and heating coil valve modulation for heating/reheat.
   b. The following status LEDs to be on the controller:
      1) Alarm - indicates there has been a failure requiring service.
      2) Dehumidification - indicates that the system is dehumidifying the space.
      3) Cooling - indicates that the system is operating in economizing outdoor air exchange modulation for cooling and/or dehumidifying.
      4) Reheat – indicated reheat is operating in conjunction with dehumidification.
      5) Space Heat - indicates that the space heating is operating.
      6) Maintenance - indicates whether or not maintenance is required.
      7) Manual - indicates that the system has been set to manual operation.
      8) Purge – indicates system has been manually set to purge for a specific time (3hr – adj.).
   c. The following set points to be accessible and adjustable from the operator panel, and mapped to BAS for monitoring and adjustability.
      1) Space temperature
      2) Space relative humidity
   d. The following sensors to be unit-mounted and monitored at the operator panel, remote panel, and mapped to BAS for monitoring. All information from these items to be actively used in the system control and operation strategies:
      1) Return air temperature
      2) Supply air temperature

3) Return air relative humidity
4) Outdoor air temperature
5) Outdoor air humidity

e. System Fault: To indicate via text message to the display and mapped to BAS graphic interface what systems require attention or servicing. Built-in monitoring and diagnostics to allow the user to view the following:
1) Power failure
2) Dirty air filter
3) System off

9. Roof Curb:
a. Reference Section 23 05 48, Vibration and Seismic Controls for HVAC Equipment. Coordinate fastening unit to top steel frame and lower sheet metal curb and attachment to roof structure raise mounting pad or curb.
b. Lower perimeter type curb made minimum 12-gauge galvanized steel with stiffeners, not less than 2.0 in of rigid acoustical and thermal fiberglass insulation, and all necessary hardware to be provided for field assembly of the curb on the roof structural pad prior to system shipment.

10. Factory Performance Testing:
a. The system to be thoroughly tested under factory test conditions.

2.3 SEQUENCE OF OPERATION

A. System Startup:

1. Power is turned on or the system is started.
2. After a short initial delay to allow the sensors to stabilize, the blowers start and operate continuously.
3. Based on sensor feedback, the system will begin or resume operation, based on the sequence below.

B. Airside Configuation:

1. The system continuously delivers the specified supply air volume to the natatorium to achieve minimum 6ACH.
2. The minimum exhaust air volume is set to meet the engineer's schedule, and as set by balance to achieve and maintain ASHRAE recommended 0.05-0.15-inch WC negative pressure relative to surrounding spaces. NOTE: exhaust fan dedicated to exhaust behind the spa is also operating continuously and must be operating when determining fan speed settings to maintain negative space pressure.
3. Unit microprocessor will control modulation of dampers and exhaust fan(s) to exhaust a set percentage offset more than introduced outside air to maintain a negative space pressure (as determined by balancer).

C. Dehumidification Mode:

1. The return air relative humidity is above the humidity setpoint: 50% RH (adj.).
2. Return air dewpoint is above dewpoint setpoint: 59.7°F (adj.) based on space temp set at 80°F (adj.).
3. The microprocessor sends an output signal to modulate the dampers and fan speeds to increase OA percentage based on return air temperature, relative humidity, and dewpoint.
4. The microprocessor heating output signal (0-10 volts) is sent to the heating coil controller if needed based on return air temperature, relative humidity, and dewpoint.

D. Space Cooling Mode:

1. The return air temperature is above the room temperature setpoint 82°F (adj.).
2. The microprocessor sends an output signal to modulate the dampers and fan speeds to increase OA percentage based on return air temperature.

E. Space Heating Mode:

1. The return air temperature is below the room temperature setpoint 80°F (adj.)
2. The microprocessor space heating output signal (0-10 volts) is sent to the heating coil controller. The signal output will regulate based on the return air temperature.

F. Exhaust Air Heat Recovery Mode:

1. The minimum outdoor air damper and minimum exhaust fan(s) and will operate as continuously as programmed, minimum OA occupied and setback by 50% OA unoccupied.
2. Outdoor air temperature is compared with the return air temperature, if the differential is greater or equal to 10°F (adj.), the glycol pump to circulate a glycol mixture between the exhaust air and the outdoor air heat recovery coils to precool or preheat the incoming outside air.

G. Purge Mode:

1. This mode is triggered automatically if cooling mode or dehumidification mode requires up to 100% OA; Or this mode is manually triggered by an operator when super-chlorinating the pool. It can be manually triggered at the unit-mounted, remote operator panel, through the online WebSentry interface, or by the BACnet interface controller on the BAS graphic user interface.
2. Manual triggered Purge Mode has an adjustable timed duration (3hr adj.) after which the system automatically resumes normal operation.
3. Once manually triggered by the operator:
    a. A signal from the microprocessor sets the exhaust fan(s) to their maximum CFM.
    b. The unit-mounted outdoor air dampers open fully and the return air dampers close
    c. The system stays in 100% outdoor air ventilation mode.
    d. After the timed period expires, all dampers and fans return to normal operating settings and the system resumes normal operation.
    e. During Purge Mode, the system will control heating based on supply air temperature

H. Economizer Cooling Mode:

1. Same as cooling mode above since system uses outside air as primary cooling and dehumidifying.

I. Economizer Dehumidification Mode:

1. Same as dehumidification mode above since system uses outside air as primary cooling and dehumidifying.

J. Freeze Protection:

1. The supply air temperature falls below the freeze stat setpoint.
2. Exhaust fan(s) are stopped and outdoor air damper(s) are fully closed.

3. When the freeze stat alarm is tripped, it must be manually cleared by the operator.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS

A. Install in accordance with manufacturer's written instructions and recommendations.

B. Connect unit to water supply. Provide isolation valves, strainer, and drain down on hydronic connections.

C. Install piping with unions or flanges for easy removal of pan for servicing.

D. Duct connections: drawings indicate the general arrangements of the ducts. Connect units to 304 stainless steel ductwork, acoustic attenuators, and chemical/corrosion proof flex connections.

E. Perform a thorough physical inspection of the system upon delivery from the shipment carrier.

F. Identify and immediately report any physical damage to manufacturer.

G. Cleaning: Prior to acceptance, thoroughly clean exposed portions of the units, remove shipping labels and traces of foreign substance.

H. Install and make connection to allow space for service and maintenance.

I. Field Quality Control:

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test and adjust field-assembled components and equipment installation, including connections and to assist in field testing. Report results in writing.
2. Perform the following field quality-control tests and inspections and prepare test reports:
    a. After installing units and after electrical circuitry has been energized, test units for compliance with requirements.
    b. Inspect for and remove shipping bolts, blocks, and tie-down straps.
    c. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
    d. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
3. Remove malfunctioning units, replace with new units, and retest as specified above.

J. Startup Services:

1. Engage a factory-authorized service representative to perform startup service.
2. Complete installation and startup checks according to manufacturer's written instructions.

K. Adjusting:

1. Adjust initial temperature and humidity.
2. Set field-adjustable switches and circuit-breaker trip ranges as indicated.
3. Within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual conditions.

L. Demonstration: Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain air-handling units. Reference Division 01, General Requirements.

END OF SECTION 23 84 00

SECTION 26 00 10 – REQUIREMENTS FOR ELECTRICAL, COMMMUNICATIONS, AND ESS

PART 1 GENERAL

1.1 SUMMARY

A. Supplemental requirements generally applicable to the Work specified in Divisions 26, 27, and 28. This Section is also referenced by related Work specified in other Divisions.

B. Section Includes:

1. Electrical equipment coordination and installation
2. Sleeves for raceways and cables
3. Sleeve Seals
4. Grout
5. Common installation requirements

C. General Requirements: Conform to Contract Documents. This section is supplemental and in addition to requirements of Division 01.

D. Conditions and Requirements: Conditions and requirements of the General Provisions, Supplemental General provisions and Special Provisions are hereby made a part of the Electrical Division of this Specification. If requirements disagree, the more stringent requirement will become the contractual obligation.

E. Provide a complete working installation with all equipment called for in proper operating condition. Documents do not undertake to show or list every item to be provided. When an item not shown or specified is clearly necessary for proper operation of equipment shown or specified, provide an item which will allow the system to function at no increase in Contract Sum.

F. Work shall be of the best quality and competent and experienced electricians and subcontractors shall be employed and shall be under supervision.

G. The drawings and specifications are complimentary and what is called for (or shown) in either is required to be provided as if called for in both

1.2 REFERENCES

A. Definitions

1. Definitions of all terms shall be in accordance with applicable definitions of all applicable industry standards included but not limited to:
    a. AIA
    b. NFPA
    c. ICC
    d. IEEE

e. IES

f. NEMA

g. UL

h. BICSI

i. EIA/TIA

j. Local Jurisdiction requirements

B. Abbreviations and Acronyms for Electrical Terms and Units of Measure:

1. A: Ampere, unit of electrical current.

2. AC or ac: Alternating current.

3. AFCI: Arc-fault circuit interrupter.

4. AIC: Ampere interrupting capacity.

5. AL, Al, or ALUM: Aluminum.

6. ASD: Adjustable-speed drive.

7. ATS: Automatic transfer switch.

8. AWG: American wire gauge; see ASTM B258.

9. BIL: Basic impulse insulation level.

10. BIM: Building information modeling.

11. CAD: Computer-aided design or drafting.

12. CATV: Community antenna television.

13. CB: Circuit breaker.

14. CU or Cu: Copper.

15. dB: Decibel, a unitless logarithmic ratio of two electrical, acoustical, or optical power values.

16. dB(A-weighted) or dB(A): Decibel acoustical sound pressure level with A-weighting applied in accordance with IEC 61672-1.

17. dB(adjusted) or dBa: Decibel weighted absolute noise power with respect to 3.16 pW (minus 85 dBm).

18. dBm: Decibel absolute power with respect to 1 mW.

19. DC or dc: Direct current.

20. DDC: Direct digital control (HVAC).

21. EGC, GND: Equipment grounding conductor.
22. EMF: Electromotive force.
23. EMI: Electromagnetic interference.
24. EPM: Electrical preventive maintenance.
25. EPS: Emergency power supply.
26. EV: Electric vehicle.
27. fc: Footcandle, an internationally recognized unit of illuminance equal to one lumen per square foot or 10.76 lx. The simplified conversion 1 fc = 10 lx in the Specifications is common practice and considered adequate precision for building construction activities. When there are conflicts, lux is the primary unit; footcandle is specified for convenience.
28. FLC, FLA: Full-load current.
29. ft: Foot.
30. GEC: Grounding electrode conductor.
31. GFCI: Ground-fault circuit interrupter.
32. GFP: Ground-fault protection of equipment.
33. GND: Ground.
34. HDPE: High-density polyethylene.
35. HID: High-intensity discharge.
36. HP or hp: Horsepower.
37. HVAC: Heating, ventilating, and air conditioning.
38. Hz: Hertz.
39. IP: Ingress protection rating (enclosures); Internet protocol (communications).
40. IR: Infrared.
41. IS: Intrinsically safe.
42. kcmil or MCM: One thousand circular mils.
43. kV: Kilovolt.
44. kVA: Kilovolt-ampere.
45. kVAr or kVAR: Kilovolt-ampere reactive.
46. kW: Kilowatt.

47. kWh: Kilowatt-hour.
48. LAN: Local area network.
49. lb: Pound (weight).
50. LCD: Liquid-crystal display.
51. LED: Light-emitting diode.
52. LRC: Locked-rotor current.
53. LV: Low voltage.
54. MCC: Motor-control center.
55. MLO: Main lugs only.
56. MV: Medium voltage.
57. MVA: Megavolt-ampere.
58. mW: Milliwatt.
59. MW: Megawatt.
60. MWh: Megawatt-hour.
61. NC: Normally closed.
62. NIU: Network interface unit.
63. NO: Normally open.
64. PC: Personal computer.
65. PF or pf: Power factor.
66. PoE: Power over Ethernet.
67. PV: Photovoltaic.
68. PVC: Polyvinyl chloride.
69. RFI: (electrical) Radio-frequency interference; (contract) Request for interpretation.
70. RMS or rms: Root-mean-square.
71. RPM or rpm: Revolutions per minute.
72. SCR: Silicon-controlled rectifier.
73. SPD: Surge protective device.
74. TCP/IP: Transmission control protocol/Internet protocol.

75. TR: Tamper resistant.

76. TVSS: Transient voltage surge suppressor.

77. UL: (standards) Underwriters Laboratories, Inc.; (product categories) UL, LLC.

78. UPS: Uninterruptible power supply.

79. USB: Universal serial bus.

80. UV: Ultraviolet.

81. V: Volt, unit of electromotive force.

82. VA: Volt-ampere, unit of complex electrical power.

83. VAR: Volt-ampere reactive, unit of reactive electrical power.

84. VFC, VFD: Variable-frequency controller.

85. VPN: Virtual private network.

86. W: Watt, unit of real electrical power.

87. Wh: Watt-hour, unit of electrical energy usage.

88. WR: Weather resistant.

C. Abbreviations and Acronyms for Electrical Raceway Types:

1. EMT: Electrical metallic tubing.

2. ENT, Innerduct: Electrical nonmetallic tubing.

3. RMC, RGS: Electrical rigid metal conduit.

4. RGS-P: PVC-coated-steel electrical rigid metal conduit.

5. ERMC-SS: Stainless steel electrical rigid metal conduit.

6. FMC: Flexible metal conduit.

7. HDPE: HDPE underground conduit (thick wall).

8. IMC: Steel electrical intermediate metal conduit.

9. LFMC: Liquidtight flexible metal conduit.

10. PVC: Rigid PVC conduit.

D. Abbreviations and Acronyms for Electrical Single-Conductor and Multiple-Conductor Cable Types:

1. AC: Armored cable.

2. CATV: Coaxial general-purpose cable.

3. CL2: Class 2 cable.
4. CL3: Class 3 cable.
5. CM: Communications general-purpose cable.
6. FC: Flat cable, undercarpet cable.
7. MC: Metal-clad cable.
8. MV: Medium-voltage cable.
9. PV: Photovoltaic cable.
10. RHW: Thermoset rubber, moisture-resistant cable.
11. SE: Service-entrance cable.
12. THW: Thermoplastic, heat- and moisture-resistant cable.
13. THHN: Thermoplastic, heat-resistant cable with nylon jacket outer sheath.
14. THHW: Thermoplastic, heat- and moisture-resistant cable.
15. THWN: Thermoplastic, moisture- and heat-resistant cable with nylon jacket outer sheath.
16. TW: Thermoplastic, moisture-resistant cable.
17. XHHW: Cross-linked polyethylene, heat- and moisture-resistant cable.

1.3 CODES

A. Follow all relevant industry codes listed above. At no point shall contractor deviate from National or local codes. Specific codes as follows (local amendments not listed) but not limited to all codes adoped in local jurisdiction

1. National Electric Code – NFPA 70
2. IBC
3. IFC
4. NFPA 72
5. Energy Code

1.4 PERMITS AND INSPECTIONS

A. Obtain permits and pay fees required by governmental agencies having jurisdiction over this work. Arrange for inspections required during construction. On completion of work, furnish satisfactory evidence to show all work installed in accordance with codes.

1.5 CLEARANCES

A. Provide clearances and working clearances around all equipment as required by relevant codes including 110-26 of the NEC.

1.6 QUALITY ASSURANCE

A. Nothing in the Drawings or Specifications shall be construed to permit Work not conforming to applicable laws, ordinances, rules or regulations.

B. When Drawings or Specifications exceed requirements of applicable laws, ordinances, rules, or regulations, comply with documents establishing the more stringent requirements.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Ship equipment in its original package to prevent damage or entrance of foreign matter. Perform all handling and shipping in accordance with manufacturer's recommendations. Provide protective coverings during construction.

B. Identify materials and equipment delivered to the Site to permit check against approved materials list, and reviewed submittals.

C. No equipment that is not approved in submittals shall be installed.

1.8 MATERIAL AND EQUIPMENT ENVIRONMENT

A. All equipment and material shall be suitable for the environment of the installation, and the installation including equipment shall satisfy the governmental agencies having jurisdiction.

1.9 DRAWINGS AND SPECIFICATIONS

A. Specifications, with drawings, are intended to cover installation of all electrical equipment. Materials shown and called for on drawings, but not mentioned in specifications, or vice versa, necessary for proper completion and operation of equipment, shall be furnished the same as if called for in both.

B. Electrical drawings do not attempt to show complete details of project construction which affect electrical installations. Refer to architectural, structural and mechanical drawings for additional details which affect installation of this work.

1.10 COORDINATION

A. Coordinate arrangement, mounting, and support of electrical equipment:

1. To allow maximum possible headroom unless specific mounting heights that reduce headroom are indicated.

2. To provide for ease of disconnecting the equipment with minimum interference to other installations.

3. To allow right of way for piping and conduit installed at required slope.

4. So connecting raceways, cables, wireways, cable trays, and busways will be clear of obstructions and of the working and access space of other equipment.

B. Coordinate installation of required supporting devices and set sleeves in cast-in-place concrete, masonry walls, and other structural components as they are constructed.

C. Coordinate location of access panels and doors for electrical items that are behind finished surfaces or otherwise concealed. Access doors and panels are specified in Division 08 Section "Access Doors and Frames."

D. Before installation Contractor shall make proper provisions for electrical work and to avoid interferences with installation of other work. Any changes caused by neglect to do so shall be made at Contractor's expense.

E. Electrical drawings and specifications shall be compared with drawings and specifications of other trades and any discrepancies between them reported to the Architect prior to installation of work.

F. Coordinate and arrange work so there is no interference between wiring outlets, lighting fixtures, and raceways with sheet metal work, insert hangers, mechanical piping, and structural members.

1.11 CUTTING AND PATCHING

A. Do all cutting and patching for installation of the work. All cutting done carefully to prevent damage to work of other trades, and all patching done by mechanics skilled in the trade affected, and subject to approval by Architect. Provide all work per Division 01. Work shall include.

1. All openings for removed equipment shall be patched or entire system replaced. No openings shall remain at completion of work.

2. Exterior cutting and patching shall be done by qualified Contractors. Patching of asphalt and concrete shall be per Division 01 and approved by Civil Engineers and Architect. Grass and earth patching, seeding, and sod work shall be per Division 01 and approved by the Landscaper, Civil Engineer, and Architect. All backfill per Division 01.

3. Painting: All exposed conduit, boxes, surface metal raceway, enclosures, multi-outlet assemblies shall be painted to match wall color. Where exact color unknown, coordinate with Architect to obtain color. All items shall be painted regardless of whether wall, ceiling, floor finish is painted.

1.12 RUBBISN AND CLEANUP

A. Contractor shall promptly remove waste material and rubbish caused by workers.

B. At completion of work, clean all fixtures, electrical panel interiors, switchboards, distribution centers, and all other equipment installed.

1.13 SUBMITTALS

A. Provide general equipment and shop drawings for each section included in the project manual.

1. General:

a. Submittals shall be in accordance with requirements of Division 01 and as specified.

b. Forward all submittals to the Architect, together, at one time. Individual or incomplete submittals are not acceptable.

c. Organize submittals in same sequence as they appear in Specification Sections.

d. Identify each submittal item by reference to Specification Section paragraph in which item is specified, or Drawing and Detail number.

e. Identify each item by manufacturer, brand, trade name, number, size, rating, or whatever other data is necessary to properly identify and review materials and equipment. Words “as specified” are not sufficient identification.

2. Shop Drawings:

a. Show physical arrangement, construction details, finishes, materials used in fabrication, provisions for conduit entrance, access requirements for installation and maintenance, physical size, electrical characteristics, foundation and support details, and weights.

3. Substitutions

a. Any substitutions from specified equipment shall include formal substitution request form in the submittal.

1.14 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data:

1. Provide emergency operation, normal operation, and preventive maintenance manuals for each system, equipment, and device listed below:

2. Include the following information:

a. Manufacturer's operating specifications.

b. User's guides for software and hardware.

c. Schedule of maintenance material items recommended to be stored at Project site.

d. Detailed instructions covering operation under both normal and abnormal conditions.

e. Time-current curves for overcurrent protective devices and manufacturer's written instructions for testing and adjusting their settings.

f. List of load-current and overload-relay heaters with related motor nameplate data.

g. List of lamp types and photoelectric relays used on Project, with ANSI and manufacturers' codes.

h. Manufacturer's instructions for setting field-adjustable components.

i. Manufacturer's instructions for testing, adjusting, and reprogramming microprocessor controls.

j. EPSS: Manufacturer's system checklists, maintenance schedule, and maintenance log sheets in accordance with NFPA 110.

k. Exterior pole inspection and repair procedures.

3. Software and Firmware Operational Documentation: Provide software and firmware operational documentation, including the following:

a. Software operating and upgrade manuals.

b. Names, versions, and website addresses for locations of installed software.

c. Device address list.

d. Printout of software application and graphic screens.

e. Testing and adjusting of panic and emergency power features.

f. For lighting controls, include the following:

1) Adjustments of scene preset controls, adjustable fade rates, and fade overrides.

2) Operation of adjustable zone controls.

4. Software:

a. Provide Program Software Backup

b. Provide to Owner upgrades and unrestricted licenses for installed and backup software, including operating systems and programming tools required for operation and maintenance.

B. As- Built Drawings

1. Drawings shall be continuously maintained in the field by the Contractor. Drawings used for this purpose shall be the latest revision and shall be kept neat and clean.

2. Drawings shall include dimensions on all underground, feeder, and communications feeder conduit including location of pullboxes and handholes.

3. Drawing shall show all work changed from the original drawings

4. Deliver in Autocad or Revit, current format.

5. See Division 1 for additional requirements.

1.15 MOCKUPS

A. Provide mockups where requested of installations prior to implementing the work. Corrections shall be made based on owner. Architect, and engineer comments prior to proceeding with work.

B. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Owner specifically approves such deviations by Change Order.

1.16 UTILITY COORDINATION

A. Coordinate with serving utilities and provide all provisions required by the serving utility.

1. Serving power utility is Snohomish County PUD

PART 2 PRODUCTS

2.1 MATERIALS

A. Materials and Equipment General Requirements:

1. All items of materials in each category of equipment shall be of one manufacturer.

2. Groups of items having same or similar function shall be by single manufacturer to facilitate maintenance and service.

3. Compatible with space allocated. Modifications necessary to adjust items to space limitations shall be at Contractor's expense.

4. Conform with conditions shown and specified. Coordinate with other trades for best possible assembly of completed Work.

5. Install fully operating without objectionable noise or vibration.

B. Access Doors:

1. Furnish under this Division where shown, required by regulatory agencies, and for access to all concealed electrical items requiring access. Access doors shall be in accordance with requirements of Division 08. Doors in this Division, Division 08, and Division 15 shall be from the same manufacturer for identical appearance and keying. Furnish fire rated doors where required. Deliver access doors for installation under Division 08. Mark each access door to accurately establish its location.

C. Firestopping and Smokestopping:

1. General Penetrations

a. STI Firestop Spec Seal of appropriate type for installation

1) Provide firestopping where wiring, conduit, or cable tray penetrates fire wall or floor.

2) Provide smokestopping where wiring, conduit, or cable tray penetrates smoke barrier.

2. Outlet Boxes

a. STI Fire Stop SSP putty pads on all boxes in fire rated walls.

3. Conduits

a. Seal around conduits with STI firestop above or Provide STI EZ Path

b. EZ Path shall be sized to same size and capacity as conduits shown.

c. EZ path may be used anywhere instead of conduit.

d. All sleeves over 6 inch shall be EZ Path

2.2 SLEEVES FOR RACEWAYS AND CABLES

A. Steel Pipe Sleeves: ASTM A 53/A 53M, Type E, Grade B, Schedule 40, galvanized steel, plain ends. PVC 40 permitted where not passing through a structural opening.

B. Minimum Metal Thickness:

1. For sleeve cross-section rectangle perimeter less than 50 inches and no side more than 16 inches, thickness shall be 0.052 inch.

2. For sleeve cross-section rectangle perimeter equal to, or more than, 50 inches and 1 or more sides equal to, or more than, 16 inches, thickness shall be 0.138 inch.

2.3 SLEEVE SEALS

A. Description: Modular sealing device, designed for field assembly, to fill annular space between sleeve and raceway or cable.

1. Basis-of-Design Product: Subject to compliance with requirements, provide comparable product by one of the following:

a. Advance Products & Systems, Inc.

b. Calpico, Inc.

c. Metraflex Co.

d. Pipeline Seal and Insulator, Inc.

B. Sealing Elements: EPDM interlocking links shaped to fit surface of cable or conduit. Include type and number required for material and size of raceway or cable.

C. Pressure Plates: Plastic, Carbon steel. Include two for each sealing element.

D. Connecting Bolts and Nuts: Carbon steel with corrosion-resistant coating of length required to secure pressure plates to sealing elements. Include one for each sealing element.

2.4 GROUT

A. Nonmetallic, Shrinkage-Resistant Grout: ASTM C 1107, factory-packaged, nonmetallic aggregate grout, noncorrosive, nonstaining, mixed with water to consistency suitable for application and a 30-minute working time.

PART 3 EXECUTION

3.1 INSTALLATION OF WORK

A. Unless more stringent requirements are specified in the Contract Documents or manufacturers' written instructions, comply with NFPA 70 and NECA NEIS 1 for installation of Work specified in Division 26. Consult Architect for resolution of conflicting requirements.

B. Follow manufacturer’s directions in all cases where manufacturers of articles used furnish directions covering points not shown or specified.

C. Accurately set and level equipment with supports neatly placed and properly fastened. No allowance of any kind will be made for negligence on the part of the Contractor to foresee means of bringing in and installing equipment in position inside the building.

D. Measure indicated mounting heights to bottom of unit for suspended items and to center of unit for wall-mounting items.

E. Headroom Maintenance: If mounting heights or other location criteria are not indicated, arrange and install components and equipment to provide maximum possible headroom consistent with these requirements.

F. Equipment: Install to facilitate service, maintenance, and repair or replacement of components of both electrical equipment and other nearby installations. Connect in such a way as to facilitate future disconnecting with minimum interference with other items in the vicinity.

G. Right of Way: Give to piping systems installed at a required slope.

3.2 CONDUIT SYSTEM:

A. Work into complete integrated arrangement with like elements. Make Work neat and finished appearing.

B. Run concealed, except where shown otherwise. Routing for exposed conduit and wiring, not indicated clearly on plan, to be approved by Architect, Owner and Engineer team prior to install. Where exposed run parallel with walls or structural elements with vertical runs plumb, horizontal runs level and close to ceiling, concealing conduit as much as possible; groups racked together neatly with bends parallel and uniformly spaced.

C. Flash and counterflash all penetrations through roof in accordance with requirements of Division 07 and as shown.

D. Provide hangers, supports, anchors and chases as required for installation of Electrical Work.

E. Excavating and Backfilling: In accordance with requirements of Division 02. Provide all necessary shoring, sheeting, and pumping as part of Work of this Division.

F. Concrete: In accordance with requirements of Division 3.

G. Interface with other products:

1. For purposes of clarity and legibility, Drawings are essentially diagrammatic to the extent that many offsets, bends, special fittings, and exact locations of items are not indicated, unless specifically dimensioned. Exact routing of wiring, and locations of outlets, panels, and other items shall be governed by structural conditions or obstructions. Contractor shall make use of data in Contract Documents. In addition,

Architect reserves right, at no increase in Contract Sum, to make any reasonable change in location of electrical items exposed at ceilings or on partitions to group them in orderly relationships or to increase their utility. Verify requirements in this regard prior to roughing-in.

2. Take dimensions, location of doors, partitions, and similar features from Architectural Drawings. Verify at the Site under this Division. Consult Architectural Drawings for exact location of outlets, and other items to center with architectural features. Coordinate location of all ceiling mounted items with Division 09.

3.3 FIELD QUALITY CONTROL

A. Test panels and circuits for grounds and shorts with mains disconnected from feeders, branch circuits connected, and circuit breakers closed, all fixtures in place, permanently connected, grounding jumper to neutral lifted, and with all wall switches closed.

B. Contractor shall engage qualified testing agencies and contractors as defined in specification sections included in this manual

C. Run Meggar test on all feeders

D. Run meggar test on all branch circuits requested.

3.4 CLEANING

A. Properly prepare Work under this Division to be finish painted under Division 01.

3.5 EQUIPMENT IDENTIFICATION

A. Properly identify panelboards, circuit breakers in panelboards, disconnect switches, starters, and other apparatus used for operation or control of circuits, appliances or equipment.

3.6 SLEEVE INSTALLATION FOR ELECTRICAL PENETRATIONS

A. Electrical penetrations occur when raceways, cables, wireways, cable trays, or busways penetrate concrete slabs, concrete or masonry walls, or fire-rated floor and wall assemblies.

B. Concrete Slabs and Walls: Install sleeves for penetrations unless core-drilled holes or formed openings are used. Install sleeves during erection of slabs and walls.

C. Use pipe sleeves unless penetration arrangement requires rectangular sleeved opening.

D. Fire-Rated Assemblies: Install sleeves for penetrations of fire-rated floor and wall assemblies unless openings compatible with firestop system used are fabricated during construction of floor or wall.

E. Cut sleeves to length for mounting flush with both surfaces of walls.

F. Extend sleeves installed in floors 2 inches above finished floor level.

G. Size pipe sleeves to provide 1/4-inch annular clear space between sleeve and raceway or cable, unless indicated otherwise.

H. Seal space outside of sleeves with grout for penetrations of concrete and masonry

I. Promptly pack grout solidly between sleeve and wall so no voids remain. Tool exposed surfaces smooth; protect grout while curing.

J. Interior Penetrations of Non-Fire-Rated Walls and Floors: Seal annular space between sleeve and raceway or cable, using joint sealant appropriate for size, depth, and location of joint. Comply with requirements in Division 07 Section "Joint Sealants.".

K. Fire-Rated-Assembly Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at raceway and cable penetrations. Install sleeves and seal raceway and cable penetration sleeves with firestop materials. Comply with requirements in Division 07 Section "Penetration Firestopping."

L. Roof-Penetration Sleeves: Seal penetration of individual raceways and cables with flexible boot-type flashing units applied in coordination with roofing work.

M. Aboveground, Exterior-Wall Penetrations: Seal penetrations using steel pipe sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.

N. Underground, Exterior-Wall Penetrations: Install cast-iron pipe sleeves. Size sleeves to allow for 1-inch annular clear space between raceway or cable and sleeve for installing mechanical sleeve seals.

3.7 SLEEVE-SEAL INSTALLATION

A. Install to seal exterior wall penetrations.

B. Use type and number of sealing elements recommended by manufacturer for raceway or cable material and size. Position raceway or cable in center of sleeve. Assemble mechanical sleeve seals and install in annular space between raceway or cable and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

3.8 FIRESTOPPING

A. Apply firestopping to penetrations of fire-rated floor and wall assemblies for electrical installations to restore original fire-resistance rating of assembly. Firestopping materials and installation requirements are specified in Division 07 Section "Penetration Firestopping."

3.9 SYSTEM STARTUP

A. Provide startup with manufacturer’s representatives on all systems requested by the owner. Provide list to owner 1 month prior to startup for owner to advise on startup training required.

3.10 CLOSEOUT ACTIVITIES

A. Demonstration: Demonstrate to Owner's maintenance and clerical personnel and building occupants how to operate the following systems and equipment as defined in specifications as requested by the owner.:

B. Provide video recordings of demonstrations to Owner and provided minimum 3 copies to owner.

END OF SECTION

SECTION 26 05 19 – LOW-VOLTAGE CONDUCTORS AND CABLES

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:

1. Copper building wire.
2. Aluminum building wire.
3. Metal-clad cable, Type MC.
4. Connectors and splices.

1.2 SUBMITTALS

A. Product Data:

1. Copper building wire.
2. Aluminum building wire.
3. Metal-clad cable, Type MC.
4. Connectors and splices.

PART 2 PRODUCTS

2.1 CONDUCTORS AND CABLES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Alcan Products Corporation; Alcan Cable Division.
2. American Insulated Wire Corp.; a Leviton Company.
3. General Cable Corporation.
4. Senator Wire & Cable Company.
5. Southwire Company.

B. Wire, Copper Conductors: Building wire will be 600V, Copper, TWHN unless noted otherwise

1. Underground wire may be RHW subject to approval from the engineer.
2. Aluminum wire is permitted for feeders sizes #2 when terminated with high pressure terminations equal to Burndy Hy-Lug or Hy-Plug
   a. Conduit size shall be increased to allow for aluminum wire
   b. Aluminum is based on THWN but XHHW is allowed if conduit size is increased.
   c. Stabloy Aluminum, complying with ASTM B800 and ASTM B801
3. Standards:
   a. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and use.

b. Conductor and Cable Marking: Comply with wire and cable marking according to UL's "Wire and Cable Marking and Application Guide."

4. Conductor Insulation:

5. Type THHN and Type THWN-2. Comply with UL 83.

2.2 METAL-CLAD CABLE, TYPE MC

A. See section 260533 for instances when MC Cable is allowed instead of conduit and building wire specified above. MC Cable shall not be installed anywhere not specifically listed.

B. Description: A factory assembly of one or more current-carrying insulated conductors in an overall metallic sheath.

C. Standards:

1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and use.

2. Comply with UL 1569.

D. Circuits:

1. Single circuit and multicircuit with color-coded conductors.

E. Conductors: Copper, complying with ASTM B3 for bare annealed copper and with ASTM B8 for stranded conductors

F. Ground Conductor: [Insulated]

G. Conductor Insulation:

1. Type TFN/THHN/THWN-2. Comply with UL 83.

H. Armor: Steel preferred, Aluminum acceptable, interlocked.

I. Jacket: PVC applied over armor.

2.3 CONNECTORS AND SPLICES

A. Splices and Terminations

1. 600 Volt

a. Splices: Solderless type only. Preinsulated "twist-on" type permitted on solid conductor size number 10 and smaller. Hydraulic compression long barrel type with application preformed insulated cover, heat shrinkable tubing or plastic insulated tape for all stranded conductors. For stranded conductors provide terminations designed for use with stranded conductors.

b. Terminations: 250 kcmil and above - two hole long barrel compression lugs. Below 250 kcmil - single hole compression lug. Conductors No. 12 and smaller: provide eye or forked tongue compression lugs at bolted or screw connections - no lugs required for compression style terminal blocks.

c. Cable Ties: Nylon or accepted, locking type. Use a torque limiting tool for installation of ties.

2. Control Cable Splices and Terminations

a. Splices: Preinsulated crimp pigtail or butt splice connectors.

b. Terminations: Locking spade, insulated, compression lugs.

B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. AFC Cable Systems, Inc.

2. Hubbell Power Systems, Inc.

3. O-Z/Gedney; EGS Electrical Group LLC.

4. 3M; Electrical Products Division.

5. Tyco Electronics Corp.

C. Description: Factory-fabricated connectors and splices of size, ampacity rating, material, type, and class for application and service indicated.

PART 3 EXECUTION

3.1 CONDUCTOR MATERIAL APPLICATIONS

A. Type THHN-THWN, single conductors in raceway.

B. Branch Circuits: Type THHN-THWN, single conductors in raceway.

C. Class 1 Control Circuits: Type THHN-THWN, in raceway.

D. Class 2 Control and Low Voltage Circuits: Type THHN-THWN, in raceway, or as required by manufacturer. Plenum rated where required. Cable shall not be installed in slab or under ground. All circuits shall be installed in raceway when installed in walls and non-accessible spaces.

3.2 INSTALLATION, GENERAL

A. Conceal cables in raceway in finished walls, ceilings, and floors unless otherwise indicated.

B. Complete raceway installation between conductor and cable termination points in accordance with Section 260533 prior to pulling conductors and cables.

C. Use manufacturer-approved pulling compound or lubricant where necessary; compound used must not deteriorate conductor or insulation. Do not exceed manufacturer's recommended maximum pulling tensions and sidewall pressure values.

D. Use pulling means, including fish tape, cable, rope, and basket-weave wire/cable grips, that will not damage cables or raceway.

E. Install exposed cables parallel and perpendicular to surfaces of exposed structural members, and follow surface contours where possible.

F. Support cables according to Section 260529 "Hangers and Supports for Electrical Systems."

3.3 CONNECTIONS

A. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B.

B. Make splices, terminations, and taps that are compatible with conductor material and that possess equivalent or better mechanical strength and insulation ratings than unspliced conductors.

1. Use oxide inhibitor in each splice, termination, and tap for aluminum conductors.

C. Wiring at Outlets: Install conductor at each outlet, with at least [6 inch (150 mm)] [12 inch (300 mm)] of slack.

3.4 BRANCH WIRING

A. General: Complete system of conduit required to all light outlets, receptacles, switches, etc. as shown. Conduit size as shown on drawings, except where no size is shown, conduit shall be sized per National Electrical Code. No conduit shall carry more than 8 conductors. All exposed switches, receptacles or outlet boxes for other purposes, install die cast boxes, except where specifically noted otherwise. Feeder cables shall have each phase identified according to the established code.

B. Coding: Branch circuit color code shall be: For 120/208 V. Black – Phase A, Red – Phase B, Blue – Phase C, White – Neutral, Green – Ground, Isolated Ground – Green with Yellow stripe, Purple "Travellers" on 3 and 4 way switching. For 277/480V. Brown (A), Orange (B), Yellow (C), and Gray neutral. Where colors are not available (No. 4 and larger) all terminals shall be coded, both on the wire and on the terminal. Phase and neutral wires shall appear in the same position and rotation at all appearances.

3.5 EQUIPMENT WIRING

A. General: Wiring connections for power and control for all equipment shall be complete including disconnect switches and controls unless otherwise specified or noted on drawings.

B. Control wiring for mechanical systems installed under this section of specifications shall be in accordance with mechanical drawings and specifications.

3.6 FIELD QUALITY CONTROL

A. Tests and Inspections:

1. After installing conductors and cables and before electrical circuitry has been energized, test service entrance and feeder conductors for compliance with requirements.

2. Perform each of the following visual and electrical tests:

a. Inspect exposed sections of conductor and cable for physical damage and correct connection according to the single-line diagram.

b. Test bolted connections for high resistance using one of the following:

1) A low-resistance ohmmeter.

2) Calibrated torque wrench.

3) Thermographic survey.

c. Inspect compression-applied connectors for correct cable match and indentation.

d. Inspect for correct identification.

e. Inspect cable jacket and condition.

f. Insulation-resistance test on each conductor for ground and adjacent conductors. Apply a potential of 500 V(dc) for 300 V rated cable and 1000 V(dc) for 600 V rated cable for a one-minute duration.

g. Continuity test on each conductor and cable.

h. Uniform resistance of parallel conductors.

B. Cables will be considered defective if they do not pass tests and inspections.

C. Prepare test and inspection reports to record the following:

1. Procedures used.

2. Results that comply with requirements.

3. Results that do not comply with requirements, and corrective action taken to achieve compliance with requirements.

END OF SECTION

SECTION 26 05 26 – GROUNDING AND BONDING

PART 1 GENERAL

1.1 SUMMARY

A. This section includes methods and materials for grounding

1.2 SUBMITTALS

A. Product Data:

1. For each type of product indicated.

PART 2 PRODUCTS

2.1 GROUNDING AND BONDING CONDUCTORS

A. Grounding Conductors:

1. General Characteristics: 600 V, THHN/THWN-2, copper wire or cable, green color, in accordance with Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

2. Isolated Equipment Grounding Conductor: same except green with continuous yellow stripe.

B. Bare Copper Grounding and Bonding Conductor:

a. Soft or Annealed Copper Wire: ASTM B3

b. Concentric-Lay Stranded Copper Conductor: ASTM B8.

c. Tin-Coated Soft or Annealed Copper Wire: ASTM B33.

d. 19-Wire Combination Unilay-Stranded Copper Conductor: ASTM B787/B787M.

2.2 GROUNDING AND BONDING CLAMPS

A. Description: Clamps suitable for attachment of grounding and bonding conductors to grounding electrodes, pipes, tubing, and rebar. Grounding and bonding clamps specified in this article are also suitable for use with communications applications.

B. Source Limitations: Obtain products from single manufacturer.

C. Performance Criteria:

1. Regulatory Requirements:

a. Listed and labeled in accordance with NFPA 70, by qualified electrical testing laboratory recognized by authorities having jurisdiction, and marked for intended location and application.

2. Listing Criteria:

a. Grounding and Bonding Equipment: UL CCN KDER; including UL 467.

b. Grounding and Bonding Equipment for Communications: UL CCN KDSH; including UL 467.

D. Exothermically Welded Connection

1. General Characteristics: Exothermic-welding kits of types recommended by kit manufacturer for materials being joined and installation conditions.

2.3 GROUNDING AND BONDING BUSHINGS

A. Description: Bonding bushings connect conduit fittings, tubing fittings, threaded metal conduit, and unthreaded metal conduit to metal boxes and equipment enclosures, and have one or more bonding screws intended to provide electrical continuity between bushing and enclosure. Grounding bushings have provision for connection of bonding or grounding conductor and may or may not also have bonding screws.

B. Performance Criteria:

1. Regulatory Requirements:

a. Listed and labeled in accordance with NFPA 70, by qualified electrical testing laboratory recognized by authorities having jurisdiction, and marked for intended location and application.

2. Listing Criteria:

a. Grounding and Bonding Equipment: UL CCN KDER; including UL 467.

2.4 GROUNDING AND BONDING CONNECTORS

A. Performance Criteria:

1. Regulatory Requirements:

a. Listed and labeled in accordance with NFPA 70, by qualified electrical testing laboratory recognized by authorities having jurisdiction, and marked for intended location and application.

2. Listing Criteria:

a. Grounding and Bonding Equipment: UL CCN KDER; including UL 467.

b. Grounding and Bonding Equipment for Communications: UL CCN KDSH; including UL 467.

2.5 GROUNDING (EARTHING) ELECTRODES

A. Description: Grounding electrodes include rod electrodes, ring electrodes, metal underground water pipes, metal building frames, concrete-encased electrodes, and pipe and plate electrodes.

B. Performance Criteria:

1. Regulatory Requirements:

a. Listed and labeled in accordance with NFPA 70, by qualified electrical testing laboratory recognized by authorities having jurisdiction, and marked for intended location and application.

2. Listing Criteria:

a. Grounding and Bonding Equipment: UL CCN KDER; including UL 467.

2.6 GROUND BUS

A. Copper, 0.25 inch thick, minimum 16” x 4”, pre-drilled, 32 hole. Burndy BBB series or equal

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine facility's grounding electrode system and equipment grounding for compliance with requirements for maximum ground-resistance level and other conditions affecting performance of grounding and bonding of electrical system.

3.2 BUSBARS

A. Grounding Bus: Install in electrical equipment rooms, in rooms housing service equipment, all MDF and IDF rooms and elsewhere as indicated.

1. Install bus horizontally, on insulated spacers 2 inch (50 mm) minimum from wall, 6 inch (150 mm) above finished floor unless otherwise indicated.

3.3 SELECTION OF CONNECTORS

A. Conductor Terminations and Connections:

1. Pipe and Equipment Grounding Conductor Terminations: Bolted connectors.

2. Underground Connections: Welded connectors except at test wells and as otherwise indicated.

3. Connections to Ground Rods at Test Wells: Bolted connectors.

4. Connections to Structural Steel: Welded connectors.

3.4 INSTALLATION

A. Comply with manufacturer's published instructions.

B. Special Techniques:

1. Conductors:

a. Route along shortest and straightest paths possible unless otherwise indicated or required by Code. Avoid obstructing access or placing conductors where they may be subjected to strain, impact, or damage.

2. Connections: Make connections so possibility of galvanic action or electrolysis is minimized. Select connectors, connection hardware, conductors, and connection methods so metals in direct contact are galvanically compatible.

a. Use electroplated or hot-tin-coated materials to ensure high conductivity and to make contact points closer in order of galvanic series.

b. Make connections with clean, bare metal at points of contact.

c. Make aluminum-to-steel connections with stainless steel separators and mechanical clamps.

d. Make aluminum-to-galvanized-steel connections with tin-plated copper jumpers and mechanical clamps.

e. Coat and seal connections having dissimilar metals with inert material to prevent future penetration of moisture to contact surfaces.

f. Bonding Straps and Jumpers: Install in locations accessible for inspection and maintenance except where routed through short lengths of conduit.

1) Bonding to Structure: Bond straps directly to basic structure, taking care not to penetrate adjacent parts.

2) Bonding to Equipment Mounted on Vibration Isolation Hangers and Supports: Install bonding so vibration is not transmitted to rigidly mounted equipment.

3) Use exothermic-welded connectors for outdoor locations and UFER; if disconnect-type connection is required, use bolted clamp.

g. Grounding and Bonding for Piping:

1) Metal Water Service Pipe: Install insulated copper grounding conductors, in conduit, from building's main service equipment, or grounding bus, to main metal water service entrances to building. Connect grounding conductors to main metal water service pipes; use bolted clamp connector or bolt lug-type connector to pipe flange by using one of lug bolts of flange. Where dielectric main water fitting is installed, connect grounding conductor on street side of fitting. Bond metal grounding conductor conduit or sleeve to conductor at each end.

2) Water Meter Piping: Use braided-type bonding jumpers to electrically bypass water meters. Connect to pipe with bolted connector.

3) Bond each aboveground portion of gas piping system downstream from equipment shutoff valve.

h. Bonding Interior Metal Ducts: Bond metal air ducts to equipment grounding conductors of associated fans, blowers, electric heaters, and air cleaners. Install bonding jumper to bond across flexible duct connections to achieve continuity.

i. Grounding for Steel Building Structure: Bond to common ground point. Where not common steel ground point is provided install driven ground rod at base of each corner column and at intermediate exterior columns at distances not more than 60 ft (18 m) apart.

3. Electrodes:

a. Ground Rods: Drive rods until tops are 2 inch (50 mm) below finished floor or final grade unless otherwise indicated.

1) Interconnect ground rods with grounding electrode conductor below grade and as otherwise indicated. Make connections without exposing steel or damaging coating if any.

2) Use exothermic welds for below-grade connections.

b. For grounding electrode system, install at least four rods spaced at least one-rod length from each other and located at least same distance from other grounding electrodes, and connect to service grounding electrode conductor.

c. Concrete-Encased Electrode (Ufer Ground):

1) Fabricate in accordance with NFPA 70; use minimum of 20 ft (6 m) of bare copper conductor not smaller than #3/0 Copper

a) If concrete foundation is less than 20 ft (6 m) long, coil excess conductor within base of foundation.

b) Bond grounding conductor to reinforcing steel in at least four locations and to anchor bolts. Extend grounding conductor below grade and connect to building's grounding grid or to grounding electrode external to concrete.

d. Fabricate in accordance with NFPA 70; using electrically conductive coated steel reinforcing bars or rods, at least 20 ft (6.0 m) long. If reinforcing is in multiple pieces, connect together by usual steel tie wires or exothermic welding to create required length.

4. Grounding at Service:

a. Equipment grounding conductors and grounding electrode conductors must be connected to ground bus. Install main bonding jumper between neutral and ground buses.

5. Grounding Separately Derived Systems:

    a. Bond to structural steel, main waterpipe within five feet of waterpipe entry to building, or building grounding electrode.

6. Grounding Underground Distribution System Components:

    a. Duct-Bank Grounding Conductor: Bury 12 inch (300 mm) above duct bank when indicated as part of duct-bank installation.

        1) Comply with IEEE C2 grounding requirements.

    b. Grounding Manholes and Handholes: Install driven ground rod through manhole or handhole floor, close to wall, and set rod depth so 4 inch (100 mm) will extend above finished floor. If necessary, install ground rod before manhole is placed and provide 1/0 AWG bare, tinned-copper conductor from ground rod into manhole through waterproof sleeve in manhole wall. Protect ground rods passing through concrete floor with double wrapping of pressure-sensitive insulating tape or heat-shrunk insulating sleeve from 2 inch (50 mm) above to 6 inch (150 mm) below concrete. Seal floor opening with waterproof, nonshrink grout.

    c. Grounding Connections to Manhole Components: Bond exposed-metal parts such as inserts, cable racks, pulling irons, ladders, and cable shields within each manhole or handhole, to ground rod or grounding conductor. Make connections with 4 AWG minimum, stranded, hard-drawn copper bonding conductor. Train conductors level or plumb around corners and fasten to manhole walls. Connect to cable armor and cable shields in accordance with manufacturer's published instructions with splicing and termination kits.

    d. Pad-Mounted Transformers and Switches when owner provided: Install two ground rods and ring electrode around pad. Ground pad-mounted equipment and noncurrent-carrying metal items associated with substations by connecting them to underground cable and grounding electrodes. Install tinned-copper conductor not less than 2 AWG for ring electrode and for taps to equipment grounding terminals. Bury ring electrode not less than 6 inch (150 mm) from foundation.

7. Equipment Grounding:

    a. Install insulated equipment grounding conductors with all feeders and branch circuits.

    b. Install insulated equipment grounding conductors with the following items, in addition to those required by NFPA 70:

        1) Feeders and branch circuits.

        2) Lighting circuits.

        3) Receptacle circuits.

        4) Single-phase motor and appliance branch circuits.

        5) Three-phase motor and appliance branch circuits.

        6) Flexible raceway runs.

        7) Armored and metal-clad cable runs.

    c. Air-Duct Equipment Circuits: Install insulated equipment grounding conductor to duct-mounted electrical devices operating at 120 V and more, including air cleaners, heaters, dampers, humidifiers, and other duct electrical equipment. Bond conductor to each unit and to air duct and connected metallic piping.

d. Water Heater, Heat-Tracing, and Antifrost Heating Cables: Install separate insulated equipment grounding conductor to each electric water heater and heat-tracing cable. Bond conductor to heater units, piping, connected equipment, and components.

e. Isolated Grounding Receptacle Circuits: Install insulated equipment grounding conductor connected to receptacle grounding terminal. Isolate conductor from raceway and from panelboard grounding terminals. Terminate at equipment grounding conductor terminal of applicable derived system or service unless otherwise indicated.

f. Isolated Equipment Enclosure Circuits: For designated equipment supplied by branch circuit or feeder, isolate equipment enclosure from supply circuit raceway with nonmetallic raceway fitting listed for the purpose. Install fitting where raceway enters enclosure, and install separate insulated equipment grounding conductor. Isolate conductor from raceway and from panelboard grounding terminals. Terminate at equipment grounding conductor terminal of applicable derived system or service unless otherwise indicated.

g. Metallic Fences: Comply with requirements of IEEE C2.

3.5 FIELD QUALITY CONTROL

A. Tests and Inspections:

1. After installing grounding system but before permanent electrical circuits have been energized, test for compliance with requirements.

2. Inspect physical and mechanical condition. Verify tightness of accessible, bolted, electrical connections with calibrated torque wrench in accordance with manufacturer's published instructions.

B. After installation, protect grounding and bonding cables and equipment from construction activities. Remove and replace items that are contaminated, defaced, damaged, or otherwise caused to be unfit for use prior to acceptance by Owner.

END OF SECTION

SECTION 26 05 29 – HANGERS AND SUPPORTS

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:

1. Support, anchorage, and attachment components.

2. Fabricated metal equipment support assemblies.

1.2 SUBMITTALS

A. Product Data:

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for the following:

a. Slotted support systems, hardware, and accessories.

b. Clamps.

c. Hangers.

d. Sockets.

e. Eye nuts.

f. Fasteners.

g. Anchors.

h. Saddles.

i. Brackets.

j. Trapeze

1.3 QUALITY ASSURANCE

A. Comply with NFPA 70.

1.4 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

B. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Division 07 Section "Roof Accessories."

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Delegated Design: Design supports for multiple raceways, including comprehensive structural analysis provided by the manufacturer of support equipment. Where not available engage a qualified structural professional engineer to design hanger and support system.

B. Design supports for multiple raceways capable of supporting combined weight of supported systems and its contents.

C. Design equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.

D. Rated Strength: Adequate in tension, shear, and pullout force to resist maximum loads calculated or imposed for this Project, with a minimum structural safety factor of five times the applied force.

E. All supports shall comply with IBC, Washington Seismic Zone and IBC Standards

2.2 SUPPORT, ANCHORAGE, AND ATTACHMENT COMPONENTS

A. Steel Slotted Support Systems: Preformed steel channels and angles with minimum 13/32 inch (10 mm) diameter holes at a maximum of 8 inch (200 mm) on center in at least one surface.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. Allied Tube & Conduit.

b. Cooper B-Line, Inc.; a division of Cooper Industries.

c. ERICO International Corporation.

d. GS Metals Corp.

e. Thomas & Betts Corporation.

f. Unistrut; Tyco International, Ltd.

g. Wesanco, Inc.

2. Standard: Comply with MFMA-4 factory-fabricated components for field assembly.

3. Material for Channel, Fittings, and Accessories: Hot dipped galvanized steel unless stainless steel specified.

4. Channel Width: Selected for applicable load criteria

5. Metallic Coatings: Hot-dip galvanized after fabrication and applied according to MFMA-4.

6. Nonmetallic Coatings: Manufacturer's standard PVC, polyurethane, or polyester coating applied according to MFMA-4.

7. Painted Coatings: Manufacturer's standard painted coating applied according to MFMA-4.

8. Protect finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

B. Nonmetallic and Aluminum Slotted Support Systems: not permitted

C. Conduit and Cable Support Devices: Steel hangers, clamps, and associated fittings, designed for types and sizes of raceway or cable to be supported.

D. Support for Conductors in Vertical Conduit: Factory-fabricated assembly consisting of threaded body and insulating wedging plug or plugs for nonarmored electrical conductors or cables in riser conduits. Plugs must have number, size, and shape of conductor gripping pieces as required to suit individual conductors or cables supported. Body must be made of malleable iron.

E. Structural Steel for Fabricated Supports and Restraints: ASTM A36/A36M steel plates, shapes, and bars; black and galvanized.

F. Mounting, Anchoring, and Attachment Components: Items for fastening electrical items or their supports to building surfaces include the following:

1. Powder-Actuated Fasteners: Threaded-steel stud, for use in hardened portland cement concrete, steel, or wood, with tension, shear, and pullout capacities appropriate for supported loads and building materials where used.

2. Mechanical-Expansion Anchors: Insert-wedge-type, [zinc-coated] [stainless] steel, for use in hardened portland cement concrete, with tension, shear, and pullout capacities appropriate for supported loads and building materials where used.

3. Concrete Inserts: Steel or malleable-iron, slotted support system units are similar to MSS Type 18 units and comply with MFMA-4 or MSS SP-58.

4. Clamps for Attachment to Steel Structural Elements: MSS SP-58 units are suitable for attached structural element.

5. Through Bolts: Structural type, hex head, and high strength. Comply with ASTM F3125/F3125M, Grade A325 (Grade A325M).

6. Toggle Bolts:Steel springhead type.

7. Hanger Rods: Threaded steel.

2.3 FABRICATED METAL EQUIPMENT SUPPORT ASSEMBLIES

A. Description: Welded or bolted structural-steel shapes, shop or field fabricated to fit dimensions of supported equipment.

B. Materials: Comply with requirements in Division 5 Section "Metal Fabrications" for steel shapes and plates.

PART 3 EXECUTION

3.1 SELECTION

A. Comply with the following standards for selection and installation of hangers and supports, except where requirements on Drawings or in this Section are stricter:

1. NECA `

2. NECA NEIS 101

3. NECA NEIS 105.

B. Provide vibration and seismic controls with hangers and supports in accordance with requirements specified in Section 260548

C. Maximum Support Spacing and Minimum Hanger Rod Size for Raceways: Space supports for EMT, IMC, and ERMC as required by NFPA 70. Minimum rod size must be 1/4 inch (6 mm) in diameter.

D. Multiple Raceways or Cables: Install trapeze-type supports fabricated with steel slotted support system, sized so capacity can be increased by at least 25percent in future without exceeding specified design load limits.

1. Secure raceways and cables to these supports with two-bolt conduit clamps.

E. Spring-steel clamps designed for supporting single conduits without bolts may be used for 1-1/2 inch (38 mm) and smaller raceways serving branch circuits and communication systems above suspended ceilings, and for fastening raceways to trapeze supports.

3.2 INSTALLATION OF SUPPORTS

A. Comply with NECA NEIS 101 for installation requirements except as specified in this article.

B. Raceway Support Methods: In addition to methods described in NECA NEIS 1, EMT, IMC and RMC may be supported by openings through structure members, in accordance with NFPA 70.

C. Strength of Support Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry present and future static loads within specified loading limits. Minimum static design load used for strength determination must be weight of supported components plus 200 lb (90 kg).

D. Mounting and Anchorage of Surface-Mounted Equipment and Components: Anchor and fasten electrical items and their supports to building structural elements by the following methods unless otherwise indicated by code:

1. To Wood: Fasten with lag screws or through bolts.

2. To New Concrete: Bolt to concrete inserts.

3. To Masonry: Approved toggle-type bolts on hollow masonry units and expansion anchor fasteners on solid masonry units.

4. To Existing Concrete: Expansion anchor fasteners.

5. Instead of expansion anchors, powder-actuated driven threaded studs provided with lock washers and nuts may be used in existing standard-weight concrete 4 inch (100 mm) thick or greater. Do not use for anchorage to lightweight-aggregate concrete or for slabs less than 4 inch (100 mm) thick.

6. To Steel: Welded threaded studs complying with AWS D1.1/D1.1M, with lock washers and nuts

7. To Light Steel: Sheet metal screws.

8. Items Mounted on Hollow Walls and Nonstructural Building Surfaces: Mount cabinets, panelboards, disconnect switches, control enclosures, pull and junction boxes, transformers, and other devices on slotted-channel racks attached to substrate by means that comply with seismic-restraint strength and anchorage requirements.

E. Drill holes for expansion anchors in concrete at locations and to depths that avoid the need for reinforcing bars.

3.3 INSTALLATION OF FABRICATED METAL SUPPORTS

A. Comply with installation requirements in Division 6 "Metal Fabrications" for site-fabricated metal supports.

B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor electrical materials and equipment.

C. Field Welding: Comply with AWS D1.1/D1.1M. Submit welding certificates.

3.4 CONCRETE BASES

A. Provide concrete bases under Switchboards, Generators, Floor Mounted Distribution Panels, and transformers as well as where noted on the drawings.

B. Construct concrete bases of dimensions indicated, but not less than 4 inch (100 mm) larger in both directions than supported unit, and so anchors will be a minimum of 10 bolt diameters from edge of the base.

C. Use 3000 psi (20.7 MPa), 28-day compressive-strength concrete. Concrete materials, reinforcement, and placement requirements are specified in Section 033000 "Cast-in-Place Concrete."

D. Anchor equipment to concrete base as follows:

1. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

2. Install anchor bolts to elevations required for proper attachment to supported equipment.

3. Install anchor bolts according to anchor-bolt manufacturer's written instructions.

3.5 PAINTING

A. Touchup:

1. Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.

a. Apply paint by brush or spray to provide minimum dry film thickness of 2.0 mils (0.05 mm).

B. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A780.

END OF SECTION

SECTION 26 05 33 – RACEWAY AND BOXES

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes raceways, fittings, boxes, enclosures, and cabinets for electrical wiring.

1.2 DEFINITIONS

A. EMT: Electrical metallic tubing.

B. ENT: Electrical nonmetallic tubing.

C. FMC: Flexible metal conduit.

D. HDPE: High Density Polyethlyene

E. IMC: Intermediate metal conduit.

F. LFMC: Liquidtight flexible metal conduit.

G. LFNC: Liquidtight flexible nonmetallic conduit.

H. RMC: Rigid Galvanized Steel

I. RNC: Rigid nonmetallic conduit.

J. RGS: Rigid galvanized steel

K. PVC: Polyvinyl Chloride

1.3 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. Comply with NFPA 70.

1.4 SUBMITTALS

A. Product Data: For the following:

1. Conduit, Raceways, and Boxes
2. Wireways and auxiliary gutters.
3. Surface metal raceways.
4. Floor boxes.
5. Cabinets and cutout boxes.

PART 2 PRODUCTS

2.1 METALLIC RACEWYAS

A. EMT

1. Performance Criteria:

    a. Regulatory Requirements: Listed and labeled in accordance with NFPA 70 and marked for intended location and use.

    b. General Characteristics: UL 797 and UL Category Control Number FJMX.

    c. Hot dipped galvanized inside and outside

2. Steel Electrical Metal Tubing (EMT) and Elbows:

    a. Material: Steel.

3. Minimum size ½”

B. RMC (Rigid Galvanized Steel)

1. Performance Criteria:

    a. Regulatory Requirements: Listed and labeled in accordance with NFPA 70 and marked for intended location and use.

    b. General Characteristics: UL 6 and UL Category Control Number DYIX.

2. Galvanized-Steel Electrical Rigid Metal Conduit, Elbows, Couplings, and Nipples:

    a. Exterior Coating: Zinc.

    b. Interior Coating: Zinc with organic top coating

3. Minimum Size is 1/2”

C. PVC-Coated-Steel Rigid Metal Conduit, Elbows, Couplings, and Nipples:

1. Exterior Coating: PVC complying with NEMA RN 1.

2. Interior Coating: Zinc with organic top coating

3. Minimum Trade Size: ½”.

D. IMC

1. Performance Criteria:

    a. Regulatory Requirements: Listed and labeled in accordance with NFPA 70 and marked for intended location and use.

    b. General Characteristics: UL 1242 and UL Category Control Number DYBY.

    c. Steel Electrical Intermediate Metal Conduit (IMC):

    d. Exterior Coating: Zinc

    e. Interior Coating: Zinc with organic top coating

    f. Minimum Size: ½”

E. Flexible Metallic Conduit

1. Performance Criteria:

   a. Regulatory Requirements: Listed and labeled in accordance with NFPA 70 and marked for intended location and use.

   b. General Characteristics: UL 1 and UL Category Control Number DXUZ.

   c. Material: Steel preferred or Aluminum acceptable.

   d. Minimum Size: ½"

F. Liquid Tight Flexible Metallic Conduit

1. Performance Criteria:

   a. Regulatory Requirements: Listed and labeled in accordance with NFPA 70 and marked for intended location and use.

   b. General Characteristics: UL 360 and UL Category Control Number DXHR.

2. Material: Steel preferred or aluminum, acceptable

3. Minimum Trade Size: ½".

G. Aluminum conduit: Not permitted

2.2 NON METALLIC RACEWAYS

A. PVC

1. Performance Criteria:

   a. Regulatory Requirements: Listed and labeled in accordance with NFPA 70 and marked for intended location and use.

   b. General Characteristics: UL 651 and UL Category Control Number DZYR.

2. Schedule 40 Rigid PVC Conduit (PVC-40) and Fittings:

   a. Dimensional Specifications: Schedule 40.

   b. Minimum size: ½"

3. Schedule 80 Rigid PVC Conduit (PVC-80) and Fittings:

   a. Dimensional Specifications: Schedule 80.

   b. Minimum size: ½"

B. ENT: Not allowed except for fiber optic innerduct

2.3 FITTINGS FOR CONDUIT, TUBING, AND CABLE

A. Performance Criteria:

1. Regulatory Requirements: Listed and labeled in accordance with NFPA 70 and marked for intended location and use.

B. Fittings for Type RMC, Type IMC, and Type PVC Raceways:

1. General Characteristics: UL 514B and UL Category Control Number DWTT.

2. Options:

   a. Material: Steel.

   b. Coupling Method: Setscrew coupling. Setscrew couplings with only single screw per conduit are unacceptable.

   c. Conduit Fittings for Hazardous (Classified) Locations: UL 1203.

C. Fittings for Type EMT Raceways:

1. General Characteristics: UL 514B and UL Category Control Number FKAV.

2. Options:

   a. Material: Steel.

   b. Coupling Method: Setscrew coupling. Setscrew couplings with only single screw per conduit are unacceptable.

   c. Conduit Fittings for Hazardous (Classified) Locations: UL 1203.

   d. Expansion and Deflection Fittings: UL 651 with flexible external bonding jumper.

D. Fittings for Type FMC Raceways:

1. General Characteristics: UL 514B and UL Category Control Number ILNR.

E. Fittings for Type LFMC Raceways:

1. General Characteristics: UL 514B and UL Category Control Number DXAS.

2.4 SOLVENT CEMENTS

A. Performance Criteria:

1. Regulatory Requirements: Listed and labeled in accordance with NFPA 70 and marked for intended location and use.

2. General Characteristics: As recommended by conduit manufacturer in accordance with UL 514B and UL Category Control Number DWTT.

2.5 MULTIOUTLET ASSEMBLY

A. See 262726

2.6 RACEWAYS AND AUXILIARY GUTTERS

A. Performance Criteria:

1. Regulatory Requirements: Listed and labeled in accordance with NFPA 70 and marked for intended location and use.

2. General Characteristics: UL 870 and UL Category Control Number ZOYX.

B. Metal Wireways and Auxiliary Gutters:

1. Additional Characteristics:

    a. Fittings and Accessories: Include covers, couplings, offsets, elbows, expansion joints, adapters, hold-down straps, end caps, and other fittings to match and mate with wireways as required for complete system.

    b. Finish: Manufacturer's standard enamel finish.

2. Options:

    a. Degree of Protection: Type 1 (interior), Type 4 (exterior and kitchen) unless otherwise indicated.

    b. Wireway Covers: Hinged type unless otherwise indicated.

2.7 METALLIC OUTLET BOXES, DEVICE BOXES, RINGS, AND COVERS

A. Performance Criteria:

1. Regulatory Requirements: Listed and labeled in accordance with NFPA 70 and marked for intended location and use.

2. General Characteristics: UL 514A and UL Category Control Number QCIT.

B. Metallic Outlet Boxes:

1. Description: Box having pryout openings, knockouts, threaded entries, or hubs in either the sides of the back, or both, for entrance of conduit, conduit or cable fittings, or cables, with provisions for mounting outlet box cover, but without provisions for mounting wiring device directly to box.

    a. Material: Sheet steel.

    b. Sheet Metal Depth: Minimum 1.5 inch (38 mm) for power 2.5 inch (65 mm) for ESS and Communications

2. Exposed Exterior: Diecast FS and FD type

    a. Cast-Metal Depth: Minimum 1.8 inch (44.5 mm) for power and 2.4 inch (60.3 mm) for communications.

3. Luminaire Outlet Boxes and Covers: Nonadjustable, listed and labeled for attachment of luminaire weighing up to 50 lb (23 kg).

    a. Paddle Fan Outlet Boxes and Covers: Nonadjustable, designed for attachment of paddle fan weighing up to 70 lb (32 kg).

4. Surface boxes interior

    a. In finished areas provide Wiremold outlet boxes

        1) Power: 4-5/8” x 2-7/8” by 1-3/4” deep similar to WH2048 box. Dual gang WH2048-2

        2) Communications: Same but extra deep at 2-3/4”

5. Device Boxes: Same but with provision for mounting outlet directly to box

C. Metallic Conduit Bodies:

1. Description: Means for providing access to interior of conduit or tubing system through one or more removable covers at junction or terminal point. In the United States, conduit bodies are listed in accordance with outlet box requirements.

D. Floorboxes

1. Standard

a. Description: Floor box with provisions for mounting wiring devices below floor surface and floor box cover with provisions for passage of cords to recessed wiring devices mounted within floor box.

b. Six gang with scrubproof cover

c. Wiremold EFB6S in all floor types

1) Diecast cover of color selected by architect.

2) Provide Wiremold EFB6S when on grade.

d. Install devices with brackets shown on the drawings.

2. Wet Locations (Kitchen and areas near kitchen)

a. Full waterproof, with diecast lid

b. Cole Lighting #TLS-351-W (-C when in concrete)

c. Device mounting area is 4”x 9.5” (4 gang). Provide brackets for mounting

3. Performance Spaces (Stage)

a. Cast Iron non–skid lid

b. Cole Lighting #TLS-354 (-C when in concrete)

c. Device mounting area is 6”x 12”. Provide brackets for mounting

2.8 CABINETS, CUTOUT BOXES, JUNCTION BOXES, AND PULL BOXES

A. Performance Criteria:

1. Regulatory Requirements: Listed and labeled in accordance with NFPA 70 and marked for intended location and use.

2. General Characteristics:

a. Non-Environmental Characteristics: UL 50.

b. Environmental Characteristics: UL 50E.

c. Outdoor products labeled Nema 4

B. Sheet Metal Cabinets and Boxes

1. Description: Enclosure provided with frame, mat, or trim in which swinging door or doors are or can be hung.

2. Additional Characteristics: UL Category Control Number CYIV.

C. Sheet Metal Junction and Pull Boxes:

1. Description: Box with a blank cover that serves the purpose of joining different runs of raceway or cable.

2. Additional Characteristics: UL Category Control Number BGUZ.

D. Cast-Metal Junction and Pull Boxes:

1. Description: Box with a blank cover that serves the purpose of joining different runs of raceway or cable.

2. Additional Characteristics: UL Category Control Number BGUZ.

E. Cover Plates: Provide blank stainless steel covers for all junction or pull through boxes. See other sections for device plates

2.9 UNDERGROUND VAULTS

A. Handhole and Pull-Box Prototype Test: Test prototypes of handholes and boxes for compliance with SCTE 77. Strength tests shall be for specified tier ratings of products supplied.

B. Strength tests of complete boxes and covers shall be by either an independent testing agency or manufacturer. A qualified registered professional engineer shall certify tests by manufacturer.

C. Testing machine pressure gages shall have current calibration certification complying with ISO 9000 and ISO 10012, and traceable to NIST standards.

D. Where not shown handholes are Utility Vault#444LA with 44-332P H20 rated cover

PART 3 EXECUTION

3.1 SELECTION OF RACEWAYS

A. Unless more stringent requirements are specified in Contract Documents or manufacturers' written instructions, comply with NFPA 70 for selection of raceways. Consult Architect for resolution of conflicting requirements.

B. Outdoors:

1. Exposed: Rigid Galvanized Steel Conduit

2. Concealed Aboveground: Rigid Galvanized Steel or PVC where acceptable to AHJ and not subject to damage. Provide expansion fittings

3. Underground: PVC-40 unless noted PVC-80. Elbows to be fiberglass or plastic coated rigid steel in sizes 1.5” and larger

4. Connection to Vibrating Equipment (Including Transformers and Hydraulic, Pneumatic, Electric Solenoid, or Motor-Driven Equipment): LFMC.

C. Indoors:

1. Exposed in non-finished spaces: Rigid Steel, IMC, or EMT

2. Exposed Finished Spaces: Surface Metal Raceway

3. Concealed in Ceilings and Interior Walls and Partitions: EMT.

   a. MC Cable is permitted for branch circuitry only within the same room. All homeruns and connections between rooms are EMT

4. Damp or Wet Locations: RGS

5. Connection to Vibrating Equipment (Including Transformers and Hydraulic, Pneumatic, Electric Solenoid, or Motor-Driven Equipment): LFMC and FMC.

D. Raceway Fittings: Select fittings in accordance with NEMA FB 2.10 guidelines.

3.2 SELECTION OF BOXES AND ENCLOSURES

A. Unless more stringent requirements are specified in Contract Documents or manufacturers' written instructions, comply with NFPA 70 for selection of boxes and enclosures. Outdoors: Nema 4 unless noted. Indoors: Type 1 unless noted. At exposed boxes provide cast metal or wiremold

3.3 INSTALLATION OF RACEWAYS

A. Raceway Sizes: When raceway is used all homeruns shall be minimum 1”, branch circuitry ¾” minimum, runs that end in a single device may be ½”. Note: where MC cable is acceptable these minimums do not apply

B. Comply with Neca 1 and NFPA 70 for installation of raceways.

C. Comply with requirements in Section 260529 "Hangers and Supports for Electrical Systems" for hangers and supports.

D. Comply with NECA NEIS 101 for installation of steel raceways.

E. Install raceways square to the enclosure and terminate at enclosures without hubs with locknuts on both sides of enclosure wall. Install locknuts hand tight, plus one-quarter turn more.

F. Terminate threaded conduits into threaded hubs or with locknuts on inside and outside of boxes or cabinets. Install bushings on conduits up to metric designator 35 (trade size 1-1/4) and insulated throat metal bushings on metric designator 41 (trade size 1-1/2) and larger conduits terminated with locknuts.

G. Raceway Terminations at Locations Subject to Moisture or Vibration: Provide insulating bushings to protect conductors, including conductors smaller than No. 4 AWG.

H. General Requirements for Installation of Raceways:

1. Complete raceway installation before starting conductor installation.

2. Provide stub-ups through floors with coupling threaded inside for plugs, set flush with finished floor. Plug coupling until conduit is extended above floor to final destination or a minimum of 2 ft (0.6 m) above finished floor.

3. Install no more than equivalent of three 90-degree bends in conduit run except for communications conduits, for which no more than equivalent of two 90-degree fewer bends are permitted . Support within 12 inch (300 mm) of changes in direction.

4. Make bends in raceway using large-radius preformed ells except for parallel bends. Field bending must be in accordance with NFPA 70 minimum radii requirements. Provide only equipment specifically designed for material and size involved.

5. Conceal conduit within finished walls, ceilings, and floors unless otherwise indicated. Install conduits parallel or perpendicular to building lines.

6. Support conduit within 12 inch (300 mm) of enclosures to which attached.

7. Install raceway sealing fittings at accessible locations in accordance with NFPA 70 and fill them with listed sealing compound. For concealed raceways, install fitting in flush steel box with blank cover plate having finish similar to that of adjacent plates or surfaces. Install raceway sealing fittings in accordance with NFPA 70.

8. Install devices to seal raceway interiors at accessible locations. Locate seals so no fittings or boxes are between the seal and the following changes of environments. Seal interior of raceways at the following points:

    a. Where conduits pass from warm to cold locations, such as boundaries of refrigerated spaces.

    b. Where an underground service raceway enters a building or structure.

    c. Conduit extending from interior to exterior of building.

    d. Conduit extending into pressurized duct and equipment.

    e. Conduit extending into pressurized zones that are automatically controlled to maintain different pressure set points.

    f. Where otherwise required by NFPA 70.

9. Do not install conduits within 2 inch (50 mm) of the bottom side of a metal deck roof.

10. Keep raceways at least 6 inch (150 mm) away from parallel runs of flues and steam or hot-water pipes. Install horizontal raceway runs above water and steam piping.

11. Cut conduit perpendicular to the length. For conduits metric designator 53 (trade size 2”) and larger, use roll cutter or a guide to make cut straight and perpendicular to the length. Ream inside of conduit to remove burrs.

12. Install pull wires in empty raceways. Provide polypropylene or monofilament plastic line with not less than 200 lb (90 kg) tensile strength. Leave at least 12 inch (300 mm) of slack at both ends of pull wire. Cap underground raceways designated as spare above grade alongside raceways in use.

I. Requirements for Installation of Specific Raceway Types:

1. Types RMC and IMC: Threaded Conduit Joints, Exposed to Wet, Damp, Corrosive, or Outdoor Conditions: Apply listed compound that maintains electrical conductivity to threads of raceway and fittings before making up joints. Follow compound manufacturer's written instructions.

2. Plastic Coated RMC: Follow manufacturer's installation instructions for clamping, cutting, threading, bending, and assembly. Provide PVC-coated sealing locknut for exposed male threads transitioning into female NPT threads that do not have sealing sleeves, including transitions from PVC couplings/female adapters to Type ERMC-S-PVC elbows in direct-burial applications. PVC-coated sealing locknuts must not be

used in place of conduit hub. PVC-coated sealing locknut must cover exposed threads on Type ERMC-S-PVC raceway. Coat field-cut threads on PVC-coated raceway with manufacturer-approved corrosion-preventing conductive compound prior to assembly.

3. Types FMC and LFMC: Comply with NEMA RV 3. Provide a maximum of 72 inch (1830 mm) equipment subject to vibration, noise transmission, or movement; and for transformers and motors and if used for fixture whips.

4. Type PVC:: Do not install Type PVC conduit where ambient temperature exceeds 122 deg F (50 deg C). Conductor ratings must be limited to 75 deg C except where installed in a trench outside buildings with concrete encasement, where 90 deg C conductors are permitted. Comply with manufacturer's written instructions for solvent welding and fittings.

J. Raceways Embedded in Slabs: Run raceways larger than metric designator 27 (trade size 1) below concrete slab. Run raceways larger than metric designator 27 (trade size 1) parallel or at right angles to main reinforcement. Where at right angles to reinforcement, place raceway close to slab support. Secure raceways to reinforcement at maximum 10 ft (3 m) intervals]. Arrange raceways to cross building expansion joints with expansion fittings at right angles to the joint. Arrange raceways to ensure that each is surrounded by a minimum of 2 inch (50 mm) of concrete without voids. Do not embed threadless fittings in concrete unless locations have been specifically approved by Architect.

K. Stub-ups to Above Recessed Ceilings: Provide EMT, IMC, or RMC for raceways. Provide a conduit bushing or insulated fitting to terminate stub-ups not terminated in hubs or in an enclosure.

L. Expansion-Joint Fittings: Install in runs of aboveground PVC that are located where environmental temperature change may exceed 30 deg F (17 deg C) and that have straight-run length that exceeds 25 ft (7.6 m). Install in runs of aboveground RMC conduit that are located where environmental temperature change may exceed 100 deg F (55 deg C) and that have straight-run length that exceeds 100 ft (30 m).

M. Raceways Penetrating Rooms or Walls with Acoustical Requirements: Seal raceway openings on both sides of rooms or walls with acoustically rated putty or firestopping.

3.4 INSTALLATION OF SURFACE RACEWAYS

A. Install surface raceway with a minimum 2 inch (50 mm) radius control at bend points. Secure surface raceway with screws or other anchor-type devices at intervals not exceeding 48 inch (1200) mm) and with no less than two supports per straight raceway section. Support surface raceway in accordance with manufacturer's written instructions. Tape and glue are unacceptable support methods.

3.5 INSTALLATION OF BOXES AND ENCLOSURES

A. Provide boxes in wiring and raceway systems wherever required for pulling of wires, making connections, and mounting of devices or fixtures.

B. Mount boxes at heights indicated on Drawings. If mounting heights of boxes are not individually indicated, give priority to ADA requirements. Install boxes with height measured as follows:

1. Receptacle, AV, and Data: 18” to center of box, 20” to top

2. Light, Control Switches, Fire Alarm Pull Stations, and Access control panic/lockdown buttons: 48” to top of box

3. Fire Alarm Evacuation Device: 96” to top

4. Speakers and Clocks: 8’ to top or 6” below ceiling

5. Monitor Power, Data, and AV Boxes: 66” unless noted on the drawings

C. Recessed Boxes in Masonry Walls: Saw-cut opening for box in center of cell of masonry block, and install box flush with surface of wall. Prepare block surfaces to provide a flat surface for a raintight connection between box and cover plate or supported equipment and box, whether installed indoors or outdoors.

D. Horizontally separate boxes mounted on opposite sides of walls so they are not in the same vertical channel.

E. Locate boxes so that cover or plate will not span different building finishes.

F. Support boxes in recessed ceilings independent of ceiling tiles and ceiling grid.

G. Support boxes of three gangs or more from more than one side by spanning two framing members or mounting on brackets specifically designed for purpose.

H. Fasten junction and pull boxes to, or support from, building structure. Do not support boxes by conduits.

I. Set metal floor boxes level and flush with finished floor surface.

J. Set nonmetallic floor boxes level. Trim after installation to fit flush with finished floor surface.

K. Do not install aluminum boxes, enclosures, or fittings in contact with concrete or earth.

L. Do not rely on locknuts to penetrate nonconductive coatings on enclosures. Remove coatings in the locknut area prior to assembling conduit to enclosure to ensure a continuous ground path.

M. Boxes and Enclosures in Areas or Walls with Acoustical Requirements:

1. Seal openings and knockouts in back and sides of boxes and enclosures with acoustically rated putty.

2. Provide gaskets for wallplates and covers.

N. Handholes and Vaults: Install level and true on minimum 24” of pea gravel. Lids shall be completely flush with grade and be labeled.

3.6 FIRESTOPPING

A. Install firestopping at penetrations of fire-rated floor and wall assemblies. Comply with requirements 260100.

3.7 PROTECTION

A. Protect coatings, finishes, and cabinets from damage and deterioration.

1. Repair damage to galvanized finishes with zinc-rich paint recommended by manufacturer.

2. Repair damage to PVC coatings or paint finishes with matching touchup coating recommended by manufacturer.

3.8 CLEANING

A. Boxes: Remove construction dust and debris from device boxes, outlet boxes, and floor-mounted enclosures before installing wallplates, covers, and hoods.

END OF SECTION

SECTION 26 05 34 – RACEWAY AND BOXES FOR COMMUNICATIONS AND ESS

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes requirements for raceways, fittings, and boxes specific to communications circuits for fire alarm, security, CCTV, sound, television, voice, and data which are additional to 260533

B. This section applies to all conduit and boxes installed for all Division 27 and 28 systems.

1.2 REFERENCES

A. The applicable portions of the following specifications, standards, codes and regulations (latest editions and/or amendments) shall be incorporated by reference into these specifications.

B. General:

1. National Electrical Code (NEC)

2. National Electrical Safety Code (NESC)

3. Washington Industrial Safety and Health Act (WISHA)

4. Occupational Safety and Health Act (OSHA)

5. Communications:

6. TIA/EIA - 568A: Commercial Building Telecommunications Cabling Standard

7. TIA/EIA - 568A2: Corrections and Additions to TIA/EIA 568A

8. TIA/EIA - 569A: Commercial Building Standard for Telecommunication Pathways and Spaces

9. TIA/EIA - 606: The Administration Standard for the Telecommunications Infrastructure of Commercial Buildings

10. TIA/EIA - 607: Commercial Building Grounding and Bonding Requirements for Telecommunications

11. TIA/EIA -TSB67: Transmission Performance Specifications for Field Testing of Unshielded Twisted Pair Cabling Systems

12. ISO/IEC IS 11801: Generic Cabling for Customer Premises

13. BICSI: BICSI Cabling Installation Manual

PART 2 PRODUCTS

2.1 RACEWAYS AND BOXES

A. Cable Tray

1. Basket (Wire Mesh) Cable Tray is 4” high with IEC 61537 BlacK Class C8 coating

a. Chastworth 60283450-003, 18” wide in MDF and IDF Rooms

b. Other areas of the building shall use size noted and 12 where not noted

c. Chatsworth #60283300-003

2. Include the following and all additional accessories for a complete system as shown on drawings

   a. Wall mount: Medium Duty Cantilever: Chatsworth RPlus#62085X03-004 of width required for tray

   b. Ceiling Mount: Omega SPLUS#62082X04 or width required

   c. Joint Clamps: Chatsworth#604800061-50

   d. Accessory Clamp (for joining waterfalls). Chatsworth #4080158-050

   e. Splice Plate: Chatsworth 67080053-010

   f. Radius Drop: CPI #60500-701 and 67020139-010

   g. Conduit Bracket: CPI#67080040-010

   h. Bend Radius: CPI #34742-706

   i. Ground Kit: CPI #68000032-020/68000033-020 with 680000370929 strap

   j. Cable Tie Clip and Hook and Loop: CPI#68000110-20 and 89011000-001

   k. Wire Cutter: CPI # 68000058-001

B. Raceway

1. Provide per 260533

   a. Minimum size for ESS systems is 1”

   b. Minimum size for Data and AV Systems is 1.25”

   c. Minimum size for other Communications Systems is 1”

   d. Elbows and sweeps: Bend radius is minimum 8x conduit radius up to 2” and 10x bending radius above 2”.

C. Boxes

1. Randl 5” x 5” x 2.875” deep box with single and double gang mudrings. Randl R-55014 for electronic safety and security and signal systems and Randl T-55017 for communications systems

   a. Exception: When in fire rated wall, Randl box exceeds allowable area, provide 4” x 4” by 2-1/2” box.

   b. Alternate approved box Hubbell HBL260 or HBL263 extra deep 4-11/16” box.

2. Surface mounted outlets – Not allowed except where shown. Wiremold 2.5” deep box:

D. Pull Boxes:

1. Provide pull boxes (junction boxes) as shown on the Drawings and as required. 90 degree condulets (LB’s) are not acceptable.

2. Increase size of pull boxes

Conduit	Width	Length	Depth
1”	4”	16”	4”
1.25”	6”	20”	5”

1.5”	8”	27”	6”
2”	8”	36”	6”
2.5”	8”	43”	8”
3”	12”	48”	8”
3.5”	12”	54”	10”
4”	12”	60”	10”

2.2 ACCESSORIES

A. Backboards: Provide backboards which are 5/8” A-C fire treated plywood, void free, 8-ft high unless otherwise noted, capable of supporting attached equipment, and painted with a minimum of two coats of fire retardant light gray semi gloss paint

B. Grounding Conductor: Provide #6 AWG insulated solid copper conductor (green) to bond all metallic raceway to the nearest grounding bus bar, cable tray or structural steel as required by the AHJ

C. Labels: Provide labels as recommended in TIA/EIA 606. Labels shall be permanent/legible typed and created by a Brady LS-2000 label maker or equivalent system. Handwritten labels are not acceptable. Labels are required for all raceway and pull boxes.

D. Pull Strings: Provide pull strings in all conduit per 260533

PART 3 EXECUTION

3.1 SELECTION OF RACEWAYS

A. All work shall comply with 260533

B. Cable shall not be run underground except between the MDF and IDF unless specifically approved by the engineer.

C. Outdoors:

1. Exposed: Rigid Galvanized Steel Conduit

2. Concealed Aboveground: Rigid Galvanized Steel or PVC where acceptable to AHJ and not subject to damage. Provide expansion fittings

3. Underground: PVC-40 unless noted PVC-80. Elbows to be fiberglass or plastic coated rigid steel in sizes 1.5” and larger.

D. Indoors:

1. Exposed in non-finished spaces: Rigid Steel, IMC, or EMT

2. Exposed Finished Spaces: Surface Metal Raceway Boxes

3. Concealed in Ceilings and Interior Walls and Partitions: EMT.

4. Damp or Wet Locations: RGS

3.2 INSTALLATION OF RACEWAYS

A. Comply with all requirements identified in 260533.

B. Install the raceway system in a manner ensuring that communications circuits, when installed, are able to fully comply with the TIA/EIA, ISO/IEC and BICSI references listed in Part 1 — References, above.

C. Run conduit in the most direct route possible, parallel to building lines. Do not route conduit through areas in which flammable material may be stored, or over or adjacent to boilers, incinerators, hot water lines, or steam lines.

D. Conduit bends: A conduit bend shall not exceed 90 degrees.

E. For conduit up to 2”, the bend must be at least 8 times the internal diameter of the conduit. For conduit greater than 2”, the bend must be at least 10 times the internal diameter of the conduit.

F. The sum total of conduit bends for a section of conduit shall not exceed 180 degrees, except one additional bend of up to 90 degrees is acceptable if the bend is located within 12 inches of the cable feed end.

G. 90 degree condulets (LB’s) are not acceptable.

H. Ream conduits to eliminate sharp edges and terminate with metallic insulated grounded throat bushings. Cap each conduit with a mechanical-type seal for protection. Equip all conduits with a plastic or nylon pull string with a minimum test rating of 200 lb.

I. Terminate conduits that protrude through a floor 1” to 3” above the surface of the floor. Conduits stubbed to ceiling shall be clear of all casework and obstacles on floor below. Also conduits shall be located to be easily accessible and not blocked by structural members, ductwork, piping, equipment, etc.

J. Label each conduit end in a clear manner by designating the location of the other conduit end (i.e. room name, communications closet name, junction box number, etc.). Indicate conduit length on the label.

K. Pull Boxes: Install pull boxes in an exposed location, readily accessible both at time of construction and after building occupation. Pull boxes shall not be installed in interstitial building space.

L. Do not exceed one pull box per total conduit run between device box and termination point in a communications closet.

M. If mounting pull box on ceiling structure above ceiling grid, do not mount higher than 4’ above grid (mount on wall instead).

N. Install pull boxes such that conduit enters and exits at opposite ends of the box as follows:

END OF SECTION

SECTION 26 05 43 – UNDERGROUND RACEWAY AND BOXES

PART 1 GENERAL

1.1 SUMMARY

A. This Section provides additional requirements to Section 260533

B. Provide all materials and labor for the installation of a pathway system underground circuits. Work in this section includes excavation and trenching, duct (raceway) construction, cutting and patching, concrete, underground cable vault construction, and landscaping.

C. This Section includes requirements for the above work which specifically pertain to outside plant communications and which are more stringent, additional to, or different from that of the Division 2, Division 3, Division 26, Division 27 and Division 28 sections.

D. Primary voltage (over 600 Volts) shall be encapsulated by red CDF. RED CDF – Allow 3000psi concrete

1.2 REFERENCES

A. The applicable portions of the following specifications, standards, codes and regulations (latest editions and/or amendments) shall be incorporated by reference into these specifications.

1. National Electrical Code (NEC)

2. National Electrical Safety Code (NESC)

3. Washington Industrial Safety and Health Act (WISHA)

4. Occupational Safety and Health Act (OSHA)

5. WSDOT/APWA 1998 Standards Specifications for Road, Bridge and Municipal Construction (APWA Standard Specifications)

6. TIA/EIA - 758: Customer-owned Outside Plant Telecommunications Cabling Standard

7. TIA/EIA - 568A: Commercial Building Telecommunications Cabling Standard

8. TIA/EIA - 569: Commercial Building Standard for Telecommunication Pathways and Spaces

9. TIA/EIA - 606: The Administration Standard for the Telecommunications Infrastructure of Commercial Buildings

10. TIA/EIA - 607: Commercial Building Grounding and Bonding Requirements for Telecommunications

11. ISO/IEC IS 11801: Generic Cabling for Customer Premises

1.3 SUBMITTALS

A. Product Data: Raceways, fittings, elbows, manholes, handoles, supports

PART 2 PRODUCTS

2.1 RACEWAYS AND FITTINGS

A. Comply with all requirements of 260533 except per below.

2.2 DUCTS AND DUCTBANKS

A. Ducts: Provide in locations as shown on the drawings. All conduit, fittings, and adhesives shall be provided by the same manufacturer.

B. Types:

1. Rigid Non-Metallic Conduit (RNC):

a. RNC shall be NEMA TC 2 schedule 40 rigid polyvinyl chloride (PVC) approved for direct burial without concrete encasement. RNC shall be UL listed.

b. Fittings shall be NEMA TC3, matched to conduit and material.

c. Bends shall be Fiberglass, Plastic Coated Rigid Galvanized Steel, or Taped Rigid Galvanized steel in sizes 1.5” and larger

d. Minimum burial depth is 24”

e. Use Schedule 80 PVC where directed on the drawings.

C. Fittings:

1. Bends/Sweeps:

a. Unless otherwise noted on the Drawings, bends/sweeps shall be factory manufactured.

b. Unless otherwise shown on the Drawings, bends of a bend radius shall not be less than 10 times the internal diameter of the conduit for communications circuits.

c. Unless otherwise shown on the Drawings, the use of 90 degree elbows, LB’s, condulets, or the use of a UCV in place of a bend/sweep is not acceptable for communications circuits.

2. End Caps (Plugs): Provide pre-manufactured water-tight end caps for all ducts during construction. Tape is not an acceptable end cap or cover.

3. End Bells: Provide end bells for terminating conduit in UCVs. Do not provide for conduit ends terminating in UCVs which are equipped with TERM-A-DUCT.

D. Pull Cords: Provide nylon pull cord indicating length measurement for each duct. Pull cord strength shall be a minimum of 130 pounds.

E. Ductbanks:

1. Duct Spacers/Supports: Provide high-density plastic interlocking spacers/supports to maintain uniformity of multiple ducts within a ductbank. Spacers shall be:

2. Underground Devices Inc.: WUNPEECE

F. Warning Tape: Provide metallic warning tape above each ductbank. Tape shall be 6” wide and orange in color.

G. Grounding/Bonding: Provide #2 bare ground along length of ductbank.

H. Concrete Warning Planks: At buried conduit for future locations. Mark each plank with "ELECTRIC" or “Communications” in 2 inch (50 mm) high, 3/8 inch (10 mm) deep letters.

2.3 HANDHOLES AND BOXES FOR EXTERIOR UNDERGROUND WIRING

A. Description: Factory-fabricated, reinforced-concrete, monolithically poured walls and bottom unless open-bottom enclosures are indicated. Frame and cover must form top of enclosure and must have load rating consistent with that of handhole or box with closed bottom and H20 fully rated lid

1. Utility Vault #444LA with 44-332P Cover for power. Label Electric

2. Utility Vault #253T with 38/25-TA cover (253TA Vault). Label Communications

3. Joint Sealant: Asphaltic-butyl material with adhesion, cohesion, flexibility, and durability properties necessary to withstand maximum hydrostatic pressures at installation location with ground-water level at grade.

4. Knockout Panels: Precast openings in walls, arranged to match dimensions and elevations of approaching duct, plus additional 12 inch (300 mm) vertically and horizontally to accommodate alignment variations.

PART 3 EXECUTION

3.1 EARTHWORK

A. Backfill

1. Provide 4” of sand bedding under all underground conduit

2. Embed conduits with sand shading around duct bank

3. Provide 12” of sand shading above conduits after compaction.

4. Top of trench may be native backfill with no rocks over 6”

B. Depth of excavation

1. For handholes and vaults: Depth shall allow for the overall assembled height of the vault plus the added height of risers, covers and bedding material.

2. For trenches: 24 inch minimum depth but 36” depth for all trenches with over 600 volt power

C. Width of excavation: Minimum 24” to maintain

1. 24” clearance from gas or water lines

2. 12” clearance between communications and over 600 volt lines

3. 12” clearance between under and over 600 volt lines.

D. Trench grade shall be sloped to fall 3 inches per 100 feet in general and ¼” per foot where possible. Slope shall fall toward lower handholes.

E. All conduits entering the building slabe shall slope up minimum ¼” per foot.

F. Waste Disposal: The Contractor shall remove all materials and other construction debris from the site in a timely manner. Materials shall be disposed of legally.

G. Restoration:

1. Restore area immediately after backfilling is completed.

2. Restore surface features at areas disturbed by excavation, and re-establish original grades unless otherwise indicated. Replace removed sod immediately after backfilling is completed.

3. Restore areas disturbed by trenching, storing of dirt, cable laying, and other work. Restore vegetation and include necessary topsoiling, fertilizing, liming, seeding, sodding, sprigging, and mulching.

4. Cut and patch existing pavement in path of underground duct, duct bank, and underground structures in accordance with "Cutting and Patching" Article in Section 017300 "Execution."

3.2 INSTALLATION OF DUCTS

A. Reference Standards: Unless more stringent requirements are specified in Contract Documents or manufacturers' published instructions, comply with NEMA TCB 2 for installation of underground ducts and duct banks.

B. Duct Terminators for Entrances to Cast-in-Place Manholes and Concrete Handholes: Use manufactured, cast-in-place duct terminators, with entrances into structure spaced approximately 6 inch (150 mm) o.c. for 4 inch (100 mm) duct, and vary proportionately for other duct sizes.

C. Building Wall Penetrations: Make transition from underground duct to steel raceway at least 10 ft (3 m) outside building wall, without reducing duct line slope away from building and without forming trap in line. Use fittings manufactured for transition to steel raceway type installed. Install steel raceway penetrations of building walls

D. Install manufactured steel raceway elbows for stub-ups at poles unless otherwise indicated. Encase elbows for stub-up ducts throughout length of elbow. Couple steel elbows to ducts with adapters designed for this purpose, and encase coupling with minimum 3 inch (75 mm) of concrete for minimum of 12 inch (300 mm) on each side of coupling.

E. Sealing: Provide temporary closure at terminations of duct with pulled cables. Seal spare duct at terminations. Use sealing compound and plugs to withstand at least 15 psig (1.03 MPa) hydrostatic pressure.

F. Pulling Cord: Install 200 lbf (1000 N) test nylon cord in empty ducts.

G. Duct and Duct Bank:

1. Excavate and backfill per earthwork above

2. Support ducts on duct spacers coordinated with duct size, duct spacing, and outdoor temperature.

a. Spacer Installation: Place spacers close enough to prevent sagging and deforming of duct, with not less than four spacers per 20 ft (6 m) of duct. Place spacers within 24 inch (600 mm) of duct ends. Stagger spacers approximately 6 inch (150 mm) between tiers. Secure spacers to earth and to ducts to prevent floating during concreting. Tie entire assembly together using fabric straps; do not use tie wires or reinforcing steel that may form conductive or magnetic loops around ducts or duct groups.

3. Install manufactured duct elbows for stub-ups, at building entrances, and at changes of direction in duct direction unless otherwise indicated. Encase elbows for stub-up ducts throughout length of elbow.

a. Install manufactured steel elbows for stub-ups, at building entrances, and at changes of direction in duct. Couple RNC duct to steel raceway with adapters designed for this purpose, and encase coupling with minimum 3 inch (75 mm) of concrete.

b. Stub-ups to Equipment: Extend concrete-encased steel raceway horizontally minimum of 60 inch (1500 mm) from edge of base. Install insulated grounding bushings on terminations at equipment. Stub-ups must terminate in coupling installed flush with finished base and minimum 3 inch (75 mm) from conduit side to edge of base.

4. Underground-Line Warning Tape: Bury nonconducting underground line no less than 12 inch (300 mm) above. Align tape parallel to and within 3 inch (75 mm) of centerline of duct bank. Provide additional warning tape for each 12 inch (300 mm) increment of duct-bank width over nominal 18 inch (450 mm). Space additional tapes 12 inch (300 mm) apart, horizontally across width of ducts.

5. Ground ducts and duct banks in accordance with Section 260526."

H. Concrete Encasement

1. Reinforcement: Reinforce concrete-encased duct where crossing disturbed earth and where indicated. Arrange reinforcing rods and ties without forming conductive or magnetic loops around ducts or duct groups.

2. Forms: Use walls of trench to form side walls of duct bank where soil is self-supporting and concrete envelope can be poured without soil inclusions; otherwise, use forms. Remove all forms

3. Concrete Cover: Install minimum of 3 inch (75 mm) of concrete cover between edge of duct to exterior envelope wall, 2 inch (50 mm) between duct of like services, and 4 inch (100 mm) between power and communications ducts.

4. Place minimum 6 inch (150 mm) of engineered fill above concrete encasement of duct.

5. Place concrete carefully during pours to prevent voids under and between duct and at exterior surface of envelope. Do not allow heavy mass of concrete to fall directly onto ducts. Allow concrete to flow around duct and rise up in middle, uniformly filling open spaces. Do not use power-driven agitating equipment unless specifically designed for duct-installation application.

3.3 INSTALLATION OF CONCRETE MANHOLES, HANDHOLES, AND BOXES

A. Precast Concrete Handholes and Manholes:

1. Install units level and plumb and with orientation and depth coordinated with connecting duct to minimize bends and deflections required for proper entrances.

2. Unless otherwise indicated, support units on level bed of crushed stone or gravel graded from 1 inch (25 mm) sieve to No. 4 (4.75 mm) sieve and compacted to same density as adjacent undisturbed earth.

3. Field-cut openings for conduits in accordance with enclosure manufacturer's published instructions. Cut wall of enclosure with tool designed for material to be cut. Size holes for terminating fittings to be used, and seal around penetrations after fittings are installed.

B. Drainage: Install drains in bottom of manholes where indicated. Coordinate with drainage provisions indicated.

C. Waterproofing: Apply waterproofing to exterior surfaces of manholes and handholes after concrete has cured at least three days. After duct has been connected and grouted, and before backfilling, waterproof joints and connections, and touch up abrasions and scars.

3.4 CLEANING

A. Pull leather-washer-type duct cleaner, with graduated washer sizes, through full length of duct until duct cleaner indicates that duct is clear of dirt and debris. Follow with rubber duct swab for final cleaning and to assist in spreading lubricant throughout ducts.

B. Clean internal surfaces of manholes, including sump, and building interiors affected by Work.

1. Sweep floor, removing dirt and debris.

2. Remove foreign material.

END OF SECTION

SECTION 26 05 48 – VIBRATION AND SEISMIC CONTROLS

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:

1. Elastomeric isolation pads.
2. Restraints - rigid type.
3. Restraints - cable type.
4. Restraint accessories.
5. Post-Installed concrete anchors.
6. Concrete inserts.

1.2 SUBMITTALS

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Delegated Design: Use manufacturer’s structural engineer approved details or engage qualified structural professional engineer to design seismic control system.

B. Seismic-Restraint Device Load Ratings: Devices to be tested and rated in accordance with applicable code requirements and authorities having jurisdiction. Devices to be listed by a nationally recognized third party that requires periodic follow-up inspections and has a listing directory available to the public. Provide third-party listing by one or more of the following: ICC-ES product listing or UL product listing

C. Consequential Damage: Provide additional seismic restraints for suspended electrical components or anchorage of floor-, roof-, or wall-mounted components so that failure of a non-essential or essential component will not cause failure of any other essential building component.

D. Fire/Smoke Resistance: Seismic restraint devices that are not constructed of ferrous metals must have a maximum flame-spread index of 25 and maximum smoke-developed index of 50 when tested by an NRTL in accordance with ASTM E84 or UL 723, and be so labeled.

E. Component Supports:

1. Load ratings, features, and applications of reinforcement components must be based on testing standards of a nationally recognized testing agency.

2.2 ELASTOMERIC ISOLATION PADS

A. Elastomeric Isolation Pads:

1. Fabrication: Single or multiple layers of sufficient durometer stiffness for uniform loading over pad area.

2. Size: Factory or field cut to match requirements of supported equipment.

3. Pad Material: Oil and water resistant with elastomeric properties. Neoprene rubber, silicone rubber, or other elastomeric material.

4. Surface Pattern: Smooth, ribbed, or waffle pattern.

5. Infused nonwoven cotton or synthetic fibers.

6. Load-bearing metal plates adhered to pads.

7. Sandwich-Core Material: Resilient.

   a. Surface Pattern: Smooth, ribbed, or waffle pattern.

   b. Infused nonwoven cotton or synthetic fibers.

2.3 RESTRAINTS - RIGID TYPE

A. Description: Shop- or field-fabricated bracing assembly made of ANSI/AISI S110-07-S1 slotted steel channels, ANSI/ASTM A53/A53M steel pipe, or other rigid steel brace member. Includes accessories for attachment to braced component at one end and to building structure at the other end and other matching components and with corrosion-resistant coating; rated in tension, compression, and torsion forces.

2.4 RESTRAINTS - CABLE TYPE

A. Seismic-Restraint Cables: ASTM A603 galvanized-steel cables. End connections made of steel assemblies with thimbles, brackets, swivel, and bolts designed for seismic-restraining cable service; with fittings attached by means of poured socket, swaged socket, or mechanical (Flemish eye) loop.

B. Restraint cable assembly and cable fittings must comply with ASCE/SEI 19. Cable fittings and complete cable assembly must maintain the minimum cable breaking force. U-shaped cable clips and wedge-type end fittings do not comply and are unacceptable.

2.5 RESTRAINT ACCESSORIES

A. Hanger-Rod Stiffener: Steel tube or steel slotted-support-system sleeve with internally bolted connections or Reinforcing steel angle clamped]to hanger rod. Non-metallic stiffeners are unacceptable.

B. Hinged and Swivel Brace Attachments: Multifunctional steel connectors for attaching hangers to rigid channel bracings and restraint cables.

C. Bushings for Floor-Mounted Equipment Anchor Bolts: Neoprene bushings designed for rigid equipment mountings, and matched to type and size of anchor bolts and studs.

D. Bushing Assemblies for Wall-Mounted Equipment Anchorage: Assemblies of neoprene elements and steel sleeves designed for rigid equipment mountings, and matched to type and size of attachment devices used.

E. Resilient Isolation Washers and Bushings: One-piece, molded, oil- and water-resistant neoprene, with a flat washer face.

2.6 POST-INSTALLED CONCRETE ANCHORS

A. Mechanical Anchor Bolts:

1. Drilled-in and stud-wedge or female-wedge type in zinc-coated steel for interior applications and stainless steel for exterior applications. Select anchor bolts with strength for anchor and as tested according to ASTM E488/E488M.

B. Provide post-installed concrete anchors that have been prequalified for use in seismic and wind-load applications.

1. Prequalify post-installed anchors in concrete in accordance with ACI 355.2 or other approved qualification testing procedures.

2. Prequalify post-installed anchors in masonry in accordance with approved qualification procedures.

2.7 CONCRETE INSERTS

A. Provide preset concrete inserts that are seismically prequalified in accordance with ICC-ES AC446 testing.

B. Comply with MSS SP-58.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine areas and equipment to receive seismic control devices for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for reinforcement and cast-in-place anchors to verify actual locations before installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 APPLICATIONS

A. Multiple Raceways or Cables: Secure raceways and cables to trapeze member with clamps approved for application.

3.3 INSTALLATION OF SEISMIC-RESTRAINT DEVICES

A. Provide seismic restraint devices for systems and equipment where indicated in Equipment Schedules or Seismic and Wind-Load Controls Schedule, where indicated on Drawings, where the Specifications indicate they are to be installed on specific equipment and systems, and where required by applicable codes.

1. Install equipment and devices to withstand the effects of earthquake motions.

B. Coordinate location of embedded connection hardware with supported equipment attachment and mounting points and with requirements for concrete reinforcement and formwork specified in Section 033000 "Cast-in-Place Concrete."

C. Installation of seismic restraints must not cause any stresses, misalignment, or change of position of equipment or conduits.

D. Equipment Restraints:

1. Install resilient bolt isolation washers on equipment anchor bolts where clearance between anchor and adjacent surface exceeds 0.125 inch (3.2 mm).

2. Install seismic-restraint devices using methods approved by an agency acceptable to authorities having jurisdiction that provides required submittals for component.

E. Raceway, Cable, Wireway, Cable Tray, and Busway Support and Hanger Restraints:

1. Install resilient bolt isolation washers on equipment anchor bolts where clearance between anchor and adjacent surface exceeds 0.125 inch (3.2 mm).

2. Install resilient, bolt-isolation washers on equipment anchor bolts where clearance between anchor and adjacent surface exceeds 0.125 inch (3.2 mm).

F. Install cables so they do not bend across edges of adjacent equipment or building structure.

G. Install bushing assemblies for mounting bolts for wall-mounted equipment, arranged to provide resilient media where equipment or equipment-mounting channels are attached to wall.

H. Attachment to Structure: If specific attachment is not indicated, anchor bracing to structure at flanges of beams, at upper truss chords of bar joists, or at concrete members.

I. Post-Installed Concrete Anchors:

1. Identify position of reinforcing steel and other embedded items prior to drilling holes for anchors. Do not damage existing reinforcing or embedded items during coring or drilling. Notify structural engineer if reinforcing steel or other embedded items are encountered during drilling. Locate and avoid prestressed tendons, electrical and telecommunications conduit, and gas lines.

2. Do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength.

3. Mechanical-Type Anchor Bolts: Protect threads from damage during anchor installation. Heavy-duty sleeve anchors must be installed with sleeve fully engaged in the structural element to which anchor is to be fastened.

4. Set anchors to manufacturer's recommended torque using a torque wrench.

5. Install zinc-coated steel anchors for interior and stainless steel anchors for exterior applications.

3.4 ACCOMMODATION OF DIFFERENTIAL SEISMIC MOTION

A. Install flexible connections in runs of raceways, cables, wireways, cable trays, and busways where they cross seismic joints, where adjacent sections or branches are supported by different structural elements, and where connection is terminated to equipment that is anchored to a different structural element from the one supporting them as they approach equipment.

END OF SECTION

SECTION 26 05 53 – IDENTIFICATION FOR ELECTRICAL SYSTEMS

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes label requirements for Divisions 26,27,28:

1.2 SUBMITTALS

A. Product Data

B. Identification Schedule: For each piece of electrical equipment and electrical system components to be index of nomenclature for electrical equipment and system components used in identification signs and labels. Use same designations indicated on Drawings.

1.3 COORDINATION

A. Coordinate identification names, abbreviations, colors, and other features with requirements in the Contract Documents, Shop Drawings, manufacturer's wiring diagrams, and the Operation and Maintenance Manual, and with those required by codes, standards, and 29 CFR 1910.145. Use consistent designations throughout Project.

B. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.

C. Coordinate installation of identifying devices with location of access panels and doors.

D. Install identifying devices before installing acoustical ceilings and similar concealment.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Comply with ASME A13..

B. Comply with 29 CFR 1910.144 for color identification of hazards; 29 CFR 1910.145 for danger, caution, warning, and safety instruction signs and tags; and the following:

1. Fire- -alarm equipment, including boxes, must be finished, painted, or suitably marked safety red or as required by AHJ

2. finished floor.

C. Signs, labels, and tags required for personnel safety must comply with the following standards:

1. Safety Colors: NEMA Z535.1.

2. Facility Safety Signs: NEMA Z535.2.

3. Safety Symbols: NEMA Z535.3.

4. Product Safety Signs and Labels: NEMA Z535.4.

5. Safety Tags and Barricade Tapes for Temporary Hazards: NEMA Z535.5.

D. Comply with NFPA 70E and Section 260573 requirements for arc-flash warning labels.

E. Adhesive-attached labeling materials, including label stocks, laminating adhesives, and inks used by label printers, must comply with UL 969.

F. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes.

2.2 COLOR REQUIREMENTS

A. Raceways, equipment, and boxes Carrying Circuits at 1000 V or Less:

1. 120/208 Volt Power: White letters on a black field.
2. 277/480 Volt Power – White letters on blue
3. 120/208 Volt emergency Power: Black letters on a red field (Use dark orange if AHJ objects)
4. 277/480 Volt Power – Blue letters on red field (Use dark orange if AHJ objects)
5. Fire Alarm: White on red.
6. Legend: Indicate system or service and voltage, if applicable.

B. Cable Colors

1. Color must be factory applied and field applied tape for sizes larger than 4 AWG.
2. Colors for 208Y/120 V Circuits:
   a. Phase A: Black.
   b. Phase B: Red.
   c. Phase C: Blue.
   d. Neutral: White
   e. Ground: Green
   f. Isolated Ground: Green with yellow stripe
3. Colors for 480Y/277 V Circuits:
   a. Phase A: Brown.
   b. Phase B: Orange.
   c. Phase C: Yellow.
   d. Neutral: Gray
   e. Ground: Green
   f. Isolated Ground: Green with yellow stripe
4. Travellers: Purple

C. Raceways and Cables Carrying Circuits at More Than 1000 V:

1. Black letters on orange field.
2. Legend: "DANGER - CONCEALED HIGH VOLTAGE WIRING."

D. Junction Box Colors. Paint all junction boxes

1. 277 Volt Normal: Brown
2. 120 Volt Normal: Black
3. 277 Volt emergency: Darkest Orange or Red as allowed by code authority
4. 120 Volt Normal: Dark Orange or Red as allowed by code authority
5. Fire Alarm: Red
6. Intercom/Clock: Gray
7. Data/Phone: Blue
8. Television: White
9. Sound: Purple
10. Security: Yellow
11. In addition indicate with pen the system type, circuit, and voltage for power junction boxes

2.3 LABELS, TAGS, BANDS, SIGNS, AND WARNING LABELS

A. Comply with NFPA 70 and 29 CFR 1910.145

B. Labels

1. Vinyl Wraparound Labels: Preprinted, flexible labels laminated with clear, weather- and chemical-resistant coating and matching wraparound clear adhesive tape for securing label ends.
2. Snap-Around Labels: Slit, pretensioned, flexible, preprinted, color-coded acrylic sleeves, with diameters sized to suit diameters and that stay in place by gripping action.
3. Self-Adhesive Wraparound Labels: Write-on, 3 mil (0.08 mm) thick, polyester or vinyl flexible label with acrylic pressure-sensitive adhesive.
4. Self-Lamination: Clear; UV-, weather- and chemical-resistant; self-laminating, protective shield over legend. Labels sized such that clear shield overlaps entire printed legend.
5. Marker for Labels:
    a. Permanent, waterproof, black ink marker recommended by tag manufacturer.
    b. manufacturer.
6. Self-Adhesive Labels: Polyester or Vinyl, thermal, transfer-printed, 3 mil (0.08 mm) thick, multicolor, weather- and UV-resistant, pressure-sensitive adhesive labels, configured for intended use and location.
7. Minimum Nominal Size:
    a. 1-1/2 by 6 inch (37 by 150 mm) for raceway and conductors.
    b. 3-1/2 by 5 inch (76 by 127 mm) for equipment.
    c. As required by authorities having jurisdiction.

C. Bands and Tubes

1. Snap-Around, Color-Coding Bands: Slit, pretensioned, flexible, solid-colored acrylic sleeves, 2 inch (50 mm) long, with diameters sized to suit diameters and that stay in place by gripping action.

2. Heat-Shrink Preprinted Tubes: Flame-retardant polyolefin tubes with machine-printed identification labels, sized to suit diameter and shrunk to fit firmly. Full shrink recovery occurs at maximum of 200 deg F (93 deg C). Comply with UL 224.

D. Tapes and Stencils

1. Marker Tapes: Vinyl or vinyl-cloth, self-adhesive wraparound type, with circuit identification legend machine printed by thermal transfer or equivalent process.

2. Self-Adhesive Vinyl Tape: Colored, heavy duty, waterproof, fade resistant; not less than 3 mil (0.08 mm) thick by 1 to 2 inch (25 to 50 mm) wide; compounded for outdoor use.

3. Tape and Stencil: 4 inch (100 mm) wide black stripes on 10 inch (250 mm) centers placed diagonally over orange background and are 12 inch (300 mm) wide. Stop stripes at legends.

4. Underground-Line Warning Tape:

a. Tape:

1) Recommended by manufacturer for method of installation and suitable to identify and locate underground electrical and communications utility lines.

2) Printing on tape must be permanent and may not be damaged by burial operations.

3) Tape material and ink must be chemically inert and not be subject to degradation when exposed to acids, alkalis, and other destructive substances commonly found in soils.

4) Color and Printing:

a) Comply with APWA Uniform Color Code using NEMA Z535.1 safety colors.

b) Inscriptions for Red Tapes: "CAUTION BURIED ELECTRIC LINE BELOW" or for over 600V. "CAUTION BURIED HIGH VOLTAGE ELECTRIC LINE BELOW"

c) Inscriptions for Orange Tapes: CAUTION BURIED FIBER OPTIC LINE BELOW" OR "CAUTION BURIED COMMUNICATION LINE BELOW".

5. Tape:

a. Pigmented polyolefin, bright colored, [continuous-printed on one side with inscription of utility,]compounded for direct-burial service.

b. Width: 3 inch (75 mm).

c. Thickness: 4 mil (0.1 mm).

d. Weight: 18.5 lb/1000 sq. ft (9.0 kg/100 sq. m).

e. Tensile in accordance with ASTM D882: 30 lbf (133.4 N) and 2500 psi (17.2 MPa).

E. Tags

1. Metal Tags: Brass or aluminum, 2 by 2 by 0.05 inch (50 by 50 by 1.3 mm), with stamped legend, punched for use with self-locking cable tie fastener.

F. Signs

1. Baked-Enamel Signs:

a. Preprinted aluminum signs, punched or drilled for fasteners, with colors, legend, and size required for application.

b. 1/4 inch (6.4 mm) grommets in corners for mounting.

c. Nominal Size: 7 by 10 inch (180 by 250 mm).

2. Metal-Backed Butyrate Signs:

a. Weather-resistant, nonfading, preprinted, cellulose-acetate butyrate signs, with 0.0396 inch (1 mm) galvanized-steel backing, punched and drilled for fasteners, and with colors, legend, and size required for application.

b. 1/4 inch (6.4 mm) grommets in corners for mounting.

c. Nominal Size: 10 by 14 inch (250 by 360 mm).

3. Laminated Acrylic or Melamine Plastic Signs:

a. Engraved legend.

b. Thickness:

1) For signs up to 20 sq. inch (129 sq. cm), minimum 1/16 inch (1.6 mm) thick.

2) For signs larger than 20 sq. inch (129 sq. cm), 1/8 inch (3.2 mm) thick.

3) Punched or drilled for mechanical fasteners with 1/4 inch (6.4 mm) grommets in corners for mounting

4) Framed with mitered acrylic molding and arranged for attachment at applicable equipment.

G. Cable Ties

1. General-Purpose Cable Ties: Fungus inert, self-extinguishing, one piece, self-locking, and Type 6/6 nylon.

a. Minimum Width: 3/16 inch (5 mm).

b. Tensile Strength at 73 deg F (23 deg C) in accordance with ASTM D638: 12,000 psi (82.7 MPa).

c. Temperature Range: Minus 40 to plus 185 deg F (Minus 40 to plus 85 deg C).

d. Color: Black, except where used for color-coding.

2. UV-Stabilized Cable Ties: Fungus inert, designed for continuous exposure to exterior sunlight, self-extinguishing, one piece, self-locking, and Type 6/6 nylon.

a. Minimum Width: 3/16 inch (5 mm).

b. Tensile Strength at 73 deg F (23 deg C) in accordance with ASTM D638: 12,000 psi (82.7 MPa).

c. Temperature Range: Minus 40 to plus 185 deg F (Minus 40 to plus 85 deg C).

d. Color: Black.

3. Plenum-Rated Cable Ties in all plenums: Self-extinguishing, UV stabilized, one piece, and self-locking.

a. Minimum Width: 3/16 inch (5 mm).

b. Tensile Strength at 73 deg F (23 deg C) in accordance with ASTM D638: 7000 psi (48.2 MPa).

c. UL 94 Flame Rating: 94V-0.

d. Temperature Range: Minus 50 to plus 284 deg F (Minus 46 to plus 140 deg C).

e. Color: Black.

2.4 MISCELLANEOUS IDENTIFICATION PRODUCTS

A. Wiring Device Labels

1. Label all wiring devices with panel and circuit number with clear dymo label with black letters for normal power, red letters for emergency power.

2. At Wiring devices in black pen on inside of box indicated panel, voltage, and circuit numbers in the box.

B. Panel Directory

1. Directory: Provide typewritten circuit directory on the inside of each panel door under plastic cover, identifying the type and location of every load. At lighting and receptacle circuits, indicate room numbers and names. All room numbers shall be as furnished by the Owner. All replaced or modified panels shall be provided with new directories.

2. Identification: Spare circuits will be identified as such in pencil. Permanent room numbers, as furnished by owner, shall be used for location identification.

3. Paint: Comply with requirements in painting Sections for paint materials and application requirements. Retain paint system applicable for surface material and location (exterior or interior).

4. Fasteners for Labels and Signs: Self-tapping, stainless steel screws or stainless steel machine screws with nuts and flat and lock washers.

C. Ceiling Tile Labels

1. Where equipment is above an accessible ceiling label the ceiling T or ceiling panel if T is not available.

a. Label shall be clear dymo label indicating equipment description

PART 3 EXECUTION

3.1 IDENTIFICATION SCHEDULE

A. Label the following equipment

1. Panelboards: Typewritten directory of circuits in location provided by panelboard manufacturer. Panelboard identification must be in form of self-adhesive, engraved, laminated acrylic or melamine label.

2. Enclosures and electrical cabinets.
3. Access doors and panels for concealed electrical items.
4. Switchboards.
5. Transformers: Label that includes tag designation indicated on Drawings for transformer, feeder, and panelboards or equipment supplied by secondary.
6. Emergency system boxes and enclosures.
7. Motor-control
8. Enclosed switches.
9. Enclosed circuit breakers.
10. Enclosed controllers and starters.
11. Variable-speed controllers.
12. Push-button stations.
13. Power-transfer equipment.
14. Generator
15. Contactors.
16. Lighting Control Devices
17. Remote-controlled switches, dimmer modules, and control devices.
18. Battery-inverter units.
19. Monitoring and control equipment.
20. UPS equipment.
21. Label the following Division 27 and 28 equipment per their specifications
    a. Communications/Intercom Equipment
    b. Communications/Data and Telephone
    c. Communications/Emergency Responder
    d. Communications/Audio Visual
    e. Other communications systems
    f. Access Control Equipment
    g. Security Systems equipment
    h. Fire alarm equipment
    i. Video Surveillance Equipment

B. Install identification materials and devices at locations for most convenient viewing without interference with operation and maintenance of equipment. Install access doors or panels to provide view of identifying devices.

C. Identify conductors, cables, and terminals in enclosures and at junctions, terminals, pull points, and locations of high visibility. Identify by system and circuit designation.

D. Specific Label Types

1. Cable Identification: For cables in vaults, pull and junction boxes, and handholes, use vinyl wraparound labels or self-adhesive vinyl tape to identify cable type and voltage where appropriate

2. Cable Identification at Lighting Control, Communications, and ESS: Provide vinyl wraparound labels or self-adhesive vinyl tape to identify cable type, destination, and circuit where appropriate at all control devices

3. Future Boxes, Conduits, and Circuits: Attach write-on tags or hand mark cable, conduit, or box as the stub location and future purpose

4. Spare Boxes, Conduits, and Circuits: Attach write-on tags or hand mark cable, conduit, or box as the stub location and future purpose

5. Conduit Stubs (Used, Spare, and Future): Attach write-on tags or hand mark cable, conduit, or box as the stub location and future purpose

6. Future Stub out locations underground: Mark with 20” x 4” concrete marker block labeled with size, destination and purpose of stub

7. Conduits in Handholes: Label all conduits with destination with hand marker

8. Concealed and Accessible Raceways, Duct Banks, More Than 600V, within Buildings: Tape and stencil. Stencil legend "DANGER - CONCEALED HIGH-VOLTAGE WIRING" with 3 inch (75 mm) high, black letters on 20 inch (500 mm) centers. Locate identification at changes in direction, at penetrations of walls and floors, and at 10 ft (3 m)

9. Accessible Raceways and Metal-Clad Cables, 600V or Less, for Service, Feeder, and Branch Circuits, More Than 30A: Identify with self-adhesive raceway labels. Locate identification at changes in direction, at penetrations of walls and floors, at 50 ft (15 m) maximum intervals in straight runs, and at 25 ft (7.6 m) maximum intervals in congested areas.

10. Locations of Underground Lines: Underground-line warning tape for power, lighting, communication, and control wiring and optical-fiber cable.

11. Instructional Signs: Baked-enamel warning signs or Metal-backed, butyrate

12. Warning Labels for Cabinets, Boxes, and Enclosures for Power and Lighting: Baked-enamel warning signs or Metal-backed, butyrate warning signs.

    a. Apply to exterior of door, cover, or other access.

    b. For equipment with multiple power or control sources, apply to door or cover of equipment, including, but not limited to, the following:

        1) Power-transfer switches.

        2) Controls with external control power connections.

13. Arc Flash Warning Labeling: Self-adhesive labels.

14. Instruction Signs: Baked-enamel warning signs, Metal-backed, butyrate warning signs, or Laminated acrylic or melamine plastic signs

15. Emergency Operating Instruction Signs: Baked-enamel warning signs, Metal-backed, butyrate warning signs, or Laminated acrylic or melamine plastic signs with white legend on red background with minimum 3/8 inch (10 mm) high letters

E. Equipment Identification Labels: Equipment: Self-adhesive label

3.2 PREPARATION

A. Self-Adhesive Identification Products: Before applying electrical identification products, clean substrates of substances that could impair bond, using materials and methods recommended by manufacturer of identification product.

3.3 INSTALLATION

A. Verify and coordinate identification names, abbreviations, colors, and other features with requirements in other Sections requiring identification applications, Drawings, Shop Drawings, manufacturer's wiring diagrams, and operation and maintenance manual. Use consistent designations throughout Project.

B. Install identifying devices before installing acoustical ceilings and similar concealment.

C. Verify identity of item before installing identification products.

D. Coordinate identification with Project Drawings, manufacturer's wiring diagrams, and operation and maintenance manual.

E. Apply identification devices to surfaces that require finish after completing finish work.

F. Install signs with approved legend to facilitate proper identification, operation, and maintenance of electrical systems and connected items.

G. System Identification for Raceways and Cables under 1000 V: Identification must completely encircle cable or conduit. Place identification of two-color markings in contact, side by side.

1. Secure tight to surface of conductor, cable, or raceway.

H. System Identification for Raceways and Cables over 1000 V: Identification must completely encircle cable or conduit. Place adjacent identification of two-color markings in contact, side by side.

1. Secure tight to surface of conductor, cable, or raceway.

I. Auxiliary Electrical Systems Conductor Identification: Identify field-installed alarm, control, and signal connections.

J. Vinyl Wraparound Labels:

1. Secure tight to surface of raceway or cable at location with high visibility and accessibility.

2. Attach labels that are not self-adhesive type with clear vinyl tape, with adhesive appropriate to location and substrate.

K. Snap-Around Labels: Secure tight to surface at location with high visibility and accessibility.

L. Self-Adhesive Wraparound Labels: Secure tight to surface at location with high visibility and accessibility.

M. Self-Adhesive Labels:

1. Install unique designation label that is consistent with wiring diagrams, schedules, and operation and maintenance manual.

2. Unless otherwise indicated, provide single line of text with 1/2 inch (13 mm) high letters on 1-1/2 inch (38 mm) high label; where two lines of text are required, use labels 2 inch (50 mm) high.

N. Snap-Around Color-Coding Bands: Secure tight to surface at location with high visibility and accessibility.

O. Heat-Shrink, Preprinted Tubes: Secure tight to surface at location with high visibility and accessibility.

P. Marker Tapes: Secure tight to surface at location with high visibility and accessibility.

Q. Self-Adhesive Vinyl Tape: Secure tight to surface at location with high visibility and accessibility.

1. Field-Applied, Color-Coding Conductor Tape: Apply in half-lapped turns for minimum distance of 6 inch (150 mm) where splices or taps are made. Apply last two turns of tape with no tension to prevent possible unwinding.

R. Tape and Stencil: Comply with requirements in painting Sections for surface preparation and paint application.

S. Underground Line Warning Tape:

1. During backfilling of trenches, install continuous underground-line warning tape directly above cable or raceway at 6 to 8 inch (150 to 200 mm) below finished grade. Use multiple tapes where width of multiple lines installed in common trench [or concrete envelope]exceeds 16 inch (400 mm) overall.

2. Install underground-line warning tape for direct-buried cables and cables in raceways.

T. Metal Tags:

1. Place in location with high visibility and accessibility.

U. Write-on Tags:

1. Place in location with high visibility and accessibility.

V. Baked-Enamel Signs:

1. Attach signs that are not self-adhesive type with mechanical fasteners appropriate to location and substrate.

2. Unless otherwise indicated, provide single line of text with 1/2 inch (13 mm) high letters on minimum 1-1/2 inch (38 mm) high sign; where two lines of text are required, use signs minimum 2 inch (50 mm) high.

W. Metal-Backed Butyrate Signs:

1. Attach signs that are not self-adhesive type with mechanical fasteners appropriate to location and substrate.

2. Unless otherwise indicated, provide single line of text with 1/2 inch (13 mm) high letters on 1-1/2 inch (38 mm) high sign; where two lines of text are required, use labels 2 inch (50 mm) high.

X. Laminated Acrylic or Melamine Plastic Signs:

1. Attach signs that are not self-adhesive type with mechanical fasteners appropriate to location and substrate.

2. Unless otherwise indicated, provide single line of text with 1/2 inch (13 mm) high letters on 1-1/2 inch (38 mm) high sign; where two lines of text are required, use labels 2 inch (50 mm) high.

Y. Cable Ties: General purpose, for attaching tags, except as listed below:

1. Outdoors: UV-stabilized nylon.

2. In Spaces Handling Environmental Air: Plenum rated.

END OF SECTION

SECTION 26 05 73 – POWER SYSTEMS PROTECTIVE DEVICE STUDY

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:

1. System coordination study for normal systems.

2. Short circuit study for normal and emergency systems.

3. Protective device calibration and setting to achieve coordination.

4. Arc fault study per NEC 70E or entire system. Provide an Arc Flash Hazard Study for the electrical distribution system shown on the one-line drawings. The intent of the Arc Flash Hazard Study is to determine hazards that exist at each major piece of electrical equipment shown on the one-line drawings. This includes switchgear, switchboards, panelboards, motor control centers, automatic transfer switches, VFD's, and transformers. The study will include creation of Arc Flash Hazard warning labels. These labels serve as a guide to assist technicians and others in the selection of proper personal protective equipment when working around exposed and energized conductors. Electrical contractor shall install the labels.

5. The system coordination engineer must include a statement in the front of the study stating that Selective Coordination has been provided to meet NEC 700.27. The report shall have the coordination engineer's stamp on the cover page.

6. Contractor shall provide all changes including transformers, fuses, wire size and conduit size changes required by the coordination engineer.

1.2 SCOPE

A. It is the intent of these tests to assure that protective devices are operational, correctly applied, within industry and manufacturer's tolerances, and installed in accordance with the specifications. This effort should minimize the damage caused by any electrical failure. The testing agency shall verify that the electrical system and electrical equipment configuration matches the contract documents, vendor shop drawings, and the electric system coordination study recommended settings.

B. Prepare a coordination study for the specific electrical overcurrent devices and feeder lengths, to be installed under this project, from the primary overcurrent protective device to the branch circuit breaker panels to assure proper equipment and personnel protection.

C. The study shall present an organized time-current analysis of each protective device in series from the individual device back to the source at Puget Sound Energy. The study shall reflect the operation of each device during normal and abnormal current conditions, and confirm that devices are coordinated.

D. The study shall coordinate the emergency system to meet NEC 700, 701, and 702. The system shall selectively coordinate to comply with all requirements of 700.27 and 701.18. all equipment provided under Panels, Switchboards, Circuit Breakers, Fusing, Controllers, etc. shall be designed and provided by the contractor to comply with the selective coordination requirements of the code. Study shall be completed and accepted by the engineer prior to ordering any equipment.

E. Provide arc fault/flash study per NFPA 70E.

F. Study shall be stamped by the coordination study engineer with a Professional Engineer's stamp from the State of Washington

G. Report shall not be submitted until complete compliance with NEC 700.27 is complete. Contractor shall provide all devices as directed in the coordination study.

H. Coordination Study Engineer report and stamp states that the coordination engineer is stating that the system complies with NEC 700.27 and 701.18.

1.3 APPLICABLE CODES, STANDARDS AND REFERENCES

A. Inspection and tests shall be in accordance with the following codes and standards except as provided otherwise herein:

1. American National Standards Institute ANSI C2: National Electrical Safety Code

2. American Society for Testing and Materials – ASTM

3. Association of Edison Illuminating Companies – AEIC

4. Institute of Electrical and Electronic Engineers – IEEE

5. Insulated Cable Engineers Association – ICEA

6. International Electrical Testing Association NETA Maintenance Testing Specifications MTS- 1989

7. National Electrical Manufacturer's Association – NEMA

8. National Fire Protection Association – NFPA

a. ANSI/NFPA 70: National Electrical Code

b. ANSI/NFPA 70B: Electrical Equipment Maintenance

c. NFPA 70E: Electrical Safety Requirements for Employee Workplaces

d. ANSI/NFPA 78: Lightning Protection Code

e. ANSI/NFPA 101: Life Safety Code

f. NFPA 70E

9. Occupational Safety and Health Administration – OSHA

10. State and local codes and ordinances

1.4 SUBMITTALS

A. Submit the following in accordance with Division 01:

1. Protective equipment shop drawings with the protective device study. The one-line diagram showing available fault currents and timing of devices shall be submitted both as hard copies and as two electronic copies of Autocad drawings on Compact Disc. Two electronic copies of both the Dapper and Captor software files shall be provided on Compact Disc. An index shall be provided which cross references the file names on these disks to the specific pieces of equipment or system.

2. Certifications: Two weeks prior to final inspection, the Contractor shall deliver four copies of the following certifications to the Owner's representative:

a. That the protective devices have been adjusted and set in accordance with the approved protective device study.

b. That tests and settings have been witnessed by the Owner.

c. Report of results.

3. Short circuit study in conjunction with, and at the same time as, the submittal for Panelboards. The study shall show fault currents available at key points in the system down to a fault current of 7000A. The purpose of this submittal is to verify the fault current ratings of the panelboards.

1.5 QUALIFICATIONS

A. The coordination study shall be prepared by qualified engineers of the switchgear manufacturer or an approved consultant. Provide pertinent information required by the preparers to complete the study.

B. The short circuit study and coordination study shall be performed on the Dapper and Captor computer software packages. No substitutions.

C. Preapproved: Electrotest, Power Systems Engineering, Siemens Engineering Service Division, Square D, GE.

PART 2 EXECUTION

2.1 REQUIREMENTS

A. The complete study shall include a system one line diagram, short circuit and ground fault analysis, and protective coordination plots.

B. One-Line Diagram:

1. Show, on the one line diagram, electrical equipment wiring to be protected by the overcurrent devices installed under this project. Clearly show, on the one line, the schematic wiring of the electrical distribution system.

2. Show reference nodes on the one line diagram referring to a formal report, to include the following specific information:

a. X/R ratios, utility contribution, and short circuit values (asymmetric and symmetric) at the bus of the main switchboard, and all downstream equipment containing overcurrent devices.

b. Breaker and fuse ratings.

c. Transformer KVA and voltage ratings, percent impedance, X/R ratios, and wiring connections.

d. Voltage at each bus.

e. Identifications of each bus.

f. Conduit material, feeder sizes, and length.

g. Calculated short circuit current.

C. Short Circuit Study:

1. Determine the available 3 phase short circuit and ground fault currents at each bus. Incorporate the motor contribution in determining the momentary and interrupting ratings of the protective devices.

2. The study shall be calculated by means of the Dapper computer software package. Pertinent data and the rationale employed in developing the calculations shall be incorporated in the introductory remarks of the study.

3. Present the data determined by the short circuit study in a table or report format. Include:

a. Device identification.

b. Operating voltage.

c. Protective device.

d. Device rating.

e. Calculated 3 phase short circuit current (asymmetrical and symmetrical), and ground fault current.

D. Coordination Curves:

1. Prepare the coordinations curves to determine the required settings of protective devices to assure selective coordination. Graphically illustrate on log-log paper that adequate time separation exists between existing and supplied series devices. Plot the specific time-current characteristics of each protective device in such a manner that all upstream devices will be clearly depicted on one sheet.

2. The following specific information shall also be shown on the coordination curves:

a. Device identifications.

b. Time and current ratio for curves.

c. ANSI damage points for each transformer.

d. Complete fuse curves.

e. Cable damage curves.

f. Transformer inrush points.

g. Maximum short circuit cutoff point.

3. Develop a table to summarize the settings selected for the protective devices. Include in the table the following:

a. Device identification.

b. Tap, time delay, and instantaneous pickup.

c. Circuit breaker sensor rating, long-time, short-time, and instantaneous settings, and time bands.

d. Fuse rating and type.

e. Ground fault pickup and time delay.

4. Provide electronic copies of the Captor Data files on two Compact Discs. Provide a cross reference between the data file names and the hard copy tables and reports.

2.2 ANALYSIS

A. Analyze the short circuit calculations, and highlight any equipment that is determined to be underrated as specified or not coordinated. Propose approaches to effectively protect the underrated equipment. Proposed major corrective modifications will be taken under advisement by the Owner and further instructions will be given.

B. After developing the coordination curves, highlight areas lacking coordination. Present a technical evaluation with a discussion of the logical compromises for best coordination.

2.3 ADJUSTMENTS, SETTINGS AND MODIFICATIONS

A. Accomplish necessary field settings, adjustments and minor modifications to conform with the study without additional cost to the Owner. (Examples of minor modifications are trip sizes within the same frame, the time curve characteristics of induction relays, ranges etc.)

2.4 FIELD INFORMATION

A. Gather field information needed for the protective device study.

END OF SECTION

SECTION 26 09 23 – LIGHTING CONTROL SYSTEM

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:

1. System Software Interfaces.

2. System Backbone and Integration Equipment.

3. Wired Networked Devices for relay panels or only where shown on drawings.

4. Wireless Networked Devices provided with power for all instances except noted..

B. Hybrid wireless system, power to all devices, no batteries allowed

C. System shall be fixture based wireless controls in 90% of fixtures to meet Washington State Energy Code

1.2 DEFINITIONS

A. Data Bus: A wired interface used to communicate with connected devices.

B. Device: A collective term for bus or wireless connected devices, including fluorescent ballasts, LED drivers, incandescent luminaires, manual switches, switching relays, sensors, and similar.

C. Global: Communication between devices in otherwise separate spaces using a bridging device or system controller.

D. Group: A set of devices that communicate together.

E. Monitoring: Acquisition, processing, communication, and display of equipment status data, metered electrical parameter values, power quality evaluation data, event and alarm signals, tabulated reports, and event logs.

F. Scene: Digital light level associated with a preset.

G. System Backbone: Devices used to connect and manage otherwise separate spaces, including bridging devices and gateways or system controllers. Used to expose devices to software configuration via TCP/IP.

1.3 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site

B. Preinstallation Coordination Meeting(s): For digital-network lighting controls. Conduct meeting(s) at Project site

1. Attendees: Installers, fabricators, representatives of manufacturers, and administrants for field tests and inspections. Notify Architect of scheduled meeting dates.

2. Engage factory-authorized service representative to attend preinstallation conference and review the submittal drawing, sequence of operation, and device installation best practices with Project team.

1.4 SUBMITTALS

A. Product Data:

1. Bill of Materials necessary to install the networked lighting control system.

2. Product Specification Sheets indicating general device descriptions, dimensions, electrical specifications, wiring details, and nomenclature.

3. Information Technology (IT) connection information pertaining to interconnection with facility IT networking equipment and third-party systems.

4. Other Diagrams and Operational Descriptions - as needed to indicate system operation or interaction with other system(s).

B. Shop Drawings:

1. Riser Diagrams showing device wiring connections of system backbone and typical per room/area type.

C. Contractor Startup/Commissioning Worksheet.

D. Service Specification Sheets indicating general service descriptions, including startup, training, post-startup support, and service contract terms.

E. Field quality-control reports.

F. Sample Warranty: For manufacturer's special warranty.

1.5 CLOSEOUT SUBMITTALS

A. Maintenance Contracts:

1. Hardware and Software Operation Manuals

2. Maintenance service agreement.

3. Software service agreement.

B. Warranty documentation.

1.6 QUALITY ASSURANCE

A. Manufacturer Qualifications:

1. Phone Support: Toll-free technical support available from manufacturer through an online tool to schedule a technical support appointment and provide 24/7 emergency support.

2. Remote Support: Manufacturer capable of providing remote support and ability to virtually connect with customers to address issues with visual guidance overlaid on images of real-world objects.

3. Cellular Connectivity: Manufacturer capable of cellular connectivity to a networked lighting control systems available to provide remote support within the continental United States.

4. On-Site Support: Manufacturer capable of providing a 72-hour, on-site response time within the continental United States.

5. Service Contracts: Manufacturer capable of providing service contracts for continued on-site and remote support of the lighting control system post-installation for terms up to 10 years from substantial completion, including:

    a. Remote and on-site emergency response.

    b. Remote system performance checks.

    c. Remote diagnostics.

    d. Replacement parts.

1.7 WARRANTY

A. Warranty: Manufacturer and Installer warrant that installed lighting control devices perform in accordance with specified requirements and agree to repair or replace, including labor, materials, and equipment, devices that fail to perform as specified within extended warranty period.

1. Failures include, but are not limited to, the following:

    a. Faulty operation of lighting control hardware.

    b. Faulty operation of lighting control firmware.

2. Minimum Warranty Period: Five years from date of shipment.

PART 2 PRODUCTS

2.1 MANUFACTURER

A. Specification is based on Nlight or equal by Avi-On, Cooper Lighting Controls, or Wattstopper/Encelium

2.2 SYSTEM COMPLIANCE

A. System components manufactured in accordance with UL 916 and UL 924 standards where applicable.

B. System components manufactured in accordance with CFR Title 47, Part 15 standards where applicable.

C. System components manufactured in accordance with ISED Canada RSS-247 standards where applicable.

D. System components manufactured in accordance with IFT-008-2015 and NOM-208-SCFI-2016 standards where applicable.

E. System listed as qualified under DesignLights Consortium Networked Lighting Control System Specification v5.0.

F. Performance Criteria:

1. Regulatory Requirements:

a. Listed and labeled in accordance with NFPA 70, by qualified electrical testing laboratory recognized by authorities having jurisdiction, and marked for intended location and application.

2.3 SYSTEM PERFORMANCE REQUIREMENTS

A. System Architecture:

1. System architecture based upon the following concepts:

a. Networkable intelligent lighting control devices.

2. Intelligent lighting control devices with individually addressable network communication capability and having one or more basic lighting control components including: occupancy sensor, photosensor, relay, dimming output, contact closure input, analog 0-10 V(dc) input, and manual wall station capable of indicating switching, dimming, and/or scene control. Combining one or more of these components into a single device enclosure permissible to minimize overall system device count.

3. System capable of interfacing directly with networked luminaires such that either low-voltage network cabling or wireless RF communication is used to interconnect networked luminaires with control components such as sensors, switches, and system backbone.

4. Networked luminaires and intelligent lighting control devices support individual (unique) configuration of device settings and properties, with such configuration residing within the networked luminaires and intelligent control devices.

5. Lighting control zones consisting of one or more networked luminaires and intelligent lighting control devices capable of providing automatic control from sensors (occupancy and/or photosensor) and manual control from local wall stations without requiring connection to a higher-level system backbone.

a. Lighting control zones (wired and wireless) support at least 128 devices per zone.

b. Capable of being networked with a higher-level system backbone to provide time-based control, control from inputs or systems external to control zone, and remote configuration and monitoring through a software interface.

6. Networked luminaires and intelligent lighting control devices with distributed intelligence programming stored in non-volatile memory, such that following any loss of power the lighting control zones operate according to their defined default settings and sequence of operations.

7. System to include one or more system controllers that provide time-based control.

8. System controller provides means of connecting the lighting control system to a system software interface and building management systems via BACnet/IP or BACnet MS/TP protocol.

9. System controller supports both low-voltage wired and wireless RF communication within a single controller device.

10. System devices support firmware update, either remotely or from within the application space, for purposes of upgrading functionality at a later date.

11. System capable of reporting lighting system events and performance data to management software for display and analysis.

B. Wired Networked Control Zone Characteristics:

1. Connections to devices within a wired networked lighting control zone and to backbone components accomplished with a single type of low-voltage network cable

2. Devices connected in "daisy-chain" topology. "Hub-and-spoke" topology, requiring all individual networked devices to be connected to a central component, is unacceptable, to reduce the total amount of network cable required for each control zone.

3. Following proper installation and provision of power, all networked devices connected with low-voltage network cable must automatically form a functional lighting control zone without requiring any type of programming, regardless of the programming mechanism (e.g. software application, handheld remote, pushbutton).

   a. The "out of box" default sequence of operation is intended to provide typical sequence of operation to minimize the system startup and programming requirements and to also have functional lighting control operation prior to system startup and programming.

4. System software capable of automatic discovery of all connected devices without requiring any provisioning of system or zone addresses.

5. Networked devices capable of detecting improper communication wiring and LED notification to alert installation/startup personnel.

6. Networked control devices suitable for control of egress or emergency light sources without additional, externally mounted UL 924 shunting or 0-10 V(dc) disconnect devices, to provide a compliant sequence of operation while reducing the overall installation and wiring costs of the system. Capable of supporting the following sequence of operation:

   a. Low-Voltage Power Sensing: Devices automatically provide 100 percent light level upon detection of loss of power sensed via low-voltage network cable connection where applicable.

   b. Line-Voltage Power Sensing: Devices listed as UL 924 emergency relays which automatically close load-control relay and provide 100 percent light output upon detection of loss of power sensed via line voltage connection to normal power.

7. Global Control Zones: Networked luminaires and intelligent lighting control devices located in different areas able to transmit and track information within at least 128 system-wide control zones to support required sequences of operation that may span multiple areas. Occupancy, photosensor inhibit, and switch commands available across multiple controllers.

8. Wired Networked Wall Station Scene-Control Capabilities:

   a. Preset Scenes that activate a specific combination of light levels across multiple local and global channels.

   b. Local Profile Support: Profile Scenes that modify the sequence of operation for devices in the area (group) in response to a button press to dynamically optimize occupant experience and lighting energy usage.

1) Wall stations able to manually start and stop local profiles, or local profile capable of ending after a specific duration of time between five minutes and 12 hours.

2) Configurable Parameters:

a) Fixture light level.

b) Occupancy time delay.

c) Response to occupancy sensors (including enabling/disabling response).

d) Response to daylight sensors (including enabling/disabling response).

e) Enabling/disabling wall stations.

a. Three-Way or Multi-Way Control: Multiple wall stations capable of controlling the same local and global control zones, to support "multi-way" preset scene and profile scene control.

C. Wireless Networked Control Zone Characteristics:

1. No wired connections between networked devices required for the purposes of system communications.

2. Multiple wireless networking protocols supported:

a. Standards-based, distributed star topology type of protocol for 900 MHz communication, to support lighting control applications and IoT applications.

b. Bluetooth standard protocol for 2.4 GHz communication that supports direct connection to smartphone or tablet, to support device configuration, control applications, and IoT without requiring the use of a system backbone.

3. Wireless network must be self-healing, such that the loss of backbone or local communication between devices does not result in the loss of local control of lights in the space.

4. Wireless network communication must support uniform and instant response such that all luminaires in a lighting control zone respond immediately and synchronously in response to a sensor or wall station signal.

5. Communication of control signals from sensors and wall stations to networked luminaires and wireless load-control devices occur directly, without any communication, interpretation, or translation of information through a backbone device such as a wireless access point, communication bridge, or gateway.

6. All wireless communication between lighting control components supports the following five tiers of security measures.

a. Data encryption.

b. Firmware protection.

c. Tamper-proof hardware.

d. Authenticated user access.

e. Mutual device authentication.

7. Wireless devices use AES encryption to secure communication with a unique encryption key generated for each programmed site.

8. Wireless devices use signed firmware to ensure that unmodified, authentic software is always installed.

9. Wireless networked devices capable of communicating a minimum distance of 150 ft. (45 m) between devices under typical site conditions accounting for typical environmental conditions and building construction materials encountered within commercial indoor lighting environments.

10. Minimum Line-of-Sight Communication Range: 1000 ft. (304 m) under ideal environmental conditions.

11. Wireless devices self-identify when communication to system controller cannot be accomplished or when communication to the system controller is lost.

    a. Self-identification not required for wireless switches or battery-powered devices.

12. Wireless devices self-establish connection to system controller through other devices if direct communication cannot be accomplished or when communication to system controller is lost.

    a. Communication path formation to utilize existing, wireless networked devices located between system controller and respective end devices.

    b. No additional hardware for formation of networked communication path between a system controller and end devices required.

    c. Automatic connection not required for wireless switches or battery-powered devices.

13. Networked control devices suitable for control of egress or emergency light sources without additional, externally mounted UL 924 shunting or 0-10 V(dc) disconnect devices, to provide a compliant sequence of operation while reducing the overall installation and wiring costs of the system. Capable of supporting the following sequence of operation:

    a. Line-Voltage Power Sensing: Devices listed as UL 924 emergency relays that automatically close load-control relay and provide 100 percent light output upon detection of loss of power sensed via line voltage connection to normal power.

    b. Normal-Power-Broadcast Sensing: Devices listed as UL 924 emergency relays that automatically close load-control relay and provide 100 percent light output upon loss of a wireless normal-power broadcast from devices connected to normal power.

D. System Integration Capabilities:

1. Capable of interface with third-party building management systems (BMS) to support two-way communication using BACnet/IP protocol, BACnet MS/TP protocol, and RESTful API including the following system integration capabilities:

    a. "Write" messages for control of individual devices, including control of relay and dimming output.

b. "Write" messages for control of groups of devices through a single command, including control of relay and dimming output of all devices.

c. "Read" messages for individual device status information.

1) Available status will vary based on device type and capabilities, which may include relay state, dimming output, power measurement, occupancy sensor status, and photosensor light measurement.

d. "Read" messages for group status information for occupancy, relay state, and dimming output.

e. Activation of pre-defined system Global Profiles.

E. Supported Sequence of Operations:

1. Control Zones:

a. Local Control Zones: Networked luminaires and intelligent lighting control devices installed in an area (also referred to as a group of devices) capable of transmitting and tracking occupancy sensor, photosensor, and manual switch information within at least 48 unique control zones to support different and reconfigurable sequences of operation within area. These will also be referred to as local control zones.

b. Adjacent Control Zones: Networked luminaires and intelligent lighting control devices capable of tracking occupancy broadcasts from adjacent zones. When this feature is enabled, luminaire output for a vacant zone will reduce to a configurable dimmed state if one or more adjacent zones are occupied. Luminaires will turn off when both primary and adjacent zones are vacant.

c. Global Control Zones: Networked luminaires and intelligent lighting control devices located in different areas able to transmit and track information within at least 128 system-wide control zones to support required sequences of operation that may span across multiple areas. Occupancy, photosensor inhibit, and switch commands available across multiple controllers.

2. Wall Station Capabilities:

a. Wall stations support the following capabilities:

1) On/Off of a local or global control zone.

2) Continuous dimming control of light level of a local or global control zone.

b. Multi-Way Control: Multiple wall stations capable of controlling the same local or global control zones, to support "multi-way" switching and dimming control.

3. Occupancy Sensing Capabilities:

a. Occupancy sensors configurable to control a local or global zone.

b. Multiple occupancy sensors capable of controlling the same local or global zones. This capability combines occupancy sensing coverage from multiple sensors without consuming multiple control zones.

c. Occupancy sensing sequence of operation modes:

1) On/Off Occupancy Sensing.

2) Partial-On Occupancy Sensing.

3) Partial-Off Occupancy Sensing.

4) Vacancy Sensing (Manual-On / Automatic-Off).

d. On/Off, Partial-On, and Partial-Off Occupancy Sensing Modes Sequence of Operation:

1) Occupancy automatically turn lights on to a designated level when occupancy is detected. Designated occupied light level support at least 100 dimming levels.

2) Occupancy sensors automatically turn lights off or to a dimmed state (Partial-Off) when vacancy occurs or if sufficient daylight is detected. Designated unoccupied dim level support at least 100 dimming levels.

3) System capable of combining Partial-Off and Full-Off operation by dimming lights to a designated level when vacant and turning the lights off completely after an additional time delay.

4) Photosensor readings, if enabled in occupancy sensing control zone, automatically adjust light levels during occupied or unoccupied conditions as necessary.

5) Wall station activation changes the dimming level or turn lights off as selected by the occupant. Lights optionally remain in this manually specified light level until the zone becomes vacant. Upon vacancy, normal sequence of operation resumes.

e. Vacancy Sensing or Manual-On/Automatic-Off Mode Sequence of Operation:

1) Activation of a wall station is required turn lights on. System capable of programming the zone to turn on to either a designated light level or previous user-set light level. Initially occupying the space without using a wall station must not result in lights turning on.

2) Occupancy sensors automatically turn lights off or to a dimmed state (Partial-Off) when vacancy occurs or if sufficient daylight is detected. Designated unoccupied dim level support at least 100 dimming levels.

3) System capable of dimming the lights when vacant and then turning the lights off completely after an additional time delay.

4) System capable of an "automatic grace period" immediately following detection of vacancy, during which time any detected occupancy results in the lights reverting to the previous level. After the grace period has expired, the use of a wall station is required to turn lights on.

5) Photosensor readings, if enabled in the Occupancy Sensing control zone, capable of automatically adjusting the light level during occupied or unoccupied conditions as necessary.

6) Wall station interaction changes the dimming level or turn lights off as selected by occupant. Lights remain at manually specified light level until

zone becomes vacant; normal sequence of operation resumes upon vacancy.

f. Occupancy time delays before dimming or shutting off lights separately programmable for all control zones from 15 seconds to 2 hours.

4. Photosensor Sensing Capabilities (Automatic Daylight Sensing):

a. Photosensor devices configurable to control a local zone.

b. Photosensor-Based Control:

1) Continuous Dimming: Control zone automatically adjusts dimming output in response to photosenor readings, to maintain a minimum light level consisting of both electric light and daylight sources. Photosensor response configurable to adjust set point and dimming rates.

5. Schedule Capabilities:

a. System capable of time schedules for time-of-day to override devices including offsets from dusk and dawn.

b. System capable of providing a visible "blink warning" five minutes prior to the end of the schedule.

c. Wall stations may be programmed to provide timed extensions/overrides that turn the lights on for an additional time period.

1) Timed override/extension duration programmable for each individual device, zone of devices, or customized group of devices, from five minutes to 12 hours.

6. Global Profile Capabilities:

a. System capable of automatically modifying the sequence of operation for selected devices in response to any of the following:

1) Time-of-day schedule.

2) Contact closure input state.

3) Manually triggered wired wall station input.

4) RS-232/RS-485 command to wired input device.

5) BACnet input command.

b. Global Profile Capabilities:

1) Global Profiles stored within and executed from the system controller (via internal timeclock). Dedicated software host or server is not required to be online to support automatic scheduling and/or operation of Global Profiles.

2) Global Profile time-of-day schedules capable of recurrence settings including daily, specific days of week, every "n" number of days, weekly, monthly, and yearly. Lighting control global profile schedules support definition of start date, end date, end after "n" recurrences, or never ending.

3) Daylight savings time adjustments capable of being performed automatically, if desired.

4) Global Profile holiday schedules follow recurrent settings for specific U.S. holiday dates regardless if they always occur on a specific date or are determined by day/week of the month.

5) Global Profiles capable of being scheduled to run according to timed offsets relative to sunrise or sunset. Sunrise/sunset times automatically derived from location information using an astronomical clock.

6) Software management interface capable of displaying a graphic calendar view of profile schedules for each control zone.

7) Global Profiles capable of manual activation directly from system controller, specially programmed wired input devices, scene-capable wired wall stations, and software management interface.

8) Global Profiles selectable to apply to a single device, zone of devices, or customized group of devices.

9) Global Profile Configurable Parameters:

a) Fixture light level.

b) Occupancy time delay.

c) Response to occupancy sensors (including enabling/disabling response).

d) Response to daylight sensors (including enabling/disabling response).

e) Enabling/disabling of wall stations.

c. Local and Global Profiles backed up and stored on software's host server such that Profile backup can be applied to a replacement system controller or wired wall station.

7. System supports automated demand response capabilities with automatic reduction of light level to at least three levels of demand response, configurable for each output device.

2.4 SYSTEMS SOFTWARE INTERFACES

A. Management Interface:

1. Web-based management interface for remote system control, live status monitoring, and configuration of lighting control settings and schedules.

2. Compatible with industry-standard web browser clients.

3. Minimum of 100 unique password-protected user accounts.

4. Minimum of three user permission levels: read-only, read and change settings, and full administrative system access.

5. Capable of restricting access for user accounts to specific devices within the system.

6. All system devices capable of being given user-defined names.

7. Device identification information displayed in the Management interface including:

    a. Model number.

    b. Model description.

    c. Serial number or network ID.

    d. Manufacturing date code.

    e. Custom label.

    f. Parent network device.

8. Management interface capable of displaying live status of a networked luminaire or intelligent control device including:

    a. Luminaire on/off status.

    b. Dim level.

    c. Power consumption.

    d. Device temperature.

    e. PIR occupancy sensor status.

    f. Microphonic occupancy sensor status.

    g. Remaining occupancy time delay.

    h. Photosensor reading.

    i. Active Profiles.

9. Management interface capable of displaying and modifying the current active settings of a networked luminaire or intelligent control device including:

    a. Dimming trim levels.

    b. Occupancy sensor and photosensor enable/disable.

    c. Occupancy sensor time delay and light level settings.

    d. Occupancy sensor response (normal or vacancy).

    e. Photosensor setpoints and transition time delays.

10. Management interface capable of applying settings changes for a zone of devices or a group of selected devices using a single action that does not require the user to apply settings changes for each individual device.

11. Management interface capable of compiling a printable network inventory report.

12. Management interface capable of compiling a printable report detailing all system profiles.

13. All sensitive information stored encrypted.

14. System software updates available for automatic download and installation via the Internet.

B. System Energy Analysis and Reporting:

1. Intuitive graphical screens to facilitate simple viewing of system energy performance.

2. Energy Scorecard: Summarized display that indicates calculated energy savings in dollars or KWh.

3. Software calculates allocation of energy savings by control measures including occupancy sensors, photosensors, and manual switching.

4. Energy savings data calculated for the system as a whole.

5. Time-scaled graph showing all relay transitions.

6. Time-scaled graph showing zone occupancy time delays.

7. Time-scaled graph showing the total light level.

8. Software capable of storing information remotely onto an open-source, object-relational database, such as PostgreSQL.

9. Data stored in the database will be accessed utilizing an open standard, application programming interface, such as Open Database Connectivity (ODBC).

C. Visualization and Programming Interfaces:

1. System provides an optional web-based visualization interface that displays a graphical floorplan.

2. Graphical floorplan will offer the following types of system visualization:

a. Full Device Option: Master graphic of entire building, by floor, showing each control device installed with zones outlined including:

1) Controls embedded light fixtures.

2) Controls devices not embedded in light fixtures.

3) Daylight sensors.

4) Occupancy sensors.

5) Wall switches and dimmers.

6) Scene controllers.

7) Networked relays.

8) Wired bridges.

9) System Controllers.

10) Wired relay panels.

11) Group outlines.

b. Group-Only Option: Master graphic of the entire building, by floor, showing only control groups outlined.

c. Pan and zoom commands supported to allow smaller areas to be displayed on a larger scale simply by panning and zooming each floor's master graphic.

d. Selecting any control device displays the following as applicable:

1) Device catalog number.

2) Device name and custom label.

3) Device diagnostic information.

4) Link to further information on device including status or current configuration.

3. Programming capabilities through the application will include the following:

a. Switch, occupancy sensor, and photosensor zone configuration.

b. Manual-on or automatic-on modes.

c. Turn-on and dim to dimming levels.

d. Occupancy sensor time delays and PIR sensitivity.

e. Dual technology occupancy sensors sensitivity.

f. Photosensor calibration adjustment and auto-setpoint.

g. Multiple photosensor zone offset.

h. Trim level settings.

i. Preset scene creation and copy for scene-capable devices.

j. Application of custom device labels to the Bluetooth Low-Energy Programming Devices and individual connected lighting control devices.

k. Fade rate settings.

D. Smartphone Programming Interface for Wired and Wireless Devices:

1. Interface provided for both Apple iOS and Android operating systems that allows configuration of lighting control settings.

2. Application supports configuration of wireless networked control devices.

a. Application access granted with valid user name and password.

b. Access to program information governed by permission system that allows users to share access with other users and restrict access to those who should not be able to reconfigure the equipment.

c. Indication of signal strength where multiple Bluetooth Low-Energy Programming Devices are available for configuration.

3. Application supports configuration or wired networked control devices.

    a. Connected device access granted through user-defined passcode at initial install.

    b. Indication of signal strength where multiple Bluetooth Low-Energy Programming Devices are available for configuration.

4. Programming Capabilities:

    a. Switch, occupancy sensor, and photosensor group configuration.

    b. Manual-on or automatic-on modes.

    c. Turn-on and dim to dimming levels.

    d. Occupancy sensor time delays and PIR sensitivity.

    e. Dual technology occupancy sensors sensitivity.

    f. Photosensor calibration adjustment and auto-setpoint.

    g. Multiple photosensor zone offset.

    h. Trim level settings.

    i. Preset scene creation.

    j. Application of custom device labels for individual connected lighting control devices.

    k. Fade rate settings.

2.5 SYSTEM BACKBONE AND SYSTEM INTEGRATION EQUIPMENT

A. System Controller: Multi-tasking, real-time digital control processor consisting of modular hardware with plug-in enclosed processors, communication controllers, and power supplies.

1. System Controller Processor: 32-bit microprocessor operating at a minimum of 1 GHz.

2. System Controller Memory: Minimum of 512MB memory, with a minimum of 4GB non-volatile flash, to support operating system and databases.

3. System Controller Functions:

    a. Time-based control of downstream wired and wireless network devices.

    b. Linking into an Ethernet network.

    c. Integration with Building Management Systems (BMS) and Heating, Ventilation and Air Conditioning (HVAC) equipment.

    d. Connection to various software interfaces, including management interface, historical database and analytics interface, and visualization interface.

4. Integral web server to support system controller configuration and diagnostics

    a. Web Server Control Interface:

        1) Display associated devices within the context of a graphical floorplan.

2) Provide control of output-capable devices through virtual sliders, toggle buttons, preset level widgets, and transparent layers on floorplan.

3) Control Capabilities:

a) Control of individual output devices, including control of relay state and analog dimming level where applicable.

b) Control of local lighting control zones, including control of relay state and analog dimming level where applicable.

c) Control of global lighting control zones, including control of relay state and analog dimming level where applicable.

d) Control of Global Profiles.

5. Minimum of three RJ-45 networked lighting control ports for connection to any of the following:

6. Device will automatically detect all network-connected devices.

7. Capable of managing and operating a minimum of 750 networked devices (wired or wireless) per system controller.

8. Multiple System Controllers capable of connection via LAN for scalability to a minimum of 20,000 networked devices.

9. Supports BACnet/IP and BACnet MS/TP protocols to directly interface with BMS and HVAC equipment without additional protocol translation gateways.

a. BACnet MS/TP Connection Speed: 9600 to 115200 baud rate.

b. BACnet Testing Laboratory (BTL listed) using Device Profile BACnet Building Controller (B-BC) with outlined enhanced features.

10. Integral FIPS 140-2, Level 1 cryptographic module.

11. Supports RESTful API for control of BACnet objects, user management, date and time, and file management.

12. NEMA 1 enclosure with Class 1 and Class 2 separation.

a. Power Supply Voltage: 120 to 277V(ac).

13. Automatic algorithm to eliminate redundant, wireless networked paths to streamline communication between the system controller and end devices.

14. System Controller Security Provisions:

a. Disallow the use of default passwords and require passwords to be updated prior to use.

b. Support user role-based access, such as administrator, user, and viewer.

c. Signed firmware to ensure that unmodified, authentic software is always installed.

d. IP-based communication protected with strong encryption algorithms such as AES or TLS1.2+.

e. Prevent rollback of firmware to firmware versions with known, critical vulnerabilities.

f. Valid cybersecurity listing through a third party.

2.6 WIRED NETWORKED DEVICES

A. Wired Networked Wall Switches

1. Mounting: Suitable for installation in single-gang switch box.

2. Communication and low-voltage power delivered via standard low-voltage network cabling with RJ-45 connectors.

3. All switches detect valid communication and blink a unique LED pattern to visually indicate a potential wiring issue.

4. Devices with mechanical push buttons provide tactile and LED user feedback.

5. Devices with mechanical push buttons manufactured with custom button labeling.

6. Wall switch and dimmer options:

a. Control Types Supported:

1) On/Off.

2) On/Off/Dimming.

3) On/Off/Dimming/Correlated Color Temperature Control for specific luminaire types.

b. Color: Per 262726

B. Wall Switch Occupancy Sensor: WSXA or equal

C. Exterior photocell input to relay panel

D. Wired Networked Relay Panel:

1. Outputs: 16 Individual relays per pane

2. Field Configurable Relays (FCR):

a. Field configurable to operate in single-, double-, or triple-pole relay groupings.

b. Field configurable to operate as normally closed or normally open.

c. Provides visual status of current state and manual override control of each relay.

d. Minimum Relay Contact Ratings:

1) 40 A at 120-480 V(ac) Ballast.

2) 16 A at 120-277 V(ac) Electronic.

3) 20 A at 120-277 V(ac) Tungsten.

4) 20 A at 48V (dc) Resistive.

5) 2 HP at 120 V(ac).

6) 3 HP at 240-277 V(ac).

7) 65kA SCCR at 480 V(ac).

3. Dimming Output Rating: Minimum of 100 mA sink current per dimming output.

4. Relay and dimming outputs individually programmable.

5. Listing: UL 924 for control of emergency lighting circuits.

6. Low-Voltage Sensor Input:

a. Configurable to support any of the following input types:

1) Indoor Photosensor.

2) Outdoor Photosensor.

3) Occupancy Sensor.

4) Contact Closure.

b. Low-voltage sensor input provides 24 V(dc) power for sensor so additional auxiliary power supplies are not required.

c. Sensor input supports all standard sequence of operations.

7. Integrated Digital Time Clock for local schedule control.

8. Panel supplies current limited low-voltage power to other networked devices connected via low-voltage network cable.

9. Enclosure:

a. Enclosure Rating: NEMA 1. Divide emergency circuits

b. Surface mount with switch adjacent

2.7 WIRELESS NETWORKED DEVICES

A. Wireless Networked Wall Switches, Dimmers:

1. Mounting: Suitable for installation in single-gang switch box.

2. Wireless Communication:

a. Dual 900 MHz IEEE 802.15.4 based and 2.4 GHz, Version 4.0+ Bluetooth.

b. Security: AES-128 bit.

3. Power Supply: [120 to 277 V(ac)

4. Mechanical push buttons provide tactile and LED user feedback during button press.

5. Mechanical push buttons available with custom button labeling.

6. Wall Switches and Dimmer Options:

   a. Control Types Supported: On/Off and On/Off/Dimming.

7. Scene Switch Options:

   a. Control Types Supported: On/Off, On/Off/Dimming, and Preset Level Scene Type.

8. Color: Pe 262726

B. Wireless Networked Embedded Fixture Control Devices:

1. Wireless Communication:

   a. Dual 900 MHz IEEE 802.15.4 based and 2.4 GHz, Version 4.0+ Bluetooth.

   b. Security: AES-128 bit.

2. Power Supply: Standard low-voltage wiring typically associated with an LED driver.

3. Suitable for installation within a luminaire such that the control device is not visible on the luminaire face.

4. Devices available with integrated and remote antennas such that devices can be installed within sealed container without detriment to wireless strength.

5. Power loss detection, where unit powers and controls the emergency circuit. Loss of wireless broadcasts from a dedicated normal-power-connected device forces unit to shunt closed, go to full bright, and ignore all system commands until main power is restored.

C. Wireless Networked Indoor Load Controllers with Occupancy and Photosensors:

1. Wireless Communication:

   a. Dual 900 MHz IEEE 802.15.4 based and 2.4 GHz, Version 4.0+ Bluetooth.

   b. Security: AES-128 bit.

2. Detect the presence of human activity within space and fully control the on/off function of lights.

3. Utilizes passive infrared (PIR) technology, which detects occupant motion, to initially turn lights on from an off state, thus preventing false on conditions. Ultrasonic and Microwave-based sensing technologies are unacceptable.

4. Dual technology sensors used in locations where a second method of sensing is necessary to adequately detect maintained occupancy (such as in rooms with obstructions).

5. Dual technology sensors must have one sensing technology not motion dependent to detect occupancy. Acceptable dual technology includes PIR/Microphonics (also known as Passive Dual Technology or PDT), which detects both occupant motion and sounds indicating occupants. Sensors where both technologies detect motion (PIR/Ultrasonic) are unacceptable.

6. All sensing technologies are acoustically passive, meaning they do not transmit sound waves of any frequency (for example in the Ultrasonic range), as these technologies have the potential for interference with other electronic devices within the space (such as electronic white board readers and hearing devices). Acceptable detection technologies include Passive Infrared (PIR) and/or Microphonic technology. Ultrasonic and Microwave-based sensing technologies are unacceptable.

7. Sensor programming parameters available and configurable remotely.

8. Ceiling, fixture, and junction box mounted sensors available, with multiple lens options available customized for specific applications.

9. Integral daylight photosensor for programmable daylight harvesting.

10. Photosensor includes adjustable illumination set-point and dead band to prevent the artificial light from cycling. Set-point and dead band capable of automatically calibrating through an "Automatic Set-Point Programming" procedure. Min and max dimming settings and set-point may be manually entered or modified.

11. Dead band setting verified and modified by the sensor automatically every time the lights cycle to accommodate physical changes in the space (i.e., furniture layouts, lamp depreciation, or lamp outages).

12. Power loss detection, where unit powers and controls the emergency circuit. Loss of wireless broadcasts from a dedicated normal-power-connected device forces unit to shunt closed, go to full bright, and ignore all system commands until main power is restored.

13. Power Monitoring: Integral current measurements on output with 3 percent accuracy when measuring loads 225 mA or greater.

D. Wireless Networked Indoor Occupancy and Photosensors:

1. Wireless Communication:

   a. Dual 900 MHz IEEE 802.15.4 based and 2.4 GHz, Version 4.0+ Bluetooth.

   b. Security: AES-128 bit.

2. Detect the presence of human activity within space and fully control the on/off function of lights.

3. Utilizes passive infrared (PIR) technology, which detects occupant motion, to initially turn lights on from an off state, thus preventing false on conditions. Ultrasonic and Microwave-based sensing technologies are unacceptable.

4. Dual technology sensors used in locations where a second method of sensing is necessary to adequately detect maintained occupancy (such as in rooms with obstructions).

5. Dual technology sensors must have one sensing technology not motion dependent to detect occupancy. Acceptable dual technology includes PIR/Microphonics (also known as Passive Dual Technology or PDT), which detects both occupant motion and sounds indicating occupants. Sensors where both technologies detect motion (PIR/Ultrasonic) are unacceptable.

6. All sensing technologies acoustically passive, meaning they do not transmit sound waves of any frequency (for example in the Ultrasonic range), as these technologies have the potential for interference with other electronic devices within the space (such as electronic white board readers and hearing devices). Acceptable detection technologies include Passive Infrared (PIR), and/or Microphonic technology. Ultrasonic and Microwave-based sensing technologies are unacceptable.

7. Sensor programming parameters available and configurable remotely.

8. Ceiling, fixture, and junction box mounted sensors available, with multiple lens options available customized for specific applications.

9. Dry Contact Output: One integrated dry contact switching relay, capable of switching 100 mA at 24 V, resistive only.

10. Integral daylight photosensor for programmable daylight harvesting.

11. Photosensor includes adjustable illumination set-point and dead band to prevent the artificial light from cycling. Set-point and dead band capable of automatically calibrating through an "Automatic Set-Point Programming" procedure. Min and max dimming settings and set-point may be manually entered or modified.

12. Dead band setting verified and modified by the sensor automatically every time the lights cycle to accommodate physical changes in the space (i.e., furniture layouts, lamp depreciation, or lamp outages).

E. Wireless Networked Indoor Embedded Sensors:

1. Wireless Communication:

   a. Dual 900 MHz IEEE 802.15.4 based and 2.4 GHz, Version 4.0+ Bluetooth.

   b. Security: AES-128 bit.

2. Sensors consisting of occupancy sensors and dimming photosensor suitable for installation within a luminaire such that only the lens is visible on luminaire face.

3. Power Supply: Standard low-voltage wiring typically associated with an LED driver.

4. Devices available with integrated and remote antennas such that devices can be installed within sealed container without detriment to wireless strength.

5. Detect the presence of human activity within space and fully control the on/off function of lights.

6. Dual Technology Sensor, which detects occupant motion, to initially turn lights on from an off state, thus preventing false on conditions.

7. Sensors detect valid communication and blink a unique LED pattern to visually indicate a potential issue.

8. Sensor programming parameters available and configurable remotely.

9. Available with multiple lens options available for various mounting heights.

10. Integral daylight photosensor for programmable daylight harvesting.

11. Photosensor includes adjustable illumination set-point and dead band to prevent artificial light from cycling. Set-point and dead band capable of automatically calibrating through an "Automatic Set-Point Programming" procedure. Min and max dimming settings and set-point may be manually entered or modified.

12. Dead band setting verified and modified by sensor automatically every time lights cycle to accommodate physical changes in space (i.e., furniture layouts, lamp depreciation, or lamp outages).

13. Power loss detection, where unit powers and controls the emergency circuit. Loss of wireless broadcasts from a dedicated normal-power-connected device forces unit to shunt closed, go to full bright, and ignore all system commands until main power is restored.

F. Wireless Networked Power Packs:

1. Wireless Communication:

a. Dual 900 MHz IEEE 802.15.4 based and 2.4 GHz, Version 4.0+ Bluetooth.

b. Security: AES-128 bit.

2. Plenum rated.

3. Supply Voltage: 120 to 277V(ac).

4. Relay Output: Class 1 relay rated for 20 A and 1.5 HP at 120 to 277 V(ac) and 5 A and 0.5 HP at 480 V(ac).

5. Dimming Output: 0-10 V(dc).

6. Sink Current: 150 mA at 0-10 V(dc).

7. Antenna Type: Integrated

8. Programming parameters available and configurable remotely.

9. Mounting: Integral 1/2-inch (16-mm) chase nipple. Plastic clips into junction box are unacceptable.

10. Power Packs Options:

a. Power Pack capable of full 20-Amp switching of all normal power lighting load types, with optional 0-10V dimming output capable of up to 150 mA of sink current.

b. Power Packs capable of full 20-Amp switching of general purpose receptacle (plug-load) control.

c. Listing: UL 924 for control of emergency lighting circuits, field configurable for two distinct sequence of operation:

1) Power sense of normal power feed, where unit powers and controls emergency circuit, and loss of the normal power sense circuit forces the power pack to shunt closed, go to full bright, and ignore all system commands until normal power is restored.

2) Power loss detection, where unit powers and controls the emergency circuit. Loss of wireless broadcasts from a dedicated normal-power-connected device forces unit to shunt closed, go to full bright, and ignore all system commands until main power is restored.

d. Power Monitoring: Integral current measurements on output with 3 percent accuracy when measuring loads 425] mA or greater.

G. Wireless Networked Communication Adapter:

1. Wireless Communication:

a. Dual 900 MHz IEEE 802.15.4 based and 2.4 GHz, Version 4.0+ Bluetooth.

b. Security: AES-128 bit.

2. Capable of supporting a minimum of 750 networked wireless devices per adapter.

3. Interface: USB connection.

4. Ingress Protection: Minimum IP66.

5. Mounting: Integral 1/2-inch (16-mm) chase nipple. Minimum 16 ft. (4.8 m) USB cable and optional cable extenders for remote mounting.

H. Spare Parts

1. Fixture Embedded Sensors – 2 per type

2. Wall Switches, 2, 4 button and 2, 6 button

3. Plug load Controller: 2

4. Fixture Controller: 2

PART 3 EXECUTION

3.1 INSTALLATION OF WIRING

A. Wiring Method: Comply with Section 260519 "Low-Voltage Electrical Power Conductors and Cables" and Section 260523 "Control-Voltage Electrical Power Cables." Minimum conduit size is 1/2 inch (13 mm).

1. Comply with requirements for cable trays specified in Section 260536 "Cable Trays for Electrical Systems."

2. Comply with requirements for raceways and boxes specified in Section 260533.13 "Conduits for Electrical Systems," and Section 260533.16 "Boxes and Covers for Electrical Systems,"

B. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Install lacing bars and distribution spools.

3.2 IDENTIFICATION

A. Identify system components, wiring, cabling, boxes, cabinets, and terminals. Comply with identification requirements specified in Section 260553 "Identification for Electrical Systems."

B. Identify field-installed conductors, interconnecting wiring, and components; install warning signs complying with Section 260553 "Identification for Electrical Systems."

C. Identify all controls with device address.

D. Label each device cable within 6 inch (152 mm) of connection to bus power supply or termination block.

3.3 FIELD QUALITY CONTROL

A. Acceptance Testing Preparation:

1. Test continuity of each circuit.

B. Tests and Inspections: Engage a factory-authorized service representative to perform test inspections.

1. Test each zone using local and remote control hardware.

2. Perform each visual and mechanical inspection and electrical test stated in NETA ATS. Certify compliance with test parameters.

C. Nonconforming Work:

1. Lighting controls will be considered defective if they do not pass tests and inspections.

2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.

D. Field Test Reports: Prepare field test reports.

1. Prepare functionality and inspection reports, including a certified report that identifies controls included and describes test results. Include notation of deficiencies detected, remedial action taken, and observations made after remedial action.

2. Include list of all points created from actual tests of all addressed control points for lamps, ballasts, manual controls, and sensors.

3.4 REMOTE ACCESS

A. Digital network lighting control system capable of remote access by manufacturer with the following features:

1. System diagnostics including detection of fault condition in hardware or connected devices.

2. Access to all connected devices for complete programming including scheduling of time-of-day events and device parameters necessary to meet required sequence of operations.

3. Browser-based interface to verify system functionality.

4. On-demand access to manufacturer technical support for remote troubleshooting, diagnostics, configuration, and programming.

5. Owner training on the digital network lighting control system available remotely.

B. Remote access system fully functional over commercial cellular connection or Internet-connected ethernet network.

C. All hardware associated with remote access including cellular modem and cellular antenna are to remain on-site regardless of warranty or cellular contract status.

3.5 SYSTEM STARTUP

A. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks in accordance with manufacturer's published instructions.

2. Activate luminaires and verify that all maximum output levels match output levels detailed in an Owner-approved sequence of operations.

3. Confirm correct communications wiring, initiate communications between control devices and controller/gateways, and program the lighting control system in accordance with approved configuration schedules, time-of-day schedules, and input override assignments.

4. Program network devices to meet required sequence of operations.

5. Program and verify all sequence of operations.

6. Create backup of system programming.

7. Assist in installation of system software on customer-provided workstation or server.

8. Verify bidirectional communication of manufacturer-provided cellular router with manufacturer-managed remote access portal.

B. Commissioning Walkthrough: Collaborate with third-party commissioning agent to demonstrate lighting control system functionality and verify the system meets the specified Project requirements.

3.6 CLOSEOUT ACTIVITIES

A. Enhanced Documentation: Engage lighting system manufacturer to provide comprehensive system documentation including detailed programming, sequence of operation data per Project specifications, and related code requirements.

B. Training: Engage lighting system manufacturer to provide comprehensive system overview, software overview, and documentation relating to system operation and maintenance.

3.7 PROTECTION

A. After installation, protect digital network lighting controls from construction activities. Remove and replace items that are contaminated, defaced, damaged, or otherwise caused to be unfit for use prior to acceptance by Owner.

3.8 MAINTENANCE

A. Engage a factory-authorized service representative to perform on-site system adjustments.

1. On-Site Occupancy Adjustments: When requested within 12 months from date of Substantial Completion, provide on-site settings adjustments to suit actual occupied

conditions. Provide up to 2 visits to Project during other-than-normal occupancy hours for this purpose.

2. Prepare and submit report after each visit that details activities performed.

3. Prepare and submit report after each session that details activities performed.

END OF SECTION

SECTION 26 22 00 – LOW-VOLTAGE TRANSFORMERS

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes: Distribution, dry-type transformers with nominal primary and secondary rating of 600 V and less, with capacities up to 1500 kVA.

1.2 SUBMITTALS

Action submittals are submittals requiring responsive action and return of reviewed documents to Contractor.

A. Product Data:

1.3 DELIVERY, STORAGE, AND HANDLING

A. Inspection: On receipt, inspect for and note shipping damage to packaging and transformer.

1. If manufacturer packaging is removed for inspection, and transformer will be stored after inspection, re-package transformer using original or new packaging materials that provide protection equivalent to manufacturer's packaging.

B. Storage: Store in warm, dry, and temperature-stable location in original shipping packaging.

C. Temporary Heating: Apply temporary heat in accordance with manufacturer's published instructions within enclosure of ventilated-type units, throughout periods during which equipment is not energized and when transformer is not in space that is continuously under normal control of temperature and humidity.

D. Handling: Follow manufacturer's instructions for lifting and transporting transformers.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Federal Pacific or alternate approved equal

1. Schneider Electric, Eaton, ABB/GE, and Siemens are approved if they can meet the nosie levels specified below.

B. Source Limitations: Obtain each type of transformer from single source from single manufacturer.

2.2 GENERAL TRANSFORMER REQUIREMENTS

A. Description: Factory-assembled and -tested, air-cooled units for 60 Hz service.

B. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with NFPA 70, by qualified electrical testing laboratory recognized by authorities having jurisdiction, and marked for intended location and application.

C. Comply with 10 CFR 431 (DOE 2016) efficiency levels.

D. Marked as compliant with DOE 2016 efficiency levels by qualified electrical testing laboratory recognized by authorities having jurisdiction.

E. Comply with all Washington State Energy Code requirements. Chart below indicates minimum but not limted to current energy code requirements. Transformer shall meet current energy code requirements if they exceed standards below.

MINIMUM NOMINAL EFFICIENCY LEVELS FOR 10 CFR 431 LOW VOLTAGE DRY-TYPE DISTRIBUTION TRANSFORMERS		Three Phase Transformers	
Single Phase Transformers			
kVAa	Efficiency (%)b	kVAa	Efficiency (%)b
15	97.70	15	97.89
25	98.00	30	98.23
37.5	98.20	45	98.40
50	98.30	75	98.60
75	98.50	112.5	98.74
100	98.60	150	98.83
167	98.70	225	98.94
250	98.80	300	99.02
333	98.90	500	99.14
750		99.23	
1000		99.28	

2.3 TRANSFORMERS

A. Manufacturer: Federal Pacific or alternate approved equal

B. Comply with NFPA 70 and list and label as complying with UL 1561

C. Low-Sound-Level Requirements: Maximum sound levels when factory tested in accordance with IEEE C57.12.91, as follows:

1. Up to 300 KVA: 36 dB(A-weighted)
2. Over 300 KVA: 42 dB(A-weighted)

D. Cores: Electrical grade, non-aging silicon steel with high permeability and low hysteresis losses. One leg per phase.

E. Coils: Continuous windings without splices except for taps.

1. Coil Material: Aluminum or Copper.

2. Internal Coil Connections: Brazed or pressure type.

3. Terminal Connections: Welded or bolted.

F. Enclosure: Ventilated with no other openings to not require 1 hour rating of room per NEC.

1. Core and coil must be encapsulated within resin compound to seal out moisture and air. One leg per phase. Fungus proof

2. KVA Ratings: Based on convection cooling only and not relying on auxiliary fans.

3. Wiring Compartment: Sized for conduit entry and wiring installation.

4. Environmental Protection:

   a. Indoor: UL 50E, Type 2

   b. Outdoor: UL 50E, Type 3R

5. Finish Color: Gray weather-resistant enamel.

G. Taps for Transformers Two 2.5 percent taps above and four 2.5 percent taps below normal full capacity.

H. Insulation Class,

1. Smaller Than 30 kVA: 180 deg C, UL-component-recognized insulation system with maximum of 115 deg C rise above 40 deg C ambient temperature.

2. 30 kVA and Larger: 220 deg C, UL-component-recognized insulation system with maximum of 150 deg C rise above 40 deg C ambient temperature.

I. Load Rating: Transformers shall be capable of operating at 100% of nameplate rating continuously while in an ambient temperature not exceeding 40°C. Transformers 5 kVA and larger shall be capable of meeting the daily overload requirements of ANSI Standard C57.12.

J. Vibration Isolation: Each transformer core and coil shall be mounted in the transformer enclosure on rubber vibration isolators. Vibration isolators shall limit the transmission of sound from the 120 Hz harmonic to 10% of its unisolated level, and shall certified as such on the Shop Drawings.

K. Grounding: Provide ground-bar kit or ground bar installed on inside of transformer enclosure. Provide isolated ground bar where shown. Bond neutral to ground per NEC separately derived system

L. K-Factor Rating: Transformers shall be K13 rated and must comply with UL 1561 requirements for non-sinusoidal load current-handling capability to degree defined by designated K-factor.

1. Unit may not overheat when carrying full-load current with harmonic distortion corresponding to designated K-factor, without exceeding indicated insulation class in 40 deg C maximum ambient and 24-hour average ambient of 30 deg C.

2. Indicate value of K-factor on transformer nameplate.

3. Unit must comply with requirements of DOE 2016 efficiency levels when tested in accordance with NEMA TP 2 with K-factor equal to one.

M. Mounting

1. Provide Korfund VMC Type NRC isolators on all transformers unless more stringent requirements shown in 260548.

2. Wall Brackets where shown: Manufacturer's standard brackets

2.4 IDENTIFICATION

A. Nameplates: Engraved, laminated-acrylic or melamine plastic signs for distribution transformers, mounted with corrosion-resistant screws. Nameplates and label products are specified in Section 260553"

2.5 SOURCE QUALITY CONTROL

A. Factory Tests and Inspections: Test and inspect assembled system, by, or under supervision of, qualified electrical testing laboratory recognized by authorities having jurisdiction, in accordance with IEEE C57.12.01 and IEEE C57.12.91 before delivering to site. Affix label with name and date of manufacturer's or qualified electrical testing laboratory's certification of system compliance on control units.

1. Resistance measurements of windings at rated voltage connections and at tap connections.

2. Ratio tests at rated voltage connections and at tap connections.

3. Phase relation and polarity tests at rated voltage connections.

4. No load losses, and excitation current and rated voltage at rated voltage connections.

5. Impedance and load losses at rated current and rated frequency at rated voltage connections.

6. Applied and induced tensile tests.

7. Regulation and efficiency at rated load and voltage.

8. Insulation-Resistance Tests:

a. Line-side to ground.

b. Load-side to ground.

c. Line-side to load-side.

9. Temperature tests.

10. Factory Sound-Level Tests: Conduct sound-level tests on equipment for this Project and confirm ratings

B. Nonconforming Work:

1. System equipment that does not pass tests and inspections will be considered defective.

C. Prepare test and inspection reports.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine conditions for compliance with enclosure- and ambient-temperature requirements for transformers.

B. Verify that field measurements are as needed to maintain working clearances required by NFPA 70 and manufacturer's published instructions.

C. Examine walls, floors, roofs, and concrete bases for suitable mounting conditions where transformers will be installed.

D. Verify that ground connections are in place and requirements in Section 260526 have been met. Maximum ground resistance must be 5 Ω at location of transformer.

E. Environment: Enclosures must be rated for environment in which they are located. Covers for UL 50E, Type 4X enclosures may not cause accessibility problems.

F. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install wall-mounted transformers level and plumb with wall bracket. Coordinate installation of wall-mounted and structure-hanging supports with actual transformer provided. Brace wall-mounted transformers as specified in Section 260548

B. Install transformers level and plumb on concrete base with vibration-dampening supports. Locate transformers away from corners and not parallel to adjacent wall surface.

C. Construct concrete bases and anchor floor-mounted transformers over 45 KVA in accordance with manufacturer's published instructions, seismic requirements applicable to Project, and requirements in Section 260529

1. Coordinate size and location of concrete bases with actual transformer provided. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified with concrete.

D. Secure transformer to concrete base in accordance with manufacturer's published instructions.

E. Secure covers to enclosure and tighten bolts to manufacturer-recommended torques to reduce noise generation.

F. Remove shipping bolts, blocking, and wedges.

3.3 CONNECTIONS

A. Ground equipment in accordance with Section 260526 "

B. Bond neutral to ground per NEC separately derived system

C. Connect wiring in accordance with Section

D. Tighten electrical connectors and terminals in accordance with manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B.

E. Provide flexible connections at conduit and conductor terminations and supports to eliminate sound and vibration transmission to building structure.

3.4 FIELD QUALITY CONTROL

A. Tests and Inspections:

1. Dry-Type Transformer Field Tests:

a. Visual and Mechanical Inspection.

1) Inspect physical and mechanical condition.

2) Inspect anchorage, alignment, and grounding.

3) Verify that resilient mounts are free and that shipping brackets have been removed.

4) Verify that unit is clean.

5) Perform specific inspections and mechanical tests recommended by manufacturer.

6) Verify that as-left tap connections are as specified.

7) Verify presence of surge arresters and that their ratings are as specified.

b. Electrical Tests:

1) Verify correct secondary voltage, phase-to-phase and phase-to-neutral, after energization and prior to loading.

3.5 ADJUSTING

A. Record transformer secondary voltage at unit for at least 48 hours of typical occupancy period. Adjust transformer taps to provide optimum voltage conditions at secondary terminals. Optimum is defined as not exceeding nameplate voltage plus 5 percent and not being lower than nameplate voltage minus 3 percent at maximum load conditions. Submit recording and tap settings as test results.

B. Output Settings Report: Prepare written report recording output voltages and tap settings.

3.6 CLEANING

A. Vacuum dirt and debris; do not use compressed air to assist in cleaning.

END OF SECTION

SECTION 26 24 13 – SWITCHBOARDS

PART 1 GENERAL

1.1 SUMMARY

A. Scope: Provide labor, material, equipment, related services, and supervision required, including, but not limited to, manufacturing, fabrication, configuration and installation for low voltage switchboards (SWBDs) as required for the complete performance of the Work, as shown on the Drawings, as specified herein

B. Section Includes:

1. Switchboards.
2. Surge protection devices.
3. Overcurrent protective devices.
4. Metering
5. Control power.
6. Accessory components and features.

1.2 SELECTIVE COORDINATION

A. See section 260573 for protective device coordination study requirements. All equipment specified herein shall comply with the requirements of 260573. All equipment shall be increased in size, electronic trip added, wire and conduit size increased as require to provide a complete selectively coordinated system. Nothing in the following specification relieves the contractor from providing a complete selectively coordinated system. Fuses shall not be used to provide selective coordination

1.3 REFERENCES

A. General, Publications: The publications listed below form a part of this Specification to the extent referenced. The publications are referred to in the text by the basic designation only. The edition/revision of the referenced publications shall be the latest date as of the date of the Contract Documents, unless otherwise specified.

1. ASTM (ASTM): ASTM E 329 "Standard Specification for Agencies Engaged in the Testing and/or Inspection of Materials Used in Construction."
2. Federal Specifications (FS): FS W C 375 "Circuit Breakers, Molded Case, Branch Circuit and Service."
3. International Electrotechnical Commission (IEC): IEC 60364-6 Low voltage Electrical Installations - Part 6: Verification
4. Institute of Electrical and Electronics Engineers, Inc. (IEEE): ANSI/IEEE C57.13 "Standard Requirements for Instrument Transformers".
5. International Electrical Testing Association (NETA): NETA ATS "Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems."
6. International Organization for Standardization (ISO)

a. ISO 9001 “Quality Management Systems - Requirements”

b. ISO 14001 “Environmental Management Systems – Requirements”

7. National Electrical Contractors Association (NECA): NECA 400 “Standard for Installing and Maintaining Switchboards"

8. National Electrical Manufacturers Association (NEMA):

a. NEMA EI 21.1 "Instrument Transformers for Revenue Metering (110 kV BIL and Less).”

b. NEMA KS 1 "Enclosed and Miscellaneous Distribution Equipment Switches (600 Volts Maximum)"

c. NEMA PB 2 "Deadfront Distribution Switchboards."

d. NEMA PB 2.1 "General Instructions for Proper Handling, Installation, Operation and Maintenance of Deadfront Distribution Switchboards Rated 600 Volts or Less."

9. National Fire Protection Agency (NFPA)

a. NFPA 70 “National Electrical Code (NEC)”

b. NFPA 70B “Electrical Equipment Maintenance”

c. NFPA 70E “Standard for Electrical Safety in the Workplace”

10. Underwriters Laboratories, Inc. (UL)

a. UL 98 "Enclosed and Dead Front Switches"

b. UL 489 "Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit-Breaker Enclosures."

c. UL 891 "Switchboards"

d. UL 943 "Ground Fault Circuit-Interrupters"

e. UL 1008 ”Transfer Switch Equipment”

f. UL 1283 “Standard for Electro Magnetic Interference Filters"

g. UL 1449 "Surge Protective Devices"

1.4 LAYOUT AND COORDINATION

A. Coordinate layout and installation of switchboards and components with other construction that penetrates walls or is supported by them, including electrical and other types of equipment, raceways, piping, encumbrances to workspace clearance requirements, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

B. Coordinate sizes and locations of concrete bases with actual equipment provided.

1.5 SUBMITTALS

A. Submit sufficient information to determine compliance with the Contract Documents. Identify submittal data with the specific equipment tags and/or service descriptions to which they pertain. Submittal data shall be clearly marked to identify the specific model numbers, options, and features of equipment and work proposed

B. Product Data:

1. Switchboards.

2. Overcurrent protective devices.

3. Surge protection devices.

4. Ground-fault protection devices.

5. Metering

6. Accessories.

7. Other components.

8. Include dimensions and manufacturers' technical data on features, performance, electrical characteristics, ratings, accessories, and finishes.

C. Shop Drawings: For each switchboard and related equipment.

1. Include dimensioned plans, elevations, sections, and details, including required clearances and service space around equipment. Show tabulations of installed devices, equipment features, and ratings.

2. Detail enclosure types for types other than UL 50E, Type 1.

3. Detail bus configuration, current, and voltage ratings.

4. Detail short-circuit current rating of switchboards and overcurrent protective devices.

5. Detail utility company's metering provisions with indication of approval by utility company.

6. Include evidence of listing, by qualified electrical testing laboratory recognized by authorities having jurisdiction, for series rating of installed devices.

7. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.

1.6 MAINTENANCE MATERIAL SUBMITTALS

A. Submit required Operations & Maintenance data specific to each product and accessory proposed. In addition, include the following information:

1. Manufacturer, supplier, support, and repair center specific contact information.

2. Manufacturer’s standard operation and maintenance data assembled for each size and type of equipment furnished.

3. All construction, installation, schematic, and wiring diagrams updated to an as-installed and commissioned state

4. All configured settings/parameters for adjustable components updated to an as-installed and commissioned stated if different from the factory default. Electronic copies of configuration files shall be provided, on media acceptable to the Owner (e.g., CD, USB stick, etc.), where these configurations can be saved as an electronic file for future upload into replaced or repaired components.

5. List of furnished and recommended spare parts.

6. Statement of standard Warranty.

7. Final Assembly and Testing Report

8. Spare parts list

1.7 SPARE PARTS

A. Spare Parts: Furnish to Owner spare parts, for repairing switchboards, that are packaged with protective covering for storage on-site and identified with labels describing contents.

1. Potential Transformer Fuses: Equal to 10 percent of quantity installed for each size and type but no fewer than two of each size and type.

2. Control-Power Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than two of each size and type.

3. Special Tools: Furnish to Owner proprietary equipment, keys, and software required to operate, maintain, repair, adjust, or implement future changes to switchboards, that are packaged with protective covering for storage on-site and identified with labels describing contents.

a. Accessory Set: Include tools and miscellaneous items required for overcurrent protective device test, inspection, maintenance, and operation.

B. Spare-Fuse Cabinet: Suitably identified, wall-mounted, lockable, compartmented steel box or cabinet. Arrange for wall mounting.

1.8 QUALITY ASSURANCE

A. Manufacturer Qualifications: Manufacturer shall be a firm engaged in the manufacture of specified products of types and sizes required, and whose products have been in satisfactory use in similar service for a minimum of twenty years.

1. The manufacturer shall have a valid ISO 9001 certification and an applicable quality assurance system that is regularly reviewed and audited by a third-party registrar. Manufacturing, inspection, and testing procedures shall be developed and controlled under the guidelines of the quality assurance system.

2. The manufacturer or their representative shall have service, repair, and technical support services available 24 hours 7 days a week basis.

3. The manufacturer shall have the ISO 14001 Environment Certification and shall supply the Product Environmental Profile (P.E.P.) upon request of the Engineer.

B. Installer Qualifications: Installer shall be a firm that shall have a minimum of 5 years of successful installation experience with projects utilizing equipment similar in type and scope to that required for this Project [and shall be approved by the manufacturer’s representative].

C. All work performed and all materials used shall be in accordance with the National Electrical Code and with applicable local regulations and ordinances. Equipment assemblies, materials, and equipment shall be listed and labeled by Underwriter's Laboratories or by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

1.9 DELIVERY, STORAGE AND HANDLING

A. Prior to delivery to the Project site, ensure that suitable storage space is available to store materials in a well-ventilated area protected from weather, moisture, soiling, extreme temperatures, humidity, and corrosive atmospheres. Materials shall be protected during delivery and storage and shall not exceed the manufacturer stated storage requirements. As a minimum, store indoors in clean, dry space with uniform temperature to prevent condensation. In addition, protect electronics from all forms of electrical and magnetic energy that could reasonably cause damage.

B. Deliver materials to the Project site in supplier's or manufacturer's original wrappings and containers, labeled with supplier's or manufacturer's name, material or product brand name, and equipment tag number or service name as identified within the Contract Documents.

C. Inspect and report any concealed damage or violation of delivery storage, and handling requirements to the Engineer.

1. Handle and prepare switchboards for installation in accordance with NECA 400 and NEMA PB 2.1.

1.10 WARRANTY

A. The manufacturer shall warrant products against defects in material and workmanship for [12 months from the date of final completion

PART 2 PRODUCTS

2.1 MANUFACTURER

A. Basis-of-Design Product: Subject to compliance with requirements, provide Square D QED-2 Switchboards by Schneider Electric

B. Equal products by ABB/GE are acceptable.

C. Source Limitations: Obtain switchboards, overcurrent protective devices, components, and accessories from single source from single manufacturer.

2.2 GENERAL

A. Product Selection for Restricted Space: Drawings indicate maximum dimensions for switchboards including clearances between switchboards and adjacent surfaces and other items. Comply with indicated maximum dimensions.

B. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with NFPA 70, by qualified electrical testing laboratory recognized by authorities having jurisdiction, and marked for intended location and application.

C. Comply with NEMA PB 2.

D. Comply with NFPA 70.

E. Comply with UL 891.

2.3 SWITCHBOARD – GENERAL

A. Switchboard voltage, amperage and fault current rating as shown on the drawings. Breakers provided as shown on the drawings

B. Utility Metering Compartment: Provide EUSERC metering compartment or as required by the serving utility

C. Service Entrance Rating: Switchboards intended for use as service entrance equipment may contain from one to six service disconnecting means with overcurrent protection, neutral bus with disconnecting link, grounding electrode conductor terminal, and main bonding jumper.

D. Connection ahead of main: Where shown provide separate vertical section and bus for connection

E. Enclosures shall be NEMA Type 1 unless shown otherwise on drawings] and provide front access. Switchboard sections shall all be front and rear aligned with the adjacent sections. Removable steel base channels (1.5 inch floor sills) shall be bolted to the frame to rigidly support the entire shipping section for moving on rollers and floor mounting

F. Enclosure shall be steel with a factory applied finish in the manufacturer's standard paint color over a rust inhibiting primer on treated metal surface. Bus transition and incoming pull sections shall match and align with adjacent sections. Barriers shall be provided between adjacent switchboard sections. Front covers shall be removable with a single tool. All doors shall be hinged with removable hinge pins.

G. Hinged Front Panels: Allow access to circuit breaker, metering, accessory, and blank compartments.

H. All front covers shall be screw removable with a single tool and all doors shall be hinged with removable hinge pins.

I. Top and bottom conduit areas shall be clearly indicated on shop drawings.

J. Nameplates: See 260553

K. Bus Composition: Shall be shall be of sufficient cross-sectional area to meet UL 891 temperature rise requirements. Bus shall be constructed of hard drawn silver plated copper of 98 percent conductivity or tin plated, high strength, electrical grade aluminum alloy. Plating shall be applied over all bus surface except cut edges, bus plating on contact surfaces only shall not be acceptable.

1. The phase and neutral (if present) horizontal bus shall have an ampacity equal to or greater than the switchboard system rating. Tapered bus shall not be permitted. Full provisions for the addition of future sections shall be provided. Bussing shall include, but shall not be limited to, necessary hardware to accommodate splicing for future additions..

2. Group Mounted Feeder Vertical Bus Stack:

a. Bus stack shall be capable of mounting feeder breakers with different frame sizes and number of poles across from one another on the bus stack.

b. Non-conducting surface films shall be removed during circuit breaker installation by a wiping action of the circuit breaker jaws.

c. The design of the circuit breaker jaws and bus stack shall create blow on forces under fault conditions.

d. To minimize maintenance concerns, Bolted connections for feeder breakers shall not be allowed for group mounted feeders.

3. Ground Bus: Ground bus shall be sized per current NEC and UL 891 Tables 28.1 and 28.2, hard drawn copper of 98 percent conductivity, equipped with pressure connectors for feeder and branch circuit ground conductors. For busway feeders, insulated equipment grounding cable shall be extended to busway ground connection and the cable supported at intervals in vertical run.

L. Future Devices: Compartments shall be equipped with mounting brackets, supports, bus connections, and appurtenances at full rating of circuit breaker compartment

2.4 SWITCHBOARD – INCOMING MAIN SECTION

A. Incoming section shall allow for top and bottom entry of incoming conductors.

B. Provisions for incoming connections shall be suitable for landing cables as shown on drawings

C. Incoming connections shall allow for direct connection to the line terminals of main overcurrent device via direct connection or via the Utility metering compartment

D. Where cable terminations are provided for incoming conductors, provide crimp type compression lugs in quantity and size for conductors shown on drawings. Lugs shall be suitable for use with copper and aluminum conductors and shall be rated for minimum 75 degree C.

E. Utility Metering Compartment where specified (see above) shall consist of fabricated compartment and section complying with utility company's requirements. EUSERC

F. Main Circuit Breaker(s)

1. Electronic Trip Circuit Breaker, trip units shall be Micrologic

2. Micrologic electronic trip unit shall be true RMS sensing.

3. Air core current transformers shall be used to ensure accurate measurements from low currents up to high currents.

4. Electronic trip unit shall be fitted with thermal imaging to protect intermittent short circuits or ground-faults.

5. The following monitoring functions shall be integral parts of electronic trip units:

a. A test connector shall be installed for checks on electronic and tripping mechanism operation using an external device.

b. LED for load indication at 105 percent.

c. LED for load indication at 90 percent of load for applications 600 amperes and smaller

d. LED for visual verification of protection circuit functionality for applications 600 amperes or smaller.

e. Micrologic trip unit functions shall consist of adjustable protection settings with the capability to be set and read locally by rotating a switch.

f. Long-time pickup shall allow for adjustment to nine long-time pickup settings. This adjustment must be at least from 0.4 to 1 times the sensor plug (In), with finer adjustments available for more precise settings to match the application.

g. Adjustable long-time delay shall be in nine bands. At six times Ir, from 0.5 to 24 seconds above 600 amperes, and 0.5 to 16 seconds for 600 amperes and below.

h. Short-time pickup shall allow for nine settings from 1.5 to 10 times Ir.

i. Short-time delay shall be in nine bands from 0.1–0.4 I^2t ON and 0–0.4 I^2t OFF.

j. Instantaneous settings on the trip units with LSI protection shall be available in nine bands.

1) Above 600 amperes, from 2 to 15 times In

2) 600 amperes, from 1.5 to 11 times In

3) 400 amperes from 1.5 to 12 times In

4) 250 amperes and below, from 1.5 to 15 times In

k. Four-pole devices shall be equipped for neutral protection with a three-position setting; neutral not protected, neutral tripping threshold equal to half the phase value, and neutral threshold equal to the phase value.

l. Ground fault settings for circuit breaker sensor sizes 1200 amperes or below shall be in nine bands from 0.2 to 1.0 times In. The ground fault settings for circuit breakers above 1200 amperes shall be nine bands from 500 to 1200 amperes.

6. It shall be possible to fit the trip unit with a seal to prevent unauthorized access to the settings in accordance with NEC Section 240-6(b).

7. Trip unit shall provide local trip indication and capability to locally and remotely indicate reason for trip, i.e., overload, short circuit, or ground fault.

8. Neutral current transformers shall be available for four-wire systems.

9. Trip units shall have the capability to electronically adjust the settings locally and remotely to fine increments below the switch settings. Fine increments for pickup adjustments shall be 1 ampere. Fine increments for delay adjustments shall be one second

10. Trip units shall be available to provide real time metering. Metering functions shall include, but shall not be limited to, the following:

a. Current (phases, neutral, average, maximum)

b. Voltage (phase-to-phase, phase-to-neutral, average, unbalance)

c. Power (active [kW], reactive [kVAR], apparent [kVA], power factor)

d. Energy (active [kWh], reactive [kVAR], apparent [kVA])

e. Frequency

f. Total harmonic distortion (current, voltage)

g. Metering accuracy shall be 1.5 percent current (above 600 amperes), 1.0 percent current (600 amperes and below), 0.5 percent voltage, and 2 percent energy. This accuracy shall be total system, including, but not limited to, CT and meter.

11. Measurement chain shall be independent from the protection chain.

12. The measurements shall be displayed on the breaker itself and/or on a remote display and/or on a remote system via Modbus communication.

13. Connections from circuit breaker to remote display and/or communication module shall be plug-n-play via RJ45 connector. No special tools or programming shall be required.

14. Provide Arc Energy Reduction Device

2.5 SWITCHBOARD – DISTRIBUTION

A. Section shall connect to main section above via bus. Bus size same as main size

B. Provisions for connections shall be suitable for landing cables as shown on drawings

C. Where cable terminations are provided for incoming conductors, provide crimp type compression lugs in quantity and size for conductors shown on drawings. Lugs shall be suitable for use with copper and aluminum conductors and shall be rated for minimum 75 degree C.

D. All breakers to be provided per the selective coordination study, including using electronic trip to match specifications above.

E. Circuit breaker(s) shall be group mounted with mechanical restraint on a common pan or rail assembly.

F. Circuit breaker(s) shall not require additional external mounting hardware. Circuit breaker(s) shall be held in mounted position by aself-contained bracket secured to the mounting pan by fasteners. Circuit breaker(s) of different frame sizes shall be capable of being mounted across from each other.

G. All unused spaces provided, unless otherwise specified, shall be fully equipped for future devices, including all appropriate connectors and mounting hardware.

H. Group mounted circuit breakers through 1200A, individual compartmentalized above 1200 amp.

1. Molded Case Circuit Breakers (MCCBs):

a. MCCBs shall be of standard frame sizes, trip ratings, and number of poles.

b. Lugs shall be Compression style, suitable for number, size, trip ratings, and conductor material.

c. Application Listing shall be appropriate for application; Type SWD for switching fluorescent lighting loads; Type HACR for heating, air conditioning, and refrigerating equipment.

d. Ground Fault Protection shall be integral to circuit breaker with adjustable pickup and time delay settings, push to test feature, and ground fault indicator when specified.

e. Shunt Trip when specified shall be 277 volt trip coil energized from separate circuit.

2. Electronic Trip ET 1.0 Trip System (300 to 800 Amperes):

a. The circuit breaker trip system shall be a microprocessor-based true RMS sensing design.

b. Sensor ampere ratings shall be as indicated on the drawings or schedules.

c. The integral trip system shall be independent of any external power source and shall contain no less than industrial grade electronic components.

d. Trip unit shall not be field-replaced.

e. ET 1.0 trip unit functions shall consist of adjustable instantaneous pickup with no intentional time delay.

f. The long time trip point setting shall be fixed and cannot be adjusted.

g. The instantaneous settings on the trip unit shall allow 2 to 10 times the sensor rating (In).

h. The trip unit shall have the capability for the adjustment to be set and read locally by a rotating switch.

3. Electronic Trip over 800 amps – same as main breaker above

I. Barriers: Between adjacent switchboard sections.

J. Bus Transition and Incoming Pull Sections: Matched and aligned with basic switchboard.

2.6 SURGE PROTECTION DEVICES

A. TPS TK-ST240-3Y480-L or equal

1. Modes of Protection: All Modes. L-N, L-L, L-G, & N-G

2. Input Power Frequency: 40-68Hz

3. Response Time: < 1 nanosecond

4. Standard Monitoring: Status indicator lights (one per phase & one service LED); Form C dry relay contacts for suppressor status; Audible alarm with silence button

5. Short Circuit Current Rating: 200 kAIC on all units.

6. No upstream over-current protection required.

7. Enclosure: Steel. Weather-proof. NEMA 4 (IP 56)

8. Connection: Hardwired via internal lugs #10 AWG-#2 AWG

B. Mounting: Multi-point mounting feet.

C. If a dedicated breaker for the surge protective device is not provided, the surge protective device shall include an UL recognized disconnect switch.

D. Mount within 12” of switchboard breaker and busing.

2.7 METERING

A. Main Switchboard Meter

1. Provide a Square D PM2230 meter with LCD display

2. Output readings via module to DDC via Bacnet or Modbus

B. Feeders Meters:

1. Feeder meters shall provide categories as shown on drawings and to meet Washington State Energy Code

2. Feeder meters shall run circuits to exterior j-box at switchboard to allow for connection building BAS/DDC system via Bacnet or Modbus as shown on the drawings.

3. Meter shall Be Veris E50H series

a.	Accuracy	+/- 0.2%
b.	Communication	BACnet (MS/TP) or Mobus per DDC Contractor
c.	Display Type	LCD
d.	Frequency Rating	50 - 60 Hz
e.	Metering Product Family	E50 Power Meter
f.	Monitored Voltage Rang	90 - 600 VAC
g.	Mounting	Din-Rail
h.	Operating Temperature	-22 - 158 °F

C. Instrument Transformers shall adhere to requirements of NEMA EI 21.1, ANSI/IEEE C57.13.

2.8 CONTROL POWER

A. Provide control power for meters from the switchboard with any transformers required. Include breaker.

PART 3 EXECUTION

3.1 EXAMINATION

A. Receive, inspect, handle, and store switchboards in accordance with NECA 400 and NEMA PB 2.1.

1. Lift or move switchboards with spreader bars and manufacturer-supplied lifting straps following manufacturer's published instructions.

2. Use rollers, slings, or other manufacturer-approved methods if lifting straps are not furnished.

3. Protect from moisture, dust, dirt, and debris during storage and installation.

4. Install temporary heating during storage in accordance with manufacturer's published instructions.

B. Examine switchboards before installation. Reject switchboards that are moisture damaged or physically damaged.

C. Examine elements and surfaces to receive switchboards for compliance with installation tolerances and other conditions affecting performance of the Work or that affect performance of equipment.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

E. to provide pathway for moving switchboards into place.

3.2 INSTALLATION

A. Comply with manufacturer's published instructions.

B. Special Techniques:

1. Equipment Mounting: Install switchboards on concrete base, 4 inch (100 mm) nominal thickness.

a. Install conduits entering underneath switchboard, entering under vertical section where conductors will terminate. Install with couplings flush with concrete base. Extend 2 inch (50 mm) above concrete base after switchboard is anchored in place.

b. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18 inch (450 mm) centers around full perimeter of concrete base.

c. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.

d. Place and secure anchorage devices. Use setting drawings, templates, diagrams, published instructions, and directions furnished with items to be embedded.

e. Install anchor bolts to elevations required for proper attachment to switchboards.

f. Anchor switchboard to building structure at top of switchboard if required or recommended by manufacturer.

2. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, straps and brackets, and temporary blocking of moving parts from switchboard units and components.

3. Comply with mounting and anchoring requirements specified in Section 260548

4. Operating Instructions: Frame and mount printed basic operating instructions for switchboards, including control and key interlocking sequences and emergency procedures. Fabricate frame of finished wood or metal and cover instructions with clear acrylic plastic. Mount on front of switchboards.

5. Install filler plates in unused spaces of panel-mounted sections.

6. Install overcurrent protective devices, surge protection devices, and instrumentation.

    a. Set field-adjustable switches and circuit-breaker trip ranges.

7. Install spare-fuse cabinet.

3.3 CONNECTIONS

A. Bond conduits entering underneath switchboard to equipment ground bus with bonding conductor sized in accordance with NFPA 70.

B. Support and secure conductors within switchboard in accordance with NFPA 70.

C. Extend insulated equipment grounding cable to busway ground connection and support cable at intervals in vertical run.

3.4 IDENTIFICATION

A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

B. Switchboard Nameplates: Label each switchboard compartment with nameplate complying with requirements for identification specified in Section

C. Device Nameplates: Label each disconnecting and overcurrent protective device and each meter and control device mounted in compartment doors with nameplate complying with requirements for identification specified in Section 260553

D. Service Equipment Label: Labeled, by qualified electrical testing laboratory recognized by authorities having jurisdiction, for use as service equipment for switchboards with one or more service disconnecting and overcurrent protective devices.

3.5 FIELD QUALITY CONTROL

A. Tests and Inspections:

1. Acceptance Testing:

2. Test ground-fault protection of equipment for service equipment in accordance with NFPA 70.

3. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.

4. Check and record torque settings on all breaker terminations and field bus connections. Post list of torque settings at the switchboard.

5. Correct malfunctioning units on-site where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.

B. Nonconforming Work:

1. Switchboard will be considered defective if it does not pass tests and inspections.

2. Remove and replace defective units and retest.

C. Collect, assemble, and submit test and inspection reports, including certified report that identifies switchboards included and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.6 ADJUSTING

A. Adjust moving parts and operable components to function smoothly, and lubricate as recommended by manufacturer.

END OF SECTION

SECTION 26 24 16 – PANELBOARDS

PART 1 GENERAL

1.1 SUMMARY

A. Provide labor, material, equipment, related services, and supervision required, including, but not limited to, manufacturing, fabrication, configuration and installation for as required for the complete performance of the Work, as shown on the Drawings, as specified herein, and as specified elsewhere for the assemblies or systems comprised of the components specified herein.

B. Contractor shall note that drawings show shared neutrals for circuits. Contractor shall comply with NEC 210.4B, which requires either separate neutrals or a disconnecting means that disconnects all ungrounded conductors at the point where the circuit originates. This requires the contractor to provide breaker ties or 3 pole breakers for all groups of 3 circuits run with shared neutral in the field as grouping is frequently changed. Contractor shall include this in the contract. No additional payments will be made for this code requirement.

C. See section 260573 for protective device coordination study requirements. All equipment specified herein shall comply with the requirements of 260573. All equipment shall be increased in size, electronic trip added, wire and conduit size increased as require to provide a complete selectively coordinated system. Nothing in the following specification relieves the contractor from providing a complete selectively coordinated system. Fuses shall not be used to provide selective coordination

D. Section Includes:

1. Power panelboards (Distribution Panels)

    a. Including Combination Power Panelboards

2. Lighting and appliance branch-circuit panelboards.

3. Disconnecting and overcurrent protective devices.

1.2 REFERENCES

A. General, Publications: The publications listed below form a part of this Specification to the extent referenced. The publications are referred to in the text by the basic designation only. The edition/revision of the referenced publications shall be the latest date as of the date of the Contract Documents, unless otherwise specified.

1. American Society of Civil Engineers (ASCE):

    a. ASCE 7, "Minimum Design Loads for Buildings and Other Structures."

2. California Office of Statewide Health Planning and Development (OSHPD)

3. USA Federal Specifications (FS):

    a. FS W-C-375, "Circuit Breakers, Molded Case, Branch Circuit and Service."

    b. FS W-P-115, "Panel, Power Distribution."

4. International Code Council (ICC):

    a. ICC IBC, "International Building Code."

b. ICC IBC Section 1621, “Architectural, Mechanical, and Electrical Component Seismic Design Requirements.”

c. ICC ES AC156, “International Code Council Evaluation Services Acceptance Criteria for Seismic Qualification by Shake-Table Testing of Nonstructural Components and Systems”

5. National Electrical Manufacturers Association (NEMA):

a. NEMA AB 1, "Molded Case Circuit Breakers and Molded Case Switches."

b. NEMA PB 1, "Panelboards."

c. NEMA PB 1.1, "General Instructions for Proper Installation, Operation and Maintenance of Panelboards Rated 600 Volts or Less."

6. National Fire Protection Agency (NFPA)

a. NFPA 70, "National Electrical Code," hereinafter referred to as NEC.

b. NFPA 5000, “Building Construction and Safety Code.”

7. Underwriter Laboratories (UL):

a. UL 50, "Enclosures for Electrical Equipment, Non-Environmental Considerations.”

b. UL50E, “Enclosures for Electrical Equipment, Environmental Considerations.”

c. UL 67, "Standard for Panelboards."

d. UL 489, "Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit-Breaker Enclosures.”

8. International Electrotechnical Commission (IEC)

a. IEC 60529: 1989+AMD1:1999+AMD2:2013 CSV Consolidated version. - Degrees of Protection Provided by Enclosures (IP Code).

1.3 QUALITY ASSURANCE

A. Manufacturer Qualifications: Manufacturer shall be a firm engaged in the manufacture of specified products of types and sizes required, and whose products have been in satisfactory use in similar service for a minimum of 20 years.

1. The manufacturer shall have a valid ISO 9001 certification and an applicable quality assurance system that is regularly reviewed and audited by a third-party registrar. Manufacturing, inspection, and testing procedures shall be developed and controlled under the guidelines of the quality assurance system.

2. The manufacturer or their representative shall have service, repair, and technical support services available 24 hours 7 days a week basis.

B. All work performed and all materials used shall be in accordance with the National Electrical Code, and with applicable local regulations and ordinances. Process controllers, assemblies, materials, and equipment shall be listed and labeled by Underwriter’s Laboratories or by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Installing contractor shall have minimum 5 years experience installing similar equipment

1.4 SUBMITTALS

A. Product Data:

1. Power and Distribution panelboards.

2. Lighting and appliance branch-circuit panelboards.

3. Load centers.

4. Disconnecting and overcurrent protective devices.

5. Include materials, switching and overcurrent protective devices, SPDs, accessories, and components indicated.

6. Include dimensions and manufacturers' technical data on features, performance, electrical characteristics, ratings, and finishes.

B. Submit sufficient information to determine compliance with the Contract Documents. Identify submittal data with the specific equipment tags and/or service descriptions to which they pertain. Submittal data shall be clearly marked to identify the specific model numbers, options, and features of equipment and work proposed.

C. Shop Drawings: For each panelboard and related equipment.

1. Include dimensioned plans, elevations, sections, and details.

2. Show tabulations of installed devices with nameplates, conductor termination sizes, equipment features, and ratings.

3. Detail enclosure types including mounting and anchorage, environmental protection, knockouts, corner treatments, covers and doors, gaskets, hinges, and locks.

4. Detail bus configuration, current, and voltage ratings.

5. Short-circuit current rating of panelboards and overcurrent protective devices.

6. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.

7. Include wiring diagrams for power, signal, and control wiring.

8. Key interlock scheme drawing and sequence of operations.

D. Closeout and Maintenance Materials

1. Manufacturer shall provide installation instructions and NEMA Standards Publication PB 1.1 - Instructions for Safe Installation, Operation and Maintenance of Panelboards Rated 600 Volts or Less.

2. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1.5 MAINTENANCE MATERIAL SUBMITTALS

A. Spare Parts: Furnish to Owner spare parts, for repairing panelboards, that are packaged with protective covering for storage on-site and identified with labels describing contents. Include the following:

1. Keys: Two spares for each type of panelboard cabinet lock.

B. Special Tools: Furnish to Owner proprietary equipment, keys, and software required to operate, maintain, repair, adjust, or implement future changes to panelboards, that are packaged with protective covering for storage on-site and identified with labels describing contents.[Include the following:]

1. Accessory Set: Include tools and miscellaneous items required for overcurrent protective device test, inspection, maintenance, and operation.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Prior to delivery to the Project site, ensure that suitable storage space is available to store materials in a well-ventilated area protected from weather, moisture, soiling, extreme temperatures, humidity, and corrosive atmospheres. Materials shall be protected during delivery and storage and shall not exceed the manufacturer stated storage requirements. As a minimum, store indoors in clean, dry space with uniform temperature to prevent condensation. In addition, protect electronics from all forms of electrical and magnetic energy that could reasonably cause damage.

B. Deliver materials to the Project site in supplier’s or manufacturer’s original wrappings and containers, labeled with supplier’s or manufacturer’s name, material or product brand name, and equipment tag number or service name as identified within the Contract Documents.

C. Inspect and report any concealed damage or violation of delivery storage, and handling requirements to the Engineer.

1.7 WARRANTY

A. Manufacturer shall warrant specified equipment free from defects in materials and workmanship for the lesser of 1 year from final completion.

PART 2 PRODUCTS

2.1 GENERAL REQUIREMENTS

A. Manufacturer

1. Basis-of-Design Product: Subject to compliance with requirements, provide Square D brand NQ Panelboard, NF Panelboard, and I-Line Power(Distribution) panels

2. Alternative Products by ABB/GE are acceptable

B. Acceptable Products: Panelboards specified herein shall be the product of a single manufacturer. Products and manufacturers specified are to establish a standard of quality for design, function, materials, and appearance.

2.2 PANELBOARDS COMMON REQUIREMENTS

A. Fabricate and test panelboards in accordance with IEEE 344 to withstand seismic forces

B. Product Selection for Restricted Space: Drawings indicate maximum dimensions for panelboards including clearances between panelboards and adjacent surfaces and other items. Comply with indicated maximum dimensions.

C. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with NFPA 70, by qualified electrical testing agency recognized by authorities having jurisdiction, and marked for intended location and application.

1. Comply with NEMA PB 1.

2. Comply with NFPA 70.

2.3 PANELBOARDS

A. Interiors:

1. Panelboards shall be rated for:

a. Type NQ: 240Vac maximum, with continuous main current ratings, as indicated on associated schedules and the Drawings

b. Type NF: 480Y/277Vac maximum, with continuous main AC current ratings, as indicated on associated schedules and the Drawings.

c. Panelboard ratings (bus ratings, heat rise, etc.) shall be conducted in accordance with, and certified by UL, as per UL67.

d. Main lug interiors up to 600 amperes shall be field convertible to main breaker.

2. Provide UL-listed short circuit current ratings (SCCR) as indicated on the associated schedules and the Drawings, not to exceed the lowest interrupting capacity rating of any circuit breaker installed with a maximum of 200,000 RMS symmetrical amperes. The panelboard shall be rated for the minimum short circuit current rating in rms symmetrical amperes:

a. Type NQ panelboards shall be Fully rated to 10,000 minimum or as shown on the drawings

b. Type NF panelboards shall be to 14,000 minimum or as shown on the drawings

3. Each bus bar shall have sequentially phased branch circuit connectors.

a. The bussing shall be fully rated, with one (1) continuous bus bar per phase, unless a Split Bus or Separated Distribution panel is specified:

1) Up to 84 circuits for 240 Vac maximum panelboards,

2) Up to 54 circuits for 480Y/277 Vac max panelboards up to 54 circuit spaces.

3) Where Split Bus and Separated Distribution panelboards are shown – provide one (1) continuous bus bar per phase for each branch distribution section.

a) Split Bus panelboard sections shall be connected from upstream lugs or branch breaker to one (1) back-fed main breaker in downstream section.

b) Separated Distribution panelboard sections shall be connected via removable, stranded copper cables, secured via mechanical lugs on each section.

b. Panelboard bus current ratings shall be determined by heat-rise tests conducted in accordance with UL 67.

c. Bussing rated 100-400 amperes shall be plated copper or aluminum. Bussing rated at or above 600 amperes shall be plated copper as standard construction. Bus bar plating shall run the entire length of the bus bar.

d. Interior phase bus shall be pre-drilled to accommodate field installable options i.e., Sub-Feed Lugs, Sub-Feed Breakers, Thru-Feed Lugs.

e. 240 Vac maximum panelboards shall have branch circuit connectors suitable for both plug-on and bolt-on branch circuit breakers. All breakers shall be bolt on

4. Panelboards shall be suitable for use as Service Equipment when application requirements comply with UL 67 and NEC Articles 230-F and -G.

5. A solidly bonded copper equipment ground bar shall be provided. An additional copper isolated/insulated ground bar shall also be provided where shown on the panel schedule

6. Neutral shall be plated, solid, and split for 20” nominal and wider panelboards. 14” wide and column width panelboards shall have a plated solid neutral.

7. Interior trim shall be of dead-front construction to shield user from energized parts. Dead-front trim shall have filler plates covering unused mounting spaces.

8. Nameplates shall contain system information and catalog number or factory order number. Interior wiring diagram, neutral wiring diagram, CSA and UL Listed label and short circuit current rating shall be displayed on the interior or in a booklet format.

9. Interiors in NEMA 1 or 2 enclosures shall be field convertible for top or bottom incoming feed. Interior leveling provisions shall be provided for flush mounted applications.

10. Main circuit breakers in 240 Vac max panelboards shall be vertically mounted. Sub-feed circuit breakers may be vertically or horizontally mounted.

11. Main circuit breakers in 480Y/347 max panelboards shall be vertically mounted. Sub-feed circuit breakers shall be vertically or horizontally mounted.

B. Enclosures

1. Type 1 Boxes

a. Boxes shall be hot zinc dipped galvanized steel constructed in accordance with UL 50 and UL50E requirements. Unpainted galvannealed steel is not acceptable.

b. Boxes shall have removable end walls with knockouts located on [one end] [both ends] [neither end]. Standard 5.75” deep NEMA 1 enclosures shall have permanently affixed interior mounting studs. Interior mounting brackets shall be provided as required.

2. Nominal box width shall be 20”

3. Type 1 Fronts

a. Front shall meet strength and rigidity requirements per UL 50 standards. Front shall have ANSI 49 gray enamel baked onto cleaned phosphatized steel.

b. Fronts shall be hinged 1-piece with door. Panel cover shall include dual hinges to allow access to breaker compartment and entire panel enclosure (Door in Door).

1) Mounting shall be flush or surface as indicated on panel schedules.

c. Doors on front shall have rounded corners and edges shall be free of burrs.

d. Front shall have cylindrical tumbler type lock with catch and spring-loaded steel door pull, quarter-turn fasteners, or three-point latch. All lock assemblies shall be keyed alike. One key shall be provided with each lock. A clear plastic directory cardholder, or welded metal frame directory cardholder, shall be mounted on the inside of door.

4. Type 3R, 5, and 12

a. Enclosures shall be constructed in accordance with UL 50 and UL50E requirements. Enclosures shall be painted with ANSI 49 gray enamel baked onto cleaned phosphatized steel.

b. All doors shall be equipped with at least one L-Handle lock mechanisms. Enclosures 59 inches or more in height shall have additional L-Handle mechanisms or two (2) additional quarter turn fasteners. All lock assemblies shall be keyed alike. One key shall be provided with each lock. A clear plastic directory cardholder, or welded metal frame directory cardholder, shall be mounted on the inside of door. Doors in enclosures which may configured for NEMA 5 or 12 service shall be gasketed.

c. Nominal enclosure dimensions shall be:

1) 21” wide and 6.75” deep, not counting the handle, for standard Type 3R, 5, 12.

2) 21” wide and 8.75” deep, not counting the handle, for Door-in-door Type 12.

3) 27” wide and 8.75” deep, not counting the handle, for vented NEMA Type 3R.

5. Type 4, 4X

a. Enclosures shall be constructed in accordance with UL 50 and UL 50E requirements.

b. All doors shall be gasketed and equipped with a L-Handle mechanism with additional clamps or fasteners on the top, bottom, and/or side to ensure tight closure. All lock assemblies shall be keyed alike. One key shall be provided with each lock. A clear plastic directory cardholder, or welded metal frame directory cardholder, shall be mounted on the inside of door.

c. Nominal enclosure dimensions shall be 20.13” wide and 7.25” deep, not counting the handle.

C. Main Circuit Breakers

1. Main circuit breakers shall have an over center, trip-free, toggle mechanism which will provide quick-make, quick-break contact action. Main circuit breakers shall have

Thermal Magnetic trip units unless electronic trip required by the coordination study or shown on the drawings..

a. Thermal Magnetic circuit breakers shall have a permanent trip unit with thermal and magnetic trip elements in each pole. Each thermal element shall be true rms sensing and be factory calibrated to operate in a 40° C ambient environment. Thermal elements shall be ambient compensating above 40° C.

b. Electronic trip units shall have Long time, Instantaneous, & Short time (LSI) functionality, Electronic trip units shall use current transformers combining “iron-core” sensors for self-powered electronics and “air-core”, Rogowski coil sensors for measurement accuracy.

1) Basic Electronic trip units shall allow adjustment of Trip Current.

2) Adjustable electronic trip units shall provide adjustable protection settings for [Long time & Instantaneous (LI)] [Long time, Short time, & Instantaneous (LSI)] for flexible system coordination.

2. Two- and three-pole circuit breakers shall have common tripping of all poles. Vertically mounted molded case circuit breaker frame sizes above 125 amperes shall have a single magnetic trip adjustment located on the front of the circuit breaker that allows the user to simultaneously select the desired trip level of all poles. Molded case circuit breakers shall have a push-to-trip button for maintenance and testing purposes.

3. Breaker handle and faceplate shall indicate rated ampacity. Standard construction circuit breakers shall be UL Listed for reverse connection without restrictive line or load markings.

4. Vertically mounted main circuit breaker escutcheon shall have international I/O markings, in addition to standard ON/OFF markings. Circuit breaker handle accessories shall provide provisions for locking handle in the ON or OFF position.

5. Lugs shall be CSA and UL Listed to accept solid or stranded [copper and aluminum conductors] [copper conductors only]. Lugs shall be suitable for [75° C rated wire] [90° C rated wire, sized according to the 75° C temperature rating per NEC Table 310-16]. Lug body shall be bolted in place; snap-in designs are not acceptable.

6. The circuit breakers shall be CSA and UL Listed for use with the following accessories: Shunt Trip, Under Voltage Trip, Ground Fault Shunt Trip, Auxiliary Switch, Alarm Switch, Mechanical Lug Kits, and Compression Lug Kits.

D. Branch Circuit Breakers

1. Circuit breakers shall be CSA and UL Listed with amperage ratings, interrupting ratings, and number of poles as indicated on the associated schedules.

2. Molded case branch circuit breakers in 240 Vac maximum panelboards shall bolt-on to the bus, and shall not require additional external mounting hardware, except when installed into IP2X enhanced fingersafe interiors.

a. Branch circuit breakers shall be available with the following nominal interrupting ratings:

1) 1 pole: 10A - 70A

2) 2 poles: 15 - 125A [(up to 200A in a single phase. panelboard)]

3) 3 poles: 15 –150A

4) Larger breakers may be subfeed type or use Power/Distribution Panel board

3. Molded case branch circuit breakers in 480Y/277 Vac maximum panelboards shall bolt-on to the bus and shall not require additional external mounting hardware.

a. Branch circuit breakers shall be available with the following nominal interrupting ratings:

1) 1 pole: 10A - 70A

2) 2 poles: 15 - 125A

3) 3 poles: 15 – 125A

b. Larger breakers may be subfeed type or use a Power/Distribution Panelboard

4. Circuit breakers shall have an over center toggle mechanism which will provide quick-make, quick-break contact action. Circuit breakers shall have a permanent trip unit with thermal and magnetic trip elements in each pole. Each thermal element shall be true RMS sensing and shall be factory-calibrated to operate in a 40 degrees C ambient environment. Circuit breakers shall have an operating range from – 10 degrees C to + 60 degrees. Thermal elements shall be ambient compensating above 40 degrees C.

5. Two- and three-pole circuit breakers shall have common tripping of all poles.

6. There shall be two forms of visible trip indication. The breaker handle shall reside in a position between ON and OFF. In addition, there shall be a red, Visi-Trip indicator appearing in the clear window of the circuit breaker housing.

7. Lugs shall be UL Listed to accept solid or stranded [copper and aluminum conductors] [copper conductors only]. Lugs shall be suitable for 90° C rated wire, sized according to the 75° C temperature rating per NEC Table 310-16.

8. Circuit Breakers shall be CSA and UL Listed for use with the following factory installed accessories: Shunt Trip, Auxiliary Switch, and Alarm Switch. See schedule

2.4 POWER (DISTRIBTUION) PANELBOARDS

A. Panelboard interior

1. Shall be rated a shown on the drawing. Continuous main current ratings as indicated on associated schedules not to exceed 1200 amperes maximum main lugs or main circuit breaker. Panelboard bus current ratings shall be determined by heat-rise tests conducted in accordance with UL 67.

2. Provide UL Listed short circuit current ratings (SCCR) as indicated on the associated schedules not to exceed the lowest interrupting capacity rating of any circuit breaker installed with a maximum of 200,000 RMS symmetrical amperes. Main lug and main breaker panelboards shall be suitable for use as Service Equipment when application requirements comply with UL 67 and NFPA70 National Electric Code.

3. The panelboard interior shall have three flat bus bars stacked and aligned vertically with glass reinforced polyester insulators laminated between phases. The molded polyester insulators shall support and provide phase isolation to the entire length of bus.

4. The bussing shall be fully rated with sequentially phased branch distribution. Panelboard bussing rated 100 through 600 amperes shall be plated copper or aluminum. Bussing rated 800 amperes and above shall be plated copper. Bus bar plating shall run the entire length of the bus bar. The entire interleaved assembly shall be contained between two (2) U-shaped steel channels, permanently secured to a galvanized steel-mounting pan by fasteners.

5. Interior trim shall be of dead-front construction to shield user from all energized parts. Main circuit breaker and main lug interiors shall be field convertible for top or bottom incoming feed.

6. A solidly bonded copper equipment ground bar shall be provided. An additional copper isolated/insulated ground bar shall also be provided where scheduled.

7. Solid neutral shall be equipped with a full capacity bonding strap for service entrance applications. Gutter-mounted neutral will not be acceptable.

8. Nameplates shall contain system information and catalog number or factory order number. Interior wiring diagram, neutral wiring diagram, UL Listed label, and Short Circuit Current Rating shall be displayed on the interior or in a booklet format. Leveling provisions shall be provided for flush mounted applications.

9. Group mounted circuit breakers through 1200A

    a. Molded case or electronic trip if scheduled or required by the coordination study.

    b. Circuit breaker(s) shall be group mounted with plug-on electrical connection, bolted to common pan or rail assembly.

    c. The interior shall have three flat bus bars stacked and aligned vertically with glass reinforced polyester insulators laminated between phases. The molded polyester insulators shall support and provide phase isolation to the entire length of bus.

    d. Circuit breakers equipped with line terminal jaws shall not require additional external mounting hardware. Circuit breakers shall be held in mounted position by a self-contained bracket secured to the mounting pan by fasteners. Circuit breakers of different frame sizes shall be capable of being mounted across from each other.

    e. Line-side circuit breaker connections are to be jaw type.

    f. All unused spaces provided, unless otherwise specified, shall be fully equipped for future devices, including all appropriate breaker connectors and mounting hardware.

10. Molded Case Circuit Breaker Characteristics - General

    a. Circuit breakers shall be I-LINE - up to 1200 Amp maximum construction with factory installed mechanical lugs. All circuit breakers shall be UL Listed to accept field installable/removable mechanical type lugs. All lugs shall be UL Listed to accept solid (not larger than #8 AWG) and/or stranded copper and aluminum conductors,. Lugs shall be suitable for 90° C rated wire, sized according to the 75° C temperature rating in the National Electrical Code.

b. All circuit breakers with permanent trip units shall be UL Listed for reverse connection without restrictive line and load markings and be suitable for mounting in any position.

B. Panelboard Enclosures

1. Type 1 Boxes

a. Boxes shall be hot zinc dipped galvanized steel constructed in accordance with UL 50 requirements. Unpainted galvannealed steel is not acceptable.

b. Boxes shall have removable blank end walls and interior mounting studs. Interior support bracket shall be provided for ease of interior installation.

c. Standard enclosure widths shall be 26”, 32”,42”, and 44” depending on application.

2. Type 1 Trim Fronts

a. Trim front steel shall meet strength and rigidity requirements per UL 50 standards. Shall have an ANSI 49 medium gray enamel electrodeposited over cleaned phosphatized steel.

b. Trim front shall be hinged 1-piece with door available in flush or surface mount as schedukled. Trim front door shall have rounded corners and edges free of burrs. A clear plastic directory cardholder shall be mounted on the inside of the door.

c. Locks shall be cylindrical tumbler type with larger enclosures requiring sliding vault locks with 3-point latching. All lock assemblies shall be keyed alike. One (1) key shall be provided with each lock.

3. Type 3R, 5, and 12

a. Enclosures shall be constructed in accordance with UL 50 requirements. Enclosures shall be painted with ANSI 49 gray enamel electrodeposited over cleaned phosphatized steel.

4. Metering (only where shown on the one line diagram)

a. Feeder meters shall provide categories as shown on drawings and to meet Washington State Energy Code

b. Feeder meters shall run circuits to exterior j-box at switchboard to allow for connection building BAS/DDC system via Bacnet or Modbus as shown on the drawings.

c. Meter shall be Veris E50H series

1)	Accuracy	+/- 0.2%
2)	Communication	BACnet (MS/TP) or Mobus per DDC Contractor
3)	Display Type	LCD
4)	Frequency Rating	50 - 60 Hz
5)	Metering Product Family	E50 Power Meter

6) Monitored Voltage Rang 90 - 600 VAC

7) Mounting Din-Rail

8) Operating Temperature -22 - 158 °F

d. Instrument Transformers shall adhere to requirements of NEMA EI 21.1, ANSI/IEEE C57.13.

e. Provide control power for meters from the Distribution Panel with any transformers required. Include breaker.

2.5 SURGE PROTECTORS

A. Surge Protectors basis of design is the TPS LP series for 208 volt panels and Transtack 2 for 480 volt panels. Alternative projects must meet performance criteria below

1. 208/120 Volt Panelboards.. Provide at all 120/208 volt panels

a. Total Protection Solutions#TK-LP080-3Y208-L

1) Maximum Rated Surge Current: 80kA per phase; 40kA per mode

2) Application: ANSI/IEEE C62.41 Location A, B & C. Ideal for flush mount in-wall and adjacent panelboards

3) Design: Fusing for safety and hybrid suppression design provides lowest let-through voltage protection for mission critical loads

4) Warranty: 30-Year Unlimited Free Replacement

5) Safety Listing: UL 1449 4th Ed., Type 1 for Type 1 & Type 2 locations and UL 1283

6) Mode of Protection: All Mode. L-N, L-L, L-G, & N-G

7) Input Power Frequency: 40-68Hz

8) Response Time: < 1 nanosecond

9) Standard Monitoring: Status indicator lights (one per phase & one service LED); Form C dry contacts for suppressor status; Audible alarm with silence button

10) Short Circuit Current Rating: 200 kAIC short circuit current rating. Component Level fusing (CLF) allows direct bus connection without the need for upstream over-current protection.

11) Provide flush mount kit where shown on the drawings

b. ANSI/IEEE C62.41.1-2002, C62.41.2-2002, & C62.45-2002 Measured Limited Voltage and UL Voltage Ratings

Model Number	System Voltage	System Configuration	Protection Mode	MCOV	ETF Models A1 Ring Wave 2kV, 67A 180° Phase Angle	ETF Models A3 Ring Wave 6kV, 200A 180° Phase Angle	All Models B3 Ring Wave 6kV, 500A 90° Phase Angle	UL1449 2nd Ed./ UL1449 3rd & 4th Ed. Voltage Protection Ratings

TK-LP080-3Y208-L	120/208V	3-Phase WYE 4-wire+grnd	L-N	150V	29V	56V	437V	400/700
			L-G	150V	46V	81V	592V	400/700
			L-L	300V	39V	88V	612V	800/1000
			N-G	150V	40V	112V	324V	400/700

2. 480/277 Volt Panelboards. Provide where scheduled

   a. Total Protection Solutions#TK-TT2-100-3Y480-FL

      1) Maximum Rated Surge Current: 100kA per phase (50kA/mode)

      2) Repetitive Surge Current Rating: 3,000 impulses per mode based on actual test data (using ANSI/IEEE C62.41.1-2002 C3 combo wave)

      3) Application: ANSI/IEEE C62.41 Location C, B & A. Ideal for distribution panels, branch panels and critical loads

      4) Design: Hybrid parallel design with individual fused MOV's and UL

      5) 1283 EMI/RFI filter Warranty: 25-Year Unlimited Free Replacement

      6) Safety Listing: UL 1449 4th Ed., Type 1 for Type 1 & Type 2 locations and UL 1283

      7) Modes of Protection: All modes: L-N, L-G, N-G & L-L

      8) Input Power Frequency: 40-68Hz

      9) Connection Method: Parallel to electrical distribution system

      10) Response Time: Less than 1 nanosecond

      11) Standard Monitoring: Status indicator lights (one per phase)

      12) Short circuit Current Rating: 200 kAIC – no upstream over-current protection device (breaker or fuse) required.

      13) Provide flush mount kit where shown on the drawings

3. Distribution boards HB AND HC

   a. TPS #TK-ST160-3Y480

      1) Modes of Protection: All Modes. L-N, L-L, L-G, & N-G

      2) Input Power Frequency: 40-68Hz

      3) Response Time: < 1 nanosecond

      4) Standard Monitoring: Status indicator lights (one per phase & one service

      5) LED); Form C dry relay contacts for suppressor status; Audible alarm

      6) with silence button

      7) Short Circuit Current Rating: 200 kAIC on all units.

      8) No upstream over-current protection required on CLF unit.

9) Non CLF units require 60A Max fuse or breaker.

10) Enclosure: Steel, Weatherproof. NEMA 4 (IP 56)

11) Connection: Hardwired via internal lugs #10 AWG-#2 AWG

12) Mounting: Multi-point mounting feet

b. Provide 50/3 breaker.

B. Surge protective devices shall be electrically connected to each phase bus of the panelboard, and should be installed close to the main incoming lugs or circuit breaker. Maximum distance is 8-12” from the bus and breaker

C. Provide 30/3 circuit breaker whether scheduled or not

PART 3 EXECUTION

3.1 EXAMINATION

A. Verify actual conditions with field measurements prior to ordering panelboards to verify that equipment fits in allocated space in, and comply with, minimum required clearances specified in NFPA 70.

B. Receive, inspect, handle, and store panelboards in accordance with NECA 407 and NEMA PB 1.1.

C. Examine panelboards before installation. Reject panelboards that are damaged, rusted, or have been subjected to water saturation.

D. Examine elements and surfaces to receive panelboards for compliance with installation tolerances and other conditions affecting performance of the Work.

E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with manufacturer's published instructions.

B. Examine equipment exterior and interior prior to installation. Report any damage and do not install any equipment that is structurally, moisture, or mildew damaged.

C. Verification of Conditions: Examine areas and conditions under which the work is to be installed, and notify the Contractor in writing, with a copy to the Owner and the Engineer, of any conditions detrimental to the proper and timely completion of the work. Do not proceed with the work until unsatisfactory conditions have been corrected

D. Torque bolted connections and circuit breaker connections using calibrated torque wrench or torque screwdriver per manufacturer's written specifications

E. Reference Standards:

1. Panelboards: Unless more stringent requirements are specified in Contract Documents or manufacturers' published instructions, comply with NECA 407 and NEMA PB 1.1.

2. Consult Architect for resolution of conflicting requirements.

F. Special Techniques:

1. Equipment Mounting:

a. Wall mount standard panels

b. Install Power (Distribution) panelboards on cast-in-place concrete equipment base(s).

c. Attach panelboard to vertical finished or structural surface behind panelboard.

d. Comply with requirements for seismic control devices specified in Section 260548

2. Mount top of trim 6.5 feet above finished floor unless otherwise indicated or panel is larger.

3. Mount panelboard cabinet plumb and rigid without distortion of box.

4. Mount recessed panelboards with fronts uniformly flush with wall finish and mating with back box.

5. Install overcurrent protective devices and controllers not already factory installed.

a. Set field-adjustable, circuit-breaker trip ranges.

b. Tighten bolted connections and circuit breaker connections using calibrated torque wrench or torque screwdriver in accordance with manufacturer's published instructions.

6. Make grounding connections and bond neutral for services and separately derived systems to ground. Make connections to grounding electrodes, separate grounds for isolated ground bars, and connections to separate ground bars.

7. Install filler plates in unused spaces.

8. Stub four 1 inch (25 mm) empty conduits from flush panelboards into accessible ceiling space or space designated to be ceiling space in future. Stub four 1 inch (25 mm) empty conduits into raised floor space or below slab not on grade.

9. Arrange conductors in gutters into groups and bundle and wrap with wire ties and label with circuit numbers

10. Mount spare fuse cabinet in accessible location.

G. Interfaces with Other Work:

1. Coordinate layout and installation of panelboards and components with other construction that penetrates walls or is supported by them, including electrical and other types of equipment, raceways, piping, encumbrances to workspace clearance requirements, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

3.3 IDENTIFICATION

A. Identify field-installed conductors, interconnecting wiring, and components; install warning signs complying with requirements in Section 260553

B. Panelboard Nameplates: Label each panelboard with nameplate complying with requirements for identification specified in Section 260553

C. Device Nameplates: Label each branch circuit device in power panelboards with nameplate complying with requirements for identification specified in Section 260553

D. Install warning signs complying with requirements in Section 260553

E. Panelboard Label: Manufacturer's name and trademark, voltage, amperage, number of phases, and number of poles must be located on interior of panelboard door.

F. Breaker Labels: Faceplate must list current rating, UL and IEC certification standards, and AIC rating.

G. Circuit Directory:

1. Provide directory card inside panelboard door, mounted in metal frame with transparent protective cover.

a. Circuit directory must identify specific purpose with detail sufficient to distinguish it from other circuits and location. For example Receptacles Room 56 West Wall.

2. Circuit directory must use final room numbers that appear on the door of the room. Obtain door numbers from architect prior to creating directories.

3. Provide computer-generated circuit directory mounted inside panelboard door with transparent plastic protective cover.

a. Circuit directory must identify specific purpose with detail sufficient to distinguish it from other circuits.

3.4 FIELD QUALITY CONTROL

A. Acceptance Testing Preparation:

1. Perform each visual and mechanical inspection and electrical test for low-voltage air circuit breakers stated in NETA ATS, Paragraph 7.6 Circuit Breakers

2. Check tightness of bolted connections and circuit breaker connections using calibrated torque wrench or torque screwdriver per manufacturer's written specifications

3. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.

3.5 ADJUSTING

A. Adjust moving parts and operable components to function smoothly, and lubricate as recommended by manufacturer.

B. Set field-adjustable circuit-breaker trip ranges as specified in Section 260573

END OF SECTION

SECTION 26 27 26 – WIRING DEVICES

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:

1. Receptacles, Special receptacles
2. Switches
3. Receptacles with arc-fault and ground-fault protective devices.
4. Locking receptacles.
5. Multioutlet assemblies
6. Connectors, cords, and plugs.

1.2 SUBMITTALS

A. Product Data for all wiring devices

B. Shop Drawings: List of legends and description of materials and process used for pre--marking wall plates.

C. Operation and Maintenance Data: For wiring devices to include in all manufacturers' packing label warnings and instruction manuals that include labeling conditions.

D. Samples if requested

1.3 QUALITY ASSURANCE

A. Source Limitations: Obtain each type of wiring device and associated wall plate through one source from a single manufacturer. Insofar as they are available, obtain all wiring devices and associated wall plates from a single manufacturer and one source.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Comply with NFPA 70.

1.4 COORDINATION

A. Receptacles for Owner-Furnished Equipment: Match plug configurations.

B. Cord and Plug Sets: Match equipment requirements.

1.5 SPARE PARTS

A. Provide the following spare parts. Include 50 feet of MC Cable with 3#12 with reach receptacle so owner may elect to use devices during project. Any not used to be turned over to the owner as spare parts.

B. Receptacles – 5

C. Controlled Receptacles - 2

D. GFI Receptacles -1

E. Plates – 5

PART 2 PRODUCTS

2.1 GENERAL WIRING DEVICE REQUIREMENTS.

A. Wiring Devices, Components, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and use. RoHS compliant. Comply with NEMA WD 1.

B. Devices that are manufactured for use with modular plug-in connectors may be substituted under the following conditions:

1. Connectors shall comply with UL 2459 and shall be made with stranding building wire.

2. Devices shall comply with requirements in this Section.

C. Devices for Owner-Furnished Equipment:

1. Receptacles: Match plug configurations.

2. Cord and Plug Sets: Match equipment requirements.

D. Wiring Device Color

1. All wiring devices shall be White color

2. Controlled receptacles shall be Green Color and labeled

3. Receptacles on Emergency Power: Match wiring device color but provide “Emergency” engraved plate

4. Isolated Ground receptacles shall match wiring device color but have orange triangle

E. Plates shall be stainless steel

F. Manufacturers

1. Legrand/Pass and Seymour (Basis of Design)

2. Hubbell

3. Leviton

2.2 RECEPTACLES

A. Duplex Straight Blade

1. Convenience Receptacles, extra heavy duty. tamper resistant, 125 V, 20 A: 5-20R

2. Comply with ANSI C73, NEMA WD 1 and NEMA WD 6, and UL 498 and UL Fed Spec WC-596: File E13399, 10 year warranty.

3. Manufacturers

a. Pass and Seymour TR5362

b. Leviton T5362

c. Hubbell HBL5362TR

4. Single receptacles meet same standards as above

B. Isolated Ground Straight Blade

1. Convenience Receptacles, extra heavy duty. tamper resistant, 125 V, 20 A: 5-20R

2. Comply with NEMA WD 1, NEMA WD 6 configuration 5-20R, and UL 498 and UL Fed Spec WC-596: File E13399.

3. Manufacturers

a. Pass and Seymour TRIG5362

b. Leviton T5362-IG

c. Hubbell HBLIG5362TR

C. Controlled Straight Blade

1. Specs per above, both outlets marked controlled.

a. Manufacturers

1) Pass and Seymour TR5362CDN – Green Color

2) Leviton 5362-2PN

3) Hubbell HBL5362C2TR – Green color

2. Twistlock, L5-20R

a. Manufacturers

1) Pass and Seymour L520R

2) Leviton 2310-B

3) Hubbell: HBL2310

b. Twistlock
1) Pass and Seymour L530 and L630

2.3 GFCI RECEPTACLES

A. Duplex Straight Blade

1. Convenience Receptacles, extra heavy duty. tamper resistant, 125 V, 20 A

2. GFCI and components shall be designed, manufactured, tested and installed to comply with NFPA 70 (NationalElectrical Code) and the following: cULus Listed File Number E42190, Standard UL498 Attachment Plugs and Receptacles, UL943 GFCIs. Federal

Specification WC596. Standard CSA C22.2 No. 42 General Use Receptacles, CSA C22.2 No.144 GFCIs. Conforms to NEMA WD-1 and WD-6.

3. Manufacturers

a. Pass and Seymour 2097TR (No Substitute in Kitchen areas)

b. Leviton GFTR2-F

c. Hubbell GF5362SG

4. Single receptacles meet same standards as above

B. Controlled GFCI Straight Blade

1. Specs per above, both outlets marked controlled.

2. Manufacturers

a. Leviton#G5362-2TN

2.4 SPECIAL RECEPTACLES

A. Power outlets shall be industrial specification grade.

B. Standards and Certifications: ANSI: C-73, CSA C22.2 No. 42: File 152105, NEMA WD-6, NOM 057, UL49 File E13399, Warranty: 10-Year Limited

1. Dryer: 14-30R

a. Pass and Seymour #3864

b. Leviton #278

c. Hubbell # HBL9430A

2. Range: 14-50R

a. Pass and Seymour #3894

b. Leviton #279

c. Hubbell # HBL9450A

3. Special outlets shown on drawings will be industrial hard use specification grade to match NEMA designation on drawings

4. Provide custom stainless steel plate per below.

2.5 SWITCHES

A. Switches that are part of the low voltage lighting control system are specified in 260923

B. Listed and labeled in accordance with NFPA 70, by qualified electrical testing laboratory recognized by authorities having jurisdiction, and marked for intended location and application. General Characteristics: Extra Heavy Duty Industrial Spec Grade, ANSI: C-73, CSA C22.2 No. 111: File #152105, NEMA: WD-1 & WD-6, NOM: 057, RoHS: Compliant, UL Fed Spec WS896E: File #E7458, UL Standard: UL 20, Warranty: 10-Year Limited

C. Toggle Switch

1. Manufacturers

a. Pass and Seymour PS20AC1 series

b. Leviton 1221 series

c. Hubbell HBL1221 series

2. Configuration:

a. Extra-heavy-duty, 120-277 V, 20 A, single pole, double pole, three way, and four way as shown.

D. Key Switch

1. Meet same standards as above

2. Manufacturers

a. Pass and Seymour# PS20AC1

b. Leviton 1221-2l with key per switch

c. Hubbell # HBL1221L

3. Configuration:

a. Extra-heavy-duty, 120-277 V, 20 A, single pole, double pole, three way, and four way as shown.

E. Pilot Light Switch

1. Meet same standards as above

a. Manufacturers

1) Pass and Seymour# PS20AC1CPL

2) Leviton #1221-PLC

3) Hubbell #HBL1221PL

2. Configuration:

a. Extra-heavy-duty, 120-277 V, 20 A, single pole, double pole, three way, and four way as shown

F. Special switches meet same specs as above and of configuration shown on the drawings.

2.6 PLATES

A. Brushed-finish wall plates are made with .032" Type 302/304 stainless steel. This alloy is nonmagnetic and contains 18 percent chromium and 8 percent nickel for superior corrosion resistance. UL Listed, Standard UL514, Cover Plates for Flush Mounted Wiring Devices. CSA Certified

B. Configurations include but are not limited to duplex, double duplex, decora, double decora, switch, switch to match gangs on drawings, special outlets, combo switch/receptacle, combo switch/decora, blank plates

C. Manufacturer

1. Pass and Seymour SS Series

2. Leviton 8400X Series

3. Hubbell SSJ Series

D. Special plates shall be provided for emergency outlets and shall be engraved with red “Emergency” on them.

PART 3 EXECUTION

3.1 EXAMINATION

A. Receptacles:

1. Verify that receptacles to be procured and installed for Owner-furnished equipment are compatible with mating attachment plugs on equipment.

B. Cord Reels:

1. Examine roughing-in for cord reel mounting and power connections to verify actual locations of mounts and power connections before cord reel installation.

2. Examine walls, floors, and ceilings for suitable conditions where cord reel will be installed.

3. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with manufacturer's instructions and Comply with NECA 1, including the mounting heights listed in that standard, unless otherwise noted.

B. Coordination with Other Trades:

1. Take steps to insure that devices and their boxes are protected. Do not place wall finish materials over device boxes and do not cut holes for boxes with routers that are guided by riding against outside of the boxes.

2. Keep outlet boxes free of plaster, drywall joint compound, mortar, cement, concrete, dust, paint, and other material that may contaminate the raceway system, conductors, and cables.

3. Install device boxes in brick or block walls so that the cover plate does not cross a joint unless the joint is troweled flush with the face of the wall.

4. Install wiring devices after all wall preparation, including painting, is complete.

C. Conductors:

1. Do not strip insulation from conductors until just before they are spliced or terminated on devices.

2. Strip insulation evenly around the conductor using tools designed for the purpose. Avoid scoring or nicking of solid wire or cutting strands from stranded wire.

3. The length of free conductors at outlets for devices shall meet provisions of NFPA 70, Article 300, without pigtails.

4. Existing Conductors:

5. Cut back and pigtail, or replace all damaged conductors.

6. Straighten conductors that remain and remove corrosion and foreign matter.

7. Pigtailing existing conductors is permitted provided the outlet box is large enough.

D. Device Installation:

1. Replace all devices that have been in temporary use during construction or that show signs that they were installed before building finishing operations were complete.

2. Keep each wiring device in its package or otherwise protected until it is time to connect conductors.

3. Do not remove surface protection, such as plastic film and smudge covers, until the last possible moment.

4. Connect devices to branch circuits using pigtails that are not less than 6 inches in length.

5. When there is a choice, use side wiring with binding-head screw terminals. Wrap solid conductor tightly clockwise, 2/3 to 3/4 of the way around terminal screw.

6. Use a torque screwdriver when a torque is recommended or required by the manufacturer.

7. When conductors larger than No. 12 AWG are installed on 15- or 20-A circuits, splice No. 12 AWG pigtails for device connections.

8. Tighten unused terminal screws on the device.

9. When mounting into metal boxes, remove the fiber or plastic washers used to hold device mounting screws in yokes, allowing metal-to-metal contact.

10. Install double duplex, four-plex, and multiple switch locations under common plate.

E. Device Plates: Do not use oversized or extra-deep plates. Repair wall finishes and remount outlet boxes when standard device plates do not fit flush or do not cover rough wall opening.

F. Reference Standards:

1. Unless more stringent requirements are specified in Contract Documents or manufacturers' instructions, comply with installation instructions in NECA NEIS 130.

2. Mounting Heights: See 260533

3. Receptacle Orientation: Unless otherwise indicated in Contract Documents, orient receptacle to match configuration diagram in NEMA WD 6 or as directed by the architect.

G. Identification:

1. Identify cover or cover plate for device with panelboard identification and circuit number in accordance with Section 260553

a. Mark cover or cover plate using dymo tape and provide durable mark inside device box or outlet box.

H. Interfaces with Other Work:

3.3 FIELD QUALITY CONTROL

A. Tests and Inspections:

1. Insert and remove test plug to verify that device is securely mounted.

2. Verify polarity of hot and neutral pins and hot and switch.

3. Measure line voltage.

4. Perform additional installation and maintenance inspections and diagnostic tests in accordance with NECA NEIS 130 and manufacturers' instructions.

5. Plug test all receptacles

6. Check GFCI function

B. Nonconforming Work:

1. Device will be considered defective if it does not pass tests and inspections.

2. Remove and replace defective units and retest.

3.4 PROTECTION

A. Devices:

1. Schedule and sequence installation to minimize risk of contamination of wires and cables, devices, device boxes, outlet boxes, covers, and cover plates by plaster, drywall joint compound, mortar, cement, concrete, dust, paint, and other materials.

2. After installation, protect wires and cables, devices, device boxes, outlet boxes, covers, and cover plates from construction activities. Remove and replace items that are contaminated, defaced, damaged, or otherwise caused to be unfit for use prior to acceptance by Owner.

B. Cord Reels and Fittings:

1. After installation, protect cord reels and fittings from construction activities. Remove and replace items that are contaminated, defaced, damaged, or otherwise caused to be unfit for use prior to acceptance by Owner.

C. Connectors, Cords, and Plugs:

1. After installation, protect connectors, cords, and plugs from construction activities. Remove and replace items that are contaminated, defaced, damaged, or otherwise caused to be unfit for use prior to acceptance by Owner.

END OF SECTION

SECTION 26 28 16 – ENCLOSED SWITCHES AND CIRCUIT BREAKERS

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:

1. Fusible switches.
2. Nonfusible switches.
3. Elevator Disconnecting Means
4. Molded-case circuit breakers (MCCBs).
5. Enclosures.
6. Section.

1.2 DEFINITIONS

A. NC: Normally closed.

B. NO: Normally open.

C. SPDT: Single pole, double throw.

1.3 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Enclosed switches and circuit breakers shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

B. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

1.4 SUBMITTALS

A. Product Data:

1. For each type of enclosed switch, circuit breaker, accessory, and component indicated. Include nameplate ratings, dimensioned elevations, sections, weights, and manufacturers' technical data on features, performance, electrical characteristics, ratings, accessories, and finishes.
2. Enclosure types and details for types other than UL 50E, Type 1.
3. Current and voltage ratings.
4. Short-circuit current ratings (interrupting and withstand, as appropriate).

B. Shop Drawings: For enclosed switches and circuit breakers.

1. Include plans, elevations, sections, details, and attachments to other work.
2. Include wiring diagrams for power, signal, and control wiring.

PART 2 PRODUCTS

2.1 GENERAL REQUIREMENTS

A. Manufactuers

1. Square D by Schneider, Eaton

B. Source Limitations: Obtain products from single manufacturer.

C. Product Selection for Restricted Space: Drawings indicate maximum dimensions for enclosed switches and circuit breakers, including clearances between enclosures, and adjacent surfaces and other items. Comply with indicated maximum dimensions.

D. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with NFPA 70, by qualified electrical testing laboratory recognized by authorities having jurisdiction, and marked for intended location and application.

2.2 FUSIBLE SWITCHES

A. Type HD, Heavy Duty, Single Throw, 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, with clips or bolt pads to accommodate specified fuses, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

B. Type HD, Heavy Duty, Six Pole, Single Throw, 600-V ac, 200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, with clips or bolt pads to accommodate specified fuses, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

C. Type HD, Heavy Duty, Double Throw, 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, with clips or bolt pads to accommodate specified fuses, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

D. Accessories:

1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.

2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.

3. Class R Fuse Kit: Provides rejection of other fuse types when Class R fuses are specified.

4. Service-Rated Switches: Labeled for use as service equipment where shown on drawings

5. Auxiliary Contact Kit: NO/NC (Form "C") auxiliary contact(s), arranged to activate before switch blades open.

6. Lugs: Mechanical type, suitable for number, size, and conductor material.

2.3 NONFUSIBLE SWITCHES

A. Type HD, Heavy Duty, Three Pole, Single Throw, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

B. Type HD, Heavy Duty, Six Pole, Single Throw, 200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

C. Type HD, Heavy Duty, Three Pole, Double Throw, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

D. Accessories:

1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.

2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.

3. Auxiliary Contact Kit: NO/NC (Form "C") auxiliary contact(s), arranged to activate before switch blades open.

4. Lugs: Mechanical type, suitable for number, size, and conductor material.

2.4 ELEVATOR DISCONNECT

A. 600Vac, 3-phase

B. 30 to 400 amps

C. NEMA 1, 3R, 12 and 4 enclosure options

D. Complies with the following codes and standards

1. Elevator shutdown

2. ANSI/ASME A17.1, 2.8.3.3.2

3. NEC 620.51(B) (elevator shutdown)

4. NEC 240.12 (orderly shutdown)

5. Shunt trip voltage monitoring

a. NFPA 72, 6.16.4.4

6. Selective coordination

a. NEC 620.62

7. Auxiliary contact (hydraulic elevator)

a. NEC 620.91(C)

E. The switch utilizes Bussmann series Low-Peak™ Class J fuses to easily meet requirements for selective coordination following a simple 2:1 lineside to loadside amp ratio with any other Low-Peak fuse.

F. Provide Key Switch and Pilot Light

G. Provide 100 VA control transformer

H. Provide fire alarm control relay

I. Bussman PSXX-T20-R2-K-G-NX-F1-+

1. Provide with amperage required by the elevator installer.

2.5 MOLDED-CASE CIRCUIT BREAKERS

A. Circuit breakers must be constructed using glass-reinforced insulating material. Current carrying components must be completely isolated from handle and accessory mounting area.

B. Circuit breakers must have toggle operating mechanism with common tripping of all poles, which provides quick-make, quick-break contact action. Circuit-breaker handle must be over center, be trip free, and reside in tripped position between on and off to provide local trip indication. Circuit-breaker escutcheon must be clearly marked on and off in addition to providing international I/O markings. Equip circuit breaker with push-to-trip button, located on face of circuit breaker to mechanically operate circuit-breaker tripping mechanism for maintenance and testing purposes.

C. Maximum ampere rating and UL, IEC, or other certification standards with applicable voltage systems and corresponding interrupting ratings must be clearly marked on face of circuit breaker. Circuit breakers must be 100 percent rated

D. MCCBs must be equipped with device for locking in isolated position.

E. Lugs must be suitable for 90 deg C rated wire, sized in accordance with 75 deg C temperature rating in NFPA 70.

F. Standard: Comply with UL 489 with required interrupting capacity for available fault currents.

G. Breakers – as dictated by the 260573 coordination study

1. Thermal-Magnetic Circuit Breakers: Inverse time-current thermal element for low-level overloads and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.

2. Adjustable, Instantaneous-Trip Circuit Breakers: Magnetic trip element with front-mounted, field-adjustable trip setting.

3. Electronic Trip Circuit Breakers: Field-replaceable rating plug, RMS sensing, with the following field-adjustable settings:

   a. Instantaneous trip.

   b. Long- and short-time pickup levels.

   c. Long- and short-time time adjustments.

   d. Ground-fault pickup level, time delay, and I-squared t response.

4. Current-Limiting Circuit Breakers: Frame sizes 400 A and smaller, and let-through ratings less than NEMA FU 1, RK-5.

5. GFLS Circuit Breakers: Single- and two-pole configurations with Class A ground-fault protection (6 mA trip).

6. GFEP Circuit Breakers: With Class B ground-fault protection (30 mA trip).

H. Features and Accessories:

1. Standard frame sizes, trip ratings, and number of poles.

2. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge lighting circuits.

3. Shunt Trip: Trip coil energized from separate circuit, with coil-clearing contact.

4. Alarm Switch: One contact that operates only when circuit breaker has tripped.

5. Lugs: Compression type, suitable for number, size, trip ratings, and conductor material.

6. Ground-Fault Protection: Comply with UL 1053; integrally mounted, self-powered type with mechanical ground-fault indicator; relay with adjustable pickup and time-delay settings, push-to-test feature, internal memory, and shunt trip unit; and three-phase, zero-sequence current transformer/sensor.

2.6 MOLDED-CASE SWITCHES

A. Description: MCCB with fixed, high-set instantaneous trip only, and short-circuit withstand rating equal to equivalent breaker frame size interrupting rating.

B. Standard: Comply with UL 489 with interrupting capacity to comply with available fault currents.

C. Features and Accessories:

1. Standard frame sizes and number of poles.

2. Lugs:

a. Compression type, suitable for number, size, trip ratings, and conductor material.

b. Lugs must be suitable for 90 deg C rated wire, sized in accordance with 75 deg C temperature rating in NFPA 70.

3. Ground-Fault Protection: Comply with UL 1053; remote-mounted and powered type with mechanical ground-fault indicator; relay with adjustable pickup and time-delay settings, push-to-test feature, internal memory, and shunt trip unit; and three-phase, zero-sequence current transformer/sensor.

4. Shunt Trip: Trip coil energized from separate circuit, with coil-clearing contact.

2.7 ENCLOSURES

A. Enclosed Switches and Circuit Breakers: UL 489, NEMA KS 1, UL 50E, and UL 50, to comply with environmental conditions at installed location.

1. Indoor, Dry and Clean Locations: NEMA 250, Type 1.

2. Outdoor Locations: NEMA 250, Type 3R.

3. Kitchen Areas: NEMA 250, Type 4X, stainless steel.

4. Other Wet or Damp, Indoor Locations: NEMA 250, Type 4.

5. Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids: NEMA 250, Type 12.

2.8 FUSES

A. Eaton Bussman Low Peak or equal by Littlefuse or Ferraz by Powerfuse (Gould Shawmut)

B. Characteristics: NEMA FU 1, current-limiting, nonrenewable cartridge fuses with voltage ratings consistent with circuit voltages.

1. Type RK-1: Time delay for all motor circuits except when Class J needed

2. Type RK-1: Fast actine where specified

3. Type J: where required to fit enclosure

4. Type T: for special applications where approved only

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

D. Comply with NEMA FU 1 for cartridge fuses.

E. Comply with NFPA 70.

F. Coordinate fuse ratings with utilization equipment nameplate limitations of maximum fuse size and with system short-circuit current levels.

2.9 SPARE-FUSE CABINET

A. Characteristics: Wall-mounted steel unit with full-length, recessed piano-hinged door and key-coded cam lock and pull.

B. Size: Adequate for storage of spare fuses specified with 15 percent spare capacity minimum.

C. Finish: Gray, baked enamel.

D. Identification: "SPARE FUSES" in 1-1/2-inch- (38-mm-) high letters on exterior of door.

E. Fuse Pullers: For each size of fuse, where applicable and available, from fuse manufacturer.

2.10 SPARE-PARTS

A. Provide 1 spare 30 amp disconnect

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine elements and surfaces to receive enclosed switches and circuit breakers for compliance with installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

1. Commencement of work will indicate Installer's acceptance of areas and conditions as satisfactory.

3.2 INSTALLATION

A. Comply with manufacturer's published instructions, NFPA 70 and NECA NEIS 1

B. Special Techniques:

1. Coordinate layout and installation of switches, circuit breakers, and components with equipment served and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

2. Install individual wall-mounted switches and circuit breakers with tops at uniform height unless otherwise indicated.

3. Comply with mounting and anchoring requirements specified in Section 260548

4. Install fuses in fusible devices.

3.3 IDENTIFICATION

A. Comply with requirements in Section 260553

1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.

2. Label each enclosure with engraved metal or laminated-plastic nameplate.

3.4 FIELD QUALITY CONTROL

A. Tests and Inspections for Switches:

1. Visual and Mechanical Inspection:

a. Inspect physical and mechanical condition.

b. Inspect anchorage, alignment, grounding, and clearances.

c. Verify that unit is clean.

d. Verify blade alignment, blade penetration, travel stops, and mechanical operation.

e. Verify that fuse sizes and types match the Specifications and Drawings.

f. Verify that each fuse has adequate mechanical support and contact integrity.

g. Verify that operation and sequencing of interlocking systems is as described in the Specifications and shown on Drawings.

h. Verify correct phase barrier installation.

i. Verify lubrication of moving current-carrying parts and moving and sliding surfaces.

B. Tests and Inspections for Molded-Case Circuit Breakers:

1. Visual and Mechanical Inspection:

a. Verify that equipment nameplate data are as described in the Specifications and shown on Drawings.

b. Inspect physical and mechanical condition.

c. Inspect anchorage, alignment, grounding, and clearances.

d. Verify that unit is clean.

e. Operate circuit breaker to ensure smooth operation.

f. Inspect bolted electrical connections for high resistance using one of the following methods:

1) Use low-resistance ohmmeter.

a) Compare bolted connection resistance values to values of similar connections. Investigate values that deviate from those of similar bolted connections by more than 50 percent of lowest value.

2) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or NETA ATS Table 100.12.

a) Bolt-torque levels must be in accordance with manufacturer's published data. In absence of manufacturer's published data, use NETA ATS Table 100.12.

g. Inspect operating mechanism, contacts, and chutes in unsealed units.

h. Perform adjustments for final protective device settings in accordance with coordination study.

C. Nonconforming Work:

1. Enclosed switches and circuit breakers will be considered defective if they do not pass tests and inspections.

2. Remove and replace defective units and retest.

3.5 PROTECTION

A. After installation, protect enclosed switches and circuit breakers from construction activities. Remove and replace items that are contaminated, defaced, damaged, or otherwise caused to be unfit for use prior to acceptance by Owner.

END OF SECTION

SECTION 26 32 13 – ENGINE GENERATOR AND ASSOCIATED EQUIPMENT

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes packaged engine-generator sets suitable for use in applications with the features as specified and indicated where the engine generators will be used as the Standby power source for the system.

B. Meters shall be provided at generator and ATS for load shedding.

C. Coordinate with supplier of propane tank for all connections required to propane fuel source.

D. Generator system shall be provided in alternate bid.

1.3 DEFINITIONS

A. Emergency Standby Power (ESP): Per ISO 8528: The maximum power available during a variable electrical power sequence, under the stated operating conditions, for which a generating set is capable of delivering in the event of a utility power outage or under test conditions for up to 200 hours of operation per year with the maintenance intervals and procedures being carried out as prescribed by the manufacturers. The permissible average power output (Ppp) over 24 hours of operation shall not exceed 70 percent of the ESP unless otherwise agreed by the RIC engine manufacturer.

B. Operational Bandwidth: The total variation from the lowest to highest value of a parameter over the range of conditions indicated, expressed as a percentage of the nominal value of the parameter.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of packaged engine generator indicated. Include rated capacities, operating characteristics, and furnished specialties and accessories. In addition, include the following:

1. Thermal damage curve for generator.

2. Time-current characteristic curves for generator protective device.

3. Sound test data, based on a free field requirement.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, and location and size of each field connection.

1. Dimensioned outline plan and elevation drawings of engine-generator set and other components specified.

2. Wiring Diagrams: Control interconnection, Customer connections.

C. Certifications:

1. Submit statement of compliance which states the proposed product(s) is certified to the emissions standards required by the location for EPA, stationary emergency application.

1.5 INFORMATIONAL SUBMITTALS

A. Source quality-control test reports.

1. Certified summary of prototype-unit test report. See requirements in Part 2 "Source Quality Control" Article Part A. Include statement indicating torsional compatibility of components.

2. Certified Test Report: Provide certified test report documenting factory test per the requirements of this specification, as well as certified factory test of generator set sensors per NFPA110 level 1.

3. List of factory tests to be performed on units to be shipped for this Project.

4. Report of exhaust emissions and compliance statement certifying compliance with applicable regulations.

B. Warranty:

1. Submit manufacturer's warranty statement to be provided for this Project.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.

B. Manufacturer Qualifications: A qualified manufacturer. Maintain, within 100 of Project site, a service center capable of providing training, parts, and emergency maintenance repairs.

C. Source Limitations: Obtain packaged generator sets and auxiliary components through one source from a single manufacturer.

D. Comply with NFPA 37 (Standard For the Installation and Use of Stationary Combustion Engines and Gas Turbines).

E. Comply with NFPA 70 (National Electrical Code. Equipment shall be suitable for use in systems in compliance to Article 700, 701, and 702).

F. Comply with NFPA 110 (Emergency and Standby Power Systems) requirements for Level 1 emergency power supply system.

1.7 PROJECT CONDITIONS

A. Environmental Conditions: Engine-generator system shall withstand the following environmental conditions without mechanical or electrical damage or degradation of performance capability:

1. Ambient Temperature: 0.0 deg C (32.0 deg F) to 40.0 deg C (104.0 deg F).

2. Relative Humidity: 0 to 95 percent.

3. Altitude: Sea level to 500.0 feet (152.4 m).

1.8 WARRANTY

A. Base Warranty: Manufacturer shall provide base warranty coverage on the material and workmanship of the generator set for a minimum of twenty-four (24) months for Standby product and twelve (12) months for Prime/Continuous product from registered commissioning and start-up.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: The basis for this specification is Cummins Power Generation equipment, approved equals may be considered if equipment performance is shown to meet the requirements herein.

2.2 ENGINE-GENERATOR SET

A. Factory-assembled and -tested, engine-generator set.

B. Mounting Frame: Maintain alignment of mounted components without depending on concrete foundation; and have lifting attachments.

1. Rigging Information: Indicate location of each lifting attachment, generator-set center of gravity, and total package weight in submittal drawings.

C. Capacities and Characteristics:

1. Power Output Ratings: Electrical output power rating for Standby operation of not less than 335KW, at 80 percent lagging power factor, 277/480, Series Wye, Three phase, 4 -wire, 60 hertz.

2. Alternator shall be capable of accepting maximum 1000.0 kVA in a single step and be capable of recovering to a minimum of 90% of rated no load voltage. Following the application of the specified kVA load at near zero power factor applied to the generator set.

3. Nameplates: For each major system component to identify manufacturer's name and address, and model and serial number of component. The engine-generator nameplate shall include information of the power output rating of the equipment.

D. Generator-Set Performance:

1. Steady-State Voltage Operational Bandwidth: 1.0 percent of rated output voltage from no load to full load.

2. Transient Voltage Performance: Not more than 20 percent variation for 50 percent step-load increase or decrease. Voltage shall recover and remain within the steady-state operating band within 5 seconds. On application of a 100% load step the generator set shall recover to stable voltage within 10 seconds.

3. Steady-State Frequency Operational Bandwidth: 0.5 percent of rated frequency from no load to full load.

4. Steady-State Frequency Stability: When system is operating at any constant load within the rated load, there shall be no random speed variations outside the steady-state operational band and no hunting or surging of speed.

5. Transient Frequency Performance: Not more than 15 percent variation for 50 percent step-load increase or decrease. Frequency shall recover and remain within the steady-state operating band within 5 seconds. On application of a 100% load step the generator set shall recover to stable frequency within 10 seconds.

6. Output Waveform: At full load, harmonic content measured line to line or line to neutral shall not exceed 5 percent total and 3 percent for any single harmonic. Telephone influence factor, determined according to NEMA MG 1, shall not exceed 50.

7. Sustained Short-Circuit Current: For a 3-phase, bolted short circuit at system output terminals, system shall supply a minimum of 300 percent of rated full-load current for not less than 8 seconds without damage to generator system components. For a 1-phase, bolted short circuit at system output terminals, system shall regulate both voltage and current to prevent over-voltage conditions on the non-faulted phases.

8. Start Time: Comply with NFPA 110, Level 1, Type 10, system requirements.

9. Ambient Condition Performance: Engine generator shall be designed to allow operation at full rated load in an ambient temperature under site conditions, based on highest ambient condition.

Ambient temperature shall be as measured at the air inlet to the engine generator for enclosed units, and at the control of the engine generator for machines installed in equipment rooms.

2.3 ENGINE

A. Fuel: Liquefied Petroleum Gas (Propane)

B. Rated Engine Speed: 1800RPM.

C. Lubrication System: The following items are mounted on engine or skid:

1. Lube oil pump: shall be positive displacement, mechanical, full pressure pump.

2. Filter and Strainer: Provided by the engine manufacturer of record to provide adequate filtration for the prime mover to be used.

3. Crankcase Drain: Arranged for complete gravity drainage to an easily removable container with no disassembly and without use of pumps, siphons, special tools, or appliances.

D. Engine Fuel System: The engine fuel system shall be installed in strict compliance to the engine manufacturer's instructions

E. Governor: Adjustable isochronous, with speed sensing. The governing system dynamic capabilities shall be controlled as a function of engine coolant temperature to provide fast, stable operation at varying engine operating temperature conditions. The control system shall actively control the fuel rate as appropriate to the state of the engine generator. Fuel rate shall be regulated as a function of starting, accelerating to start disconnect speed, accelerating to rated speed, and operating in various isochronous states.

F. Cooling System: Closed loop, liquid cooled

1. The generator set manufacturer shall provide prototype test data for the specific hardware proposed demonstrating that the machine will operate at rated standby load in an outdoor ambient condition of 40 deg C.

2. Coolant: Solution of 50 percent ethylene-glycol-based antifreeze and 50 percent water, with anticorrosion additives as recommended by engine manufacturer.

3. Size of Radiator overflow tank: Adequate to contain expansion of total system coolant from cold start to 110 percent load condition.

4. Expansion Tank: Constructed of welded steel plate and rated to withstand maximum closed-loop coolant system pressure for engine used. Equip with gage glass and petcock.

5. Temperature Control: Self-contained, thermostatic-control valve modulates coolant flow automatically to maintain optimum constant coolant temperature as recommended by engine manufacturer.

6. Duct Flange: Generator sets installed indoors shall be provided with a flexible radiator duct adapter flange.

G. Muffler/Silencer: Selected with performance as required to meet sound requirements of the application, sized as recommended by engine manufacturer and selected with exhaust piping system to not exceed engine manufacturer's engine backpressure requirements. For generator sets with outdoor enclosures the silencer shall be inside the enclosure.

H. Air-Intake Filter: Engine-mounted air cleaner with replaceable dry-filter element and restriction indicator.

I. Starting System: 12 or 24V, as recommended by the engine manufacturer; electric, with negative ground.

1. Components: Sized so they will not be damaged during a full engine-cranking cycle with ambient temperature at maximum specified in Part 1 "Project Conditions" Article.

2. Cranking Cycle: As required by NFPA 110 for level 1 systems.

3. Battery Cable: Size as recommended by engine manufacturer for cable length as required. Include required interconnecting conductors and connection accessories.

4. Battery Compartment: Factory fabricated of metal with acid-resistant finish.

5. Battery-Charging Alternator: Factory mounted on engine with solid-state voltage regulation. The battery charging alternator shall have sufficient capacity to recharge the batteries with all parasitic loads connected within 4 hours after a normal engine starting sequence.

6. Battery Chargers: Unit shall comply with UL 1236, provide fully regulated, constant voltage, current limited, battery charger for each battery bank. It will include the following features:

    a. Operation: Equalizing-charging rate based on generator set manufacturer's recommendations shall be initiated automatically after battery has lost charge until an adjustable equalizing voltage is achieved at battery terminals. Unit shall then be automatically switched to a lower float-charging mode and shall continue to operate in that mode until battery is discharged again.

    b. Automatic Temperature Compensation: Adjust float and equalize voltages for variations in ambient temperature from minus 20 deg C to plus 40 deg C to prevent overcharging at high temperatures and undercharging at low temperatures.

    c. Automatic Voltage Regulation: Maintain constant output voltage regardless of input voltage variations up to plus or minus 10 percent.

    d. Safety Functions: Sense abnormally low battery voltage and close contacts providing low battery voltage indication on control and monitoring panel. Sense high battery voltage and loss of ac input or dc output of battery charger. Either condition shall close contacts that provide a battery-charger malfunction indication at system control and monitoring panel.

    e. Provide LED indication of general charger condition, including charging, faults, and modes. Provide a LCD display to indicate charge rate and battery voltage. Charger shall provide relay contacts for fault conditions as required by NFPA110.

    f. Enclosure and Mounting: NEMA, Type 1, wall-mounted cabinet.

2.4 CONTROL AND MONITORING

A. Engine generator control shall be microprocessor based and provide automatic starting, monitoring, protection and control functions for the unit.

B. Automatic Starting System Sequence of Operation: When mode-selector switch on the control and monitoring panel is in the automatic position, remote-control contacts in one or more separate automatic transfer switches initiate starting and stopping of generator set. When mode-selector switch is switched to the on position, generator set starts. The off position of same switch initiates generator-set shutdown. (Switches with different configurations but equal functions are acceptable.) When generator set is running, specified system or equipment failures or derangements automatically shut down generator set and initiate alarms. Operation of the local (generator set-mounted) and/or remote emergency-stop switch also shuts down generator set.

C. Manual Starting System Sequence of Operation: Switching on-off switch on the generator control panel to the on position starts generator set. The off position of same switch initiates generator-set shutdown. When generator set is running, specified system or equipment failures or derangements automatically shut down generator set and initiate alarms. Operation of the local (generator set-mounted) and/or remote emergency-stop switch also shuts down generator set.

D. Configuration: Operating and safety indications, protective devices, system controls, engine gages and associated equipment shall be grouped in a common control and monitoring panel. Mounting method shall isolate the control panel from generator-set vibration. AC output power circuit breakers and other output power equipment shall not be mounted in the control enclosure.

E. Indicating and Protective Devices and Controls: As required by NFPA 110 for Level 1 system, and the following:

1. AC voltmeter (3-phase, line to line and line to neutral values).

2. AC ammeter (3-phases).

3. AC frequency meter.

4. AC kVA output (total and for each phase). Display shall indicate power flow direction.

5. Ammeter-voltmeter displays shall simultaneously display conditions for all three phases.

6. Emergency Stop Switch: Switch shall be a red “mushroom head” pushbutton device complete with lock-out/tag-out provisions. Depressing switch shall cause the generator set to immediately stop the generator set and prevent it from operating.

7. Fault Reset Switch: Supply a dedicated control switch to reset/clear fault conditions.

8. DC voltmeter (alternator battery charging).

9. Engine-coolant temperature gage.

10. Engine lubricating-oil pressure gage.

11. Running-time meter.

12. Generator-voltage and frequency digital raise/lower switches. Rheostats for these functions are not acceptable. The control shall adjustment of these parameters in a range of plus or minus 5% of the voltage and frequency operating set point (not nominal voltage and frequency values.)

13. AC Protective Equipment: The control system shall include over/under voltage, over current, short circuit, loss of voltage reference, and over excitation shut down protection. There shall be an overload warning, and overcurrent warning alarm.

14. Status LED indicating lamps to indicate remote start signal present at the control, existing alarm condition, not in auto, and generator set running.

15. A graphical display panel with appropriate navigation devices shall be provided to view all information noted above, as well as all engine status and alarm/shutdown conditions (including those from an integrated engine emission control system). The display shall also include integrated provisions for adjustment of the gain and stability settings for the governing and voltage regulation systems.

16. Panel lighting system to allow viewing and operation of the control when the generator room or enclosure is not lighted.

17. DC control Power Monitoring: The control system shall continuously monitor DC power supply to the control, and annunciate low or high voltage conditions. It shall also provide an alarm indicating imminent failure of the battery bank based on degraded voltage recover on loading (engine cranking).

2.5 GENERATOR OVERCURRENT AND FAULT PROTECTION

A. Generator Overcurrent Protection: The generator set shall be provided with a UL Listed/CSA Certified protective device that is coordinated with the alternator provided to prevent damage to the generator set on any possible overload or overcurrent condition external to the machine. The protective device shall be listed as a utility grade protective device under UL category NRGU. The control system shall be subject to UL follow-up service at the manufacturing location to verify that the protective system is fully operational as manufactured. Protector shall perform the following functions:

1. Initiates a generator kW overload alarm when generator has operated at an overload equivalent to 110 percent of full-rated load for 60 seconds. Indication for this alarm is integrated with other generator-set malfunction alarms.

2. Under single phase or multiple phase fault conditions, or on overload conditions, indicates an alarm conditions when the current flow is in excess of 110% of rated current for more than 10 seconds.

3. Under single phase or multiple phase fault conditions, operates to switch off alternator excitation at the appropriate time to prevent damage to the alternator.

4. The operator panel shall indicate the nature of the fault condition as either a short circuit or an overload.

5. Senses clearing of a fault by other overcurrent devices and controls recovery of rated voltage to avoid overshoot greater than 120% of nominal voltage.

6. The protective system provided shall not include an instantaneous trip function.

2.6 GENERATOR, EXCITER, AND VOLTAGE REGULATOR

A. Comply with NEMA MG 1.

B. Drive: Generator shaft shall be directly connected to engine shaft. Exciter shall be rotated integrally with generator rotor.

C. Electrical Insulation: Class H

D. Temperature Rise: 105 / Class F environment.

E. Construction shall prevent mechanical, electrical, and thermal damage due to vibration, over speed up to 125 percent of rating, and heat during operation at 110 percent of rated capacity.

F. Permanent Magnet Generator (PMG) shall provide excitation power for optimum motor starting and short circuit performance.

G. Enclosure: Drip-proof.

H. Voltage Regulator: Solid-state type, separate from exciter, providing performance as specified. The voltage regulation system shall be microprocessor-controlled, 3-phase true RMS sensing, full wave rectified, and provide a pulse-width modulated signal to the exciter. No exceptions or deviations to these requirements will be permitted.

I. Windings: Two-thirds pitch stator winding and fully linked amortisseur winding.

J. Subtransient Reactance: 15 percent maximum, based on the rating of the engine generator set.

2.7 OUTDOOR GENERATOR-SET ENCLOSURE

A. Description: Sound Attenuated Steel housing. Multiple panels shall be lockable and provide adequate access to components requiring maintenance. Instruments, control, and battery system shall be mounted within enclosure.

B. Construction:

1. Louvers: Equipped with bird screen to permit air circulation when engine is not running while excluding birds and rodents.

2. Hinged Doors: With padlocking provisions. Restraint/Hold back hardware to prevent door to keep door open at 180 degrees during maintenance. Rain lips over all doors.

3. Exhaust System:

a. Muffler Location: Within enclosure.

4. Hardware: All hardware and hinges shall be stainless steel.

5. Mounting Base: Suitable for mounting on sub-base fuel tank or housekeeping pad.

6. A weather protective enclosure shall be provided which allows the generator set to operate at full rated load with a static pressure drop equal to or less than 0.5 inches of water.

7. Inlet ducts shall include rain hoods

C. Engine Cooling Airflow through Enclosure: Housing shall provide ample airflow for engine generator operation at rated load in an ambient temperature of 40 deg C.

D. Sound Performance: Reduce the sound level of the engine generator while operating at full rated load to a maximum of 76 dBA measured at any location 7 m from the engine generator in a free field environment.

E. Site Provisions:

1. Lifting: Complete assembly of engine generator, enclosure shall be designed to be lifted into place as a single unit, using spreader bars.

2.8 AUTOMATIC TRANSFER SWITCH

A. Provide automatic transfer switch per voltage, amperage and configuration indicated on one line diagram in drawings.

B. Indicated Current Ratings: Apply as defined in UL 1008 for continuous loading and total system transfer.

C. Provide meter at ATS for load shedding purposes.

2.9 VIBRATION ISOLATION DEVICES

A. Vibration Isolation: Generators installed on grade shall be provided with elastomeric isolator pads integral to the generator, unless the engine manufacturer requires use of spring isolation.

2.10 FINISHES

A. Indoor and Outdoor Enclosures and Components: Powder-coated and baked over corrosion-resistant pretreatment and compatible primer. Manufacturer’s standard color or as directed on the drawings.

2.11 SOURCE QUALITY CONTROL

A. Prototype Testing: Factory test engine-generator set using same engine model, constructed of identical or equivalent components and equipped with identical or equivalent accessories.

1. Tests: Comply with NFPA 110, Level 1 Energy Converters. In addition, the equipment engine, skid, cooling system, and alternator shall have been subjected to actual prototype tests to validate the capability of the design under the abnormal conditions noted in NFPA110.

Calculations and testing on similar equipment which are allowed under NFPA110 are not sufficient to meet this requirement.

B. Project-Specific Equipment Tests: Before shipment, factory test engine-generator set manufactured specifically for this Project. Perform tests at rated load and power factor. Include the following tests:

1. Test engine generator set manufactured for this Project to demonstrate compatibility and functionality.

2. Full load run.

3. Maximum power.

4. Voltage regulation.

5. Steady-state governing.

6. Single-step load pickup.

7. Simulated safety shutdowns.

8. Provide 14 days' advance notice of tests and opportunity for observation of tests by Owner's representative.

PART 3 EXECUTION

3.1 INSTALLATION

A. Comply with packaged engine-generator manufacturers' written installation, application, and alignment instructions and with NFPA 110.

B. Equipment shall be installed by the contractor in accordance with final submittals and contract documents. Installation shall comply with applicable state and local codes as required by the authority having jurisdiction. Install equipment in accordance with manufacturer's instructions and instructions included in the listing or labeling of UL listed products.

C. Installation of equipment shall include furnishing and installing all interconnecting wiring between all major equipment provided for the on-site power system. The contractor shall also perform interconnecting wiring between equipment sections (when required), under the supervision of the equipment supplier.

D. Equipment shall be installed on concrete housekeeping pads. Equipment shall be permanently fastened to the pad in accordance with manufacturer’s instructions and seismic requirements of the site.

E. Equipment shall be initially started and operated by representatives of the manufacturer. All protective settings shall be adjusted as instructed by the consulting engineer.

F. All equipment shall be physically inspected for damage. Scratches and other installation damage shall be repaired prior to final system testing. Equipment shall be thoroughly cleaned to remove all dirt and construction debris prior to initial operation and final testing of the system.

G. On completion of the installation by the electrical contractor, the generator set supplier shall conduct a site evaluation to verify that the equipment is installed per manufacturer’s recommended practice.

3.2 ON-SITE ACCEPTANCE TEST

A. The complete installation shall be tested to verify compliance with the performance requirements of this specification following completion of all site work. Testing shall be conducted by representatives of the manufacturer, with required fuel supplied by Contractor. The Engineer shall be notified in advance and

shall have the option to witness the tests. The generator set manufacturer shall provide a site test specification covering the entire system. Tests shall include:

B. Prior to start of active testing, all field connections for wiring, power conductors, and bus bar connections shall be checked for proper tightening torque.

C. Installation acceptance tests to be conducted on site shall include a "cold start" test, a two hour full load (resistive) test, and a one-step rated load pickup test in accordance with NFPA 110. Provide a resistive load bank and make temporary connections for full load test, if necessary.

D. Perform a power failure test on the entire installed system. This test shall be conducted by opening the power supply from the utility service, and observing proper operation of the system for at least 2 hours. Coordinate timing and obtain approval for start of test with site personnel.

3.3 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

3.4 SERVICE AND SUPPORT

A. The generator set supplier shall maintain service parts inventory for the entire power system at a central location which is accessible to the service location 24 hours per day, 365 days per year. The inventory shall have a commercial value of $3 million or more. The manufacturer of the generator set shall maintain a central parts inventory to support the supplier, covering all the major components of the power system, including engines, alternators, control systems, paralleling electronics, and power transfer equipment.

B. The generator set shall be serviced by a local service organization that is trained and factory certified in generator set service. The supplier shall maintain an inventory of critical power system replacement parts in the local service location. Service vehicles shall be stocked with critical replacement parts. The service organization shall be on call 24 hours per day, 365 days per year. The service organization shall be physically located within 100 of the site.

C. The manufacturer shall maintain model and serial number records of each generator set provided for at least 20 years.

END OF SECTION

SECTION 26 51 00 – INTERIOR LIGHTING

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:

1. Light Fixtures
2. Materials.
3. Luminaire support.

1.2 DEFINITIONS

A. CCT: Correlated color temperature.

B. CRI: Color Rendering Index.

C. Fixture: See "Luminaire."

D. IP: International Protection or Ingress Protection Rating.

E. LED: Light-emitting diode.

F. Lumen: Measured output of lamp and luminaire, or both.

G. Luminaire: Complete lighting unit, including lamp, reflector, and housing.

1.3 SUBMITTALS

A. Product Data: For each type of product.

1. Arrange in order of luminaire designation.
2. Include data on features, accessories, and finishes.
3. Include physical description and dimensions of luminaires.
4. Include emergency lighting units, including batteries and chargers.
5. Include life, output (lumens, CCT, and CRI), and energy-efficiency data.
6. Photometric data and adjustment factors based on laboratory tests IES LM-79 and IES LM-80.

a. Manufacturers' Certified Data: Photometric data certified by manufacturer's laboratory with a current accreditation under the National Voluntary Laboratory Accreditation Program for Energy Efficient Lighting Products.

B. Shop Drawings: For nonstandard or custom luminaires.

1. Include plans, elevations, sections, and mounting and attachment details.
2. Include details of luminaire assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

3. Include diagrams for power, signal, and control wiring.

C. Samples: Provide where requested

D. Mockups: Provide where requested.

1.4 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For luminaires and lighting systems to include in operation and maintenance manuals.

1. Provide a list of all lamp types used on Project; use ANSI and manufacturers' codes.

1.5 SPARE MATERIALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Drivers

a. One for each type of fixture

2. Fixtures

a. Provide 1 spare of the following fixtures

1) PL-7
2) RL-1
3) RL-3

3. Diffusers and Lenses: One for every 100 of each type and rating installed. Furnish at least one of each type.

1.6 QUALITY ASSURANCE

A. Luminaire Photometric Data Testing Laboratory Qualifications:

1. Luminaire manufacturer's laboratory that is accredited under the NVLAP for Energy Efficient Lighting Products.

2. Provided by an independent agency, with the experience and capability to conduct the testing indicated, that is an NRTL as defined by OSHA in 29 CFR 1910.7, accredited under the NVLAP for Energy Efficient Lighting Products, and complying with the applicable IES testing standards.

B. Provide luminaires from a single manufacturer for each luminaire type.

C. Each luminaire type shall be binned within a three-step MacAdam Ellipse to ensure color consistency among luminaires.

D. Installer Qualifications: An authorized representative who is trained and approved by manufacturer.

E. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

F. Comply with IEEE C2, "National Electrical Safety Code."

G. Comply with NFPA 70.

H. UL listed

I. Energy Star Rated

J. DLC rated

K. Mockups: Where requested for interior luminaires in room or module mockups, complete with power and control connections.

1. Obtain Architect's approval of luminaires in mockups before starting installations.

2. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.

3. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Protect finishes of exposed surfaces by applying a strippable, temporary protective covering before shipping.

1.8 WARRANTY

A. Warranty: Manufacturer and Installer agree to repair or replace components of luminaires that fail in materials or workmanship within specified warranty period.

B. Warranty Period: Five year(s) from date of Final Completion.

PART 2 PRODUCTS

2.1 FIXTURE TYPES

A. See Schedule on drawings

2.2 PERFORMANCE REQUIREMENTS

A. Seismic Performance:

1. Luminaires shall withstand the effects of earthquake motions determined in accordance with ASCE/SEI 7.

2. Luminaires and lamps shall be labeled vibration and shock resistant.

2.3 LUMINAIRE REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. Factory-Applied Labels: Comply with UL 1598. Include recommended lamps. Locate labels where they will be readily visible to service personnel, but not seen from normal viewing angles when lamps are in place.

C. Recessed luminaires shall comply with NEMA LE 4.

D. NRTL Compliance: Luminaires for hazardous locations shall be listed and labeled for indicated class and division of hazard by an NRTL.

E. FM Global Compliance: Luminaires for hazardous locations shall be listed and labeled for indicated class and division of hazard by FM Global.

F. California Title 24 compliant.

G. CRI of minimum 80 unless noted. CCT of 3500 K unless noted

H. Minimum Rated lamp life of 50,000 hours.

I. Lamps dimmable from 100 percent to 0 percent of maximum light output.

J. Internal drivers.

K. Nominal Operating Voltage: Per Drawings

L. Allow for Custom colors on all fixtures per architect from provided paint chip

2.4 DRIVERS

A. Input voltage range: Combination 120/277 volt except where noted differently on drawings

B. Frequency: 50/60Hz

C. Power factor: >0.9 @full load MTBF:

D. High surge protection: up to 10 kV (1 pulse) in protection class I or II

E. Lifetime: up to 100,000 h

F. Undervoltage protection

G. THD: <10%

H. Protection: Over voltage, Over current and Short circuit Withstand voltage

I. UL 8750 rated

J. Indoor and outdoor rated

K. 0-10VDC dimmable unless noted differently on the fixture or control schedule

L. Exterior drivers shall operate down to -40 F and be UL wet label

2.5 MATERIALS

A. Metal Parts:

1. Free of burrs and sharp corners and edges.

2. Sheet metal components shall be steel unless otherwise indicated.

3. Form and support to prevent warping and sagging.

B. Steel:

1. ASTM A36/A36M for carbon structural steel.

2. ASTM A568/A568M for sheet steel.

C. Stainless Steel:

1. Manufacturer's standard grade.

2. Manufacturer's standard type, ASTM A240/240M.

D. Galvanized Steel: ASTM A653/A653M.

E. Aluminum: ASTM B209.

F. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position.

G. Acrylic Diffusers: One hundred percent virgin acrylic plastic, with high resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.

H. Glass: Annealed crystal glass unless otherwise indicated.

I. Lens Thickness: At least 0.125 inch (3.175 mm) minimum unless otherwise indicated.

J. Factory-Applied Labels: Comply with UL 1598. Include recommended lamps. Locate labels where they will be readily visible to service personnel, but not seen from normal viewing angles when lamps are in place.

2.6 METAL FINISHES

A. Variations in finishes are unacceptable in the same piece. Variations in finishes of adjoining components are acceptable if they are within the range of approved Samples and if they can be and are assembled or installed to minimize contrast.

2.7 RATINGS

A. Fixture schedule will specify when UL Wet/Damp label, IK label and IP labels are required. Meet all requirements specified.

1. UL Dry, Damp, and Wet Labels

a. Wet label shall be used for all exterior locations unless noted differently

2. Impact (IK) Ratings per current standard (1-11) per BS EN60069-2-75

a. Fixtures in high impact areas shall bear IK rating per the fixture schedule.

3. Ingress Protection (IP) Ratings. Fixtures shall meet IP levels specified on the fixture schedule

2.8 LUMINAIRE SUPPORT

A. Comply with requirements in Section 260529 for channel and angle iron supports and nonmetallic channel and angle supports.

B. Single-Stem Hangers: 1/2-inch (13-mm) steel tubing with swivel ball fittings and ceiling canopy. Finish same as luminaire.

C. Wires: ASTM A641/A641M, Class 3, soft temper, zinc-coated steel, [12 gage (2.68 mm)]

D. Rod Hangers: 3/16-inch (5-mm) minimum diameter, cadmium-plated, threaded steel rod.

E. Hook Hangers: Integrated assembly matched to luminaire, line voltage, and equipment with threaded attachment, cord, and locking-type plug.

F. Recessed fixtures in acoustic panel ceilings with 2 ceiling support wires to structure and earthquake clips

G. Surface fixtures supported to structure, no attachment to ceiling for support.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for luminaire to verify actual locations of luminaire and electrical connections before luminaire installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 TEMPORARY LIGHTING

A. If approved by the Architect, use selected permanent luminaires for temporary lighting. When construction is sufficiently complete, clean luminaires used for temporary lighting and install new lamps.

3.3 INSTALLATION

A. Comply with NECA 1.

B. Install luminaires level, plumb, and square with ceilings and walls unless otherwise indicated.

C. Install lamps in each luminaire.

D. Supports:

1. Sized and rated for luminaire weight.

2. Able to maintain luminaire position after cleaning and relamping.

3. Provide support for luminaire without causing deflection of ceiling or wall.

4. Luminaire-mounting devices shall be capable of supporting a horizontal force of 100 percent of luminaire weight and a vertical force of 400 percent of luminaire weight.

E. Flush-Mounted Luminaires:

1. Secured to outlet box.

2. Attached to ceiling structural members at four points equally spaced around circumference of luminaire.

3. Trim ring flush with finished surface.

F. Wall-Mounted Luminaires:

1. Attached to structural members in walls

2. Do not attach luminaires directly to gypsum board.

G. Suspended Luminaires:

1. Ceiling Mount:

a. Two 5/32-inch- (4-mm-) diameter aircraft cable supports

b. Pendant mount with [5/32-inch- (4-mm-)] <Insert value> diameter aircraft cable supports.

2. Pendants and Rods: Where longer than 48 inches (1200 mm), brace to limit swinging.

3. Stem-Mounted, Single-Unit Luminaires: Suspend with twin-stem hangers. Support with approved outlet box and accessories that hold stem and provide damping of luminaire oscillations. Support outlet box vertically to building structure using approved devices.

4. Continuous Rows of Luminaires: Use tubing or stem for wiring at one point and wire support for suspension for each unit length of luminaire chassis, including one at each end.

5. Do not use ceiling grid as support for pendant luminaires. Connect support wires or rods to building structure.

H. Ceiling-Grid-Mounted Luminaires:

1. Provide 2 ceiling support wires to structure and earthquake clips

2. Secure luminaire to the luminaire opening using approved fasteners in a minimum of four locations, spaced near corners of luminaire.

3. Use approved devices and support components to connect luminaire to ceiling grid and building structure in a minimum of four locations, spaced near corners of luminaire.

3.4 IDENTIFICATION

A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 260553

3.5 FIELD QUALITY CONTROL

A. Perform the following tests and inspections:

1. Operational Test: After installing luminaires, switches, and accessories, and after electrical circuitry has been energized, test units to confirm proper operation.

2. Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation. Verify transfer from normal power to battery power and retransfer to normal.

B. Luminaire will be considered defective if it does not pass operation tests and inspections.

C. Prepare test and inspection reports.

3.6 ADJUSTING

A. Occupancy Adjustments: When requested within 2 months of date of Substantial Completion, provide on-site assistance in adjusting the direction of aim of luminaires to suit occupied conditions. Make up to two visits to Project during other-than-normal hours for this purpose. Some of this work may be required during hours of darkness.

1. During adjustment visits, inspect all luminaires. Replace lamps or luminaires that are defective.

2. Parts and supplies shall be manufacturer's authorized replacement parts and supplies.

3. Adjust the aim of luminaires in the presence of the Architect.

END OF SECTION

SECTION 26 56 00 – EXTERIOR LIGHTING

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:

1. Luminaire types.
2. Materials.
3. Finishes.
4. Luminaire support components.
5. Luminaire mounted controls
6. Poles and handholes
7. Concrete Bases

1.2 DEFINITIONS

A. CCT: Correlated color temperature.

B. CRI: Color rendering index.

C. Fixture: See "Luminaire."

D. IP: International Protection or Ingress Protection Rating.

E. IK: Impact Ratings

F. Lumen: Measured output of lamp and luminaire, or both.

G. Luminaire: Complete lighting unit, including lamp, reflector, and housing.

H. EPA: Equivalent projected area.

I. Pole: Luminaire-supporting structure, including tower used for large-area illumination.

1.3 SUBMITTALS

A. Product Data: For each type of luminaire.

1. Arrange in order of luminaire designation.
2. Include data on features, accessories, and finishes.
3. Include physical description and dimensions of luminaire.
4. Lamps, include life, output (lumens, CCT, and CRI), and energy-efficiency data.
5. Photometric data and adjustment factors based on laboratory tests, complying with IES LM-79 and IES LM-80.

a. Manufacturer's Certified Data: Photometric data certified by manufacturer's laboratory with a current accreditation under the NVLAP for Energy Efficient Lighting Products.

6. Wiring diagrams for power, control, and signal wiring.

7. Means of attaching luminaires to supports and indication that the attachment is suitable for components involved.

B. Shop Drawings: For nonstandard or custom luminaires.

1. Include plans, elevations, sections, and mounting and attachment details.

2. Include details of luminaire assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

3. Include diagrams for power, signal, and control wiring.

C. Samples: Provide where requested

1.4 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For luminaires [to include in operation and maintenance manuals.

1. Provide a list of all lamp types used on Project. Use ANSI and manufacturers' codes.

2. Provide a list of all photoelectric relay types used on Project; use manufacturers' codes.

B. Spare Parts and Special Tools: Furnish to Owner spare parts, proprietary equipment, and keys required to operate, maintain, repair, adjust, or implement future changes to poles, that are packaged with protective covering for storage on-site and identified with labels describing contents.

1.5 SPARE MATERIALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Drivers: One for each type of fixture

2. Glass, Acrylic, and Plastic Lenses, Covers, and Other Optical Parts: One for every 20 of each type and rating installed. Furnish at least one of each type.

3. Diffusers and Lenses: One for every 20 of each type and rating installed. Furnish at least one of each type.

4. Spare fixture: Provide 1 spare fixture for fixtures with more than 30 installed.

1.6 QUALITY ASSURANCE

A. Luminaire Photometric Data Testing Laboratory Qualifications:

1. Luminaire manufacturers' laboratory that is accredited under the NVLAP for Energy Efficient Lighting Products.

2. Provided by an independent agency, with the experience and capability to conduct the testing indicated, that is an NRTL as defined by OSHA in 29 CFR 1910.7, accredited under the NVLAP for Energy Efficient Lighting Products and complying with applicable IES testing standards.

B. Provide luminaires from a single manufacturer for each luminaire type.

C. Each luminaire type shall be binned within a three-step MacAdam Ellipse to ensure color consistency among luminaires.

D. Installer Qualifications: An authorized representative who is trained and approved by manufacturer.

E. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

F. Comply with IEEE C2, "National Electrical Safety Code."

G. Comply with NFPA 70.

H. UL listed

I. Energy Star Rated

J. DLC rated

K. Mockups: Where requested

1. Obtain Architect's approval of luminaires in mockups before starting installations.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Protect finishes of exposed surfaces by applying a strippable, temporary protective covering prior to shipping.

B. Package aluminum poles for shipping in accordance with ASTM B660.

C. Store poles on decay-resistant skids at least 12 inch (300 mm) above grade and vegetation. Support poles to prevent distortion and arrange to provide free air circulation.

D. Retain factory-applied pole wrappings on metal poles until right before pole installation. Handle poles with web fabric straps

1.8 FIELD CONDITIONS

A. Verify existing and proposed utility structures prior to the start of work associated with luminaire installation.

B. Mark locations of exterior luminaires for approval by Architect prior to the start of luminaire installation.

1.9 WARRANTY

A. Warranty: Manufacturer and Installer agree to repair or replace components of luminaires that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:

a. Structural failures, including luminaire support components.

b. Faulty operation of luminaires and accessories.

c. Deterioration of metals, metal finishes, and other materials beyond normal weathering.

2. Warranty Period: 5 years from date of Final Completion

PART 2 PRODUCTS

2.1 FIXTURE TYPES

A. See Schedule on drawings

2.2 PERFORMANCE REQUIREMENTS

A. Seismic Performance for fixtures:

1. Luminaires shall withstand the effects of earthquake motions determined according to ASCE/SEI 7

2. Luminaires and lamps shall be labeled vibration and shock resistant.

B. Seismic and Wind Performance for Poles

1. Delegated Design: Engage qualified professional engineer(s) to design and pole power system.

2. Structural Characteristics: Comply with AASHTO LTS-6-M.

a. Dead Load: Weight of luminaire and its horizontal and vertical supports, lowering devices, and supporting structure, applied in accordance with AASHTO LTS-6-M.

b. Live Load: Single load of 500 lb (2200 N) distributed in accordance with AASHTO LTS-6-M.

c. Ice Load: Load of 3 lb/ft2 (145 Pa), applied in accordance with AASHTO LTS-6-M for applicable areas on the Ice Load Map.

d. Wind Load for Poles Exceeding 50 ft (15 m) Height:

1) Basic Wind Speed: 100 mile/h (45 m/s) from AASHTO LTS-6-M for this Project>.

2) Wind Importance Factor: 1.0.

3) Minimum Design Life: 50 years

4) Velocity Conversion Factor: 1.0

e. Wind Load for Poles Not Exceeding 50 ft (15 m) Height:

1) Basic Wind Speed: 100 mile/h (45 m/s).

2) Wind Importance Factor: 1.0

3) Minimum Design Life: 50 years.

4) Velocity Conversion Factor: 1.0.

f. Strength Analysis: For each pole, multiply the actual EPA of luminaires and brackets by a factor of 1.1.

g. Luminaire Attachment Provisions: Comply with luminaire manufacturers' mounting requirements. Use stainless steel fasteners and mounting bolts unless otherwise indicated.

3. General Finish Requirements:

a. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

b. Appearance of Finished Work: Noticeable variations in same piece are unacceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.3 LUMINAIRE REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. NRTL Compliance: Luminaires shall be listed and labeled for indicated class and division of hazard by an NRTL.

C. FM Global Compliance: Luminaires for hazardous locations shall be listed and labeled for indicated class and division of hazard by FM Global.

D. UL Compliance: Comply with UL 1598 and listed for wet location unless noted otherwise.

E. CRI of minimum 70 unless noted. CCT of 3000 K unless noted

F. Minimum Rated lamp life of 50,000 hours.

G. Allow for Custom colors on all fixtures per architect from provided paint chip

H. Source Limitations:

1. Obtain luminaires from single source from a single manufacturer.

2.4 DRIVERS

A. Input voltage range: Combination 120/277 volt except where noted differently on drawings

B. Frequency: 50/60Hz

C. Power factor: >0.9 @full load MTBF:

D. High surge protection: up to 10 kV (1 pulse) in protection class I or II

E. Lifetime: up to 100,000 h

F. Undervoltage protection

G. THD: <10%

H. Protection: Over voltage, Over current and Short circuit Withstand voltage

I. UL 8750 rated

J. 0-10VDC dimmable unless noted differently on the fixture or control schedule

K. Drivers shall operate down to -40 F and be UL wet label

L. Provide fusing where specified.

2.5 POLES

A. Fixture indicates pole height, shape, and material. Where not specified provide aluminum poles

B. Provide Handhole in all poles: Oval shaped, with minimum clear opening of 2-1/2-by-5 inch (65-by-130 mm), with cover secured by stainless steel captive screws.

C. Pole fasteners and mounts shall be stainless steel

1. Materials: Compatible with poles and standards as well as the substrates to which poles and standards are fastened and may not cause galvanic action at contact points.

2. Anchor Bolts, Leveling Nuts, Bolt Caps, and Washers: Hot-dip galvanized after fabrication unless otherwise indicated.

D. Poles with Cameras

1. At poles with cameras provide the following

a. Handhole per above at camera bracket

2. Pole shall accommodate the following camera size and weight and maintain all structural ratings per above

a. Camera shall be pendant wall mounted to the pole

b. Camera size shall be 9” Tall by 12” diameter, camera will extend off pole at least 16 inches

c. Camera weight will be minimum 20 pounds with mount

E. Pole Mounting Hardware

1. Anchor Bolts: Manufactured [to ASTM F1554, Grade 55,]with a minimum yield strength of 55,000 psi (380 000 kPa). Galvanizing: Hot dip galvanized in accordance with ASTM A153, Class C.

2. Nuts: ASTM A563, Grade A, Heavy-Hex. Galvanizing: Hot dip galvanized in accordance with ASTM A153, Class C.

3. Washers: ASTM F436, Type 1. Galvanizing: Hot dip galvanized in accordance with ASTM A153, Class C

F. Painting

1. Powder-Coat Finish: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" recommendations for applying and designating finishes.

2. Surface Preparation: Clean surfaces in accordance with SSPC-SP 1 to remove dirt, oil, grease, and other contaminants that could impair powder coat bond. Grind welds and polish surfaces to a smooth, even finish. Remove mill scale and rust, if present, from uncoated steel, in accordance with SSPC-SP 5/NACE No. 1 or SSPC-SP 8.

3. Powder Coat: Comply with AAMA 2604.

4. Electrostatic-applied powder coating; single application and cured to a minimum 2.5 to 3.5 mil (64 to 89 µm) dry film thickness. Coat interior and exterior of pole for equal corrosion protection.

G. Base Covers: Manufacturers' standard metal units, finished same as pole, and arranged to cover pole's mounting bolts and nuts.

H. Concrete Bases

1. Minimum base sizes below. Delegated design requirements per above based on actual installation and soil conditions. Use larger bases where required by manufacturer or on site earthwork contractor, soils engineer, or civil engineer.

a. Poles over 16 feet shall be provided with a 24” precast concrete base equal to Old Castle/Utility Vault 24R series

1) Where subject to vehicle hits the base shall be 8’ tall with 2’ exposed above grade.

a) Utility Vault #24R-8-LB

2) Where protected from vehicle hits the base shall be 6’ tall and flush with grade

a) Utility Vault#24R-6-LB

b. Poles and Bollards 16 feet and under shall use a minim 18” diameter base equal to Old Castle/Unitlity Vault 18R series

1) Where subject to vehicle hits the base shall be 7’ tall with 2’ exposed above grade.

2) Utility Vault #18R-7-LB

3) Where protected from vehicle hits the base shall be 6’ tall and flush with grade

4) Utility Vault#18R-5-LB

2.6 MATERIALS

A. Metal Parts: Free of burrs and sharp corners and edges.

B. Sheet Metal Components: Corrosion-resistant aluminum, Stainless steel, or Epoxy-coated steel. Form and support to prevent warping and sagging.

C. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position. Doors shall be removable for cleaning or replacing lenses.

D. Diffusers and Globes:

1. Acrylic Diffusers: 100 percent virgin acrylic plastic or polycarbonate, with high resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.

2. Glass: Annealed crystal glass unless otherwise indicated.

3. Lens Thickness: At least 0.125 inch (3.175 mm) minimum unless otherwise indicated.

E. Lens and Refractor Gaskets: Use heat- and aging-resistant resilient gaskets to seal and cushion lenses and refractors in luminaire doors.

F. Reflecting surfaces shall have minimum reflectance as follows unless otherwise indicated:

1. White Surfaces: 85 percent.

2. Specular Surfaces: 83 percent.

3. Diffusing Specular Surfaces: 75 percent.

G. Housings:

1. Rigidly formed, weather- and light-tight enclosure that will not warp, sag, or deform in use.

2. Provide filter/breather for enclosed luminaires.

H. Factory-Applied Labels: Comply with UL 1598. Include recommended lamps. Labels shall be located where they will be readily visible to service personnel, but not seen from normal viewing angles when lamps are in place.

1. Label shall include the following lamp characteristics:

a. "USE ONLY" and include specific lamp type.

b. Lamp diameter, shape, size, wattage and coating.

c. CCT and CRI for all luminaires.

2.7 FINISHES

A. Variations in Finishes: Noticeable variations in same piece are unacceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

B. Luminaire Finish: Manufacturer's standard paint applied to factory-assembled and -tested luminaire before shipping. Where indicated, match finish process and color of pole or support materials.

C. Factory-Applied Finish for Aluminum Luminaires: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

1. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.

D. Factory-Applied Finish for Steel Luminaires: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

1. Surface Preparation: Clean surfaces to comply with SSPC-SP 1, to remove dirt, oil, grease, and other contaminants that could impair paint bond. Grind welds and polish surfaces to a smooth, even finish. Remove mill scale and rust, if present, from uncoated steel, complying with SSPC-SP 5/NACE No. 1 or SSPC-SP 8.

2. Exterior Surfaces: Manufacturer's standard finish consisting of one or more coats of primer and two finish coats of high-gloss, high-build polyurethane enamel.

2.8 RATINGS

A. Fixture schedule will specify when UL Wet/Damp label, IK label and IP labels are required. Meet all requirements specified.

B. UL Dry, Damp, and Wet Labels

C. Wet label shall be used for all exterior locations unless noted differently

D. Impact (IK) Ratings per current standard (1-11) per BS EN60069-2-75

E. Fixtures in high impact areas shall bear IK rating per the fixture schedule.

F. Ingress Protection (IP) Ratings. Fixtures shall meet IP levels specified on the fixture schedule

2.9 LUMINAIRE SUPPORT COMPONENTS

A. Comply with requirements in Section 260529 for channel and angle iron supports and nonmetallic channel and angle supports.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for luminaire electrical conduit to verify actual locations of conduit connections before luminaire installation.

C. Examine walls, roofs, canopy ceilings, and overhang ceilings for suitable conditions where luminaires will be installed.

D. Examine poles, luminaire-mounting devices, lowering devices, and pole accessories before installation. Components that are scratched, dented, marred, wet, moisture damaged, or visibly damaged are considered defective.

E. Examine roughing-in for foundation and conduit to verify actual locations of installation.

F. Proceed with installation only after unsatisfactory conditions have been corrected.

G. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 TEMPORARY LIGHTING

A. If approved by Architect, use selected permanent luminaires for temporary lighting. When construction is substantially complete, clean luminaires used for temporary lighting and install new lamps.

3.3 GENERAL INSTALLATION REQUIREMENTS

A. Comply with NECA 1.

B. Use fastening methods and materials selected to resist seismic forces defined for the application and approved by manufacturer.

C. Install lamps in each luminaire.

D. Fasten luminaire to structural support.

E. Supports:

1. Sized and rated for luminaire weight.

2. Able to maintain luminaire position after cleaning and relamping.

3. Support luminaires without causing deflection of finished surface.

4. Luminaire-mounting devices shall be capable of supporting a horizontal force of 100 percent of luminaire weight and a vertical force of 400 percent of luminaire weight.

F. Wall-Mounted Luminaire Support: Attached to structural members in walls

G. Pole Mounted:

1. Attached to concrete base

2. Alignment: Align pole foundations and poles for optimum directional alignment of luminaires and their mounting provisions on pole and as directed.

3. Concrete Pole Foundations: Set anchor bolts according to anchor-bolt templates furnished by pole manufacturer

H. Wiring Method: Install cables in raceways. Conceal raceways and cables.

I. Install luminaires level, plumb, and square with finished grade unless otherwise indicated.

J. Coordinate layout and installation of luminaires with other construction.

K. Adjust luminaires that require field adjustment or aiming.

L. Comply with requirements in Section 260519 and Cables" and Section 260533 for wiring connections and wiring methods.

3.4 INSTALLATION OF BOLLARD LUMINAIRES

A. Align units for optimum directional alignment of light distribution.

1. Install on concrete base per above.

3.5 INSTALLATION OF INDIVIDUAL GROUND-MOUNTED LUMINAIRES

A. Aim as indicated on field directed or as shown on drawings.

B. Install on concrete base

3.6 IDENTIFICATION

A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section

3.7 FIELD QUALITY CONTROL

A. Inspect each installed luminaire for damage. Replace damaged luminaires and components.

B. Perform the following tests and inspections:

1. Operational Test: After installing luminaires, switches, and accessories, and after electrical circuitry has been energized, test units to confirm proper operation.

2. Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation. Verify transfer from normal power to battery power and retransfer to normal.

3.8 ADJUSTING

A. Occupancy Adjustments: When requested within 2 months of date of Substantial Completion, provide on-site assistance in adjusting the direction of aim of luminaires to suit occupied conditions. Make up to two visits to Project during other-than-normal hours for this purpose. Some of this work may be required during hours of darkness.

1. During adjustment visits, inspect all luminaires. Replace lamps or luminaires that are defective.

2. Parts and supplies shall be manufacturer's authorized replacement parts and supplies.

3. Adjust the aim of luminaires in the presence of Architect.

END OF SECTION

SECTION 27 15 00 – DATA AND COMMUNICATIONS CABLING

PART 1 GENERAL

1.1 SUMMARY

A. Provide all materials and labor for the installation of a communications (telephone and data) (voice and data) cabling and termination system. This section includes Communications cabling, termination, and administration equipment and installation requirements for the specified System

B. Include all materials for the installation of a video surveillance cable plant and termination system including data cable and fiber cable.

C. The Bid includes cabling and termination. Use 568B standard.

1. WAPs are Category 6A
2. Intercom: Category 6
3. All Others: Category 6
4. Fiber: OS2

D. Contractor must be a current manufacturer certified for both fiber and copper installation.

E. Color Code for Installed Cables

1. Data - Blue Color
2. Video Surveillance –Blue color
3. Intercom –Orange Color
4. WAPs –Violet Color
5. Access Control/Security – Blue Color

1.2 REFERENCES

A. General:

        9) BICSI N3: Bonding and Grounding

        10) BICSI G1: OSP: General Practices

1.4 SYSTEM DESCRIPTION

A. Furnish, install, test and place into satisfactory and successful operation all equipment, materials, devices, and necessary appurtenances to provide a complete ANSI/TIA/EIA, NECA/NEIS and ISO/IEC compliant communications Structured Cabling System as hereinafter specified and/or shown on the Contract Documents. The system is intended to be capable of integrating voice and data signals onto a common media, and shall be tested EIA/TIA and ANSI standards

B. The work shall include all materials, equipment and apparatus not specifically mentioned herein or noted on the plans but which are necessary to make a complete working ANSI/TIA/EIA and ISO/IEC compliant cabling system.

1.5 DEFINITIONS

A. See following for sample list. Industry standard definitions for all terms

1. Cross-Connect: A facility enabling the termination of cable elements and their interconnection or cross-connection.

2. EMI: Electromagnetic interference.

3. FTP: Shielded twisted pair.

4. F/FTP: Overall foil screened cable with foil screened twisted pair.

5. F/UTP: Overall foil screened cable with unscreened twisted pair.

6. IDC: Insulation displacement connector.

7. Jack: Also commonly called an "outlet," it is the fixed, female connector.

8. LAN: Local area network.

9. Plug: Also commonly called a "connector," it is the removable, male telecommunications connector.

10. RCDD: Registered Communications Distribution Designer.

11. Screen: A metallic layer, either a foil or braid, placed around a pair or group of conductors.

12. Shield: A metallic layer, either a foil or braid, placed around a pair or group of conductors.

13. S/FTP: Overall braid screened cable with foil screened twisted pair.

14. S/UTP: Overall braid screened cable with unscreened twisted pairs.

15. UTP: Unscreened (unshielded) twisted pair.

1.6 SUBMITTALS

A. Provide standard manufacturer's cut sheets and the operating and maintenance (O&M) instructions at the time of submittal review for each device in the system, regardless of whether it is submitted as specified or as an approved equal. These instructions shall detail how to install and service the equipment and shall include information necessary for rough-in and preparation of the building facilities to receive the materials.

B. Quality Control Submittals: Provide submittal information for review as follows:

1. In accordance with quality assurance requirements below, submit the contractor-qualifications documentation.

2. Documentation indicating that the Contractor will have only manufacturer-trained and manufacturer-certified employees perform installation, testing, and firestopping work, as detailed below.

3. Documentation demonstrating that the Contractor employs a minimum of one Registered Communications Distribution Designer (RCDD) certified by and in current good standing with BICSI. The document shall declare that the RCDD is a direct full time employee of the Contractor also that the Contractor will continue to employ a minimum of one RCDD throughout the duration of the project.

4. List of references for no less than five similar projects (in terms of size and construction cost) performed by the Contractor under the Contractor's current business name within the past three years. Detail the following for each project:

a. Project name and location

b. Construction cost

c. A brief description of the project, the components involved, and the SCS manufacturer used on the project.

d. Number of station drops

e. Customer contact names, phone numbers, and addresses

C. Shop Drawings: Reviewed and stamped by RCDD

1. Submit a cable routing and grouping plan submittal as follows:

a. Where the cable routing and grouping is to be provided as shown on the Contract Documents, do not provide a cable routing and grouping plan. Submit written documentation stating that the cable routing and grouping will be provided as shown on the Contract Documents, that the Contractor has reviewed the routing and grouping on the Contract Documents with applicable Subcontractors and suppliers and agrees that it does not create conflicts with other building utility infrastructure, and that the routing and grouping meets applicable codes, regulations and standards.

b. Where changes in cable routing and grouping are proposed, submit complete floor plan(s) and/or detail drawing(s) showing the proposed routing, raceway sizes and locations, and cabling in a manner equal to that of the Contract Documents. Ensure that any cabling changes are coordinated with accommodating changes to the raceway routing and grouping. Specifically note each location where the proposed routing and grouping is different from the Contract Documents. Submit written documentation detailing the reason for each change request. Each change request must be approved in writing by the Engineer after review by the owner prior to proceeding with the change.

2. Submit patch panel and wire management elevations as follows:

a. Where patch panels and wire management are to be provided as shown on the Contract Documents, do not submit elevations. Submit written documentation stating that the patch panel and wire management will be provided as shown on the Contract Documents, that the Contractor has reviewed the elevations on the Contract Documents with applicable Subcontractors and suppliers and agrees that it does not create conflicts between trades, and that the elevations meet applicable codes, regulations and standards.

b. Where changes to patch panels and wire management are proposed, submit patch panel and wire management elevations along with written documentation detailing the reason for the change. The change request must be approved in writing by the Engineer after review by the owner prior to proceeding with the change.

D. Submit a list of proposed test equipment for use in verifying the installation of the SCS. Proposed test equipment shall meet the criteria as stated in PART 3 – TESTING.

1. Submit for each testing device:

a. Manufacturer and product number

b. Documentation from the manufacturer showing date and outcome of last re-calibration. Testing device shall have been re-calibrated within the manufacturer’s recommended calibration period, encompassing the period of time when the testing device will be used on this project.

c. Documentation from the manufacturer showing software revision. Software revision shall be most current revision available for the device and shall be based upon the most current ANSI/TIA/EIA testing guidelines.

E. Closeout Submittals: Provide submittal information for review as follows:

1. A communications-specific Operations and Maintenance (O&M) Manual for Communications shall be required for this project. O&M information submitted under other related communications sections (e.g. Raceway and Boxes for Communications Circuits, Bonding and Grounding for Communications, etc.) shall be included in the O&M Manual and statements should be included in each section directing the Contractor to provide applicable information in the O&M Manual for Communications.

2. 2 copies of either a CDR or DVD of the test data for all copper and fiber cables compatible with latest version of software. Single copy of notebook bound, printed, color, double sided and sequentially organized of all copper and fiber test results

3. 2 copies of either a CDR or DVD of the project's completed as-built drawings denoting the installed and individually labeled data drops at their locations in PDF and Current AutoCAD format from digital CAD versions of the Electrical Data/Comm sets (See example below)

F. O&M Manual for Communications - At the completion of the project, submit O&M information from product data submittals (above), updated to reflect any changes during the course of construction, to the Engineer/Designer in the telecommunications-specific O&M Manual for Communications binder labeled with the project name and description. Provide bound copies of the O&M Manual for Communications per Division 1.

G. Record Drawings - Maintain at the job site a minimum of one set of Record Drawings, Specification, and Addenda. Record Drawings shall consist of all changes to Contract Documents such as drawings, specifications and spreadsheets, including maintenance hole/handhole butterfly drawings.

1. Document changes to the system from that originally shown on the Contract Documents and clearly identify system component labels and identifiers on Record Drawings.

2. Keep Record Drawings at the job site and make available to the Owner and Engineer/Designer at any time

H. As- Built Drawings

1. Record Drawings shall be converted to As-Built Drawings at project completion.

2. As-Built Drawings shall include actual install conditions, including sleeve locations, cable routing, and detail rack elevations showing patch panel locations and rack elevations.

1.7 QUALITY ASSURANCE

A. Contractor Qualifications:

1. Contractor shall be trained and certified by the Manufacturers to install, test, and maintain the system and be certified by the Manufacturers to provide the Manufacturers' Warranties specified in this section.

2. Contractor's employees directly involved with the supervision, installation, testing, and certification of the system shall be trained and certified by the selected manufacturers. Training and certifications by employee type are required as shown below:

    a. Supervisors/Project Foremen: All (100%) shall be trained/certified for installation and testing.

    b. Test Technicians: All (100%) shall be trained/certified for installation and testing.

    c. Other personnel: Personnel not directly responsible for installation supervision, installation, testing or certifying the system (i.e. project managers, cleanup crew, etc.) are not required to be manufacturer trained and certified but should not participate in any testing or installation of the products.

3. Contractor's employees whose duties include the application of firestopping material shall be trained and certified by the specified firestopping manufacturer. Training and certifications by employee type are required as shown below:

    a. Supervisors/Project Foremen: All (100%) shall be trained/certified for installation.

    b. Firestopping Technician: All (100%) shall be trained/certified for installation.

4. Contractor shall employ a minimum of one Registered Communications Distribution Designer (RCDD) certified by and in current good standing with BICSI. The RCDD shall be a direct full time employee of the Contractor (i.e. an RCDD consultant/sub-contractor to the Contractor is not acceptable). Contractor shall continue to employ a minimum of one RCDD throughout the duration of the project.

5. Contractor shall have successfully completed no less than five similar projects (in terms of size and construction cost) under the Contractor's current business name within the past three years.

1.8 MANUFACTURER CERTIFICATION

A. Manufacturer's rep shall visit the site at 25%, 50%, and at completion to confirm installation is per the manufacturer's requirement and to meet the specified warranty.

    1. Provide coordination with the cabling manufacturers to ensure that manufacturers' inspectors are available to schedule site visits, inspections, and certification of the system. Provide and coordinate any modifications and have manufacturer's rep re-inspect and certify the system prior to the scheduled use of the system by the Owner. Owner will attend manufacturer's inspections.

        a. Notify owner minimum 1 week before manufacturer installation.

B. Manufacturer's rep shall write reports and document the visits to confirm installation is per all standards or the manufacturer and relevant standards.

C. The Contractor is solely responsible for all costs associated with scheduling the manufacturer's rep inspection, the inspection itself and any manufacturer-required re-inspections, and for any modifications to the installation as required by the manufacturers.

1.9 WARRANTY

A. Manufacturer Warranties:

1. Copper

    a. Provide Leviton Performance Lifetime Warranty for all installation. The warranty certifies that all passive connecting hardware, cabling for both copper and fiber systems has been installed by a certified installer, will support all applications designed and as follows:
        1) Subject to the limitations and conditions set forth herein, Leviton (the Manufacturer") warrant to the end-user, for the duration of the warranty, and not for the benefit of anyone else, that the structured cabling and connectivity hardware products (the "Products") comprising the Leviton structured cabling system (the "System") installed at the indicated project site will:
            a) Be free from defects in material and workmanship.
            b) Meet or exceed applicable ratified ANSI/TIA and ISO/IEC link/channel transmission performance standards in effect at the time of installation.
            c) Support any current or future application which is designed for transmission over a structured cabling system as defined by the above referenced standards in effect at the time of installation.

2. Fiber

    a. Provide Corning 25-year warranty for local area network (LAN) for installed fiber products

3. That the products will be free from manufacturing defects in materials and workmanship.

    a. That the cabling products of the installed system shall exceed the specification of ANSI/TIA/EIA 568-C and exceed ISO/IEC 11801 standards.

    b. That the system shall be application independent and shall support both current and future applications that use the ANSI/TIA/EIA 568-C and ISO/IEC 11801 component and link/channel specifications for cabling.

1.10 COORDINATION

A. Coordinate layout and installation of telecommunications pathways and cabling with Owner's telecommunications and LAN equipment and service suppliers.

B. Conduct onsite pre-installation meetings with the owner's IT department as follows:

1. Prior to starting installation of any materials

    a. Contractor shall demonstrate knowledge of standards and manufacturer requirements.

    b. Contractor shall accommodate specific requirements of the owner

2. Prior to starting installation in Communications Rooms (MDF and IDF)

    a. Owner reserves the right to modify layouts of communications rooms based on field conditions. Contractor shall accommodate changes directed by the owner and shall notify owner at meeting if any directions will result in an increase in cost

3. At cabling termination and prior to owner installation of equipment

a. Confirm room atmosphere, installation, and grounding complies with the specification, certifications, and manufacturer's requirements.

b. Room must be dust free, clean and cooled prior to the contractor requesting installation of equipment.

1.11 SPARE PARTS

A. Outlets Cat 6 – 10

B. Outlets Cat 6a – 2

C. Plates - 5

D. Biscuit Jackbox – 3

PART 2 PRODUCTS

2.1 MANUFACTURER

A. The following are approved manufacturer's

1. Copper Cabling and Termination

a. Leviton

b. Or alternate accepted equal products

2. Fiber Cabling and Termination

a. Corning (No Substitute)

3. Racks, Wire Management, Cable Runway, and Cable Tray

a. Chatsworth

b. B-Line

2.2 GENERAL REQUIREMENTS

A. Physically verify existing site conditions prior to purchase and delivery of the materials, including but not limited to lengths of conduit and/or pathway to be used for routing backbone cabling. Pre-cut materials of insufficient length are the sole responsibility of the Contractor.

B. All copper-related components shall be part of the copper product line and all fiber optic-related components shall be part of the fiber optic product line – components shall not be intermixed between manufacturers' product lines. The product lines shall be engineered "end-to-end" – the system and all of its components shall be engineered to function together as a single, continuous transmission path.

C. Racks, rack cable distribution hardware, ladder rack, and other rack and distribution components shall be manufactured by a single manufacturer unless stated otherwise in this Specification

D. Provide all incidental and/or miscellaneous hardware not explicitly specified or shown on the Contract Documents that is required for a fully operational, tested, certified and warranted system.

E. Cable Tray and Cable Runway

1. All Communication's Rooms (MDF and IDF) shall be provided with a dual level cable management system as shown on the drawings.

a. Cable runway shall be routed on top of the racks and connect all racks to the wall as shown on the drawings

b. Cable Tray shall be routed approximately 18-24 inches above the cable runway to act as a consolidation point, location of service loops, and for strain relief

F. Telecommunications Pathways and Spaces: Comply with TIA-569-D.

G. Grounding: Comply with TIA-607-B.

H. Plenums: Any cable passing through and air plenum shall be CMP plenum rated

I. Underground: Communication's station cable shall not be run underground except where noted specifically on the drawings or by specific contractor request and approval by the owner.

1. Any cable run underground shall be outside plant (OSP) rated.

2. Contractor shall provide protectors on all cables run underground outside the building slab

a. Station Cable

1) Protector shall be UL listed to UL-497 and EN/IEC 60950-1 and protect all 4 pairs, support POE pass through, and allow for minimum Category 6A

2) Ditek DTK-110C6APOE or equal

b. Multipair Cable

1) Commscope/Systimax BEP solid state protector

2) Fiber where required by code.

2.3 COMMUNICATIONS CABLE

A. Communication's cable consists of cabling for data, telephone(voice), access control, intercom, video surveillance systems

1. Data, Video Surveillance, Access Control/Security, and Intercom. Category 6: Shall exceed Category 6 transmission requirements as specified in ANSI/TIA/EIA 568-C and ISO/IEC 11801:

a. Plenum: Leviton (Berk-Tek) Lanmark 6, #10136226 (Blue) and 10141073 (Orange)

b. Riser: Leviton (Berk-Tek) Lanmark 6, #10136339 (Blue) and 10189773 (Orange)

2. WAPs Category 6A. Shall exceed Category 6A transmission requirements as specified in ANSI/TIA/EIA 568-C and ISO/IEC 11801

   a. Plenum: Leviton Lanmark 10G #11140407 (Violet Color)

   b. Riser: Leviton Lanmark 10G, # 11140415 (Violet Color)

3. Cable Underground

   a. Data, Video Surveillance, Access Control/Security, and Intercom: Category 6: Cable shall exceed Category 6 transmission requirements and be OSP rated.

      1) Levitoin Lanmark 6 OSP #10139885

   b. WAPs: Category 6A:

      1) Leviton Lanmark-10G OSP#11094458

   c. Provide protector per specification above.

4. Runs over 295 Feet

   a. Data: Not permitted

   b. Video Surveillance: Provide Page Datacom Gamechanger LSZH OSP Cable #258330804

B. Main Communications Cable

1. Provide (4) Communications Data Cables per above between MDF and each IDF. Terminate on patch panel and label MDF1,MDF2, etc.

2.4 FIBER OPTIC CABLE

A. Singlemode

1. Fiber shall meet OS2 standards, be SMF, 12 strand, distribution type unless noted

   a. Indoor Fiber Cable

      1) Corning Clear Curve# 012U81-33131-24, provide plenum rated if routed in plenums

   b. Outdoor and Underground Cable

      1) Corning #012EU4-T3100D20, OSP dry cable rated for direct bury

2. All fiber optic cables must be in innerduct.

2.5 COMMUNICATION OUTLETS

A. Outlet color to be white

B. Data, Video Surveillance, Intercom, and Access Control/Security

1. Outlets shall be EIA/TIA 568 Category 6 modular with number of RJ45 jacks indicated by Symbol on front. Provide blanks in unused sections. Color to match wiring devices in 262726. Label all jacks individually.

    a. Leviton 61110-XXX

C. WAPs (Category 6a in both base and alternate bid):

1. Outlets shall be EIA/TIA 568 Category 6A, modular with number of RJ45 jacks indicated by Symbol. Provide blanks in unused sections. Black Color. Label all jacks individually.

    a. Leviton 6110G-Re6, color to be black

D. Plates

1. Plates shall be stainless steel with 6 mounting spaces for connector and ID window top and bottom showing outlet number

    a. Leviton#43080-1L6.

2. WAPS, Intercom, and Access control shall be terminated in Biscuit Jack.

    a. Leviton#41089. Biscuit jacks to be black for WAPs, white for all other installations

3. Blanks shall be Leviton#41084-XX to match outlet color.

4. Wall phone plates where show with mounting: Leviton 4108-1SP

E. Labels

1. Label will be different for different systems and shall match the drawings.

2. Data:

    a. Based on Room Number - MDF/IDF - Room # - Location # - Outlet #

    b. Example "A-104-2-4"

3. WAPs

    a. WAP - MDF/IDF - WAP #

    b. Example "WAP-A-33"

4. Intercom

    a. INT - MDF/IDF - WAP #

    b. Example "INT-A-33"

5. Cameras

    a. CAM - MDF/IDF - WAP #

b. Example "CAM-A-33"

6. Access Contro

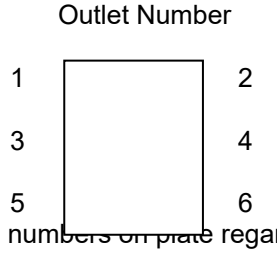
a. AC - MDF/IDF - WAP #

b. Example "AC-A-33"

7. Labels shall be at top center of each plate either an M (for MDF - No succeeding number) or I succeeded by the IDF number that drop is connected to, followed by a dash and then the room number, then a trailing dash.

a. Must use an 18 pt Times New Roman serif font on all labels so as to distinguish and "I" from a "1". Numbers do not require any preceding zeros.

F. Place the number of the jack centered above each of the 2 x 3 array of jacks, or to the side, using left-right, top-down order.



G. All outlets get 6 numbers on plate regardless of number of jacks installed.

H. WAPS, Video Surveillance, Intercom, and Access Control are on biscuit jacks

2.6 DATA PATCH PANELS

A. Data, Intercom, Video Surveillance, and Access Control/Security

1. EIA/TIA 568, Category 6, RJ45 insert jacks on front, 48 port.

a. Leviton Extreme 69270-U48

2. Label with jack number shown on drawings. Do not use preceding IDF or MDF notation for label on patch panel only. Provide field room number under outlet matching room location of installation

3. Exception: Provide 24 (-U24)port where shown on drawings.

B. WAP Patch Panels (Category 6A)

1. EIA/TIA 568, Category 6A, RJ45 insert jacks on front. Provide patch panels in MDF and all IDFs.

a. Leviton 6A586-U48

2. Label with jack number shown on drawings. Do not use preceding IDF or MDF notation for label on patch panel only. Provide field room number under outlet matching room location of installation

3. Exception: Provide 24 port (-U24) where shown on drawings.

2.7 FIBER OPTIC PATCH PANELS

A. The optical fiber cross-connect/interconnect system rack mount should provide a centralized, rack-mounted termination, identification and service assignment point for optical fiber horizontal, backbone and equipment cabling at the horizontal or main cross connects, using optical fiber patch cords for connections. Provide all accessories for a complete system

B. Corning PCH patch panel with (OS2 LC UPC panels)

1. General Specifications

   a. Product Type Rack-Mountable Hardware

   b. Accessory Type PCH

   c. Mounting Type Rack 19-in, Rack 23-in

   d. Application Data Center, Enterprise Networks

2. Standards

   a. RoHS Free of hazardous substances according to RoHS 2011/65/EU

   b. UL-Listed United States and Canadian safety standards

3. Design

   a. Housing Type PCH

   b. Locking Availability Front or rear

   c. Number of Panels per Housing 2

   d. Panel or Module Type CCH

   e. Splice Tray Options 4 category 2R, 2 category 4R

   f. Fiber Capacity (01U) Up to 24 fibers installing FC/SC/ST® Compatible connectors, or up to 48 installing LC connectors

   g. Fiber Capacity (02U) Up to 96 installing LC connectors

4. Connector Specs

5. Housing Material Metal

6. MDF Corning PCH-02U, maximum 8 panels or 96 fibers, blanks in unused

7. IDF Corning PCH-01U, maximum 2 panels or 24 fibers, blanks in unused

2.8 DATA PATCH CORDS

A. Data, Intercom, Video Surveillance, and Access Control/Security: Pre-manufactured (factory-terminated), stranded unshielded twisted pair (UTP), thin with 8- pin modular plugs (RJ45), Category 6. No boots provide on patch cables.

1. Leviton Extreme Category 6 #6H460-XX

B. WAP: Pre-manufactured (factory-terminated), stranded unshielded twisted pair (UTP), thin, with 8- pin modular plugs (RJ45), Category 6A. Optical Cable Corp OCC, Belden CAT 6A.

1. Levition Extreme Cat 6a #H6A10-XXX

C. Colors and Counts

1. Data – Blue

a. 10’ – 100

b. 7’ – 100

c. 5’ – 100

d. 3’ - 20

2. Camera, HVAC, VAP Sensors – Yellow

a. 10’ –5

b. 7’ – 5

c. 5’ – 20

d. 3’ – 30

3. WAP – Violet, Category 6A

a. 10’ –10

b. 7’ – 20

c. 5’ – 50

d. 3’ - 100

4. Security, Fire Alarm, Access Control, Cameras – Red

a. 10’ –10

b. 7’ – 10

c. 5’ – 10

d. 3’ - 30

5. Intercom – Orange or Yellow, to be confirmed.

a. 10’ – 20

b. 7’ – 20

c. 5’ – 20

d. 3' – 60

2.9 FIBER OPTIC PATCH CORDS:

A. Multimode Duplex, 50 Micron, OM4, LC on each end

1. Leviton PCF-M4-;-R2-R-R-XXXX

B. Counts

a. 10' – 5

b. 7' – 10

c. 5' – 15

d. 3' – 20

2.10 PATHWAYS AND CABLE SUPPORTS

A. Installation and materials for the raceway and boxes for the SCS shall be as specified under Division 26 Section

B. All cabling pathways are to be installed within 4 feet of the ceiling grid. No cabling pathway is to be located above 4 feet above ceiling grid.

C. Cable Supports: All cable to be installed in J-Hooks, Raceway, or Cable Tray. No other means acceptable. All connected to structure via a rigid stem. All outlets shall have conduit stubbed from outlet to cable tray and bonded to the cable tray.

1. 2" J-Hooks: Eaton/B-Line BCH32, Maximum 40 cables

2. 4" J-Hooks: Eaton/B-Line BCH64. Maximum 50 cables

3. J-Hook Supports: BCH series Beam, threaded rod, ATR, etc attachments

4. Rings: BRS-32A

5. Velcro Cable Strap: SB727 series

6. D-Rings

2.11 CABLE TRAY

A. Cable Tray: Provide in all MDF and IDF above the cable runway, approximately 18-24" above runway.

1. Basket (Wire Mesh) Cable Tray is 4" high, 18" Wide with IEC 61537 Black Class C8 coating

a. Provide Flexible Cable Tray painted with C8 Black Coating

1) Eaton/B-Line#FT4X18

2) Chatsworth#60283450-003

2. Include the following and all additional accessories for a complete system as shown on drawings. Equal products by Eaton/B-Line Acceptable.

   a. Wall mount: Medium Duty Cantilever: Chatsworth RPlus#62085X03-004 of width required for tray

   b. Ceiling Mount: Omega SPLUS#62082X04 or width required

   c. Joint Clamps: Chatsworth#604800061-50

   d. Accessory Clamp (for joining waterfalls). Chatsworth #4080158-050

   e. Splice Plate: Chatsworth 67080053-010

   f. Radius Drop: CPI #60500-701 and 67020139-010

   g. Conduit Bracket: CPI#67080040-010

   h. Bend Radius: CPI #34742-706

   i. Ground Kit: CPI #68000032-020/68000033-020 with 680000370929 strap

   j. Cable Tie Clip and Hook and Loop: CPI#68000110-20 and 89011000-001

   k. Wire Cutter: CPI # 68000058-001

2.12 CABLE RUNWAY

A. Cable Runway: Provide cable runway on top of racks and attach to wall. Runway shall be UL Listed.

   1. Runway shall be B-Line SB-13AL, black color, 9” rung spacing or equal by Chatsworth

   2. Include the following and all additional accessories for a complete system as shown on drawings

      a. Redi-Rail: B-Line #SB13AL12FB

      b. Radius Drop: B-Line #SB13ALDO12FB

      c. Bend Radius: B-Line #SB2104FB

      d. Splice Kit and Bars: B-Line #SB2107FB

      e. Ground Kit: B-Line #SB6691x73/4

      f. Support: Wall Mount: B-Line #SB21312KFB (Minimum every 4 feet)

      g. Ceiling Support – B-Line #9ZN-Rxxx xxx = 3/8” or ½” ATR

      h. Runway Wall Angle Support Kit: B-Line #SB211312FB

      i. Cable Retaining Post 6”: B-Line #SB12606FB

      j. Equipment Rack Top Plate Runway Support Kit; B-Line #SB213312FB

      k. End Caps: B-Line #SB21B

l. Innerduct: 1 ¼" Outside Diameter, bright orange in color. Plenum rated.

m. Pull Strings: Plastic or nylon with a minimum test rating of 200 lb.

n. Velcro Wraps: ½ inch wide wraps.

2.13 EQUIPMENT RACKS/ENCLOSURES

A. Unless otherwise indicated, equipment racks/enclosures and incidental equipment color shall be black or clear aluminum.

B. Unless otherwise indicated, equipment rack and incidental materials and equipment shall be provided by the selected Rack/Distribution Equipment manufacturer. Do not intermix products from different manufacturers except as specifically shown.

C. Free Standing Equipment Racks: EIA-standard 7-foot high x 19-inch wide racks with universal alternating-hole pattern, complete with top angles, self-supporting bases, and mounting holes on both sides of the rails.

1. Rack: Eaton B-Line SB556084XUFB

2. MDF Vertical Cable Management Eaton B-Line SB861610DFB. Double Sided 10" Wide Vertical Cable Manager between racks and Eaton B-Line SB86166DFB on the end of each rack.

3. IDF Vertical Cable Management Eaton B-Line SB81006FB Double Sided 6" Wide Vertical Cable Manager between racks and on end of each rack.

4. Horizontal Cable Management: Eaton B-Line SB87019S2FB

5. Power Strips (2 per rack - to be mounted at lowest section): Eaton PW101BA1U140

6. Double-sided shelves (provide 4 total for building): Eaton B-Line SB596S19103SFB

7. Grounding kit and #6 AWG insulated copper conductor grounded to the nearest TGB.

8. Horizontal Rack Busbar: Eaton B-Line SB57903

9. #6 Ground Wire: Eaton B-Line SBUBC6xxK xx= 14,18 or 32

10. Incidental materials required for proper construction, mounting and securing.

2.14 BACKBOARD

A. Grade AC Fire rated plywood of Nominal Thickness of 23/32"

1. UL Evaluation Report ER7002-01

2. Flame spread requirement by Underwriters Laboratories in the extended 30 minute duration of ASTM E-84, "Standard Test Method for Surface Burning Characteristics of Building Materials." Each piece of treated wood bears the Underwriters Laboratories Classification mark identifying it as being produced under its Classification and Follow Up Services.

3. Board Grade AC

4.	Nominal Thickness	23/32"
5.	Actual Thickness	23/32"
6.	Nominal Width	4'
7.	Actual Width	4'
8.	Board Length	8'
9.	Treatment	Fire Treated
10.	Product Type1	Treated Lumber
11.	Nominal Size	23/32" x 4'

2.15 UNINTERRUPTILBE POWER SUPPLY

A. Provide a UPS for each MDF and IDF per the following .

B. MDF x 1, APC Smart UPS online # SRT5KRMXLT with AP9641 management card

1. True online UPS, 5400 VA with network card

2. 208 Volt input, Nema L6-30R input, Output Connection Type 2 NEMA L6-20R, 2 NEMA L6-30R

C. IDF x 5, APC SmartUPS online#SRT3000RMXLA with AP9641 management card

1. True online UPS, 3000 VA with network card

2. 208 Volt input, Nema L5-30R input, Output Connection Type 8 NEMA 5-20R, 1 NEMA L5-30R

2.16 FIRESTOPPING

A. Firestopping material: Conform to both Flame (F) and Temperature (T) ratings as required by local building codes and as tested by nationally accepted test agencies per ASTM E814 or UL 1479 fire test in a configuration that is representative of the actual field conditions. Manufactured by:

B. STI Firestop

1. SSS, LCI, SIL Firestop Sealant

2. SSP Putty Pads on boxes in all rated walls. See 260533/260534

3. EZ Path is acceptable substitution for conduit

2.17 LABELING AND ADMINISTRATION

A. Labels:

1. As recommended in ANSI/TIA/EIA 606 and UL969. Permanent (i.e. not subject to fading or erasure), permanently affixed, and created by a hand-carried label maker or a computer/software-based label making system. Handwritten labels are not acceptable.

2. For Station Cable:

a. Brother P-Touch Edge Product Family (or approved equal)

3. For Backbone Cable:

a. Brother P-Touch (or approved equal) in the MDF and IDF within 12" of termination point.

4. Hand-carried label maker:

a. Brother P-Touch (or approved equal).

B. Comply with TIA-606-B and UL 969 for a system of labeling materials, including label stocks, laminating adhesives, and inks used by label printers.

2.18 WAPS

A. WAPS will be furnished by the owner and installed by the contractor. The current design allows for 83 interior WAPS and 2 exterior WAPs. See plans for locations

B. The WAPS will be as determined by the owner but similar to Juniper AP43 interior and Juniper AP63 with remote antenna – exterior label visible from ground

C. Brackets

1. Ceilings: Provide Oberon 1044 recessed ceiling

2. Wall: Provide Oberon 1007 horizontal bracket. Mount horizontal

3. Gym: Provide AccelTex Solutions #ATS-02960 bracket with cover

4. Exterior: Provide Oberon 1007. Mount horizontal

a. In addition run #10 ground wire from WAP to nearest ground.

D. On all WAPS in gym, Commons and on exterior install in protective cage furnished by the owner.

PART 3 EXECUTION

3.1 GENERAL

A. Comply with NECA 1 and NECA/BICSI 568.

B. No cable grouping shall contain more than 50 cables

C. General Requirements for Cabling:

1. Comply with TIA-568-C.0, TIA-568-C.1, and TIA-568-C.2.

2. Comply with BICSI's "Information Transport Systems Installation Methods Manual (ITSIMM), Ch. 5, "Copper Structured Cabling Systems," "Cable Termination Practices" Section.

3. Do not untwist twisted pair cables more than 1/2 inch (12 mm) from the point of termination to maintain cable geometry.

4. Terminate all conductors; no cable shall contain unterminated elements. Make terminations only at indicated outlets, terminals, cross-connects, and patch panels.

5. Consolidation points may be used upon direct approval of the engineer.

6. Cables may not be spliced. Secure and support cables at intervals not exceeding 30 inches (760 mm) and not more than 6 inches (150 mm) from cabinets, boxes, fittings, outlets, racks, frames, and terminals.

7. Install lacing bars to restrain cables, prevent straining connections, and prevent bending cables to smaller radii than minimums recommended by manufacturer.

8. Bundle, lace, and train conductors to terminal points without exceeding manufacturer's limitations on bending radii, but not less than radii specified in BICSI Information Transport Systems Installation Methods Manual, Ch. 5, "Copper Structured Cabling Systems," "Cable Termination Practices" Section. Use lacing bars and distribution spools.

9. Do not install bruised, kinked, scored, deformed, or abraded cable. Do not splice cable between termination, tap, or junction points. Remove and discard cable if damaged during installation, and replace it with new cable.

10. Cold-Weather Installation: Bring cable to room temperature before dereeling. Heat lamps shall not be used for heating.

11. Pulling Cable: Comply with BICSI Information Transport Systems Installation Methods Manual, Ch. 5, "Copper Structured Cabling Systems," "Pulling and Installing Cable" Section. Monitor cable pull tensions.

D. Open-Cable Installation above ceilings:

1. Install cabling with horizontal and vertical cable guides in telecommunications spaces with terminating hardware and interconnection equipment.

2. Suspend twisted pair cabling, not in a wireway or pathway, a minimum of 8 inches (200 mm) above ceilings by cable supports not more than 48 inches apart.

3. Cable shall not be run through structural members or in contact with pipes, ducts, or other potentially damaging items.

E. Cable run layouts indicated on the drawings are generally diagrammatic. Exact routing of conduit and wiring shall be governed by the location of obstructions and building structural conditions. Cable runs shall strictly adhere to BICSI standards for EMI distances.

F. All cables passing into and out of all MDF/ IDF must be in sleeves with bushings and have proper fill ratios. Provide (1) 4" spare sleeve with capped.

G. Backboards. For reference backboards shall be fire rated and capable of supporting attached equipment, and painted with a minimum of two coats (over primer) of fire retardant, non-conductive paint, and one coat of white colored semi- gloss top coat paint with fire rating symbol exposed. Mount A-C plywood backboards with the "A" side exposed. Install up to 8 feet AFF minimum.

H. Group connecting hardware for cables into separate logical fields.

I. Separation from EMI Sources:

1. Comply with recommendations from BICSI's "Telecommunications Distribution Methods Manual" and TIA-569-D for separating unshielded copper communication cable from potential EMI sources, including electrical power lines and equipment.

2. Separation between open communications cables or cables in nonmetallic raceways and unshielded power conductors and electrical equipment shall be as follows:

a. Electrical Equipment Rating Less Than 2 kVA: A minimum of 5 inches (127 mm).

b. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 12 inches (300 mm).

c. Electrical Equipment Rating More Than 5 kVA: A minimum of 24 inches (600 mm).

3. Separation between communications cables in grounded metallic raceways and unshielded power lines or electrical equipment shall be as follows:

J. Electrical Equipment Rating Less Than 2 kVA: A minimum of 2-1/2 inches (64 mm).

1. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 6 inches (150 mm).

2. Electrical Equipment Rating More Than 5 kVA: A minimum of 12 inches (300 mm).

K. Separation between communications cables in grounded metallic raceways, power lines, and electrical equipment located in grounded metallic conduits or enclosures shall be as follows:

1. Electrical Equipment Rating Less Than 2 kVA: No requirement.

2. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 3 inches (76 mm).

3. Electrical Equipment Rating More Than 5 kVA: A minimum of 6 inches (150 mm).

L. Separation between Communications Cables and Electrical Motors and Transformers, 5 kVA or HP and Larger: A minimum of 48 inches (1200 mm).

1. Separation between Communications Cables and Fluorescent Fixtures: A minimum of 5 inches (127 mm).

M. Routing:

1. Route Cable in as direct a route to MDF and IDF as possible and along building structural lines unless alternate approved

a. Install plenum cable in environmental air spaces, including plenum ceilings.

2. Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

N. Conduit Sleeves are not necessarily shown on the drawings. The contractor shall provide conduit or EZ path sleeves as required to accommodate routing of all communications cables and all sleeves shall have 25% spare capacity. Provide sleeves where required for cable pass-thru through building structures and/or fire rated barriers above the ceiling. Provide roto-

hammering or core drilling where required for sleeve installation. Seal (and if a fire rated barrier, firestop) between sleeve and building structure and/or barrier. Size sleeves:

1. Sleeves shall be minimum 2” and maximum 4”

2. Communications cables shall not share sleeves with any other cables.

O. Seismic Joints: All cabling passing through a seismic joint shall be looped to allow for joint movement.

P. Wiring within Enclosures: Bundle, lace, and train cables within enclosures. Connect to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Provide and use lacing bars and distribution spools. Install conductors parallel with or at right angles to sides and back of enclosure.

Q. Cable run layouts indicated on the drawings are generally diagrammatic. Exact routing of conduit and wiring shall be governed by the location of obstructions and building structural conditions. Cable runs shall be run as short as possible.

R. Communications cables shall not share sleeves with any other cables.

S. All cables passing into and out of all MDF/ IDF must be in sleeves with bushings and have proper fill ratios.

T. Backboards. For reference backboards shall be fire rated and capable of supporting attached equipment, and painted with a minimum of two coats (over primer) of fire retardant, non-conductive paint, and one coat of white colored semi- gloss top coat paint with fire rating symbol exposed. Mount A-C plywood backboards with the "A" side exposed. Install up to 8 feet AFF minimum.

U. D-Rings: Provide D-Rings as necessary for vertical management only for exposed cables on backboards in telecommunications rooms.

V. Innerduct: Provide bright orange innerduct as pathway for backbone fiber optic cables (backbone only – not station cables), from backbone fiber patch panels to conduit or plenum entrances, and as shown in the Contract Documents.

W. Pull Strings: Provide a pull string in conduits that are to remain vacant.

3.2 MDF / IDF CREATION

A. Room Layout

1. Details of the MDF/ IDF layout must be reviewed by Owner prior to construction, including rack locations, PBX location, ladder locations, etc.

2. Lighting in MDF/ IDF to be 12 inches away from any cable bundles to minimize EMI.

3. Keep MDF/ IDF accessible and clean to facilitate other services that may need access during construction phase.

4. Any cable(s) entering MDF/ IDF must be collected onto ladder rack(s) mounted to perimeter wall(s) forming a continuous pathway connecting to the rack(s).

3.3 EQUIPMENT RACKS/ENCLOSURES

A. Provide EIA racks/cabinets and all associated hardware according to locations, elevations, and plan views as shown in the Contract Documents.

B. For Floor Mount Racks/Cabinets:

1. Using cable runway, horizontally affix the top of a given rack/cabinet to the wall as shown on the Contract Documents. Bolt horizontal ladder rack to rack/cabinet and to walls. Bolt rack/cabinet to floor.

2. Any cable(s) entering MDF/ IDF must be collected onto ladder rack(s) mounted to perimeter wall(s) forming a continuous pathway connecting to the rack(s).

3.4 PATCH PANELS

A. Provide patch panels and horizontal wire management according to locations, elevations, and plan views as shown on the Contract Documents.

B. Fiber: Size and install rack-mountable patch panels as shown on the Contract Documents. Use fiber patch panels to terminate multimode fiber backbone cables.

C. Copper: Size and install rack-mountable patch panels as shown on the Contract Documents. Use copper patch panel to terminate horizontal cable on rack(s). All for spacing between patch panels for horizontal cable management.

3.5 SERVICE LOOPS

A. Provide the following service loop lengths

1. Communications Outlets: Minimum 3 feet coiled above the ceiling

2. WAP: Minimum 15 feet coiled above the ceiling

3. Copper in Communications Room: Minimum 10 feet coiled in upper cable tray

4. Fiber: Minimum 10 feet each end

3.6 CONNECTORS

A. Copper Connectors (modular jacks):

1. For Horizontal Distribution:

a. Provide connectors and install using T568B wiring pattern.

b. Mount connectors at 90-degrees (i.e. straight, not angled)

c. Must re-apply all dust covers to all jacks after punching down the cable.

d. All terminations must adhere to BICSI AND EIA/TIA standards,

3.7 STATIONS

A. Faceplates: Provide faceplates for stations in the locations and gang counts shown on the Contract Documents. Faceplates shall completely conceal outlet boxes, reducer plates, etc. Faceplates shall provide a snug and sure fit for connectors – loose connectors are not acceptable and be mounted neatly and parallel to adjacent building lines.

B. Flush-mount connectors on faceplates.

1. Faceplate Mounting Brackets: Provide faceplate mounting brackets as required and as shown for flush mounted communications outlets. Provide blanks in all unused ports.

3.8 CABLE

A. For Horizontal Distribution: Provide station cable in types, sizes, and quantities as shown on drawings. Install cable between the station and it's associated communications room. Provide one cable per each connector at each station.

B. For Intrabuilding Backbone Distribution: Provide intrabuilding backbone cable in types, sizes, and quantities as shown on the Contract Documents. Install intrabuilding backbone cables between communications rooms within the same building. Provide cables of the same type in the same color – multiple colors of the same cable type are not acceptable.

C. Install cable in compliance with ANSI/TIA/EIA and ISO/IEC 11801 requirements and BICSI practices.

D. Adhere to the bending radius and pull strength requirements as detailed in the ANSI/TIA/EIA standards and the manufacturer’s installation recommendations during cable handling and installation.

1. Pull all cables simultaneously where more than one cable is being installed in the same raceway.

2. Use pulling compound or lubricant where necessary. Use compounds that will not damage conductor or insulation (Polywater, or approved equal).

3. Use pulling means, including fish tape, cable, rope, and basket-weave wire/cable grips that will not damage media or raceway. Repair or replace conduit bushings that become damaged during cabling installation.

E. Install cable in a continuous (non-spliced) manner unless otherwise indicated.

F. Install exposed cable parallel to and perpendicular to surfaces on exposed structural members and follow surface contours where possible.

G. Tie or clamp cabling. Attaching cables to pipes, electrical conduit, mechanical items, existing cables, or the ceiling support system (grids, hanger wires, etc.) is not acceptable. Install velcro-wraps in conformance with the SCS manufacturer’s installation recommendations. Do not over-tighten velcro wraps or cause cross- sectional deformation of cabling.

H. Cable at the backboards:

1. Lay and dress cables to allow other cables to enter raceway (conduit or otherwise) without difficulty at a later time by maintaining a working distance from these openings.

2. Route cable as close as possible to the ceiling, floor, sides, or corners to insure that adequate wall or backboard space is available for current and future equipment and for cable terminations.

3. Lay cables via the shortest route directly to the nearest edge of the backboard from mounted equipment or blocks. Support cables so as not to create a load on the equipment upon which the cables are terminated. Velcro-wrap similarly routed and

similar cables together and attach to D-rings vertically and/or horizontally, then route over a path that will offer minimum obstruction to future installations of equipment, backboards or other cables.

I. Cable in the telecommunications rooms:

1. For telecommunications rooms with ladder rack, lay cable neatly in ladder rack in even bundles and loosely secure cabling to the ladder rack at regular intervals with Velcro straps.

2. Any cable(s) entering MDF/ IDF must be collected onto ladder rack(s) mounted to perimeter wall(s) forming a continuous pathway connecting to the rack(s).

J. Cable terminating on patch panels located on racks:

1. Route cables in telecommunications rooms to patch panels on racks by routing across ladder rack across top of rack and then down vertical ladder rack to patch panel.

K. Copper Cable: Terminate all pairs within a cable. Un-terminated cable pairs are not acceptable.

1. For horizontal distribution: Provide station cable in the locations shown on the Contract Documents. Provide service loops as specified above each drop location at the entrance of each stubbed conduit above the ceiling grid and for classroom drop conduits running entirely to primary hallway cable trays, then lay cable loosely in tray to act as future slack.

2. For intrabuilding backbone distribution: Install intrabuilding backbone cable in the locations shown on the Contract Documents. Provide a service loop long enough in the commun cation rooms to reach termination equipment if moved to the farthest side of the room in the future, but no less than a minimum length of 10 feet at each end.

3. Fiber Cable: Terminate all fiber strands within a fiber cable. The installation of “dark fiber” is not acceptable.

a. For Intrabuilding Backbone Distribution:

1) Test fiber optic cable on the reel upon delivery to the job site, and again prior to installation. Permanently affix the test results to the reel and submit a copy to the Owner prior to installation. Do not install cables that fail the on-reel test. Replace any cables that fail the on-reel test at no additional expense to the Owner.

2) Test shall conform to the procedures as outlined in the paragraph entitled TESTING at the end of this specification section.

3) Demonstrate that the test results are in agreement with the factory test results as shipped with the reel.

4) Provide a service loop long enough in the MDF IDF to reach termination equipment if moved to the farthest side of the room in the future, but no less than a minimum of 10 feet at each end.

5) The service slack stored inside the fiber patch panel cabinets shall be a minimum of 3 m (10 ft).

L. Patch Cords

1. Coordinate with the owner and either deliver patch cords to the owner or install port to port at locations directed by the owner.

3.9 FIRESTOPPING

A. Install firestopping in compliance with NEC, IBC, and IFC as well as TIA-569-D

B. Comply with "Firestopping Systems" stated in BICSI manual.

3.10 GROUNDING

A. Comply with requirements in Section 260526.

B. Install grounding according to the "Grounding, Bonding, and Electrical Protection" chapter in BICSI's "Telecommunications Distribution Methods Manual."

C. Comply with TIA-607-B and NECA/BICSI-607.

D. Locate grounding bus bar to minimize the length of bonding conductors. Fasten to wall, allowing at least a 2-inch (50-mm) clearance behind the grounding bus bar. Connect grounding bus bar to suitable electrical building ground, using a minimum No. 2 AWG grounding electrode conductor.

E. Bond metallic equipment to the grounding bus bar, using not smaller than a No. 6 AWG equipment grounding conductor.

3.11 LABELING AND ADMINISTRATION

A. General: Labeling and administration shall comply with ANSI/TIA/EIA 606 and standard industry practices.

B. Must use Times New Roman serif font at 18 point for faceplate labeling and fit to size legibly for patch panel labels so as to distinguish between "I" and "1".

C. Color Coding: Apply industry standard color coding to cable termination fields. Always apply the same color at both ends of any given cable. Cross-connections are generally made between termination fields of different colors. The color may be applied to the backboard behind the termination equipment, may be the color of a cover on the termination equipment, or may be the actual color of the insert label on the termination equipment. Use the following color code:

1. Orange: Identification of the telecommunication service (telephone company) demarcation point.

2. Green: Identification of network connections on the customer side of the demarcation point.

3. White: Identification of first-level backbone in the building containing the main cross-connect, or may be used to identify the second-level backbone in buildings not containing the main cross-connect.

4. Gray: Identification of the second-level backbone in the building containing the main cross-connect.

5. Blue: Identification of the horizontal distribution (station) cables. A blue color coding is only required at the telecommunications room end of the cable, not at the station end of the cable.

D. Racks: Label racks as shown on the Contract Documents. Affix label centered across top cross-member of rack.

E. Grounding/Bonding

1. Label bonding conductors: “WARNING! COMMUNICATIONS BONDING CONDUCTOR. DO NOT REMOVE OR DISCONNECT”

F. Cables:

1. Label Location: Label at each end of the cable within 12" of the termination.

2. Station Cables: Label station cables with the same label as the outlet number that terminates the cable at the station location. Handwritten (neat and legible) labels using a permanent black marker such as a Sharpie are allowed.

3. Copper Backbone Cables: Label intrabuilding copper backbone cables in the form “C (MDF/ IDF), ###-PR, CAT##, ###-FT ” where “C” stands for media type (“C” for “administrative copper” media), “(MDF/ IDF)” is the origination and destination telecommunications rooms between which the cable routes, “###-PR” is the pair count, “CAT##” is the cable type (i.e. CAT3 or CAT5E), and ###-FT is the cut length.

a. Example: If a copper backbone cable running between MDF1 and IDF6 were a 150-FT long, 100-PR, CAT3 cable, then the label for the cable would read “C (MDF/ IDF), 100-PR, CAT3, 150-FT”

G. Fiber Backbone Cables: Label intrabuilding fiber backbone cables in the form “F (MDF/ IDF), ###-ST, type, ###-FT ” where “F” stands fiber, “(MDF/ IDF)” is the origination and destination telecommunications rooms between which the cable routes, “###-ST” is the strand count, “type” is the fiber type (i.e. SM, 50MM, etc), and ###-FT is the cut length.

1. Example: If a 12-strand, 50 micron fiber backbone cable running between telecommunications rooms “MDFA” and “IDFC” were 75-FT long, then the label for the cable would read “F (MDFA” and “IDFC), 12-ST, 50MM, 75-FT”

2. Provide labels at each end of each cable within 12” of telecommunications room entrance and again within 24” of termination point.

H. Termination Blocks and Protectors:

1. General:

a. Label termination block ports/pairs sequentially beginning on the first row of each termination block column. Begin with “001” for the first port/pair.

b. Label termination strip pairs sequentially (left to right).

I. Patch Panels:

1. For Horizontal Distribution:

a. General: Label patch panels as shown on the Contract Documents.

b. IDF to MDF Uplink Ports: In each IDF and in the MDF, label copper uplink ports using the following format:

2. Must use TIA/EIA 598-A color code for all fiber strand termination and all terminated fiber needs to be in the recommended order and be consistent at both ends.

3. Both ends of fiber termination must be labeled to identify where the other end is coming from. A fiber legend displayed inside the termination box is acceptable.

4. Label fiber termination box with destination MDF/ IDF.

5. Station Connectors (Ports): Per outlet number and plate style above

6. Conduits: Label each conduit end in a clear manner by designating the location of the other end of the conduit (i.e. room name, telecommunications room identifier, pull box identifier, outlet identifier (use the label of the first port of the outlet as the outlet identifier), etc.).

3.12 TESTING

Equipment must be tested with district-owned hardware to ensure compatibility. (ie: Chromebooks or staff issued devices/laptops)

A. Provide test records on a form approved by the Owner and Engineer/Designer. Include the test results for each cable in the system. Submit the test results for each cable tested with identification. Include the cable identifier, outcome of test, indication of errors found, cable length, retest results, and name and signature of technician completing the tests. Provide test results to the Owner and Engineer/Designer for review and acceptance within two weeks of Substantial Completion.

1. Print test records for each cable within the system directly from the tester and submit in paper form (in a binder) and in electronic form (on CDROM) to be reviewed by the Owner and approved by the Engineer. Handwritten test results will not be accepted nor any spreadsheet tabulated data forms.

2. Provide PDF or of the JDSU or Fluke test data for all copper and fiber cables compatible with latest version of software. Single copy of notebook bound, printed, color, double sided and sequentially organized of all copper and fiber test results

3. Provide PDF copies of project’s completed as-built drawings denoting the installed and individually labeled data drops at their locations in PDF format from digital CAD versions of the Electrical Data/Comm sets (See example below)

4. See sample following this section for level of test results to be delivered to the owner in PDF form.

B. Test the System after installation for compliance to all applicable standards as follows:

1. Copper:

a. For Horizontal Distribution, including Backbone Distribution: Test all pairs of each copper station cable, for conformance to ANSI/TIA/EIA 568 to specified level.

b. Test each end-to-end link (the entire channel from the connector at the station to the connector or termination in the telecommunications room) utilizing sweep

tests, for alien cross talk, continuity, shorts, polarity, near- end cross talk (NEXT), far-end cross talk (FEXT), attenuation, installed length, transposition (wire map), mutual capacitance, characteristic impedance, resistance, ACR, and presence of AC voltage. Use the Power Sum method to test NEXT and FEXT.

c. Use a TIA/EIA Level III testing instrument from either Fluke or JDSU, or owner pre-approved for all copper testing. The test instrument needs to be re-calibrated within the manufacturer's recommended calibration period, with the most current software revision based upon the most current ANSI/TIA/EIA testing guidelines and be capable of storing and printing test records for each cable within the system.

d. In addition to the above, perform tests both recommended and mandated by the cable manufacturer for the warranty

C. Fiber: Test fiber optic cable on the reel upon delivery to the job site prior to installation, and again after installation.

1. Prior to testing, calculate the cable loss budget for each fiber optic cable and clearly show the result on the test documentation. Calculate maximum loss using the following formula, assuming no splices:

2. For Backbone Distribution:

a. Max Loss = [(allowable loss/km) * (km of fiber)] + [(.3db) * (# of connectors)]

b. A mated connector to connector interface is defined as a single connector for the purposes of the above formula.

c. A given fiber strand shall not exceed its calculated maximum loss (per the above formula).

3. Test all strands using a bi-directional end-to-end optical transmission loss test instrument (such as an OTDR) trace performed per ANSI/TIA/EIA 455-61 or a bi-directional end-to-end power meter test performed per ANSI/TIA/EIA 455-53A, and ANSI/TIA/EIA 568-C to eliminate any possible fiber core misalignments at connectors or splice points.

a. Calculate loss numbers by taking the sum of the two bi-directional measurements and dividing that sum by two.

b. Provide test measurements as follows:

4. Test results shall conform to:

a. The criteria specified in ANSI/TIA/EIA-568B

b. OS2 testing criteria

c. Manufacturer's requirements

D. Identify cables and equipment that do not pass to the Owner and Engineer/Designer. No marginal or star passes allowed. Marginal Pass must be enabled on all test instruments. All FAILS need to be corrected and no re-certify status of test data accepted. Determine the source of the non-compliance and replace or correct the cable or the connection materials,

and retest the cable or connection materials at no additional expense to the Owner. Provide new test results to the Owner and Engineer/Designer in the same manner as above.

1. In addition to the above, if it is determined that the cable is at fault, remove the damaged cable and replace it with a new cable. Cable “repairs” are not acceptable. The procedure for removing the cable shall be as follows:

2. Prior to removal of damaged cable and installation of new cable:

3. Inform the Owner and Engineer/Designer of the schedule for the removal and installation.

4. Test the new cable on the reel

5. Test cables that occupy the same innerduct or conduit (if not in innerduct) as the damaged cable per paragraph B, above, regardless of whether or not they are new cables installed as part of this project or existing cables installed prior to this project.

6. Provide test results to the Owner and Engineer/Designer for approval by the Owner and Engineer/Designer.

3.13 WAPS

A. Install WAPS at locations directed by owner. Clip to ceiling tile where available or horizontal wall mount where directed. Exterior, Gym, and Commons WAPS to be installed in protective enclosure. On completion furnish the following information to the owner.

FLOOR	ROOM #	DEVICE TYPE	DEVICE NAME	MAC ADD	JACK #	MDF/ IDF #	RACK #	PATCH PANEL #	PATCH PANEL PORT	SWITCH PORT	% COM-PLETE
		WAP									
		ACCESS CONTROL									
		HVAC									
		INTERCOM									
		PHONE									
		STATION									
		DATA									
		ETC									

3.14 PATCH CABLES

A. Install patch cables as directed by the owner. Plug patch cables into switchports designated. Group in a clean professional manner with appropriate length cables and use Velcro wraps for a clean install. Cables shall have minimal slack except as directed by the owner. . On an on-going basis, update the customer's shared google spreadsheet as wiring and device installation is completed. Customer needs the information in the spreadsheet in order to allow devices on the network. Spreadsheet needs to be updated at least weekly. Provide the following table to the owner at completion.

3.15 FIELD QUALITY CONTROL

A. Inspections:

1. Visually inspect jacket materials for NRTL certification markings. Inspect cabling terminations in communications equipment rooms for compliance with color-coding for pin assignments, and inspect cabling connections for compliance with TIA-568-C.1.

2. Visually inspect cable placement, cable termination, grounding and bonding, equipment and patch cords, and labeling of all components.

B. Manufacturer Services:

1. Manufacturer shall inspect final installation and test results and send warranty letter to the owner.

END OF SECTION

SECTION 27 30 00 – TWO WAY COMMUNICATIONS

PART 1 GENERAL

1.1 SUMMARY

A. Provide a complete and fully functional two way communications system from the elevator lobby to the main office. System shall be installed complete per IBC 1009

B. The Command Center is to be located at a central control point on the first floor or as determined by local Authority Having Jurisdiction. Call Boxes are to be located on all floors above and below the first floor, ideally next to a stairwell emergency exit or elevator landing on each floor.

C. The Command Center must be capable of connecting to an existing Network and providing inputs for the IP Call Boxes. Visual indicators on the IP Command Center allow rescue personnel to know which IP Call Box needs assistance. The IP Command Center must allow rescue personnel to speak to each IP Call Box individually. The IP Command Center must include both a handset and speakerphone to communicate back to the IP Call Boxes.

D. The IP stations

1. The emergency communication hardware shall comply with the Americans with Disabilities Act (ADA). The IP Call Box shall have the ability to be programmed with up to 2 emergency phone numbers (either both off-site or Base Station and off-site). Upon activation of the emergency push button, a call will be automatically placed to the IP Command Center. If no one answers at the IP Command Center, the IP Call Box must dial a secondary location outside the building to activate two-way off-site person to person voice communications

1.2 QUALITY ASSURANCE

A. All command unit installation, configurations, setup, program and related work shall be performed by electronic technicians thoroughly trained by the manufacturer in the installation and service of the equipment provided.

B. All equipment shall be warrantied against any defects in material and workmanship under normal use for a period of sixty (60) months from date of installation, provided that manufacturer receives a completed "Installation Certification" certifying the date on which the system has been installed. An "Installation Certification" card shall be enclosed with every unit. In the event that no "Installation Certification" is received by manufacturer, the sixty (60) months will commence on the date of shipment by the manufacturer.

1.3 CERTIFICATIONS AND STANDARDS

A. The command unit shall be designed to meet the following standards:

1. Accessibility

a. ADA: Standards for Accessible Design – 2010 §7

b. ANSI ICC A117.1 (2009): Accessible and Usable Buildings and Facilities

c. IBC (2015) §1009

d. NFPA 72: National Fire Alarm and Signaling Code – 2016 §24.10

e. Illinois Accessibility Code

2. Safety

a. UL 60950-1

3. Direct connection of Terminal Equipment (TE) to the Public Switched Telephone Network (PSTN)

a. FCC (47 C.F.R. Part 68)

1.4 MANUFACTURER

A. Manufacturer are as follows

1. Talkaphone or equal

2. Switches: By Owner

1.5 INSTALLER

A. Installer must be a Talkaphone certified installer

B. Installer must have installed at least 3 school projects of similar size and complexity

1.6 SUBMITTALS

A. Product Data: For each type of product indicated. Include dimensions and data on features, performance, electrical characteristics, ratings, and finishes.

B. Shop Drawings: For video surveillance. Include plans, elevations, sections, details, and attachments to other work.

1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

2. Functional Block Diagram: Show single-line interconnections between components for signal transmission and control. Show cable types and sizes.

3. Dimensioned plan and elevations of equipment racks, control panels, and consoles. Show access and workspace requirements.

C. Design Data: Include an equipment list consisting of every piece of equipment by model number, manufacturer, serial number, location, and date of original installation. Add pretesting record of each piece of equipment, listing name of person testing, date of test, set points of adjustments, name and description of the view of preset positions, description of alarms, and description of unit output responses to an alarm.

D. Product Warranty: Sample of special warranty.

1.7 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For cameras, power supplies, infrared illuminators, monitors, videotape recorders, digital video recorders, video switches, and control-station components to include in emergency, operation, and maintenance manuals. In addition to items specified in Section 017823 "Operation and Maintenance Data," include the following:

1. Lists of spare parts and replacement components recommended to be stored at the site for ready access.

1.8 WARRANTY

A. Provide the Limited Warranty for Product Line for Repair and Replacement

1. Warranty Period: FIVE Years

PART 2 PRODUCTS

2.1 TWO WAY COMMUNICATIONS SYSTEM

A. Since system is in 2 different buildings VOIP will be used. Contractor to provide switch for this system only. Mount cell dialer in the MDF.

B. Master Station: Talkaphone AOR-IP-40-CU with flush mount trim ring

1. Construction: 18 gauge painted steel enclosure, acrylic window

2. Mounting: IP Command Unit flush mounts optional trim ring

3. Communication:

a. IP Command Unit provides both an LCD and keys with LEDs to indicate IP

b. Call Station line status (i.e. idle, ringing, or busy)—receives and selectively originates calls

4. Power Source: IP Command Unit, IP Supervisor, and UPS Supervisor receive power from UPS (120VAC).

5. IP Call Stations receive power over Ethernet (PoE).

6. Wiring: Minimum Cat5e or Cat6.

7. Fire resistive Ethernet cable is supported.

8. Environment: IP Command Unit, AOR-IP Call Stations, IP Supervisor, UPS, and UPS

9. Supervisor are for indoor use.

C. Station: Talkaphone AOR-IP-CSE-FM

1. Flush mount

2. Fully compliant with IBC, ADAAG, ICC A117.1 Ch. 7, and NFPA 72

3. Network supervision available when used in conjunction with IP supervisor (Model AOR-IP-SUP)

4. Automatically plays back a recorded location message to the local IP Command Unit (not off-site)

5. Auto-answers calls initiated at the IP Command Unit

6. Exceptional sound clarity during conversation (over 85dB, configurable)

7. Power over Ethernet (PoE, 802.3af)

8. Vandal resistant stainless steel faceplate and metal button

9. LED indicator for the hearing impaired

10. Push button once to call, then speak hands-free

11. Built-in auto-dialer can dial up to five (5) phone numbers: if the first number doesn't answer or is busy, dials next number

D. Signage

1. System shall include signage required by AHJ and manufacture. Talkaphone AOR Sign series

E. Graphics

1. Command Center must include wording identifying the location of each Call Box and light an LED when a particular Call Box has been activated.

2. The Call Box wording must include “Emergency Phone”, International Phone symbol, and raised Braille lettering.

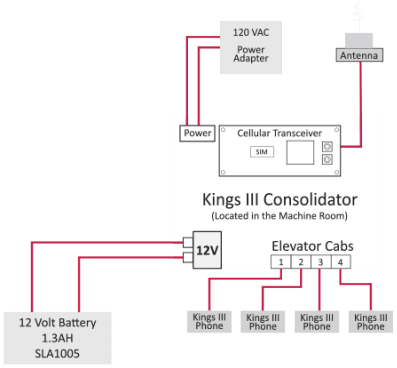
F. Cabling

1. Cabling for two-way communication system shall meet the applicable requirements for pathway survivability. Cabling installation shall consist of the following:

a. 2 hour fire-rated circuit integrity (CI) cable as required by manufacturer and AHJ

2.2 CELLULAR DIALER

A. Provide (2) Kings III Skyline cellular dialer with ethernet backup for elevator and two communications system. Include antenna



B.

C. Locate elevator device in the elevator machine room or MDF as directed by the elevator inspector. Locate two communication device in the MDF

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine roughing-in for network before device installation.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.

B. Fully program system for operation as required by the AHJ.

C. Tests and Inspections:

1. Inspection: Verify that units and controls are properly installed, connected, and labeled, and that interconnecting wires and terminals are identified.

2. Verify operation of control-station equipment.

3.3 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain video-surveillance equipment. Provide 2 hours of training. Record all sessions and deliver to owner

END OF SECTION

SECTION 27 41 16 – CONFERENCE, FITNESS, AND MONITOR AV SYSTEMS

PART 1 GENERAL

1.1 GENERAL REQUIREMENTS

A. The intent of this specification is to provide a complete and properly AV system for the pick-up, amplification, distribution, and reproduction of voice and/or other audio program material and audio-visual display including projectors in the Conference rooms, Fitness Room, and other locations as indicated on the drawings. The system shall be of modular design to facilitate both expansion and service and shall be completely solid state. All necessary hook-up and testing shall be by a factory approved representative. All equipment shall be listed with a Nationally Recognized Testing Laboratory (NRTL) such as U.L.

B. Audio Visual system is included in Alternate Bid#5. Base bid includes all conduit rough in and power for the system.

C. All system equipment shall be supplied and installed by an authorized factory distributor. The sound system contractor shall have been in the business of furnishing the specific product lines for a minimum of 5 years.

D. The installing contractor shall upon request submit a listing of similar installations that have been in service for at least 5 years and are working satisfactory. The contractor shall maintain a mobile service force capable of offering full factory authorized warranty service and able to be on site within one hour.

E. The entire system shall be guaranteed for a period of one year from the date of acceptance or first beneficial use, whichever is first, against defects in materials, workmanship, design and improper adjustment. Any defects in the system shall be corrected at no expense to the Owner, provided the system does not show signs of abuse. During the guarantee period any work found not to be in conformance with the plans, specifications and addenda shall be brought into conformity with same at no additional cost to the Owner.

F. These specifications are based on products manufactured by Lightspeed, Cables to Go, Qomo, Chief, Kramar and other manufacturers. Brand names are used to establish levels of quality and performance.

G. Approval request for installation of equipment not as specified herein must be received by the architect not less than ten days prior to bid opening. Proposals must be accompanied by complete technical data including: Equipment list on contractors letterhead listing major system components, such as loudspeakers, amplifying and control equipment including mixers, equalizers, signal processors, matching transformers, equipment housings, ancillary equipment, microphones, cabling etc. Compilation of manufacturers catalogs or specification sheets of major components and block diagrams. It is the sole responsibility of the contractor to prove equality to the satisfaction of the engineer including, laboratory test data, fabrication techniques, installation and testing procedures. Potential bidders submitting proposals for prior approval must provide, upon request, a working demonstration system for the Owner's inspection prior to final acceptance to insure that the submitted components are equal to the specified in all functional aspects.

H. Alternative proposals which are approved will be published by addenda. Proposals not complying with the prior approval requirements and conditions set forth will not be considered.

1.2 SUBMITTALS

A. Provide clearly identified, complete catalog cuts of all major components including but not limited to:

1. Equipment cabinets and enclosures

2. Cables for all interconnection of components, microphones and speakers.

3. Brackets

4. Backboxes and specialty rough-ins

5. Wire and cable

B. Provide shop drawings showing engineering details of equipment interconnection including point to point wiring, gain or losses between components in dBm, and equipment layout, speaker locations with proposed mounting and aiming. Proposed wire routing, rough-in and installation information.

1.3 OPERATIONS AND MAINTENANCE MANUALS

A. 3 complete bound O&M manuals describing maintenance and operation of the system. Include descriptions and service data on all component parts. Manual shall also include the following.

1. Warranty statement indicating effective dates.

2. Complete engineering data on all systems furnished including point to point wiring diagrams of the system in its "as built condition.

3. Step by step instructions on operational procedures, including power up and power down sequences, special operational guidelines and standard preventative maintenance procedures. One copy shall be permanently affixed to equipment rack.

1.4 SCOPE

A. Base Bid: AV systems shall be AV rough-in only for AV system devices as shown on the drawings.

B. Alternate #3: Provide complete and functioning Audio-Visual Systems including monitors, cables, sound system, etc., fully connected and operational.

PART 2 PRODUCTS

2.1 CONFERENCE ROOM, TECH ROOMS AND AREAS

A. Sound System: None provided

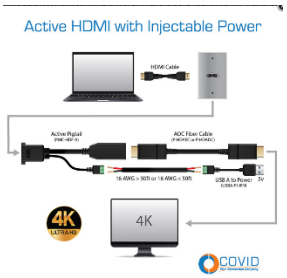
B. AV Outlets

C. AV OUTLETS

1. AV1: Custom 2 Gang Stainless Steel plate with

a. First Gang: Dual HDMI Jacks and Audio flush

1) HDMI jacks shall be Covid PMC-HDF-A active pigtail or Kramer Hybrid Optical Cable. System shall pass 4K/60 up to 50 feet.



2)

b. Second Gang: USB A and USB C

c. Black and Stainless Steel

2. AV2 where shown: Single gang with single HDMI and USB

a. Provide Startech USB combiner when AV2 is shown

3. AVM/AVS: Dual gang Stainless Steel 1.5” grommet pass through plate. Cables to go 40546

4. Cabling:

a. HDMI – Optical, 50 feet or as required. Extron HD Pro P, Covid AOC series, or Kramer Optical Hybrid HDMI of length required. System shall pass 4K, 60 HZ rated up to 50 feet.

b. 3.5mm Audio – Extron A Mini Series of length required.

c. USB A: Startech USB3SAB10M active extender cable

d. UCB C: Startech USB2C5C4M, maximum 13 feet

5. Patch Cables:

a. HDMI: Extron HDMI Pro/6. Provide 2 per system

b. Audio: Cables to Go 40412, provide 1 per system

c. USB3.0: Confirm with owner prior to ordering for either USB C or A. Startech#USB3S. Provide 1

D. Monitor and Mount

1. Monitor: FOIC

2. Monitor and Monitor Mount: Chief PNRUB with universal mounting

2.2 FITNESS ROOM AV SYSTEM

A. Audio-Visual System will be on portable carts provided by the owner. Contractor shall install sound system on the cart and connect to system. Allow for (1) cart provide by contractor and installed by contractor cable of mounting AV system as specified.

B. SOUND SYSTEM:

1. Cascadia Base Station

a. Description: Wireless audio hub

b. Wireless Communication: Access Technology (1.9 GHz)

c. Frequency Response: 20 Hz - 20 kHz Power Amp, 150 Hz - 6.5 kHz Wireless

d. Power Supply Options: 24VDC/2.5A or PoE+ 802.3at

e. Power Output: 40 WRMS total (20 WRMS/channel) with 24VDC supply

f. Tone Control: Bass/Treble control

g. Ethernet: 10/100Mbps

h. Audio Inputs: Three (3) 3.5mm inputs, one S/PDIF coaxial digital input

i. Audio Output: One (1) 3.5mm output, one S/PDIF coaxial digital output

j. Maximum Input/Output Level: 1.4VRMS / 1.4VRMS

k. Total Harmonic Distortion: <1%

l. Analog Control Signals: Inputs: PageFirst (25/70V page mute), Relay Input

2. Speakers

a. Lightspeed WMQ x 2

1) Driver Size: 4" with 1" tweeter

2) Frequency Response: 60 Hz - 20 kHz ± 6dB

3) Impedence: 8 Ohms

4) Power Handling: 30 W

3. Wireless Microphones x 2:

a. Lightspeed Flexmike

1) Description Pendant-style transceiver

2) Lanyard Magnetic clasp with integrated earbud

3) Wireless Communication Access Technology (1.9 GHz)

4) Audio Distortion <1%

5) Integrated Microphone Uni-directional electret

6) Earbud Output 3.5mm

7) Audio Input USB-C 2-way digital audio interface

8) Battery Power 3.7V Lithium Ion battery pack

9) Battery Life 8 hours (fully charged)

10) Charging 2 contacts for cradle charging

11) USB Connection Type C for charging and audio

12) Power On/off switch

b. Lightspeed Sharemike

1) Description Handheld transceiver

2) Lanyard None

3) Wireless Communication Access Technology (1.9 GHz)

4) Audio Distortion <1%

5) Integrated Microphone Uni-directional electret

6) Audio Input USB-C 2-way digital audio interface

7) Battery Power 3.7V Lithium Ion battery pack

8) Battery Life 8 hours (fully charged)

9) Charging 2 contacts for cradle charging

10) Power On/off button

c. Lightspeed Dual Flexmike Charger.

1) Capacity Two Microphones

2) Charging Methods Cradle

3) Power 5VDC

4) Provide rechargeable batteries plus 20% spare

4. Wireless Media Connector: Lightspeed media connector, mounted on teacher's desk.

a. Description Transceiver

b. Power Input 5V/1.0A USB-C connector

c. Wireless Communication Access Technology (1.9 GHz)

d. Tone control 1 bass / treble control

e. Digital audio interface USB-C 2-way digital audio interface

f. Audio output 3.5mm stereo (x2) mixed with volume control

g. Audio inputs 3.5mm stereo (x4) with volume control

h. Audio Link/Pair Indicator 1 LED on front panel

i. Device pairing Push button

C. AV OUTLETS

1. AV1 and AVM: Recessed extra deep 5” or 4-11/16” box per 260534 with blank stainless steel plate

2. AVS: Dual gang Stainless Steel 1.5” grommet pass through plate. Cables to go 40546

3. Conduit: 1.25”

4. Cabling: Not included

D. HEARING ASSISTANCE SYSTEM

1. The portable hearing assistance system shall be an FM band RF broadcast type complete with transmitter, co-axial antenna and

2. Williams Sound PFM Pro RCH system. Provide

a. One for Fitness Room

2.3 MONITOR Only Locations

1. Monitor: FOIC

2. Monitor and Monitor Mount: Chief PNRUB with universal mounting

PART 3 INSTALLATION

3.1 GENERAL

A. Equipment shall be completely installed, tested, adjusted and operating properly under the terms of this specification. Systems shall be complete and operational as installed.

B. All wiring installed in metallic raceway if concealed in wall, inaccessible ceiling space, and/or open to structure areas. Open cabling methods allowed elsewhere. Separate conduit runs shall be provided for microphone lines, speaker lines and A.C. power. Wire shall be #18 X 2 stranded with overall jacket for speakers, #20 X 2 stranded with overall shield and jacket for microphone and line levels Equal to Belden numbers: 5200UE, 5400FE. Wiring for AV systems may be open above ceilings if cable is Plenum Rated.

C. Installation is to be performed under the supervision of a qualified project technician. This technician shall be factory trained in the proper installation of the proposed equipment, shall approve and sign all documents and shop drawings attesting to compliance, and shall be present for final adjustment and training of the owners forces. All appropriate local electrical codes for installation of these systems shall be met.

D. All high voltage A.C. voltage lines shall be three wire with a coded #14 green ground wire. Electrical contractor is to provide earth grounding to the sound cabinets via either system ground rods or building safety ground. All grounding shall be done so that no more than 25 ohms of resistance to ground is maintained. Electrical Contractor shall provide duplex receptacle in ceiling area above mixer amplifier location for installation of sound system transformer.

E. Component, interconnection and cable shield grounds are to be installed so that the system is free of groundloops, hum, noise, instability and crosstalk.

F. Equipment shall be installed as specified. Equipment and installation shall be of a design to eliminate shock hazard to the operators. All equipment for a complete finished system shall be supplied even if not expressly mentioned in these specifications. The complete Audio-Visual system shall be installed and tested per the owner.

G. Only standardized test procedures shall be used for equalization, measurement of impedances, adjusting electrical levels, adjusting sound levels, minimizing hum, polarity measurements, time alignments, etc.

H. The following tests shall be performed on the system and the results shall be included in the operations and maintenance manuals for permanent record.

1. Each speaker line shall be tested for total speaker load impedance.

2. The total system shall be installed from microphone to loudspeakers in absolute polarity. A positive pressure on the microphone shall produce a positive pressure from all loudspeakers.

3.2 TESTING

A. Full test and demonstrate system operation from each location to owner. System shall pass 4K/60 through the system.

B. Source device testing shall be done with owner provide equipment include phones, tablets, Chromebooks, laptops, document cameras, and PCs. Test will not be considered complete until testing is shown to owner with owner provided devices

3.3 TRAINING

A. The contractor shall instruct the owner’s forces in proper operation and routine maintenance of the system. Include minimum 1 hour of training, record all sessions and deliver 3 copies to owner.

B. A complete technical manual with servicing instructions shall become part of the permanent owners’ operations and maintenance manual. It shall include at a minimum:

1. Manufacturer's owners’ manuals on major components, including schematics and parts lists.

2. Complete as built drawings showing internal wiring of all equipment assemblies, wiring between equipment assemblies, running sheets showing color codes and terminal connections of all equipment assemblies and junction boxes.

3. Tap connections of all speaker transformers and power amplifier outputs.

4. Designations and settings of all equalizers, etc. installed in the system.

5. Name, address and telephone number of the installing contractors service organization.

3.4 WARRANTY AND SERVICE

A. The system shall be warranted to be free of defects in materials and workmanship for a period of one year from date of Substantial Completion. During this period any defect shall be repaired or replaced at no charge to the owner

END OF SECTION

SECTION 27 51 23 – INTERCOM AND CLOCK SYSTEM

PART 1 GENERAL

1.1 SUMMARY

A. It is the intent of this Section in conjunction with the applicable Drawings to provide an IP based school intercommunication system (System). The System shall provide all of the features specified such as creating paging groups; ad-hoc, live or prerecorded audio broadcasts; administer broadcasts from a secure web interface or IP phone; programmed bell scheduler; message scheduling; simultaneous broadcast to multiple paging groups; and master clock system. The system shall be capable of integrating with Owner's IP Phone System for telephony interface.

B. The bid includes 2 separate prices for evaluation by the owner

1. Alternate Bid 6a – AND equipment with Singlewire Fusion Software

2. Alternate Bid 6b – Telecor Equipment with Singlewire Fusion Software

C. The contractor shall include 5 years of Singlewire Advanced licenses for all devices. Provide copy of licensing to owner.

D. Connect via contacts to the Access Control system. Upon pushing the lockdown/panic button the system shall initiate a lockdown page throughout the school

E. Connect to the owner's voice phone system.

1.2 WORK INCLUDED

A. Provide all labor, materials, tools, and equipment for a complete and operational system as called for in the specifications and Drawings, specifically:

1. Public Address speakers, ceiling mounted, wall mounted horn, both interior and exterior.

2. Volume attenuators as shown on the Drawings to adjust the speaker sound level. Emergency and fire alarm messages shall override volume control.

3. Paging override signal to local sound systems. Coordinate with AV contractor

4. Messaging POE calendar clocks

5. Interactive Graphical User Interface (IGUI) to intercom functions including zone or all page, answering intercom call-ins, selecting and distributing program sources to predefined zones or all zones and facilitating single action activation of multiple system interface e.g. access control and CCTV or other systems as directed by Owner.

6. All System configurations shall utilize Windows-based software. Proprietary software will not be accepted.

7. The System shall have the hardware and software necessary to be connected to the Owner's local area network (LAN) to administer the system. This includes the ability to make bell schedule changes, architectural numbering changes, zoning changes, etc.

1.3 QUALITY ASSURANCE

A. All major System equipment shall be of a single manufacturer, supplied and installed by an authorized factory distributor of the supplied equipment with full warranty privileges. The Contractor shall be authorized by the OEM to pass thru the OEM's warranty of the installed equipment to the District. In addition, the OEM and Contractor shall accept complete responsibility for the design, installation, certification, operation, and physical support for the system. This documentation, along with the system Contractor and OEM certifications must be provided in writing as part of the Contractor's Technical submittal.

B. The Contractor's Technicians assigned to the installation and programming of the system shall be fully trained, qualified, and certified by the OEM on the engineering, installation, operation, and testing of the system. The Contractor shall provide formal written evidence of current OEM certification(s) for the installer(s) as a part of their submittal or to the Consulting Engineer before being allowed to commence work on the system.

C. The System contractor shall have furnished and installed school intercommunication systems continuously for no less than five years.

D. The manufacturer shall provide proof that the system is of a modular design and supported with software updates and improvements to the product. Systems that require major replacement of head-end equipment to upgrade their system will not be acceptable.

E. The System shall be designed specifically for school applications. The System shall be installed by a contractor who has a minimum of three similar school communication systems currently installed and operating satisfactorily in Western Washington.

F. The System contractor shall furnish and install all materials, even though not specifically mentioned herein, which are necessary for the proper integration of the system so that the system shall perform the functions listed herein in compliance with all the specified requirements.

G. All major components shall be listed with the Underwriter's Laboratories. No exception to this will be accepted.

H. The System contractor shall guarantee availability of 24-hour local service by factory- trained personnel of the equipment manufacturer. The contractor shall have available stock of the manufacturer's standard parts.

1.4 FUNCTIONS – COMMUNICATIONS

A. The System shall contain software and hardware for seamless integration between the telephone and intercommunication systems, and will allow access to all of the school related intercom features from the telephone system. The Contractor shall be responsible for coordinating interface requirements with the District IT department.

B. The System shall utilize the Owner-provided VoIP telephones to access all intercom features. The System will be connected via Ethernet switches.

C. The System shall be capable of configuring recipient groups by specifying the parameters. Coordinate actual configuration with District prior to installation.

D. The System shall be capable of programming privileges by user.

E. The system shall provide office or classroom exclusion of loudspeakers from all-call, audio programs, and class change signals to allow for privacy during tests and meetings.

F. Calls to the classroom will provide for calling the loudspeaker for hands-free answer back intercommunication. The system shall provide single-step transfer from loudspeaker to private handset communication. Systems that restrict or prevent this feature will not be acceptable.

G. Provide software for Owner supplied workstations

1.5 TYPICAL CONFIGURATION – NORMAL SCHOOL HOURS

A. Provide for answering call-ins registered in the office area digital display from the office telephones by pressing a single "response" button on any telephone. Systems that require the dialing of multiple digits to answer the call will not be acceptable.

B. Provide for two-way loud-speaking communications with hands-free answer back to any location equipped with a loudspeaker extension.

C. Provide for automatically sounding a warning tone signal over any speaker selected for two-way "amplified voice" communication to alert the classroom teacher to the call and prevent unauthorized monitoring. The warning tone signal shall sound as soon as the speaker is selected, and shall automatically repeat at regular intervals for the duration of the call if no two-way communication occurs. Systems that do not sound a warning tone signal or allow for the canceling of the warning tone signal will not be acceptable.

D. Provide for restriction of all-call announcements and alarm signal origination to certain assigned administrative telephones.

E. Provide for the instantaneous distribution of pre-programmed all-call announcements simultaneously to all locations equipped with speakers by dialing a predetermined code number (i.e. school lock-down situations). Announcements shall be configured using an internal word database that allows for the building of messages to be played. Emergency announcements originating at any authorized telephone shall have priority over all regular system functions. Systems that do not allow for this capability will not be acceptable.

F. Provide for the instantaneous distribution of announcements to 16 pre-scheduled groups of speakers (zone paging capability) from any location equipped with an administrative telephone by dialing a predetermined code number.

1.6 SYSTEM CONFIGURATION – AFTER HOURS

A. Provide for answering of emergency intercom call-ins from a call switch to the office by ringing the office telephones, security office, remote telephone, or cell phone. A voice prompt on the telephone called will provide information regarding the call-in and pressing a single response button on the answering telephone will automatically connect the caller to the area that generated the call-in thus eliminating the need to dial the calling station's number.

1.7 FUNCTIONS – AUDIO PROGRAMMING

A. Transmit audio program from the multimedia control center to any one, several, or all loudspeakers simultaneously.

B. Provide software selection of audio program to any room station, individual zone, group of zones, or all zones.

C. Aurally monitor a program either before or during distribution.

1.8 SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: For intercom and clock systems.

1. Include plans, elevations, sections, and mounting details.

2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

3. Include diagrams for power, signal, and control wiring.

a. Identify terminals to facilitate installation, operation, and maintenance.

b. Single-line diagram showing interconnection of components.

c. Cabling diagram showing cable routing.

1.9 COORDINATION

A. Coordinate layout and installation of ceiling-mounted speaker microphones and suspension system with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression system, and partition assemblies.

1.10 WARRANTY

A. A five-year manufacturers warranty shall be provided covering all intercommunications system head-end components, speakers, secondary clocks, and software. A ten-year warranty on all other equipment and the installation of the system shall also be provided. A copy of the warranty shall be submitted in writing with system documentation.

1.11 SPARE PARTS

A. Provide the following spare parts

1. Talkback speaker x 2

2. Clock/Message Board x 2

3. Speaker Baffle x 2

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Software: Singlewire Informacast Advanced

B. Alternate Bid 4A: Hardware: Devices by AND

C. Alternate Bid 4B: Hardware: Devices by Telecor

2.2 GENERAL

A. All materials and equipment installed under this contract shall be new, unused, free of defects, and of current manufacture. Equipment and material shall carry Underwriters Laboratory certification if required by local, state or national codes.

B. System shall have on site controller to allow system to function completely with the loss of the WAN connection

C. UPS shall be provided to keep intercom system functioning for minimum 1 hour after power failure

D. System shall provide for Sip phone integration to the owner's phone system

2.3 SOFTWARE

A. Singlewire InformaCast Fusion with all licensing for head end and all stations for 5 years

B. The intercommunication software shall be capable of provided all the required features and interfacing with other systems.

C. Alerting Features

1. Instant Alerting: Trigger notifications the moment an incident occurs

2. Launch notifications instantly from a virtual or physical panic button, the InformaCast Mobile, or web console.

3. Receive automated weather alerts, early earthquake warnings, gunshot detection, and Internet of Things triggers. Using a variety of methods, including RSS feeds, CAP feeds and email, automatically trigger alerts when predetermined criteria are met.

4. InformaCast Fusion's open API and contact closure integrations to the physical

5. environment, leverage the IoT to trigger alerts from devices like AED cabinets,

6. eyewash stations and more.

D. Communications

1. InformaCast mass notifications can be sent as live and recorded audio to speakers and phones and text can be sent to a desktop computer, deskphone displays, and digital signage.

2. Mobile alerts from InformaCast can be delivered as SMS text, push notification, email and/or recorded audio.

3. Connected devices can trigger visual alerts like flashing strobe lights, digital displays and scrolling text.

4. Visitors self-enroll to receive notifications simply by texting a designated number.

E. Provide Integrated Public Alert and Warning

1. System to have InformaCast notifications broadcast to cell phones within a geographical area where directed by the owner.

F. Command Center

1. InformaCast Command Center to quickly send alerts for common scenarios.

2. Customize easy-to-identify buttons for different situations and provide relevant details about what's happening.

3. Send notifications that ask for a response to gain realtime insights into who is safe and who needs help.

4. Utilize dynamic replies to send relevant follow up messages based on someone's response.

5. Quickly gather key stakeholders in Microsoft Teams, Webex, Zoom or on a conference call to assess the situation and deploy assistance.

G. Compatible devices

1. InformaCast Fusion can connect to a wide array of devices to consolidate management into a single system and add value to existing technology investments by leveraging them for safety. Compatible devices include

a. AND, Atlas, Valcom IP Speakers

b. AND Panic Buttons

c. AND, Atlas, and Valcom Zoom Controls

d. Telecor E Series

H. Administration and Usability

1. Each InformaCast Fusion user can have multiple phone numbers, emails and devices associated with their profile.

2. Use Active Directory or other LDAP directories to keep your user information automatically synchronized.

3. Bulk upload of user information with the User Loader tool.

4. Self registration and self-service to receive the notifications that are most relevant to them, relieving the administrative burden.

5. Configure custom branding, including new primary colors, secondary colors, logos, and even custom help content.

I. Target Notifications

1. Create groups to send select messages to the right people.

2. Designate zones to deliver messages to a specific building, wing or floor without disrupting other areas.

J. Scalable Deployment

1. InformaCast Fusion is built for growth, whether your organization needs to reach 100 people or 100,000.

K. Security

1. Messages are encrypted in transit and at rest.

2. Domains and permissions mean only those with authority can trigger messages.

3. Independent third party testing is conducted on a regular basis to ensure InformaCast Fusion is built to withstand current security threats.

L. Reporting

1. View reports that show whether your notification was delivered successfully and who read it once it was received.

2. Analyze notification results to understand how long it took notifications to be sent to different devices and users.

3. Receive actionable insights to make adjustments for future incidents.

2.4 HEAD END

A. Alternate Bid 4A

1. The software version of InformaCast Advanced requires users to have virtual computing resources Provide the InformaCast Advanced Server Appliance to meet informacast minimum specifications

2. Computing Specifications:

a. Intel quad-core processor I7 or equal

b. Minimum 16 GB RAM

c. Minimum 512 GB SSD

d. Hardware Ports:

1) DisplayPort (preferred console monitor) or HDMI

2) Gigabit Ethernet LAN port (non-power over Ethernet)

3) USB 3.0 or USB-C port (keyboard access)

e. UL 60950 certified.

B. Alternate Bid 4B

1. Telecor Head End

a. Telecor ETBU-MI Ethernet Termination Unit -

b. Telecor EMH eSeries Master Clock & Message Host

c. Telecor E300-MA eConsole Model A

d. Telecor ECI-MA Control Interface Model A

e. Telecor EPORT-MC management Interface Model C

f. Telecor ESIP SIP Interfce

g. Telecor EAMP-MA

h. Telecor ESBM-TB

i. Telecor EDSKT-1.1

j. Telecor SI-125

k. Telecor SI-250

l. Telecor 2406

m. Telecor 2481-TBP

2.5 INTERCOM AND PUBLIC ADDRESS OPERATION

A. Each room shall be equipped with an IP display and speaker unit with enclosed microphone and indicator light.

B. All speakers shall broadcast announcements and other audio messaging individually, as zoned, or all together.

C. Common zone analog paging speakers with an amplifier shall connect to the network using a ZONE C2 zone controller, which can also receive a microphone signal via a single pair wire. This is permitted only where specifically shown on the docuemnts.

D. The system shall use Power-over-Ethernet (PoE) network switches to deliver at least twelve (12.9) watts RMS to each endpoint.

E. The system shall provide the capability of assigning IP device locations to any one or more of the software programmable zones for target paging and messaging.

F. Provide for the distribution of emergency announcements and for the distribution of manually activated visual and audio alerts to all locations with speakers from any authorized web interface.

G. Through programming, it shall be possible to exclude selected speakers from the reception of paging and messaging.

H. Provide capability of restricting the origination of emergency announcements, all page, zone page, and alarm messaging origination to specific assigned stations.

I. Provide a Priority Paging Microphone for use by administrative personnel. The microphone shall be a desk type with a locking Push-to-Talk bar. When the Push-to-Talk bar is pressed, the system shall automatically initiate an all-page from the microphone.

J. The system shall also provide the capability of initiating audio and visual alerts manually from a web interface.

2.6 PROGRAM DISTRIBUTION OPERATION

A. The system shall provide for the streaming of audio.

B. The system shall provide facilities to stream audio (i.e. music, radio broadcasts).

C. Selected AND IP devices shall be configured to receive a stream of audio at a specified common multicast IP address. One AND IP device shall be configured to broadcast the audio on its line in to the specified common multicast IP address.

D. The staff member shall approach the “remote program and microphone interface” (music input jacks connected to the line-in of an AND IP device) and plug in a program source such as a radio, tape or CD player, or mp3 player.

E. Audio played from the program source shall be broadcast to the selected AND IP devices per the configuration.

F. Power Resets

2.7 CLOCK AND BELL SCHEDULE SYSTEM FUNCTIONS / OPERATION

A. The server shall provide a bell/tone scheduler with the following minimum capabilities:

1. The system shall provide the capacity for storing 255 or more events.

2. The system shall provide a minimum of 4 bell schedules to allow flexibility due to seasonal changes or special events. One or more of the schedules may be active at any given time.

3. Classroom speakers may be assigned to any one or more zones. The system shall provide the ability to distribute class change signals to any or all of the zones. Time Zones shall be separate from paging zones. The system shall provide separate bell duration for each zone.

4. The system shall provide up to sixteen (16) programmable holidays with fully automatic holiday program execution. Bells can be silenced or special schedules can be implemented. Normal bells will resume after the holiday period.

5. The system shall provide Automatic Daylight Savings Time Change. The time will be updated automatically when the server detects daylight savings changes.

6. The system shall provide the ability to review, edit, and delete events and schedules. Editing may take place via a web browser on computer within the network with sufficient access privileges.

7. The system shall provide the ability to test all output zones.

8. The system shall provide a time base based on atomic time gathered from an NTP server or the third-party software server for assured accuracy.

2.8 PERIPHERAL EQUIPMENT

A. Alternate Bid 4 A

1. Intercom Call-in Switch

a. Advanced Network Devices AND-BTN-KIT-1 single call switch for IP LED display models. The pushbutton shall be the momentary contact type. Intercom calls or pages are placed by momentarily depressing the pushbutton. Call switches shall be installed in all locations designated on the plans.

1) The switches shall be mounted on a single-gang brushed stainless steel faceplate.

2) Each switch shall each be connected to the GPIO input of one Advanced Network Devices display/speaker device via 2-conductor 22-gauge cable.

2. Advanced Network Devices BTN-KIT-MIC-ND for IP speaker models with no displays or IP LCD display models (IPSWDHD-MW or IPCSHD-MB). The pushbutton shall be the momentary contact type. Intercom calls or pages are placed by momentarily depressing the pushbutton. Call switches shall be installed in all locations designated on the plans.

a. The switches shall be mounted on a single-gang brushed stainless steel faceplate.

b. Each switch shall each be connected to the module of one Advanced Network Devices speaker via RJ25 (6P6C) cable.

3. IP Devices

a. Classrooms and Offices: Provide combination display/speaker device

1) Standard Resolution Display

a) The speaker and baffle assembly shall be an Advanced Network Devices IP LED display device with speaker (IPSWD-RWB), furnished and installed as indicated on the plans.

b) The speaker on the IP device shall be an 8" (20.32 cm) permanent magnet dual-cone type having a ceramic magnet. It shall have a frequency range of at least 60 Hz to 17,000 Hz, a 10-watt RMS program power-handling capability, and an axial sensitivity of at least 95 dB at 1 meter with a 1-watt input. The voice coil shall have 8-ohm impedance.

c) The speaker shall accept power from any IEEE802.3af (PoE) or IEEE802.3at (PoE+) compliant network switch or injector.

d) The LED display device shall include a 56 x 16 multi-color LED display capable of displaying the current time and any messages sent from the server.

e) The baffle shall be constructed of 18-gauge (IPSWD-RWB) or 22-gauge (IPSWS) cold rolled steel, and have a semi-gloss white baked epoxy finish.

2) Music Classrooms shall be provided with an external strobe to indicate announcements. IPSTROBE-I

b. Hallways:

1) Standard Definition Display

a) The display/speaker and baffle assembly shall be an Advanced Network Devices IP LED display device with speaker (IPCDS-RWB-U), furnished and installed as indicated on the plans.

b) The display/speaker shall accept power from any IEEE802.3af (PoE) or IEEE802.3at (PoE+) compliant network switch.

c) The LED display shall include a 56 x 16 multi-color LED display capable of displaying the current time and any messages sent from the server on both sides of the device.

d) The display/speaker and baffle assembly shall include secure mounting that can mount either to the wall or to the ceiling.

e) The baffle shall be constructed of 18-gauge (IPCDS-RWB-U or IPCSHD-DS-MB) cold rolled steel, and have a stainless-steel finish (IPCSHD-RWB-U), or matte black baked epoxy finish (IPCSHD-DS-MB).

4. Gymnasium and Large Commons:

a. Standard Definition

1) The speaker and baffle assembly shall be an Advanced Network Devices Large IP Signboard display device with speaker (IPSIGNL-RWB) and/or IP speaker (IPSWS) or as approved, furnished and installed as indicated on the plans.

2) The speaker shall be an 8" (20.32 cm) permanent magnet dual-cone type having a ceramic magnet. It shall have a frequency range of at least 60 Hz to 17,000 Hz, a 10-watt RMS program power-handling capability, and an axial sensitivity of at least 95 dB at 1 meter with a 1-watt input. The voice coil shall have 8-ohm impedance.

3) The speaker shall accept power from any IEEE802.3af (PoE) or IEEE802.3at (PoE+) compliant network switch or injector.

4) The LED display shall include a 56 x 16 multi-color LED display capable of displaying the current time and any messages sent from the server.

5) The baffle shall be constructed of 18-gauge (IPSIGNL-RWB) or 22-gauge (IPSWS) cold rolled steel, and have a stainless-steel finish (IPSIGNL-RWB) or semi-gloss white baked epoxy finish (IPSWS).

b. Provide Strobe to indicate announcements IPStrobe-1

5. Enclosures

a. Flush Mount - Classroom, hallway and wherever possible

1) Where speakers are to be recessed in walls, enclosures shall be Advanced Network Devices IPS-FM1 (for IPSWD-RWB), or Advanced Network Devices IPS-FM2 (for IPSWS), or as approved. The enclosure shall be constructed of 22-gauge galvanized steel, zinc treated, and have a semi-gloss white baked epoxy finish. The IPS-FM2 enclosure shall have a dimension of 10.75” square and 3.75” deep. The IPS-FM1 enclosure shall be 11.5 x 14.5” and 3.75” deep.

b. Surface Mount – Not to be used unless specifically accepted by engineer.

1) Where speakers are to be surface mounted, enclosures shall be Advanced Network Devices IPS-SM1 (for IPSWD-RWB), or Advanced Network Devices IPS-SM2 (included with IPSWS-SM), or as approved. The enclosure shall be constructed of 22-gauge (IPS-SM1) or 16-gauge (IPS-SM2) galvanized steel, and have a semi-gloss white baked epoxy finish. The IPS-SM2 enclosure shall have a dimension of 11.75” square and 4” deep. The IPS-SM1 enclosure shall be 13.25 x 14.5” and 4.75” deep. Note: The LCD display device (IPSWDHD-MW) ships with the surface-mounted back box.

c. Contractor will need to coordinate with other divisions for locating speakers to avoid conflicts and for optimal sound coverage.

6. Ceiling Speakers

a. Ceiling mounted speakers shall be an Advanced Network Devices IPSCM or IPSCM-RMe or as approved. The IPSCM shall be a lay-in ceiling tile replacement speaker and enclosure with dimensions 2 x 2 ft square. The IPSCM-RMe shall be a single speaker with 10.5” round baffles constructed of 16-gauge steel, with a semi-gloss white baked epoxy finish.

b. The speaker shall be an 8" (20.32 cm) permanent magnet dual-cone type having a ceramic magnet. It shall have a frequency range of at least 60 Hz to 17,000 Hz, a 10-watt RMS program power-handling capability, and an axial sensitivity of at least 95 dB at 1 meter with a 1-watt input. The voice coil shall have 8-ohm impedance.

c. The speaker shall accept power from any IEEE802.3af (PoE) or IEEE802.3at (PoE+) compliant network switch or injector.

d. Drop ceiling device where shown (IPSCM-RM-CB and IPSCM-RM-BB backbox

7. Outdoor Speakers

a. Outdoor paging speakers shall be an Advanced Network Devices IPSWS-SM-O weather-resistant compressed horn speaker. The baffle and enclosure shall be constructed of 16-gauge galvanized steel, with a semi-gloss white baked epoxy finish. The enclosure shall have a dimension of 11.75” square and 4” deep.

b. The paging speaker shall be a double re-entrant horn, compression type loudspeaker. It shall have a frequency range of at least 600 Hz to 14,000 Hz, at least 10W RMS program power-handling capability, and an axial sensitivity of at least 104 dB at 1 meter with a 1-watt input, and 8-ohm impedance.

c. The speaker shall accept power from any IEEE802.3af (PoE) or IEEE802.3at (PoE+) compliant network switch or injector.

d. Wire Types: All wiring to telephones and speakers is 8 conductor, 24-gauge un-shielded CAT5 Ethernet cable or better.

8. Stand alone Displays

a. The display clock shall be a IPCSHD (Double Sided where indicated)-MB

b. The display shall accept power from any IEEE802.3at (PoE+) compliant network switch.

c. The LCD display device shall include an LCD display of at least 4" x 11.5" size capable of displaying full-color graphics and images, the current time, and any messages sent from the server on both sides of the device.

9. Where analog devices are allowed (only where specifically shown on the plans) provide a ZoneC2 zone controller and amplifier

B. Alternate Bid 4B

1. Clock/Speaker/Strobe: Telecor E2444-LD-MA with flush backbox

2. E365-TB-STB-MA with strobe: ELD-1 for gym and commons

3. eCS-1 Call Switch

4. Telecor eCS-5 Volume Control

5. Dual display corridor meassage boards

6. Telecor eSeries E2444-BBF Recessed Backbox for e2444

7. Teleocr es8 talk back speaker

8. Telecor eS8-R Speakers (No Talk Back Speaker)

9. Telecor H10 Ceiling Back Box

10. Telecor T7 Tile Bridge

11. Telecor eS8-SQ Speaker with Square Baffle

12. Telecor H20 Wall Back Box

13. Telecor eAMP Amplifier

14. Atlas 161-RES Recessed Speaker Enclosure

15. Atlas VP161-APF Vandal Proof Baffle

16. Telecor eS8-R Speakers W/O Baffle (No Talk Back Wall Speaker)

17. Atlas VP161-R8 Recessed Vandal Proof Speaker (Gym)

18. Atlas 193-8 Box

19. American Time STI9740 Clock Speaker Wire Guards (Gym)

20. Port module

21. Amp

2.9 EXTERIOR BELL

A. Exterior bell as directed by owner

B. Each bell shall be provided with a 24VAC Class II transformer. Associated conduit and four-square box will be provided by the electrical contractor.

2.10 ANALOG DEVICES

A. Analog devices shall be provided only where specifically indicated on the drawings and grouped in zones per the drawings. All devices are IP unless noted.

1. Alternate Bid 4A

a. AND: IPSMOD acts as an IP endpoint hub for a single analog speaker: Drives a traditional 8-ohm speaker

b. AND ZONEC2 acts as an IP endpoint hub for An amplifier with traditional analog speakers

c. And: ZONE-LO acts as an endpoint for an amplifier connected to existing traditional speakers.

d. Speaker Amplifer: Bogen, Atlast or approved equal

e. Ceiling Speakers: SD72 Speaker, 62-8 Baffle, CS95-8 Back Box, and 81-8R T-Bar Bridge Kit. Provide EZ95 backbox where required.

f. Wall Speakers: Atlas D161 series with 198-8 backbox

g. Exterior Wall speakers: Atlas #VP14MB with 198-8 backbox

2. Alternate Bid 4B

a. Telecor Eport Drives a traditional 8-ohm speaker

b. Teleocr Eamp

c. Speaker Amplifer: Teleocr or approved equal

d. Ceiling Speakers: S8, Back Box, and 81-8R T-Bar Bridge Kit. Provide EZ95 backbox where required.

e. Wall Speakers: S8 series with 198-8 backbox

f. Exterior Wall speakers: Atlas #VP with speaker

2.11 ETHERNET SWITCHES

A. Owner shall provide POE switches for all devices connected to system

B. Switches shall support but not be limited to the following features

1. Support POE for all devices

2. Managed

3. Larer 2 minimum connectivity

4. Remtoe configuration

5. Prioritization

C. Manufacturer: As directed by the owner

2.12 UNINTERRUPTABLE POWER SUPPLY

A. In 271500

2.13 CABLING

A. All IP data cabling provided under 271500

B. All other cabling as required by the manufacturer.

PART 3 EXECUTION

3.1 INSTALLATION

A. Install system in accordance with manufacturer's instructions.

B. Boxes, equipment, speakers, clocks, etc shall be installed plumb and square.

C. Do not support speaker enclosures with lay in tiles or gypsum wall board. Provide adequate support for back-boxes so that no perceptible sag will occur once speaker and grille are mounted.

D. All installation shall be done in a neat and professional manner.

E. Configure software to meet specified functionality and provide a fully functional and operational system.

F. System shall be rack mounted in the MDF and IDF

G. Clock headend equipment shall be installed in MDF

3.2 CABLING

A. Cabling to support the System shall be as required by the manufacturer.

B. IP/POE cabling provided in 271500

3.3 START-UP

A. Review test reports prior to starting speaker and clock installation

B. Review all station numbers with the owner prior to final programming

C. Install software with IP interface complete. Confirm functionality with the owner

D. Program and synchronize all clocks complete. Connect master clock to master system

E. Connect owner's phone system

F. Coordinate with Security/Access Control contractor to receive signal and broadcast multiple lockdown messages throughout the school

G. Cycle through Daylight Savings Time and verify correct time change on all clocks. Document results and include in as-built documentation.

3.4 SYSTEM PROGRAMMING

A. Programming: Fully brief Owner on available programming options. Record Owner's decisions and set up initial system program. Prepare a written record of decisions, implementation methodology, and final results.

3.5 FIELD QUALITY CONTROL

A. Perform tests and inspections with the assistance of a factory-authorized service representative:

B. Tests and Inspections:

1. Schedule tests with at least seven days' advance notice of test performance.

2. After installing educational intercommunications and program systems and after electrical circuitry has been energized, test for compliance with requirements.

3. Operational Test: Test originating station-to-station, all-call, and page messages at each station. Verify proper routing and volume levels and that system is free of noise and distortion. Test each available message path from each station on system.

4. Signal-to-Noise Ratio Test: Measure signal-to-noise ratio of complete system at normal gain settings as follows:

a. Disconnect speaker microphone and replace it in the circuit with a signal generator using a 1000-Hz signal. Measure signal-to-noise ratio at speakers.

b. Repeat test for three speaker microphones.

c. Minimum acceptable ratio is 45 dB.

5. Distortion Test: Measure distortion at normal gain settings and rated power. Feed signals at frequencies of 150, 200, 400, 1000, and 2500 Hz into each speaker. For each frequency, measure distortion in the paging and all-call amplifier outputs. Maximum acceptable distortion at any frequency is 5 percent total harmonics.

6. Signal Ground Test: Measure and report ground resistance at system signal ground.

C. Inspection: Verify that units and controls are properly labeled and interconnecting wires and terminals are identified. Prepare a list of final tap settings of paging and independent room speaker-line matching transformers.

3.6 TRAINING

A. A minimum of (2) 6 hour sessions shall be included for instruction of the personnel designated by the Owner as to the correct operation of the system. One additional four hour follow-up session will provide 6 months after system acceptance.

B. Provide system training to Owner which addresses all phases of operation including:

C. Remote access methodology

D. Build standard daily schedule for purposes of test and verification of operation.

END OF SECTION

SECTION 28 13 00 – ACCESS CONTROL SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Verkada cloud-based access control solution including cloud-based management platform using Verkada Command and the Verkada Pass App
2. AC41 4-Door Controller
3. AC42 4-Door Controller
4. AX11 IO Controller with Video Analytics Event Bridge
5. integration with Allegion Schlage AD Series (AD300, AD400, PIM400) and the Engage series (NDEB, LE, LEB) wireless locks
6. AD31 Multi-Format Card Reader
7. AD32 Multi-Format Card Reader
8. Verkada Badge Printing Software
9. ACC-Prox-1 Proximity Cards
10. Verkada Access Control accessories

B. Related Sections

1. 28 15 23 – Intercom Entry Systems
2. 28 17 11 – Visitor Management Systems
3. 28 20 00 – Video Surveillance
4. 28 30 00 – Environmental Sensor
5. 28 31 00 – Intrusion Detection

1.2 REFERENCES

A. Published specifications, standards, tests, Codes, or recommended standards of trade, industry, or governmental organizations apply to work in these Sections, including:

1. ADA – Americans with Disabilities Act
2. ANSI – American National Standards Institute
3. ASCII – American Standard Code for Information Interchange
4. ASTM – American Society for Testing and Materials
5. IBC – International Building Code
6. IEEE – Institute of Electrical and Electronics Engineers

7. ISO/IEC – International Organization for Standardization / International Electrotechnical Commission

8. NEC – National Electrical Code

9. NEMA – National Electrical Manufacturers' Association

10. NFPA – National Fire Protection Association

11. TIA/EIA – Telecommunications Industry Association / Electronic Industries Alliance

12. UL – Underwriters Laboratories, Inc.

1.3 DEFINITIONS

A. Abbreviations:

1. ACS – Access Control System

2. API – Application Programming Interface

3. DHCP – Dynamic Host Configuration Protocol

4. DPDT – Double pole, double throw

5. IP – Internet Protocol

6. LAN – Local Area Network

7. NFC – Near Field Communications

8. NVR – Network Video Recorder

9. ODBC – Open Database Connectivity

10. RAM – Random Access Memory

11. SPDT – Single pole, double throw

12. SSL – Secure Sockets Layer

13. SSO – Single sign-on

14. TCP – Transport Control Protocol

15. UPS – Uninterruptible Power Supply

16. VMS – Video Management System

17. Definitions:

18. ABA Track: Magnetic stripe that is encoded on track 2, at 75-bpi density in binary-coded decimal format.

19. Proximity Readers and Credentials: Readers and cards employing 125 KHz communication to validate when the card is presented within the proximity of the card reader.

20. Smart Card Readers and Contactless credentials: Readers and cards employing 13.56 MHz encrypted communication to validate when the card is presented within the proximity of the card reader.

21. Credential: Data assigned to an entity and used to identify that entity.

22. Trigger: Enables an action or a series of actions that are sent across any or all controllers, readers, contacts, or relays throughout the system. Triggers can be used to send commands to change the state of a door, multiple doors, contact states, relay states, shunt points, lockdowns or to activate predetermined overrides.

23. Pass-Through: The ability assigned to a person's credential that allows them to access a door even if in lockdown state.

24. Lockdown: An input or a credential that allows the system to be placed into a lockdown state.

25. Wiegand: Patented magnetic principle that originally used specially treated wires embedded in the credential card. Today Wiegand has become the communication standard for most reader heads.

1.4 SYSTEM DESCRIPTION

A. Cloud-based electronic access control platform, controllers, access control credential readers, and bridging hardware necessary to provide integrated access control for entry points.

B. Bridging to Fire Life Safety systems, video surveillance, and alarms.

C. Verkada Command: Access Control Cloud-Based Management Software

1. User Management and Permissions

a. Import Users via CSV or add users manually

a. Manage Users and Groups automatically with 3rd party IDPs via SCIM including (but not limited to) Okta, Azure AD, CyberArk

b. Control door access via user groups and Access Levels

c. Assign multi-format Credentials including cards, pins, and mobile Bluetooth access

d. Support bulk upload of User Photos for use in system display and card management

2. Door and Peripheral Management

a. Catalog events including live and historical footage

b. Filter by events such as unlocks, door opens, and access granted or denied

c. Create custom lock / access control / unlock / card + pin code schedules

d. Programmable inputs and outputs

e. Support for elevators security via configurable outputs

3. Video Integration

a. Associate existing Verkada cameras with doors

b. Add multiple cameras to see events from multiple angles

c. Video events associated with any individual

4. Site Management

a. Manage admins on a site-by-site basis. Allow certain Users the ability manage one site and not another.

b. Support for different Admin roles within the management platform

5. Alerting and Events

a. Configure real-time alerts via SMS or Email

b. Configurable alerts based on Door Held Open / Door Forced Open, Access Granted, Door Opens, Lockdowns, Offline, or Aux Trigger

c. Alerts can be configured to only dispatch on a configurable schedule

6. Lockdown Capabilities

a. Trigger a Lockdown via a wired button, wireless button, mobile app, or web

b. System supports configurable User Groups to trigger Lockdowns

c. System supports configurable User Groups for Access during Lockdowns

d. System supports configurable User Groups for resolving / disabling Lockdowns

7. Reporting

a. Standard reporting and export of data

b. System support Roll Call / Mustering Reporting

D. Verkada Pass App Touchless Entry via BLE

1. Verkada Pass App for either iOS or Android facilitates access control events through either tapping from inside the app or through Touchless Access via Bluetooth.

1.5 SUBMITTALS

A. Provide the following submittals for review and approval:

1. Product Data and Shop Drawings

2. System Programming

3. Operation and Maintenance Manuals (O&M's)

4. "As-Built" Record Drawings

B. Submit Product Data and Shop Drawings submittals for review and approval prior to commencement of work:

1. Manufacturer's name, brand name, exact part number, options, accessories, and catalog cutsheet references for all equipment supplied including cabling. Include manufacturer's published installation instructions. Indicate UL listings for system components.

2. Complete wiring diagrams for all components, including cable types and quantities, routings, floor plans indicating device locations, conduit sizes, and point-to-point termination and riser diagrams.

3. Device legend on the shop drawings that identifies the symbols used for all devices including mounting heights, back box requirements, part and model numbers, operating voltages (if applicable), wire and cabling requirements, label text, and panel termination points.

4. Fully dimensioned shop drawings including floorplans, enlarged plans, elevations, and installation details of all security devices, equipment rooms and closets, consoles, controllers, racks, enclosures, and fabricated equipment, showing locations of all major components including mounting details. Indicate UL system and rating listings for penetration firestop systems through rated partitions and floors.

5. Bill of Materials.

6. Material Safety Data Sheets (MSDS) for fire stopping materials and sealants.

C. Submit System Programming submittals for review and approval prior to commencement of work:

1. Proposed programming, including nomenclature conventions, device names and text descriptions, timings, camera call-up trigger alarms with associated cameras, and sequence of operations.

2. Approved device names and text descriptions as programmed into the security systems shall be reflected on the “As-Built” Record Drawings as well as on device and cable labels.

D. Submit Operation and Maintenance Manuals (O&M’s) submittals for review and approval prior to the completion of the project:

1. Updated product data and shop drawings submittals reflecting the final conditions.

2. Warranty letter with start and end date.

3. Warranty service and maintenance contact information: including names, address, phone number, and website address. Provide specific instructions or forms as required to initiate a trouble ticket or work order request.

4. Letter indicating that all software and licensing is the sole property of the Owner.

5. Troubleshooting checklist information.

6. Replacement parts and consumables ordering information including the contact information for local sources.

7. Provide an updated System Programming submittal including:

a. Final listing of doors, locations, and normal status in CSV format.

b. System administration and management operating instructions.

c. Setting up Users, User Groups, Access Levels, Doors, Door Schedules, and Exceptions

d. Assigning Access Groups to all Users.

e. Monitoring system activity.

f. Running standard reports.

g. Setting up logins and permissions.

E. Submit “As-Built” Record Drawings submittals for review and approval prior to the completion of the project:

1. Maintain a complete set of “As-Built” Record Drawings at the project site updated with mark-ups of the actual installation conditions.

2. Prior to the completion of the project transfer all installation conditions mark-ups to electronic drawings and submit to the Owner in CAD and PDF formats.

1.6 QUALITY ASSURANCE

A. Equipment shall be tested and found to comply with the limits for a Class A or B digital device, pursuant to part 15 of the FCC rules.

B. Security technology devices shall be mounted using compatible Verkada accessories.

C. Security technology devices shall be of the latest technology. No discontinued models or products are acceptable.

D. Installation technicians shall successfully complete the Verkada Certified Engineer (VCE) program prior to starting work. For more information, visit www.verkada.com/partners/trainings.

E. Contractor qualifications:

1. Minimum of two years of system design, engineering supervision, and installation experience in the access control industry.

2. Maintain a local office, with a service center staffed by trained technicians and must be adequately equipped to provide emergency phone service within 24 hours on a 24-hour, 365 days per year basis, whether or not the Owner purchases a maintenance contract with the Contractor.

3. Maintain an inventory of spare parts and other items critical to system operation, as necessary to meet the emergency service requirements.

4. Maintain an in-house engineering and project management capability consistent with the requirements of this project.

5. Provide a project manager who is actively engaged in the project. This person shall be the same individual throughout the course of the project and shall be the person responsible for the scheduling of the system programming, preparation of the submittals and project close-out documentation, training programs, system testing and report documentation, and the coordination of all subcontract labor. The Owner reserves the right to approve the Contractor’s project manager.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Ship equipment in original packaging to prevent damage. All handling shall be in accordance with manufacturer recommendations. Inspect all products and materials for any damage immediately upon delivery to the project site.

B. Provide protective covering during construction.

C. Replace equipment and products damaged during shipping, handling, distribution, storage, installation, or construction with new equipment and products.

D. Equipment and products stored at the project site or at an off-site location shall be protected from dust, dirt, and foreign matter. Protect equipment and products from water, damage, dents, bumps, and scratches.

1.8 SCHEDULING

A. Submit proposed construction schedule detailing the task milestones, durations, and sequences for the project for review and approval prior to commencement of work.

B. When work is performed in a sensitive area or in an area occupied with ongoing business activities coordinate with the Owner and the affected department's representative to determine the best time to perform the work required.

1.9 WARRANTY

A. Provide one-year parts and labor project warranty. Parts and labor shall be guaranteed against defects in materials and workmanship for one year from written notification of acceptance.

B. All Verkada hardware purchases are backed by a 10-year limited warranty. For more information, visit www.verkada.com/support/end-user-agreement.

PART 2 - PRODUCTS

2.1 MANUFACTURER

A. Manufacturer shall be Verkada Inc.

1. Headquarters: 405 E 4th Ave. San Mateo, CA 94401

2. Toll Free: (888) 829-0668

3. General: team@verkada.com

4. Sales: sales@verkada.com

5. Website: www.verkada.com

B. Non-Verkada Inc. products shall be limited to those identified as compatible within the product descriptions below.

2.2 LICENSING

A. Provide all required licenses for the specified system components.

B. All system component licenses shall be 5-year licenses.

2.3 DOOR CONTROLLERS

A. AC41 4-Door Controller by Verkada Inc.

1. Description: access control hardware controller provides power and control for up to 4 sets of access control hardware. Provides fire alarm interface and auxiliary signal integration into the access control system.

2. Technical Specifications

a. Power Consumption (at 10-14V):

1) No Readers: 1000mA

2) 4 Wiegand Readers: 2200mA

b. Power Supply: 160W PSU (capped at 100W for safety)

c. Relays:

1) Dry (External Power Supply): 6 Relays – 4 Door, 2 AUX at 500mA / 30VDC

2) Wet (Powered by AC41): 12V - 700mA per relay max, 24V - 350mA per relay max

d. Inputs: Nominal 5VDC: 1Kohm to each input (resistors built-in)

e. Contact Sensors: 4 Contact Sensors: Nominal 5VDC, 1Kohm to each input (resistors built-in)

f. Dimensions:

1) With Mount:

a) Length: 415.6mm / 16.36in

b) Width: 319.6mm / 12.58in

c) Height: 111.74mm / 4.4in

2) Without Mount:

a) Length: 415.6mm / 16.36in

b) Width: 319.6mm / 12.58in

c) Height: 105.74mm / 4.16in

g. Weight: 8.5kg / 18.74lb

h. Operating Temperature: 0°C to 50°C / 32°F to 122°F

i. Operating Humidity: 5% to 90%

j. Compliance:

1) FCC, CE

2) UL 294

3) UL 62368-1/CSA C22.2

4) CAN/ULC-60839-11-1:2016

5) NDAA

k. Connectivity:

1) Ethernet: 100/1000Mbps RJ-45 cable connector for network connection

2) USB: USB 2.0

l. Included Accessories:

1) Setup guide

2) Screw pack

m. Mounting Hardware: Dry wall anchors (M8) and screws (M5)

n. Network Settings:

1) An Ethernet connection with DHCP must be used to connect the AC41 to the Local Area Network (LAN).

2) Firewall settings: TCP port 443, UDP port 123 (NTP time synchronization)

B. AC42 4-Door Controller by Verkada Inc.

1. Description: access control hardware controller provides power and control for up to 4 sets of access control hardware. Provides fire alarm interface and auxiliary signal integration into the access control system.

2. Technical Specifications

a. Power Consumption: 60W maximum

b. AC Power Input:

1) 100 to 240VAC

2) 50 / 60Hz

3) 1.5A maximum

c. AUX Power: 1x 12V @ 250mA

d. Inputs:

1) 2x REX dry inputs per door

2) 1x DPI dry input per door

3) 2x auxiliary dry inputs

e. Readers:

1) 1x reader port (Verkada/RS-485 or Wigand) per door

2) Reader current consumption must be less than 250mA per reader.

3) Maximum of 4 readers powered simultaneously.

f. Dry Relays:

1) Dry relay max pass-through power: 24VDC @ 2A (resistive load)

2) 2x auxiliary dry relays

g. Wet Relays:

1) Wet relay switch-selectable power:

a) 12V operation: 700mA maximum

b) 24V operation: 350mA maximum

h. Contact Sensors:

1) 4x contact sensors

2) Nominal 5VDC

3) 1Kohm to each input (resistors built-in)

i. Dimensions:

1) With Mount:

a) Depth: 116.25mm / 4.6in

b) Width: 321mm / 12.6in

c) Height: 417mm / 16.4in

j. Weight: 6.35kg / 13.9lb

k. Operating Temperature: 0°C to 50°C / 32°F to 122°F

l. Operating Humidity: 5% to 90%

m. Compliance:

1) FCC, CE

2) UL 294

3) UL 62368-1/CSA C22.2

4) CAN/ULC-60839-11-1:2016

5) NDAA

n. Connectivity:

1) Ethernet: 100/1000Mbps RJ-45 cable connector for network connection

2) USB: USB 2.0

o. Included Accessories:

1) Lock key

2) Flat head screwdriver

p. Mounting Hardware: Mounting plate and 4 wood screws

q. Network Settings:

1) An Ethernet connection with DHCP must be used to connect the AC41 to the Local Area Network (LAN).

2) Firewall settings: TCP port 443, UDP port 123 (NTP time synchronization)

C. AC62 16-Door Controller by Verkada Inc.

1. Description: access control hardware controller provides power and control for up to 16 sets of access control hardware. Provides fire alarm interface and auxiliary signal integration into the access control system.

2. Technical Specifications

   a. Power Consumption: 350W maximum

   b. AC Power Input: 110-240VAC, 50-60Hz

   c. Inputs:

      1) 2x REX dry inputs per door

      2) 1x DPI dry input per door

      3) 2x auxiliary dry inputs

   d. Readers:

      1) 1x reader port (Verkada/RS-485 or Wiegand) per door

      2) 2x auxiliary reader ports (Verkada/RS-485)

      3) Reader current consumption must be < 250mA per reader

      4) Maximum of 16 readers can be powered simultaneously

   e. Relay Outputs:

      1) 1x wet or dry relay per door

      2) Wet relay switch-selectable power:

         a) 12V operation: 1A max

         b) 24V operation: 0.5A max

      3) 2x auxiliary dry relays

      4) Dry relay max pass-through power: 24VDC @ 2A (resistive load)

   f. AUX Power:

      1) 2x 12V @ 1A output

      2) 2x 24V @ 0.5A output

   g. Dimensions:

      1) Length: 773mm / 30in

      2) Width: 499mm / 20in

      3) Height: 186mm / 7in

   h. Weight: 20kg / 44lb

   i. Operating Temperature: 0°C to 50°C / 32°F to 122°F

   j. Operating Humidity: 5% to 90%

k. Compliance:

1) FCC Part 15 Class B

2) ICES-3 Class B

3) CE

4) UKCA

5) RCM

6) VCCI

7) UL 294

8) CAN/ULC 60839-11-1

9) UL 62368-1

10) CSA C22.2 No. 62368-1

11) IEC 62368-1

12) NDAA

l. Connectivity:

1) Ethernet: 100/1000Mbps RJ-45 for network connection

2) USB: USB 2.0

m. Included Accessories:

1) Lock key

2) Flat head screwdriver

n. Mounting Hardware: Mounting plate and 6 screws (#12x1")

2.4 IO CONTROLLERS

A. AX11 IO Controller by Verkada Inc.

1. Description:

a. Input/output controller which bridges up to 16 non-Verkada endpoint devices to a Verkada Command system.

b. Provides 16 AUX inputs and outputs.

c. Event Bridge: Bring door events with video analytics into Command while continuing to use existing 3rd-party access control or alarm system.

d. Support for both Verkada (over RS-485) and 3rd party card readers (over Wiegand).

e. 2x 12 Volt 4.5 Ah Sealed Lead Acid Rechargeable batteries for battery backup.

2. Technical Specifications

a. Power Consumption: 60W Max

b. Power Supply: 110-240VAC, 50-60Hz

c. Inputs: 16 Dry Inputs, Nominal 5VDC

d. Relay Outputs:

1) 16 Dry Relays

2) 1A/24VDC Contacts

e. Aux Power:

1) 16 inputs

2) 16 outputs

3) 2 External Outputs

4) 1A/12V Power Each

5) 2A Combined Max

f. Dimensions:

1) With Mount:

a) Length: 415.6mm / 16.36in

b) Width: 319.6mm / 12.58in

c) Height: 111.74mm / 4.4in

2) Without Mount:

a) Length: 415.6mm / 16.36in

b) Width: 319.6mm / 12.58in

c) Height: 105.74mm / 4.16in

g. Weight: 8.3kg / 18.3lbs

h. Operating Temperature: 0°C to 50°C / 32°F to 122°F

i. Operating Humidity: 5% to 90%

j. Compliance:

1) FCC

2) CE

3) UL 294

4) UL 62368-1/CSA C22.2

5) CAN/ULC-60839-11-1:2016

6) NDAA

k. Connectivity:

1) Ethernet: 100/1000Mbps RJ-45 cable connector for network connection

2) USB: USB 2.0

l. Included Accessories:

1) Setup guide

2) screw pack

m. Mounting Hardware: Dry wall anchors (M8) and screws (M5)

n. Network Settings:

1) An Ethernet connection with DHCP must be used to connect the AX11 to the Local Area Network (LAN).

2) Firewall settings: TCP port 443, UDP port 123 (NTP time synchronization)

2.5 INTEGRATED CARD READER DOOR LOCKS

A. Compatible electromagnetic lock integration:

1. Connect doors secured by locks to the same Access Control Unit.

2. Configure doors from Verkada Command web interface.

3. Manage all doors and ACUs in Schlage mode Verkada Command cloud-based platform.

B. Compatible Electromagnetic Locks:

1. Allegion:

a. Schlage AD Series (AD300, AD400, PIM400)

1) Refer to Allegion Schlage documentation for hardware installation.

2) The Schlage AD series of locks come in two major variants, the AD400 wireless lockset and the AD300 wired lockset. The AD400 wireless lock connects to the Verkada AC41 through a wireless bridge called the PIM 400-485. The AD300 wired locks connect directly to the AC41. Both solutions communicate with the AC41 over RS485 via the aux RS485 port on the AC41 (the last cassette).

3) The Schlage AD series of locks has the AD400 wireless lockset and the AD300 wired lock set. They act the same to the end user. The only difference is the AD300 wires directly to the AC41 via RS485 and the AD400 connects to the AC41 through a wireless bridge called the PIM-400-485. The configuration process in Command is identical with the exception of selecting Wireless (AD400) or Wired (AD300) in Command when adding the locks.

4) The Schlage AD400 wireless lockset is configured using the Schlage Utility Software (SUS) which is a free Android app (there is no iOS app).

b. Engage series (NDEB, LE, LEB)

C. Refer to Allegion Schlage documentation for hardware installation.

1. This integration supports the NDEB, LE, and LEB series. The main distinction is that the LE and LEB locks are mortise locks.

2. NDE locks are not supported - they are outdated and use old SSL standards.

3. This integration is an offline integration. That means that all door events, user updates, schedule updates etc. will be published in command every 24 hours, unless forced to sync through the Allegion mobile app.

4. This means that the engage series integration does not support remote unlock or lockdowns.

5. Real time updates are available for tamper events and door forced open events.

2.6 MULTI-FORMAT CARD READERS

A. AD33 by Verkada Inc.

1. Description:

a. Access control credential readers to read data from presented access control credentials of multiple formats, communicate with Verkada Command access control database, and validate access to associated hardware.

b. Two-way communication with an integrated LED to display door status for entry and events.

c. Accessed and managed from Verkada Command.

2. Technical Specifications:

a. Dimensions:

1) Mullion:

a) Length: 95mm / 3.74in

b) Width: 45mm / 1.77in

c) Height: 21mm / 0.83in

2) Single Gang:

a) Length: 120mm / 4.72in

b) Width: 80mm / 3.15in

c) Height: 21mm / 0.83in

b. Low Frequency Credential Formats:

1) HID Prox II 26-Bit (H10301)

2) 37-Bit Wiegand HID H10304

3) 37-Bit Wiegand HID H10302

4) HID 35-Bit Corporate 1000

c. High Frequency Credential Formats:

1) MiFare / DESFire (CSN)

2) NFC

d. Ratings:

1) IP65

2) IK08

e. Compliance:

1) FCC

2) CE

3) UL 294

4) UL 62368-1/CSA C22.2

5) CAN/ULC-60839-11-1:2016

6) NDAA

7) TELEC

f. Operating Temperature: -40° to 65°C / -40° to 149°F

g. Controller Compatibility: Requires Verkada AC41 Access Control Unit

h. Mounting Hardware:

1) Single gang mounting plate

2) Mullion mounting plate

i. Power Consumption: 12V, 300mA max

j. Wiring (Wire Color | Abbreviation | Name):

Black	GND	Ground
White	A	RS485-A
Green	B	RS485-B
Red	+12V	+12V IN

2.7 BADGE PRINTING SOFTWARE

A. Verkada Badge Printing Software by Verkada Inc.

1. Description:

a. Verkada's badge printing software is a modern, simplified way to design and print employee and student badges. With badge printing, Verkada Access Control customers can now easily design, print and administer credentials across both physical badges and the Verkada Pass App, directly through Verkada Command.

2. Key Features:

3. Simplified Badge Printing: By embedding badge printing software within Verkada's user interface, customers can now manage the entire workflow with Verkada Command, saving time and software costs. Customers can design and print badges that leverage existing

user profiles, active directory integrations, and of course, access control configurations — all from Verkada Command.

4. Printer Agnostic: Verkada's badge printing solution is also printer agnostic and is compatible with most popular badge printers. Customers simply need to ensure that the badge printer driver is correctly installed on their computer and that their browser is able to recognize it. For customers without an existing badge printer, we have a recommended list of printers available on the Verkada Docs Page of our website.

5. Automated Profiles with SCIM: Verkada's badge printing software extends the capabilities of Verkada Access Control and Automated user creation through Verkada's SCIM integration and bulk user import functionality. Verkada Access Control customers can automatically synchronize their user profiles from single sign-on service providers like Okta and Azure Active Directory to more easily manage and manage user credentials.

6. Verkada Prox and NFC Cards: Verkada badge printing can print to any standard badge type supported on Verkada Access control — a full list is available on the Verkada website.

2.8 ACCESS CONTROL BADGES

A. ACC-PROX-1 Proximity Cards by Verkada Inc.

1. Description: Standard 26-Bit Prox Format access control credential in a card format with embedded T5577 chip.

2. Technical Specifications:

a. Name and Model Number: ACC-PROX-1

b. Base Part Number – PN: 2A-68001-A

c. Descriptor: Proximity Cards

d. Chip: T5577

e. Format: Standard 26-Bit prox

f. Compatibility: Standard FSK Prox

g. Dimensions:

1) Length: 86mm / 3.39in

2) Width: 54mm / 2.13in

3) Height: 1.9mm / 0.07in

h. Weight: 6.8g / 0.24oz

3. Provide (100) proximity cards.

B. ACC-EV3-1 Encrypted Cards by Verkada Inc.

1. Description: High frequency smart access control credential in a card format with embedded MIFARE DESFire EV3 chip.

2. Technical Specifications:

a. Name and Model Number: ACC-EV3-1

b. Base Part Number – PN: 2A-78001-A

c. Descriptor: High Frequency Smartcard

d. Chip: MIFARE DESFire EV3

e. Encryption: AES 128 bit

f. Compatibility: Standard MIFARE DESFire EV3

g. Dimensions:

1) Length: 85.9mm / 3.4in

2) Width: 54.2mm / 2.1in

3) Height: 1.9mm / 0.075in

h. Weight: 5.1g / 0.18oz

PART 3 - EXECUTION

3.1 INSTALLERS

A. Installation shall be performed by technicians that have successfully completed the Verkada Certified Engineer (VCE) program. For more information, visit http://www.verkada.com/partners/trainings.

3.2 EXAMINATION

A. Installation surfaces shall be clean and free from dust, dirt, and obstructions.

B. Examine pathway elements intended for cables. Check raceways, cable trays, and other elements for compliance with space allocations, installation tolerances, hazards to cable installation, and other conditions affecting installation.

C. Examine rough-in for LAN and control cable conduit systems to server, PCs, controllers, card readers, and other cable-connected devices to verify actual locations of conduit and back boxes before device installation.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.3 PREPARATION

A. Refer to the Verkada Quick Start Guide applicable to each product.

B. Pre-Installation Conference: Prior to installation arrange conference between supplier, Owner, and related trades to review materials, procedures, and coordinating related work.

C. Furnish or coordinate any inserts required for building into concrete, masonry, and other work, to support and attach work of this Section. Furnish or coordinate in ample time to comply with schedule of work into which inserts are built.

D. Verify that power and outlets are in correct locations.

E. Verify that building structure is properly prepared for mounting, attachment, and support of equipment.

F. Prior to installation of systems components and devices, verify all required preparations have been properly performed and that substrates are acceptable for installation.

1. Verify all rough-ins and field dimensions.

G. Report in writing to the Owner's representative any prevailing conditions that will adversely affect satisfactory execution of work in this Section.

1. Owner or their representative reserves the right to review proposed methods of construction and installation, reject proposed methods, and have the installation done in a satisfactory method at the Contractor's cost.

3.4 INSTALLATION

A. Refer to the Verkada Quick Start Guide applicable to each product.

B. For support, proceed to www.verkada.com/support.

C. Sequencing: The work shall be performed in the following sequence, unless directed otherwise by Owner or their representative:

1. Installation of cables, controllers, and power supplies.

2. Installation of new field devices and new readers.

3. Installation of front-end equipment.

4. Commissioning of the new system components.

5. End User training

D. Install work in accordance with manufacturer's recommendations and instructions as well as final shop drawings. All controllers and power supplies should be installed so as to allow easy access for service in the future.

E. Anchor components securely in place, plumb, level, and accurately aligned.

F. For card readers located in equipment traffic areas, and that are exposed to damage due to collision or impact from forklifts, or manually moved carts, carriers, or other equipment used by the Owner, provide protective bollards, railings, coverings etc. to ensure that all card readers installed are properly protected from such damage.

G. Provide fastenings, plates, and other incidental items required for complete and operational installation.

H. Provide required electrical work in accordance with Code requirements.

I. Security and protection:

1. Maintain strict security during the installation of equipment and software. Rooms housing the control station, and workstations that have been powered up shall be locked and secured during periods when a qualified operator in the employ of Contractor is not present.

2. Equipment protection: Provide protective covers, fenders, and barriers as necessary to maintain work of this Section in same condition as installed until time of substantial completion.

J. Cable requirements:

1. Twisted, shielded, plenum-rated type cable shall be used.

2. All exposed cables shall be in rigid conduit, electrical metallic tubing (EMT) raceway, or wire mold as approved by the Owner.

3. All concealed cables routed in j-hook pathways shall be fastened to the structure at least every four feet.

3.5 LABELING

A. Equipment and product labels shall be printed on self-adhesive labels. Hand written labels or writing directly on the equipment enclosures is not acceptable.

B. Label equipment and products with the device address as programmed into the security systems and as reflected on the “As-Built” Record Drawings.

C. Label networked equipment enclosures with the IP address.

D. Cables shall be individually labeled at origin and termination.

3.6 PROGRAMMING

A. Add all Verkada Access Controllers and Cameras to Owner’s Verkada Command via serial number.

B. Coordinate with the Owner to verify appropriate network connections for new components.

C. Coordinate with the Owner to verify proper programming for new components into the system.

D. Change default passwords to new, custom, secure passwords in compliance with any Owner password standards for endpoint devices.

E. Complete all Verkada Command configuration programming, including but not limited to:

1. Integrations with owner software systems, such as Microsoft Single Sign-On, Active Directory, or others. Coordinate with Owner for which compatible platforms.

2. Verkada Command user information, including:

   a. User groups

   b. Username format

   c. Number of users

   d. User accounts

3. Access system configuration, including:

   a. Normal operating schedule

   b. Holiday schedule

   c. Access groups

   d. Special system configurations, such as Lockdown or Evacuation

   e. Integrations with life safety systems, such as access control overrides from fire evacuation alarm events.

3.7 ACCEPTANCE TESTING

A. Final Test and Acceptance Plan

1. Develop a final test and acceptance plan to identify each new system component, intent of test, test method, and expected results.

2. Each component listed in the plan shall include space for test part signatures, brief comments, time of test and pass/fail check boxes.

3. Test all equipment, products, and devices in accordance with the plan to ensure completely operational and fully functional security systems. Submit a written final test and acceptance report for review and approval.

4. The report shall be submitted to the Owner's representative at least 30 days prior to the scheduled system acceptance test.

5. System acceptance of the access control system shall be conditioned upon successful completion and operational demonstration of all system functions and components as documented in the final test and acceptance report.

B. System Acceptance

1. System acceptance shall not occur until after the following activities have been successfully completed:

2. Correction of all deficiencies and punch list items noted on the final test and acceptance report.

3. Acceptance of final test and acceptance report.

4. Acceptance of all project close-out submittals.

5. Delivery of final project close-out documentation.

6. Successful training and demonstration, including operation of systems, systems administration, and system management.

7. Purging of Contractor user privileges and return of all credentials.

3.8 OWNER PERSONNEL TRAINING

A. On-site operator training:

1. Instruct operating staff in proper operation, including hands-on training.

2. Minimum of two, four-hour sessions covering the operations for each system installed.

3. Training sessions shall be provided to supervisors, end-user staff, security staff, maintenance personnel, IT personnel, and any other personnel designated by the Owner.

4. Provide training sessions on all work shifts, including day, evening, and night shifts.

B. On-site administrator training:

1. Instruct security system administrators for each system installed, including hands-on training.

2. Minimum of two, four-hour sessions covering the operations for each system installed.

3. Training shall cover all administrative and management functions, including features and controls, for each system.

C. Documentation:

1. Provide owner with system component installation, configuration, and programming documentation, including but not limited to:

a. Components:

1) model name

2) model number

3) manufacturer

4) serial number

5) installation location

6) installation network port name

7) installation network port location

8) network address(es)

b. Network port configurations

c. Verkada Command users:

1) Usernames

2) Passwords

3) User groups

4) User group permissions

d. Access control system configurations:

1) Schedules

2) Holidays

3) Event logic

4) Alarm logic

e. Access control users:

1) Groups

2) Group permissions

3) Individual

4) Individual permissions

END OF SECTION

SECTION 28 16 00 – INTRUSION DETECTION SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes

1. Verkada cloud-based intrusion detection and alarm monitoring solution.
2. Alarm Panels
3. Alarm Consoles
4. Alarm Sensors
5. Alarm Accessories

1.2 RELATED SECTION

A. 28 10 00 Access Control

B. 28 15 23 Intercom Entry Systems

C. 28 17 11 Visitor Management Systems

D. 28 20 00 Video Surveillance

E. 28 30 00 Environmental Sensor

1.3 REFRENCES

A. Published specifications, standards, tests, Codes, or recommended standards of trade, industry, or governmental organizations apply to work in these Sections, including:

1. ADA – Americans with Disabilities Act
2. ANSI – American National Standards Institute
3. ASCII – American Standard Code for Information Interchange
4. ASTM – American Society for Testing and Materials
5. IBC – International Building Code
6. IEEE – Institute of Electrical and Electronics Engineers
7. ISO/IEC – International Organization for Standardization / International Electrotechnical Commission
8. NEC – National Electrical Code
9. NEMA – National Electrical Manufacturers' Association
10. NFPA – National Fire Protection Association
11. TIA/EIA – Telecommunications Industry Association / Electronic Industries Alliance
12. UL – Underwriters Laboratories, Inc.

1.4 DEFINITIONS

A. Abbreviations:

1. ACS – Access Control System
2. API – Application Programming Interface
3. DHCP – Dynamic Host Configuration Protocol
4. DPDT – Double pole, double throw
5. IP – Internet Protocol
6. LAN – Local Area Network
7. NFC – Near Field Communications
8. NVR – Network Video Recorder
9. ODBC – Open Database Connectivity
10. RAM – Random Access Memory
11. SPDT – Single pole, double throw
12. SSL – Secure Sockets Layer
13. SSO – Single sign-on
14. TCP – Transport Control Protocol
15. UPS – Uninterruptible Power Supply
16. VMS – Video Management System

1.5 SYSTEM DESCRIPTION

A. A cloud-based alarm monitoring platform and associated wired or wireless sensors.

B. Key Functions:

1. Intrusion detection events based on wired or wireless sensors.
2. Intrusion detection events based on integrations with Verkada camera or access control platforms.
3. 24/7 professional monitoring provided by trained operators through add-on services.
4. Arm and disarm through the cloud application.
5. Arm and disarm via Verkada Alarm Console with keypad, integrated camera, and talk-down.
6. 10-year warranty on all hardware.

C. Compliance and Availability

1. See the compliance webpage for current regional compliance and availability information: https://verkada.com/alarms-availability.

D. Alarms Platform component of Verkada Command

1. Alarms is powered by Verkada's Command Platform, providing secure remote access with an intuitive interface for ease of use.
2. Site Management
   a. See overview of current status and recent events from all sites.
   b. Schedule arming/disarming and configure keycodes for on-site management.
   c. Instantly view incidents and play back event footage with integrated Verkada video surveillance.
   d. Control access to Alarm-equipped sites with role-based permissions.
3. Device Management
   a. Configure wired and wireless sensors from Command.
   b. Create alarm triggers based on events from any Verkada device.
   c. Manage all deployed devices.
4. Professional Monitoring Configuration
   a. Enable video verification of alarms by trained security professionals.
   b. Enable dispatch of emergency services.

c. Configure an ordered list of contacts for monitoring agents to call and text when an alarm is raised.

5. Alarm Console Talk-Down
   a. From Command, initiate two-way video calls down to Alarm Consoles at any of your sites, from anywhere in the world.
   b. Make calls to Alarm Console to address staff, guests, or potential intruders.
   c. Configure custom messages to announce in the event of an alarm.

E. Verkada Alarms Mobile App

1. Available for iOS and Android.
2. Arm / disarm sites and raise panic alarms from a mobile device.
3. Grant users access to the app through Command and restrict which sites can be managed by which users.

1.6 SUBMITTALS

A. Provide the following submittals for review and approval:

1. Product Data and Shop Drawings
2. System Programming
3. Operation and Maintenance Manuals (O&M's)
4. "As-Built" Record Drawings

B. Submit Product Data and Shop Drawings submittals for review and approval prior to commencement of work:

1. Manufacturer's name, brand name, exact part number, options, accessories, and catalog cutsheet references for all equipment supplied including cabling. Include manufacturer's published installation instructions. Indicate UL listings for system components.
2. Complete wiring diagrams for all components, including cable types and quantities, routings, floor plans indicating device locations, conduit sizes, and point-to-point termination and riser diagrams.
3. Device legend on the shop drawings that identifies the symbols used for all devices including mounting heights, back box requirements, part and model numbers, operating voltages (if applicable), wire and cabling requirements, label text, and panel termination points.
4. Fully dimensioned shop drawings including floorplans, enlarged plans, elevations, and installation details of all security devices, equipment rooms and closets, consoles, controllers, racks, enclosures, and fabricated equipment, showing locations of all major components including mounting details. Indicate UL system and rating listings for penetration firestop systems through rated partitions and floors.
5. Bill of Materials.
6. Material Safety Data Sheets (MSDS) for fire stopping materials and sealants.

C. Submit System Programming submittals for review and approval prior to commencement of work:

1. Proposed programming, including nomenclature conventions, device names and text descriptions, timings, camera call-up trigger alarms with associated cameras, and sequence of operations.
2. Approved device names and text descriptions as programmed into the security systems shall be reflected on the "As-Built" Record Drawings as well as on device and cable labels.

D. Submit Operation and Maintenance Manuals (O&M's) submittals for review and approval prior to the completion of the project:

1. Updated product data and shop drawings submittals reflecting the final conditions.
2. Warranty letter with start and end date.
3. Warranty service and maintenance contact information: including names, address, phone number, and website address. Provide specific instructions or forms as required to initiate a trouble ticket or work order request.
4. Letter indicating that all software and licensing is the sole property of the Owner.
5. Troubleshooting checklist information.
6. Replacement parts and consumables ordering information including the contact information for local sources.
7. Provide an updated System Programming submittal including:
   a. Final listing of doors, locations, and normal status in CSV format.
   b. System administration and management operating instructions.
   c. Setting up Users, User Groups, Access Levels, Doors, Door Schedules, and Exceptions
   d. Assigning Access Groups to all Users.
   e. Monitoring system activity.
   f. Running standard reports.
   g. Setting up logins and permissions.

E. Submit "As-Built" Record Drawings submittals for review and approval prior to the completion of the project:

1. Maintain a complete set of "As-Built" Record Drawings at the project site updated with mark-ups of the actual installation conditions.
2. Prior to the completion of the project transfer all installation conditions mark-ups to electronic drawings and submit to the Owner in CAD and PDF formats.

1.7 QUALITY ASSURANCE

A. Equipment shall be tested and found to comply with the limits for a Class A or B digital device, pursuant to part 15 of the FCC rules.

B. Security technology devices shall be mounted using compatible Verkada accessories.

C. Security technology devices shall be of the latest technology. No discontinued models or products are acceptable.

D. Installation technicians shall successfully complete the Verkada Certified Engineer (VCE) program prior to starting work. For more information, visit www.verkada.com/partners/trainings.

E. Contractor qualifications:

1. Minimum of two years of system design, engineering supervision, and installation experience in the access control industry.
2. Maintain a local office, with a service center staffed by trained technicians and must be adequately equipped to provide emergency phone service within 24 hours on a 24-hour, 365 days per year basis, whether or not the Owner purchases a maintenance contract with the Contractor.
3. Maintain an inventory of spare parts and other items critical to system operation, as necessary to meet the emergency service requirements.
4. Maintain an in-house engineering and project management capability consistent with the requirements of this project.
5. Provide a project manager who is actively engaged in the project. This person shall be the same individual throughout the course of the project and shall be the person responsible for the scheduling of the system programming, preparation of the submittals and project close-out documentation, training programs, system testing and report documentation, and

the coordination of all subcontract labor. The Owner reserves the right to approve the Contractor's project manager.

6. Abide by and adhere to all Drug Free School Zone laws and participate in a drug-free workplace program.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Ship equipment in original packaging to prevent damage. All handling shall be in accordance with manufacturer recommendations. Inspect all products and materials for any damage immediately upon delivery to the project site.

B. Provide protective covering during construction.

C. Replace equipment and products damaged during shipping, handling, distribution, storage, installation, or construction with new equipment and products.

D. Equipment and products stored at the project site or at an off-site location shall be protected from dust, dirt, and foreign matter. Protect equipment and products from water, damage, dents, bumps, and scratches.

1.9 SCHEDULING

A. Submit proposed construction schedule detailing the task milestones, durations, and sequences for the project for review and approval prior to commencement of work.

B. When work is performed in a sensitive area or in an area occupied with ongoing business activities coordinate with the Owner and the affected department's representative to determine the best time to perform the work required.

1.10 WARRANTY

A. Provide one-year parts and labor project warranty. Parts and labor shall be guaranteed against defects in materials and workmanship for one year from written notification of acceptance.

B. All Verkada hardware purchases are backed by a 10-year limited warranty. For more information, visit verkada.com/support/terms-of-sale.

PART 2 - PRODUCTS

2.1 MANUFACTURER

A. Manufacturer shall be Verkada Inc.

1. Headquarters: 405 E 4th Ave. San Mateo, CA 94401
2. Toll Free: (888) 829-0668
3. General: team@verkada.com
4. Sales: sales@verkada.com
5. Website: www.verkada.com

2.2 LICENSING

A. Provide all required licenses for the specified system components.

B. All system component licenses shall be 5-year licenses.

2.3 ALARM PANELS

A. BP41 Alarm Panel by Verkada Inc.

1. Description: The BP41 Alarm Panel incorporates third-party wired intrusion sensors into the Verkada Alarms solution. The panel also supports two wired outputs for signaling devices, such as sirens or strobe lights.
2. Technical Specifications:
   a. Power Consumption (at 10V to 14V): 60W
   b. Dimensions:
      1) Width: 319.6mm / 12.58in
      2) Height: 415.6mm / 16.36in
      3) Depth: 111.74mm / 4.4in
   c. Weight: 81.9kg / 18.06lb
   d. Operating Temperature: 0°C to 50°C / 32°F to 122°F
   e. Compliance: Please see https://www.verkada.com/alarms-availability/
   f. Inputs:
      1) 32 inputs for normally open or normally closed sensors
      2) Optional 1 kΩ single or double EOLR supervision
   g. Outputs:
      1) 2x 12V programmable outputs 1A each
      2) 12V AUX power 2A total/combined
   h. Connectivity:
      1) Ethernet: 100/1000Mbps RJ-45 cable connector for network connection
      2) USB: USB 2.0
   i. Included Accessories:
      1) Setup guide
      2) Screw pack
      3) Torx screwdriver
      4) AC cord
      5) 32x 1kΩ end-of-line resistors
   j. Mounting Options:
      1) M8 drywall anchors
      2) M5 screws

B. MX21 Wireless Relay by Verkada

1. Description: Power third–party sirens, strobes and other wired alarm signaling devices and configure them as automated alarm responses to deter intruders or alert nearby individuals. Lighter-weight alternative to a BP41 Alarm Panel.
2. Technical Specifications:
   a. Power Consumption: 30W maximum
   b. DC Power Input: 12VDC to 24VDC
   c. Wireless Communication:
      1) US and Canada: Proprietary 915 MHz
      2) UK and Europe: 868 MHz
      3) Australia: 916.8 MHz
   d. Inputs: Wired signal input
   e. Wireless Range:
      1) Line-of-Sight: 305m / 1,000ft
      2) Typical Environment: 61m / 200ft

f. Relay Outputs:
   1) 1 wet relay
   2) Relay output voltage = relay input voltage, e.g.:
      a) 12VDC input, 12VDC output 2.5A max
      b) 24VDC input, 24VDC output 1.25A max
g. Relay Durability: 100,000 cycles at max load
h. Operating Temperature: 0°C to 50°C / 32°F to 122°F
i. Operating Humidity: 0% to 90%
j. Dimensions:
   1) Length: 119.6mm / 4.71in
   2) Width: 44mm / 1.73in
   3) Height: 30.3mm / 1.19in
k. Weight: 226g / 7.97oz
l. Certifications:
   1) FCC
   2) IC
   3) CE
   4) UKCA
   5) RCM
   6) NDAA
m. Included Accessories: 1x T10 Torx wrench
n. Mounting Options:
   1) 1x VHB adhesive strip
   2) 2x wall anchors and screws

C. BH61 Wireless Alarm Hub by Verkada Inc.

1. Description: A PoE-powered hub that enables two-way communication with Verkada's wireless sensors.
2. Technical Specifications:
   a. Power Consumption: 14W
   b. Dimensions:
      1) Length: 155mm / 6.1in
      2) Width: 155mm / 6.1in
      3) Height: 67mm / 2.64in
   c. Weight: 870g / 30.69oz
   d. Wireless Communication:
      1) US and Canada: Proprietary 915 MHz
      2) UK and Europe: 868 MHz
   e. Internal Backup Battery:
      1) 7.3V/2850mAh
      2) 12 hours of backup with typical use
   f. Operating Temperature: 0°C to 45°C / 32°F to 113°F
   g. Operating Humidity: 0% to 90%
   h. Compliance: Please see https://www.verkada.com/alarms-availability/
   i. Connectivity:
      1) Ethernet: 10/100Mbps RJ-45 cable connector for Network/PoE connection
      2) USB: USB 2.0 for connection to ACC-CEL-LTE Cellular Backup Module by Verkada.
   j. Included Accessories:
      1) Quick start guide
      2) 3x machine screws
      3) 3x wing nuts
      4) 3x washers
      5) 4x wall screws
      6) 4x wall anchors
      7) Torx wrench
   k. Mounting Options:
      1) M8 drywall anchors
      2) M5 screws

2.4 ALARM CONSOLES

A. BC82 Alarm Console by Verkada Inc.

1. Description: The BC82 Alarm Console is an alarm keypad with an integrated camera, two-way talk-down speaker, digital panic button, and integrated wireless sensor hub.
2. Technical Specifications:
   - a. Power Consumption: 25W
   - b. Power Input: PoE+ (802.3at) 10 to 36VDC
   - c. Battery:
     1) 32.4 watt-hour rechargeable lithium-polymer battery
     2) estimated 12 hours battery backup
   - d. Processor: A12 Bionic chip with 64-bit architecture
   - e. Display:
     1) Type: 10.2-inch diagonal LED-backlit Multi-Touch
     2) Resolution: 2160 x 1620 Pixels
     3) Brightness: 500 nits
   - f. Camera Quality: 720p HD video
   - g. Audio:
     1) Stereo speakers
     2) 3.5 mm jack for external speakers
     3) dual microphones
   - h. Dimensions:
     1) Tablet:
        a) Height: 309.9mm / 12.2in
        b) Width: 161.3mm / 6.4in
        c) Depth: 40.3mm / 1.6in
     2) Mount Plate:
        a) Length: 281.9mm / 11.1in
        b) Width: 113.9mm / 4.5in
        c) Height: 17.5mm / 0.7in
   - i. Weight:
     1) Tablet: 1,240g / 2.7lbs
     2) Mount Plate: 400g / 0.9lb
   - j. Operating Temperature: 0°C to 40°C / 32°F to 104°F
   - k. Operating Humidity: 5% to 90%
   - l. Connectivity:
     1) Ethernet 10/100Mbps
     2) Bluetooth 5.0
     3) Dual Band (2.4GHz/5GHz) WiFi
     4) 2x USB 2.0
   - m. Display:
     1) 10.1” LED-backlit multi-touch
     2) 1960 x 1200 pixel resolution
   - n. Audio:
     1) Mono Speaker: 90dB at 1 meter
     2) Buzzer: 90dB at 3 meters
     3) 3.5mm output
     4) Dual microphones
   - o. Camera:
     1) 8MP
     2) 1080p HD video
   - p. Included Accessories:
     1) T10 screwdriver
     2) 4x wall screws
     3) 4x drywall anchors
   - q. Mounting Options:
     1) Wall Mount Plate
     2) ACC-CON-STND-1 Alarm Console Table-Top Mounting Stand

2.5 ALARM SENSORS

A. BR31 Wireless Door Sensor by Verkada Inc.

1. Description: Wireless sensor to detect if a door is in the closed position.
2. Technical Specifications:
   a. Power Supply: 2 x CR123A Lithium Batteries
   b. Dimensions:
      1) Sensor:
         a) Height: 139.7mm / 5.50in
         b) Width: 27mm / 1.06in
         c) Depth: 25.4mm / 1.00in
      2) Magnet:
         a) Height: 70mm / 2.75in
         b) Width: 16mm / 0.63in
         c) Depth: 17mm / 0.67in
   c. Battery Life: Up to 10 years
   d. Wireless Range:
      1) Line-of-Sight: 304.8m / 1000ft
      2) Typical Environment: 60.96m / 200ft
   e. Door Gap Width: Adjustable up to 5cm / 2in
   f. Wireless Communication:
      1) US and Canada: Proprietary 915 MHz
      2) UK and Europe: 868 MHz
      3) Australia: 916.8 MHz
   g. Weight:
      1) Sensor: 85g / 3oz
      2) Magnet: 25g / 0.88oz
   h. Operating Temperature: 0°C to 45°C / 32°F to 113°F
   i. Operating Humidity: 0% to 90%
   j. Compliance: Please see https://www.verkada.com/alarms-availability/
   k. Included Accessories:
      1) Quick Start Guide
      2) 4x Wood Screws
      3) 4x Sheet metal screws
      4) 1x T10 Torx L Key
      5) Very High Bond (VHB) Double Sided Tape Adhesive Mount
   l. Mounting Options:
      1) Wood and Metal screws
      2) Very High Bond (VHB) Double Sided Tape Adhesive Mount

B. BR32 Wireless Motion Sensor by Verkada Inc.

1. Description: Wireless sensor to detect if there is motion within the field of view.
2. Technical Specifications:
   a. Power Supply: 2 x CR123A Lithium Batteries
   b. Dimensions:
      1) Height: 94mm / 3.7in
      2) Width: 51mm / 2in
      3) Depth: 34mm / 1.33in
   c. Battery Life: Up to 5 years
   d. Wireless Range:
      1) Line-of-Sight: 304.8m / 1000ft
      2) Typical Environment: 60.96m / 200ft
   e. Detection Range: up to 10m / 32ft
   f. Field of View: 90° Horizontal
   g. Sensor Type: Passive Infrared (PIR)
   h. Wireless Communication:
      1) US and Canada: Proprietary 915 MHz
      2) UK and Europe: 868 MHz

3) Australia: 916.8 MHz
i. Weight: 93g / 3.28oz
j. Operating Temperature: 0°C to 45°C / 32°F to 113°F
k. Operating Humidity: 0% to 90%
l. Compliance: Please see https://www.verkada.com/alarms-availability/
m. Included Accessories:
1) Quick Start Guide
2) Wall Screws
3) Wall Anchors
n. Mounting Options:
1) Corner
2) Wall
3) Dry wall anchors and screws

C. BR33 Wireless Panic Button by Verkada Inc.

1. Description: Wireless button which, whin pressed, triggers a programmable alarm response.
2. Technical Specifications:
a. Power Supply: 1 x CR123A Lithium Battery
b. Battery Life: Up to 5 years
c. Wireless Range:
1) Line-of-Sight: 304.8m / 1000ft
2) Typical Environment: 60.96m / 200ft
d. Wireless Communication:
1) US and Canada: Proprietary 915 MHz
2) UK and Europe: 868 MHz
3) Australia: 916.8 MHz
e. Dimensions:
1) Height: 81mm / 3.2in
2) Width: 36mm / 1.42in
3) Depth: 24mm / 0.94in
f. Weight: 49g / 1.73oz
g. Operating Temperature: 0°C to 45°C / 32°F to 113°F
h. Operating Humidity: 0% to 90%
i. Included Accessories:
1) Quick Start Guide
2) Wall Screws
3) Wall Anchors
4) Torx Wrench
5) Very High Bond (VHB) Double Sided Tape Adhesive Mount
j. Mounting Options:
1) Wall or surface mount
2) Loop for lanyard attachment

D. BR34 Wireless Glass Break Sensor by Verkada Inc.

1. Description: Wireless sensor to detect the sound of breaking glass.
2. Technical Specifications:
a. Power Supply: 1 x CR123A Lithium Batteries
b. Battery Life: Up to 2 years
c. Wireless Range:
1) Line-of-Sight: 304.8m / 1000ft
2) Typical Environment: 60.96m / 200ft
d. Wireless Communication:
1) US and Canada: Proprietary 915 MHz
2) UK and Europe: 868 MHz
3) Australia: 916.8 MHz
e. Detection Range: up to 5m / 15ft
f. Sensor Type: Dual detection, requiring both impact and successive shattering frequencies to trigger alarm

g. Dimensions
   1) Height: 74mm / 2.91in
   2) Width: 74mm / 2.91in
   3) Depth: 22mm / 0.87in
h. Weight: 63g / 2.22oz
i. Operating Temperature: 0°C to 45°C / 32°F to 113°F
j. Operating Humidity: 0% to 90%
k. Compliance: Please see https://www.verkada.com/alarms-availability/
l. Included Accessories:
   1) Quick Start Guide
   2) Wall Screws
   3) Wall Anchors
m. Mounting Options:
   1) Ceiling
   2) Opposite wall facing glass
   3) Dry wall anchors and screws
n. Glass Type:
   1) Plate glass, thickness: 2, 3, 5, 6mm
   2) Tempered glass, thickness: 3, 5, 6mm
   3) Wired glass, thickness: 6, 8mm
   4) Laminated glass, thickness: 3, 6mm
   5) Size: minimum 30cm x 30cm
o. Note: To reduce false alarms, the glass break sensor should be mounted in an area free of loud noises or vibrations.

E. BR35 Wireless Water Leak Sensor by Verkada Inc.

1. Description: Wireless sensor to detect the presence of standing water.
2. Technical Specifications:
   a. Power Supply: 1 x CR123A Lithium Battery
   b. Probe cable length: 2.1 m / 7 ft
   c. Battery Life: Up to 5 years
   d. Wireless Range:
      1) Line-of-Sight: 304.8m / 1000ft
      2) Typical Environment: 60.96m / 200ft
   e. Wireless Communication:
      1) US and Canada: Proprietary 915 MHz
      2) UK and Europe: 868 MHz
      3) Australia: 916.8 MHz
   f. Sensor Type: Probe with copper-nickel plated contacts
   g. Dimensions:
      1) Height: 88mm / 3.46in
      2) Width: 25.4mm / 1.00in
      3) Depth: 27mm / 1.08in
   h. Weight: 67g / 2.36oz
   i. Operating Temperature: 0°C to 45°C / 32°F to 113°F
   j. Operating Humidity: 0% to 90% humidity
   k. Compliance: Please see https://www.verkada.com/alarms-availability/
   l. Included Accessories:
      1) Quick Start Guide
      2) 4x Wall Screws
      3) Very High Bond (VHB) Double Sided Tape Adhesive Mount
   m. Mounting Options:
      1) Wall
      2) Floor

2.6 ALARM ACCESSORIES

A. ACC–CEL–LTE Cellular Backup Module by Verkada Inc.

1. Description: Cellular data network backup connection to maintain alarm panel connectivity in the event of a loss of wired network service. The ACC-CEL-LTE Cellular Backup Module includes an embedded multi-carrier SIM with automatic failover across multiple networks for redundancy.
2. Technical Specifications:
   a. Power Consumption (5V): 0.5W
      1) Dimensions:
         a) Height: 152.4mm / 6in
         b) Width: 50.8mm / 2in
         c) Depth: 30mm / 1.18in
      2) Antenna:
         a) Height: 147.32mm / 5.8 in
         b) Width: 38.1 mm / 1.5 in
         c) Depth: 12.7 mm / 0.5 in
      3) Weight: 113g / 4oz
      4) Operating Temperature: 0°C to 45°C / 32°F to 113°F
      5) Operating Humidity: 0 to 90%
      6) Compliance: Please see https://www.verkada.com/alarms-availability/
      7) Connectivity: USB 2.0 for connection to BP41 Alarm Panel or BH61 Wireless Alarm Hub
      8) Included Accessories:
         a) Quick start guide
         b) Torx screwdriver
         c) 2x screws
         d) 2x drywall anchors
      9) Mounting Options: M8 drywall anchors and M5 screws

B. BZ11 Horn Speaker by Verkada inc.

1. Description: The BZ11 Horn Speaker with integrated microphone enables two-way communication between users and individuals in the environment. With the addition of an Alarms License, professional monitoring agents can talk down intruders in real time, or pre-recorded messages can be configured to play as an automated response if an alarm is raised.
2. Technical Specifications:
   a. Power Consumption: 25.5W
   b. Power Input: PoE+ (IEEE 802.3at)
   c. Connectivity: Ethernet 100/1,000Mbps
   d. Speaker:
      1) Max SPL: 115dB (1W/1m)
      2) Frequency Range: 330Hz to 8kHz
   e. Microphone:
      1) Frequency Range: 100Hz to 16kHz
   f. Dimensions:
      1) Length: 286mm / 11.26in
      2) Width: 274mm / 10.79in
      3) Height: 197mm / 7.76in
   g. Weight: 20.1kg / 4.43lb
   h. Operating Temperature: -20°C to 50°C / -4°F to 122°F
   i. Operating Humidity: 0% to 90%
   j. Included Accessories:
      1) Mount bracket
      2) Masonry screws
      3) Wall mount screws
      4) Wall anchors
   k. Mounting Options:
      1) Verkada Pole Mount
      2) Verkada Corner Mount

C. MX21 Wireless Relay by Verkada

1. Description: Powers third–party sirens, strobes and other wired alarm signaling devices and configure them as automated alarm responses to deter intruders or alert nearby individuals.
2. Technical Specifications:
   a. Power Consumption: 30W maximum
   b. DC Power Input: 12 to 24VDC
   c. Inputs: Wired signal input (optional)
   d. Relay Outputs: 1x wet relay
   e. Relay Durability: 100,000 cycles at maximum load
   f. Dimensions:
      1) Height: 30.3mm / 1.19in
      2) Width: 44mm / 1.73in
      3) Length: 119.6mm / 7.86in
   g. Wireless Range:
      1) Line-of-Sight: 304.8m / 1000ft
      2) Typical Environment: 60.96m / 200ft
   h. Wireless Communication:
      1) US and Canada: Proprietary 915 MHz
      2) UK and Europe: 868 MHz
      3) Australia: 916.8 MHz
   i. Weight: 226g / 8oz
   j. Operating Temperature: 0°C to 50°C / 32°F to 122°F
   k. Operating Humidity: 0% to 90%
   l. Compliance: Please see https://www.verkada.com/alarms-availability/
   m. Included Accessories:
      1) 1x T10 torx wrench
   n. Mounting Options:
      1) 1x VHB adhesive strip
      2) 2x wall anchors and screws

PART 3 - EXECUTION

3.1 INSTALLERS

A. Installation shall be performed by technicians that have successfully completed the Verkada Certified Engineer (VCE) program. For more information, visit www.verkada.com/partners/trainings.

3.2 EXAMINATION

A. Installation surfaces shall be clean and free from dust, dirt, and obstructions.

B. Examine pathway elements intended for cables. Check raceways, cable trays, and other elements for compliance with space allocations, installation tolerances, hazards to cable installation, and other conditions affecting installation.

C. Examine rough-in for LAN and control cable conduit systems to server, PCs, controllers, panels, consoles, and other cable-connected devices to verify actual locations of conduit and back boxes before device installation.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.3 PREPARATION

A. Refer to the Verkada Quick Start Guide applicable to each product.

B. Pre-Installation Conference: Prior to installation arrange conference between supplier, Owner, and related trades to review materials, procedures, and coordinating related work.

C. Furnish or coordinate any inserts required for building into concrete, masonry, and other work, to support and attach work of this Section. Furnish or coordinate in ample time to comply with schedule of work into which inserts are built.

D. Verify that power and outlets are in correct locations.

E. Verify that building structure is properly prepared for mounting, attachment, and support of equipment.

F. Prior to installation of systems components and devices, verify all required preparations have been properly performed and that substrates are acceptable for installation.

1. Verify all rough-ins and field dimensions.

G. Report in writing to the Owner's representative any prevailing conditions that will adversely affect satisfactory execution of work in this Section.

1. Owner or their representative reserves the right to review proposed methods of construction and installation, reject proposed methods, and have the installation done in a satisfactory method at the Contractor's cost.

3.4 INSTALLATION

A. Refer to the Verkada Quick Start Guide applicable to each product.

B. For support, proceed to www.verkada.com/support.

C. Sequencing: The work shall be performed in the following sequence, unless directed otherwise by Owner or their representative:

1. Installation of cables, panels, consoles, and power supplies.
2. Installation of new field devices.
3. Installation of front-end equipment.
4. Commissioning of the new system components.
5. End User training

D. Install work in accordance with manufacturer's recommendations and instructions as well as final shop drawings. All panels, consoles, and power supplies should be installed so as to allow easy access for service in the future.

E. Anchor components securely in place, plumb, level, and accurately aligned.

F. For solution products located in equipment traffic areas, and that are exposed to damage due to collision or impact from forklifts, or manually moved carts, carriers, or other equipment used by the Owner, provide protective bollards, railings, coverings etc. to ensure that all products installed are properly protected from such damage.

G. Provide fastenings, plates, and other incidental items required for complete and operational installation.

H. Provide required electrical work in accordance with Code requirements.

I. Security and protection:

1. Maintain strict security during the installation of equipment and software. Rooms housing the control station, and workstations that have been powered up shall be locked and secured during periods when a qualified operator in the employ of Contractor is not present.
2. Equipment protection: Provide protective covers, fenders, and barriers as necessary to maintain work of this Section in same condition as installed until time of substantial completion.

J. Cable requirements:

1. Twisted, shielded, plenum-rated type cable shall be used.
2. All exposed cables shall be in rigid conduit, electrical metallic tubing (EMT) raceway, or wire mold as approved by the Owner.
3. All concealed cables routed in j-hook pathways shall be fastened to the structure at least every four feet.

3.5 LABELING

A. Equipment and product labels shall be printed on self-adhesive labels. Hand written labels or writing directly on the equipment enclosures is not acceptable.

B. Label equipment and products with the device address as programmed into the security systems and as reflected on the “As-Built” Record Drawings.

C. Label networked equipment enclosures with the IP address.

D. Cables shall be individually labeled at origin and termination.

3.6 PROGRAMMING

A. Complete all Verkada Command configuration programming, including but not limited to:

1. Personal/Staff information
2. Access times for all personal/staff
3. Definitions of openings for staff access
4. Holiday definitions
5. Special access privileges
6. Lock down conditions

B. Add all Verkada components to Command via serial number.

C. Contract will coordinate with the Owner to ensure that new components have appropriate network connections.

D. Coordinate with the Owner to ensure that new components will be properly programmed into the system.

E. Change default passwords to new custom secure passwords as directed by the Owner.

3.7 ACCEPTANCE TESTING

A. Final Test and Acceptance Plan

1. Develop a final test and acceptance plan to identify each new system component, intent of test, test method, and expected results.
2. Each component listed in the plan shall include space for test part signatures, brief comments, time of test and pass/fail check boxes.
3. Test all equipment, products, and devices in accordance with the plan to ensure completely operational and fully functional security systems. Submit a written final test and acceptance report for review and approval.
4. The report shall be submitted to the Owner's representative at least 30 days prior to the scheduled system acceptance test.
5. System acceptance of the access control system shall be conditioned upon successful completion and operational demonstration of all system functions and components as documented in the final test and acceptance report.

B. System Acceptance

1. System acceptance shall not occur until after the following activities have been successfully completed:
   a. Correction of all deficiencies and punch list items noted on the final test and acceptance report.
   b. Acceptance of final test and acceptance report.
   c. Acceptance of all project close-out submittals.
   d. Delivery of final project close-out documentation.
   e. Successful training and demonstration, including operation of systems, systems administration, and system management.
   f. Purging of Contractor user privileges and return of all credentials.

3.8 OWNER PERSONNEL TRAINING

A. On-site operator training:

1. Instruct operating staff in proper operation, including hands-on training.
2. Minimum of two, four-hour sessions covering the operations for each system installed.
3. Training sessions shall be provided to supervisors, end-user staff, security staff, maintenance personnel, IT personnel, and any other personnel designated by the Owner.
4. Provide training sessions on all work shifts, including day, evening, and night shifts.

B. On-site administrator training:

1. Instruct security system administrators for each system installed, including hands-on training.
2. Minimum of two, four-hour sessions covering the operations for each system installed.
3. Training shall cover all administrative and management functions, including features and controls, for each system.

3.9 DOCUMENTATION

A. Provide owner with system component installation, configuration, and programming documentation, including but not limited to:

1. Components:
   a. model name
   b. model number
   c. manufacturer
   d. serial number
   e. installation location

f. installation network port name
g. installation network port location
h. network address(es)

2. Network port configurations
3. Verkada Command users:
   a. Usernames
   b. Passwords
   c. User groups
   d. User group permissions
4. Alarm system configurations:
   a. Schedules
   b. Holidays
   c. Event logic
   d. Alarm logic
5. Alarm users:
   a. Groups
   b. Group permissions
   c. Individual
   d. Individual permissions

END OF SECTION

SECTION 28 23 00 – VIDEO SURVEILLANCE SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

A. Video Surveillance System Base Bid: Video Surveillance system shall be rough-in only and to include Category 6 cabling per Section 27 15 00.

B. Alternate #7: Provide complete video surveillance system consisting of cameras, accessories, and licenses. Provide CD62 cameras at interior video data drop locations. Provide CH52-E cameras at exterior video data drop locations. Quantities shall be per drawings. Allow for an additional (5) CH52-E cameras, including data drop rough-in, up to 150ft for each, locations to be determined by Owner at construction start.

C. Section Includes:

1. Verkada cloud-based video surveillance solution including:

   a. Verkada Command cloud-based management platform

   b. Edge-based video analytics

   c. Indoor Dome Series cameras

   d. Outdoor Dome Series cameras

   e. Mini Series cameras

   f. Bullet Series cameras

   g. Fisheye Series cameras

   h. Multisensor Series cameras

   i. Viewing Station

   j. PoE Injectors

   k. Camera mounts, adapters, and accessories

2. Refer to the Verkada Camera Selector User Guide for assistance selecting the appropriate camera for field of view, form factor, zoom, resolution, video retention, and other selection factors.

3. Refer to the Verkada User Guide for Occupancy Trends for more information regarding the deployment of the Occupancy Trends People Analytics feature.

4. Refer to the Verkada User Guide for License Plate Recognition (LPR) for more information regarding camera selection as well as camera placement, installation, and setup for LPR use cases.

5. Refer to the Verkada User Guide for People Analytics for more information regarding key features, optimizing performance, camera selection and placement, lighting, privacy, and other selection factors.

6. Refer to the Verkada User Guide for Camera Setup Best Practices for more information regarding the following camera networking best practices:

D. Related Sections

1. 28 13 00 – Access Control
2. 28 16 00 – Intrusion Detection

1.2 REFERENCES

A. Published specifications, standards, tests, Codes, or recommended standards of trade, industry, or governmental organizations apply to work in these Sections, including:

1. ADA – Americans with Disabilities Act
2. ANSI – American National Standards Institute
3. ASCII – American Standard Code for Information Interchange
4. ASTM – American Society for Testing and Materials
5. IBC – International Building Code
6. IEEE – Institute of Electrical and Electronics Engineers
7. ISO/IEC – International Organization for Standardization / International Electrotechnical Commission
8. NEC – National Electrical Code
9. NEMA – National Electrical Manufacturers' Association
10. NFPA – National Fire Protection Association
11. TIA/EIA – Telecommunications Industry Association / Electronic Industries Alliance
12. UL – Underwriters Laboratories, Inc.

1.3 DEFINITIONS

A. Abbreviations:

1. ACS – Access Control System
2. API – Application Programming Interface
3. CCD – Charge Coupled Device
4. CCTV – Closed Circuit Television
5. CMOS – Complementary Metal-Oxide Semiconductor
6. DHCP – Dynamic Host Configuration Protocol
7. DNS – Domain Name System
8. DPDT – Double pole, double throw
9. FPS – Frames Per Second
10. IP – Internet Protocol

11. LAN – Local Area Network
12. LPR – License Plate Recognition
13. NFC – Near Field Communications
14. NVR – Network Video Recorder
15. ODBC – Open Database Connectivity
16. PoE – Power Over Ethernet
17. RAM – Random Access Memory
18. SPDT – Single pole, double throw
19. SSL – Secure Sockets Layer
20. SSO – Single sign-on
21. TCP – Transport Control Protocol
22. UPS – Uninterruptible Power Supply
23. VMS – Video Management System
24. WDR – Wide Dynamic Range

1.4 SYSTEM DESCRIPTION

A. A hybrid cloud video surveillance system with storage and image processing on edge devices managed through the Verkada Command cloud platform.

B. Verkada Command Management Software

1. Access and management for all cameras and users across all sites. Command management functions include:
    a. Set up for new cameras.
    b. Create new sites.
    c. Manage camera device and system settings.
    d. Access live and archived footage.
    e. Manage users.
2. Security and Permissions:
    a. SAML/OAuth support for single sign-on
    b. 2-factor authentication options
    c. User permissions can be controlled at camera, site and organization levels
3. Remote Access
    a. Web app access

b. Native apps for iOS, Android, and the Verkada VX52 Viewing Station

4. Archiving and Sharing:

a. Command licenses include unlimited cloud archiving.

b. Export footage in MP4 format

c. Create and share Live Links via text or email.

C. Analytics:

1. People Analytics

a. Intelligent edge-based video processing to identify individuals in a scene.

b. Filter identified individuals by attributes, including:

1) Date

2) Time

3) Appearance

4) Clothing color

5) Backpack detection

6) Facial matches

2. Face Search: Quickly search for matching people by selecting an existing face from organizational records uploaded image.

3. Person History:

a. Browse through snapshots of people detected in frame.

b. Save snapshots or access associated full-resolution video.

4. Occupancy Trends:

a. Estimate how many people cross a designated line in a camera field of view.

5. Cross-Camera Tracking:

a. Search video from different cameras of the same identified individual.

D. Vehicle Analytics:

1. Intelligent edge-based video processing to identify vehicles in a scene.

2. Filter identified vehicles by attributes, including:

a. Date.

b. Time.

c. Vehicle make.

d. Color.

e. Vehicle body type.

3. Vehicle History:

a. Browse through snapshots of vehicles detected in-frame

b. Save snapshots or associated full-resolution video

4. Cross-Camera Tracking:

a. Search video from different cameras of the same identified vehicle.

5. License Plate Recognition:

a. LPR coverage, monitoring, and search by plate number

b. Generate License Plate of Interest Alerts via SMS or email with an image or link to review the associated footage

1.5 SUBMITTALS

A. Provide the following submittals for review and approval:

1. Product Data and Shop Drawings

2. System Programming

3. Operation and Maintenance Manuals (O&M's)

4. "As-Built" Record Drawings

B. Submit Product Data and Shop Drawings submittals for review and approval prior to commencement of work:

1. Manufacturer's name, brand name, exact part number, options, accessories, and catalog cutsheet references for all equipment supplied including cabling. Include manufacturer's published installation instructions. Indicate UL listings for system components.

2. Complete wiring diagrams for all components, including cable types and quantities, routings, floor plans indicating device locations, conduit sizes, and point-to-point termination and riser diagrams.

3. Device legend on the shop drawings that identifies the symbols used for all devices including mounting heights, back box requirements, part and model numbers, operating voltages (if applicable), wire and cabling requirements, label text, and panel termination points.

4. Fully dimensioned shop drawings including floorplans, enlarged plans, elevations, and installation details of all security devices, equipment rooms and closets, consoles, controllers, racks, enclosures, and fabricated equipment, showing locations of all major components including mounting details. Indicate UL system and rating listings for penetration firestop systems through rated partitions and floors.

5. Bill of Materials.

6. Material Safety Data Sheets (MSDS) for fire stopping materials and sealants.

C. Submit System Programming submittals for review and approval prior to commencement of work:

1. Proposed programming, including nomenclature conventions, device names and text descriptions, timings, camera call-up trigger alarms with associated cameras, and sequence of operations.

2. Approved device names and text descriptions as programmed into the security systems shall be reflected on the "As-Built" Record Drawings as well as on device and cable labels.

D. Submit Operation and Maintenance Manuals (O&M's) submittals for review and approval prior to the completion of the project:

1. Updated product data and shop drawings submittals reflecting the final conditions.

2. Warranty letter with start and end date.

3. Warranty service and maintenance contact information: including names, address, phone number, and website address. Provide specific instructions or forms as required to initiate a trouble ticket or work order request.

4. Letter indicating that all software and licensing is the sole property of the Owner.

5. Troubleshooting checklist information.

6. Replacement parts and consumables ordering information including the contact information for local sources.

7. Provide an updated System Programming submittal including:

a. Final listing of doors, locations, and normal status in CSV format.

b. System administration and management operating instructions.

c. Setting up Users, User Groups, Access Levels, Doors, Door Schedules, and Exceptions

d. Assigning Access Groups to all Users.

e. Monitoring system activity.

f. Running standard reports.

g. Setting up logins and permissions.

E. Submit "As-Built" Record Drawings submittals for review and approval prior to the completion of the project:

1. Maintain a complete set of "As-Built" Record Drawings at the project site updated with mark-ups of the actual installation conditions.

2. Prior to the completion of the project transfer all installation conditions mark-ups to electronic drawings and submit to the Owner in CAD and PDF formats.

1.6 QUALITY ASSURANCE

A. Equipment shall be tested and found to comply with the limits for a Class A or B digital device, pursuant to part 15 of the FCC rules.

B. Security technology devices shall be mounted using compatible Verkada accessories.

C. Security technology devices shall be of the latest technology. No discontinued models or products are acceptable.

D. Installation technicians shall successfully complete the Verkada Certified Engineer (VCE) program prior to starting work. For more information, visit http://www.verkada.com/partners/trainings.

E. Contractor qualifications:

1. Minimum of two years of system design, engineering supervision, and installation experience in the access control industry.

2. Maintain a local office, with a service center staffed by trained technicians and must be adequately equipped to provide emergency phone service within 24 hours on a 24-hour, 365 days per year basis, whether or not the Owner purchases a maintenance contract with the Contractor.

3. Maintain an inventory of spare parts and other items critical to system operation, as necessary to meet the emergency service requirements.

4. Maintain an in-house engineering and project management capability consistent with the requirements of this project.

5. Provide a project manager who is actively engaged in the project. This person shall be the same individual throughout the course of the project and shall be the person responsible for the scheduling of the system programming, preparation of the submittals and project close-out documentation, training programs, system testing and report documentation, and the coordination of all subcontract labor. The Owner reserves the right to approve the Contractor's project manager.

6. Abide by and adhere to all Drug Free School Zone laws and participate in a drug-free workplace program.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Ship equipment in original packaging to prevent damage. All handling shall be in accordance with manufacturer recommendations. Inspect all products and materials for any damage immediately upon delivery to the project site.

B. Provide protective covering during construction.

C. Replace equipment and products damaged during shipping, handling, distribution, storage, installation, or construction with new equipment and products.

D. Equipment and products stored at the project site or at an off-site location shall be protected from dust, dirt, and foreign matter. Protect equipment and products from water, damage, dents, bumps, and scratches.

1.8 SCHEDULING

A. Submit proposed construction schedule detailing the task milestones, durations, and sequences for the project for review and approval prior to commencement of work.

B. When work is performed in a sensitive area or in an area occupied with ongoing business activities coordinate with the Owner and the affected department's representative to determine the best time to perform the work required.

1.9 WARRANTY

A. Provide one-year parts and labor project warranty. Parts and labor shall be guaranteed against defects in materials and workmanship for one year from written notification of acceptance.

B. All Verkada hardware purchases are backed by a 10-year limited warranty. For more information, visit verkada.com/support/terms-of-sale.

PART 2 - PRODUCTS

2.1 MANUFACTURER

A. Manufacturer shall be Verkada Inc.

1. Headquarters: 405 E 4th Ave. San Mateo, CA 94401
2. Toll Free: (888) 829-0668
3. General: team@verkada.com
4. Sales: sales@verkada.com
5. Website: www.verkada.com
6. Non-Verkada Inc. products shall be limited to those identified as compatible within the product descriptions below.

2.2 LICENSING

A. Provide all required licenses for the specified system components.

B. All system component licenses shall be 5-yearlicenses.

2.4 INDOOR DOME SERIES

A. CD32 Indoor Dome Camera by Verkada Inc.

1. Onboard Storage: 768GB
2. Sensor Resolution: 3MP (2048 x 1536 pixels)
3. Lens Type: Fixed
4. Image Sensor: 1/2.8” Progressive CMOS
5. Focal Length: 2.8mm
6. Iris: Fixed
7. Aperture: F1.6

8. Lens Distortion Correction (LDC): LDC crops the sensor field of view to deliver a rectified, undistorted output image.

9. Field of View (FoV after LDC):

   a. Horizontal: 97° (78°)

   b. Vertical: 71° (63°)

   c. Diagonal: 128° (91°)

10. IR Range: 15m / 50ft in low light

11. Audio: Yes

12. Resistance Ratings:

   a. IK08

   b. FCC

   c. IEC60950-1

13. Dimensions:

   a. With Mount Plate:

      1) Length: 146mm / 5.75in

      2) Width: 146mm / 5.75in

      3) Height: 104.3mm / 4.11in

   b. Without Mount Plate:

      1) Length: 146mm / 5.75in

      2) Width: 146mm / 5.75in

      3) Height: 99.8mm / 3.93in

14. Weight:

   a. With Mount Plate: 748g / 26.38oz

   b. Without Mount Plate: 608g / 21.45oz

15. Operating Power: 11W (IEEE 802.3af PoE)

16. Operating Temperature: -10°C to 50°C / 14°F to 122°F

17. Operating Humidity: 0% to 90%

18. Connectivity: Ethernet 10/100Mbps RJ-45 cable connector for Network/PoE connection

B. CD42 Indoor Dome Camera by Verkada Inc.

1. Onboard Storage: 768GB

2. Sensor Resolution: 5MP (2688 x 1944 pixels)

3. Lens Type: Fixed
4. Image Sensor: 1/2.8” Progressive CMOS
5. Focal Length: 2.8mm
6. Iris: Fixed
7. Aperture: F1.6
8. Lens Distortion Correction (LDC): LDC crops the sensor field of view to deliver a rectified, undistorted output image.
9. Field of View (FoV after LDC):
    a. Horizontal: 87° (78°)
    b. Vertical: 70° (63°)
    c. Diagonal: 101° (91°)
10. IR Range: 15m / 50ft in low light
11. Audio: Yes
12. Resistance Ratings:
    a. IK08
    b. FCC
    c. IEC60950-1
13. Dimensions:
    a. With Mount Plate:
        1) Length: 146mm / 5.75in
        2) Width: 146mm / 5.75in
        3) Height: 104.3mm / 4.11in
    b. Without Mount Plate:
        1) Length: 146mm / 5.75in
        2) Width: 146mm / 5.75in
        3) Height: 99.8mm / 3.93in
14. Weight:
    a. With Mount Plate: 748g / 26.38oz
    b. Without Mount Plate: 608g / 21.45oz
15. Operating Power: 11W (IEEE 802.3af PoE)
16. Operating Temperature: -10°C to 50°C / 14°F to 122°F

17. Operating Humidity: 0% to 90%

18. Connectivity: Ethernet 10/100Mbps RJ-45 cable connector for Network/PoE connection

C. CD52 Indoor Dome Camera by Verkada Inc.

1. Onboard Storage: 768GB

2. Sensor Resolution: 5MP (2688 x 1944 pixels)

3. Lens Type: 3x Optical Zoom

4. Image Sensor: 1/2.8” Progressive CMOS

5. Focal Length: 2.8 to 8mm

6. Iris: P-Iris

7. Aperture: F1.3 to F2.4

8. Lens Distortion Correction (LDC): LDC crops the sensor field of view to deliver a rectified, undistorted output image.

9. Field of View (FoV after LDC):

   a. Horizontal: 41° to 93° (37° to 84°)

   b. Vertical: 31° to 76° (28° to 68°)

   c. Diagonal: 50° to 107° (45° to 97°)

10. IR Range: 30m / 98ft in low light

11. Audio: Yes

12. Resistance Rating:

   a. IK08

   b. FCC

   c. IEC60950-1

13. Dimensions:

   a. With Mount Plate:

      1) Length: 146mm / 5.75in

      2) Width: 146mm / 5.75in

      3) Height: 104.3mm / 4.11in

   b. Without Mount Plate:

      1) Length: 146mm / 5.75in

      2) Width: 146mm / 5.75in

      3) Height: 99.8mm / 3.93in

14. Weight:
    a. With Mount Plate: 916g / 32.31oz
    b. Without Mount Plate: 776g / 27.37oz
15. Operating Power: 11W (IEEE 802.3af PoE)
16. Operating Temperature: -10°C to 50°C / 14°F to 122°F
17. Operating Humidity: 0% to 90%
18. Connectivity: Ethernet 10/100Mbps RJ-45 cable connector for Network/PoE connection

D. CD62 Indoor Dome Camera by Verkada Inc.

1. Onboard Storage: 768GB
2. Sensor Resolution: 4K (3840 x 2160 pixels)
3. Lens Type: 3x Optical Zoom
4. Image Sensor: 1/2.8” Progressive CMOS
5. Focal Length: 2.8 to 8mm
6. Iris: P-Iris
7. Aperture: F1.3 to F2.4
8. Lens Distortion Correction (LDC): LDC crops the sensor field of view to deliver a rectified, undistorted output image.
9. Field of View (FoV after LDC):
    a. Horizontal: 44° to 97° (40° to 87°)
    b. Vertical: 26° to 63° (23° to 57°)
    c. Diagonal: 50° to 106° (45° to 95°)
10. IR Range: 30m / 98ft in low light
11. Audio: Yes
12. Resistance Rating:
    a. Rating IK08
    b. FCC
    c. IEC60950-1
13. Dimensions:
    a. With Mount Plate:
        1) Length: 146mm / 5.75in
        2) Width: 146mm / 5.75in

3) Height: 104.3mm / 4.11in

b. Without Mount Plate:

1) Length: 146mm / 5.75in

2) Width: 146mm / 5.75in

3) Height: 99.8mm / 3.93in

14. Weight:

a. With Mount Plate: 916g / 32.31oz

b. Without Mount Plate: 776g / 27.37oz

15. Operating Power: 11W (IEEE 802.3af PoE)

16. Operating Temperature: -10°C to 50°C / 14°F to 122°F

17. Operating Humidity: 0% to 90%

18. Connectivity: Ethernet 10/100Mbps RJ-45 cable connector for Network/PoE connection

2.5 OUTDOOR DOME SERIES

A. CD32-E Outdoor Dome Camera by Verkada Inc.

1. Onboard Storage: 768GB

2. Sensor Resolution: 3MP (2048 x 1536 pixels)

3. Lens Type: Fixed

4. Image Sensor: 1/2.8” Progressive CMOS

5. Focal Length: 2.8mm

6. Iris: Fixed

7. Aperture: F1.6

8. Lens Distortion Correction (LDC): LDC crops the sensor field of view to deliver a rectified, undistorted output image.

9. Field of View (FoV after LDC):

a. Horizontal: 97° (78°)

b. Vertical: 71° (63°)

c. Diagonal: 128° (91°)

10. IR Range: 15m / 50ft in low light

11. Audio: Yes

12. Resistance Ratings:

a. IK08

b. FCC

c. IEC60950-1

13. Dimensions:

a. With Mount Plate:

1) Length: 146mm / 5.75in

2) Width: 146mm / 5.75in

3) Height: 104.3mm / 4.11in

b. Without Mount Plate:

1) Length: 146mm / 5.75in

2) Width: 146mm / 5.75in

3) Height: 99.8mm / 3.93in

14. Weight:

a. With Mount Plate: 748g / 26.38oz

b. Without Mount Plate: 608g / 21.45oz

15. Operating Power: 11W (IEEE 802.3af PoE)

16. Operating Temperature: -10°C to 50°C / 14°F to 122°F

17. Operating Humidity: 0% to 90%

18. Connectivity: Ethernet 10/100Mbps RJ-45 cable connector for Network/PoE connection

B. CD42-E Outdoor Dome Camera by Verkada Inc.

1. Onboard Storage768GB

2. Sensor Resolution: 5MP (2688 x 1944 pixels)

3. Lens Type: Fixed

4. Image Sensor: 1/2.8” Progressive CMOS

5. Focal Length: 2.8mm

6. Iris: Fixed

7. Aperture: F1.6

8. Lens Distortion Correction (LDC): LDC crops the sensor field of view to deliver a rectified, undistorted output image.

9. Field of View (after LDC):

a. Horizontal: 87° (78°)

b. Vertical: 70° (63°)

c. Diagonal: 101° (91°)

10. IR Range: 15m / 50ft in low light

11. Audio: Yes

12. Resistance Rating:

a. IK10

b. IP67

c. FCC

d. IEC60950-1

13. Dimensions:

a. With Mount Plate:

1) Length: 155mm / 6.1in

2) Width: 155mm / 6.1in

3) Height: 114.6mm / 4.51in

b. Without Mount Plate:

1) Length: 155mm / 6.1in

2) Width: 155mm / 6.1in

3) Height: 107.6mm / 4.24in

14. Weight:

a. With Mount Plate: 1021g / 36.01oz

b. Without Mount Plate: 847g / 29.88oz

15. Operating Power:

a. With IR: IEEE 802.3af Type 1 PoE

b. Without IR: IEEE 802.3af Type 1 PoE

c. Extended temperature range: IEEE 802.3at Type 2 PoE+

16. Operating Temperature:

a. PoE 802.3af: -20°C to 50°C / -4°F to 122°F

b. PoE 802.3at: -40°C to 50°C / -40°F to 122°F

17. Operating Humidity: 0% to 90%

18. Connectivity: Ethernet 10/100Mbps RJ-45 cable connector for Network/PoE connection

C. CD52-E Outdoor Dome Camera by Verkada Inc.

1. Onboard Storage: 768GB

2. Sensor Resolution: 5MP (2688 x 1944 pixels)
3. Lens Type: 3x Optical Zoom
4. Image Sensor: 1/2.8” Progressive CMOS
5. Focal Length: 2.8 to 8mm
6. Iris: P-Iris
7. Aperture: F1.3 to F2.4
8. Lens Distortion Correction (LDC): LDC crops the sensor field of view to deliver a rectified, undistorted output image.
9. Field of View (FoV after LDC):
    a. Horizontal: 41° to 93° (37° to 84°)
    b. Vertical: 31° to 76° (28° to 68°)
    c. Diagonal: 50° to 107° (45° to 97°)
10. IR Range: 30m / 98ft in low light
11. Audio: Yes
12. Resistance Rating:
    a. IK10
    b. IP67
    c. FCC
    d. IEC60950-1
13. Dimensions:
    a. With Mount Plate:
        1) Length: 155mm / 6.1in
        2) Width: 155mm / 6.1in
        3) Height: 114.6mm / 4.51in
    b. Without Mount Plate:
        1) Length: 155mm / 6.1in
        2) Width: 155mm / 6.1in
        3) Height: 107.6mm / 4.24in
14. Weight:
    a. With Mount Plate: 1244g / 43.88oz
    b. Without Mount Plate: 1070g / 37.74oz

15. Operating Power:
    a. With IR: IEEE 802.3af Type 1 PoE
    b. Without IR: IEEE 802.3af Type 1 PoE
    c. Extended temperature range: IEEE 802.3at Type 2 PoE+
16. Operating Temperature:
    a. PoE 802.3af: -20°C to 50°C / -4°F to 122°F
    b. PoE 802.3at: -40°C to 50°C / -40°F to 122°F
17. Operating Humidity: 0% to 90%
18. Connectivity: Ethernet 10/100Mbps RJ-45 cable connector for Network/PoE connection

D. CD62-E Outdoor Dome Camera by Verkada Inc.
1. Onboard Storage: 768GB
2. Sensor Resolution: 4K (3840 x 2160 pixels)
3. Lens Type: 3x Optical Zoom
4. Image Sensor: 1/2.8” Progressive CMOS
5. Focal Length: 2.8 to 8mm
6. Iris: P-Iris
7. Aperture: F1.3 to F2.4
8. Lens Distortion Correction (LDC): LDC crops the sensor field of view to deliver a rectified, undistorted output image.
9. Field of View (FoV after LDC):
    a. Horizontal: 44° to 97° (40° to 87°)
    b. Vertical: 26° to 63° (23° to 57°)
    c. Diagonal: 50° to 106° (45° to 95°)
10. IR Range: 30m / 98ft in low light
11. Audio: Yes
12. Resistance Rating:
    a. IK10
    b. IP67
    c. FCC
    d. IEC60950-1
13. Dimensions:

a. With Mount Plate:

1) Length: 155mm / 6.1in

2) Width: 155mm / 6.1in

3) Height: 114.6mm / 4.51in

b. Without Mount Plate:

1) Length: 155mm / 6.1in

2) Width: 155mm / 6.1in

3) Height: 107.6mm / 4.24in

14. Weight:

a. With Mount Plate: 1168g / 41.2oz

b. Without Mount Plate: 994g / 35.06oz

15. Operating Power:

a. With IR: IEEE 802.3af Type 1 PoE

b. Without IR: IEEE 802.3af Type 1 PoE

c. Extended temperature range: IEEE 802.3at Type 2 PoE+

16. Operating Temperature:

a. PoE 802.3af: -20°C to 50°C / -4°F to 122°F

b. PoE 802.3at: -40°C to 50°C / -40°F to 122°F

17. Operating Humidity: 0% to 90%

18. Connectivity: Ethernet 10/100Mbps RJ-45 cable connector for Network/PoE connection

2.6 MINI SERIES

A. CM41 Interior Mini Dome Camera by Verkada Inc.

1. Onboard Storage: 768GB

2. Sensor Resolution: 5MP (2688 x 1944 pixels)

3. Lens Type: Fixed

4. Image Sensor: 1/2.8” Progressive CMOS

5. Focal Length: 2.8mm

6. Iris: Fixed

7. Aperture: F1.6

8. Lens Distortion Correction (LDC): LDC crops the sensor field of view to deliver a rectified, undistorted output image.

9. Field of View (FoV after LDC):
    a. Horizontal: 86° (77°)
    b. Vertical: 69° (62°)
    c. Diagonal: 100° (90°)
10. IR Range: 15m / 49ft in low light
11. Audio: Yes
12. Resistance Rating: IK08
13. Dimensions:
    a. Length: 100mm / 3.94in
    b. Width: 100mm / 3.94in
    c. Height: 63mm / 2.48in
14. Weight: 228g / 8.04oz
15. Operating Power: 6W (IEEE 802.3af PoE)
16. Operating Temperature: -10°C to 50°C / 14°F to 122°F
17. Operating Humidity: 0% to 90%
18. Connectivity: Ethernet 10/100Mb RJ-45 Cable Connector for Network/PoE Connection

B. CM41-E Exterior Mini Dome Camera by Verkada Inc.

1. Onboard Storage: 768GB
2. Sensor Resolution: 5MP (2688 x 1944 pixels)
3. Lens Type: Fixed
4. Image Sensor: 1/2.8” Progressive CMOS
5. Focal Length: 2.8mm
6. Iris: Fixed
7. Aperture: F1.6
8. Lens Distortion Correction (LDC): LDC crops the sensor field of view to deliver a rectified, undistorted output image.
9. Field of View (FoV after LDC):
    a. Horizontal: 86° (77°)
    b. Vertical: 69° (62°)
    c. Diagonal: 100° (90°)
10. IR Range: 15m / 49ft in low light

11. Audio: Yes
12. Resistance Rating:
    a. IK10
    b. IP67
    c. IP6K9K
13. Dimensions:
    a. Length: 121mm / 4.76in
    b. Width: 121mm / 4.76in
    c. Height: 72mm / 2.83in
14. Weight: 401g / 14.14oz
15. Operating Power: 12W (IEEE 802.3af PoE)
16. Operating Temperature: -40°C to 55°C / -40°F to 131°F
17. Operating Humidity: 0% to 90%
18. Connectivity: Ethernet 10/100Mb RJ-45 Cable Connector for Network/PoE Connection

C. CM41-S Modular Mini Dome Camera by Verkada Inc.

1. Onboard Storage: 768GB
2. Sensor Resolution: 5MP (2688 x 1944)
3. Lens Type: Fixed
4. Image Sensor: 1/2.8” Progressive CMOS
5. Focal Length: 2.8mm
6. Iris: Fixed
7. Aperture: F1.6
8. Lens Distortion Correction (LDC): LDC crops the sensor field of view to deliver a rectified, undistorted output image.
9. Field of View (FoV after LDC):
    a. Horizontal: 86° (77°)
    b. Vertical: 69° (62°)
    c. Diagonal: 100° (90°)
10. IR Range: N/A
11. Audio: No
12. Resistance Rating: N/A

13. Dimensions:

    a. Camera Head

        1) Length: 35.22mm / 1.39in

        2) Width: 55.22mm / 2.17in

        3) Height: 47.9mm / 1.89in

    b. Base:

        1) Length: 94.18mm / 3.71in

        2) Width: 94.18mm / 3.71in

        3) Height: 27.64mm / 1.09in

14. Weight:

    a. With Mount Plate: 254g / 8.96oz

    b. Without Mount Plate: 199g / 7.02oz

15. Operating Power: 4.5W (IEEE 802.3af PoE)

16. Operating Temperature: -10°C to 50°C / 14°F to 122°F

17. Operating Humidity: 0% to 90%

18. Connectivity: Ethernet 10/100Mb RJ-45 Cable Connector for Network/PoE Connection

2.7 BULLET SERIES

A. CB52-E Wide View Exterior Bullet Camera by Verkada Inc.

1. Onboard Storage: 768GB

2. Sensor Resolution: 5MP (2688 x 1944 pixels)

3. Lens Type: Varifocal; Motorized Zoom

4. Image Sensor: 1/2.8” Progressive CMOS

5. Focal Length: 2.8mm to 8mm

6. Iris: P-Iris

7. Aperture: F1.5 to F2.8

8. Lens Distortion Correction (LDC): LDC crops the sensor field of view to deliver a rectified, undistorted output image.

9. Field of View (FoV after LDC):

    a. Horizontal: 41° to 99° (39° to 95°)

    b. Vertical: 30° to 74° (30° to 74°)

    c. Diagonal: 50° to 125° (48° to 110°)

10. IR Range: 30m / 98ft in low light
11. Audio: No
12. Resistance Rating:
    a. IK10
    b. IP67
13. Dimensions:
    a. Length: 254mm / 10in
    b. Width: 85mm / 3.35in
    c. Height: 85mm / 3.35in
14. Weight
    a. With Mount Plate: 1497g / 52.81oz
    b. Without Mount Plate: 1464g / 51.64oz
15. Operating Power:
    a. With IR: IEEE 802.3at Type 2 PoE+
    b. Without IR: IEEE 802.3af Type 1 PoE
    c. Extended temperature range: IEEE 802.3at Type 2 PoE+
16. Operating Temperature: -40°C to 50°C / -40°F to 122°F
17. Operating Humidity: 0% to 90%
18. Connectivity: Ethernet 10/100Mb RJ-45 Cable Connector for Network/PoE Connection

B. CB52-TE Narrow View Exterior Bullet Camera by Verkada Inc.

1. Onboard Storage768GB
2. Sensor Resolution: 5MP (2688 x 1944 pixels)
3. Lens Type: Varifocal; Motorized Zoom
4. Image Sensor: 1/2.8” Progressive CMOS
5. Focal Length: 2.8mm to 8mm
6. Iris: P-Iris
7. Aperture: F1.5 to F2.8
8. Lens Distortion Correction (LDC): LDC crops the sensor field of view to deliver a rectified, undistorted output image.
9. Field of View (FoV after LDC):
    a. Horizontal: 16° to 38° (16° to 37°)

b. Vertical: 12° to 28° (12° to 27°)

c. Diagonal: 19° to 48° (19° to 44°)

10. IR Range: 50m / 164ft in low light

11. Audio: No

12. Resistance Rating:

a. IK10

b. IP67

13. Dimensions:

a. Length: 254mm / 10in

b. Width: 85mm / 3.35in

c. Height: 85mm / 3.35in

14. Weight:

a. With Mount Plate: 1511g / 53.3oz

b. Without Mount Plate: 1478g / 52.13oz

15. Operating Power:

a. With IR: IEEE 802.3at Type 2 PoE+

b. Without IR: IEEE 802.3af Type 1 PoE

c. Extended temperature range: IEEE802.3at Type 2 PoE+

16. Operating Temperature: -40°C to 50°C / -40°F to 122°F

17. Operating Humidity: 0% to 90%

18. Connectivity: Ethernet 10/100Mb RJ-45 Cable Connector for Network/PoE Connection

C. CB62-E Wide View Exterior Bullet Camera by Verkada Inc.

1. Onboard Storage768GB

2. Sensor Resolution: 4K (3840 x 2160 pixels)

3. Lens Type: Varifocal; Motorized Zoom

4. Image Sensor: 1/2.8” Progressive CMOS

5. Focal Length: 2.8mm to 8mm

6. Iris: P-Iris

7. Aperture: F1.5 to F2.8

8. Lens Distortion Correction (LDC): LDC crops the sensor field of view to deliver a rectified, undistorted output image.

9. Field of View (FoV after LDC):
    a. Horizontal: 43° to 107° (41° to 106°)
    b. Vertical: 24° to 62° (24° to 62°)
    c. Diagonal: 49° to 126° (48° to 119°)
10. IR Range: 30m / 98ft in low light
11. Audio: No
12. Resistance Rating:
    a. IK10
    b. IP67
13. Dimensions:
    a. Length: 254mm / 10in
    b. Width: 85mm / 3.35in
    c. Height: 85mm / 3.35in
14. Weight
    a. With Mount Plate: 1497g / 52.81oz
    b. Without Mount Plate: 1464g / 51.64oz
15. Operating Power:
    a. With IR: IEEE 802.3at Type 2 PoE+
    b. Without IR: IEEE 802.3af Type 1 PoE
    c. Extended temperature range: IEEE 802.3at Type 2 PoE+
16. Operating Temperature: -40°C to 50°C / -40°F to 122°F
17. Operating Humidity: 0% to 90%
18. Connectivity: Ethernet 10/100Mb RJ-45 Cable Connector for Network/PoE Connection

D. CB62-TE Narrow View Exterior Bullet Camera by Verkada Inc.
1. Onboard Storage: 768GB
2. Sensor Resolution: 4K (3840 x 2160 pixels)
3. Lens Type: Varifocal; Motorized Zoom
4. Image Sensor: 1/2.8” Progressive CMOS
5. Focal Length: 2.8mm to 8mm
6. Iris: P-Iris
7. Aperture: F1.5 to F2.8

8. Lens Distortion Correction (LDC): LDC crops the sensor field of view to deliver a rectified, undistorted output image.

9. Field of View (FoV after LDC):

   a. Horizontal: 17° to 42° (17° to 41°)

   b. Vertical: 9° to 23° (9° to 23°)

   c. Diagonal: 19° to 48° (19° to 46°)

10. IR Range: 50m / 164ft in low light

11. Audio: No

12. Resistance Rating:

   a. IK10

   b. IP67

13. Dimensions:

   a. Length: 254mm / 10in

   b. Width: 85mm / 3.35in

   c. Height: 85mm / 3.35in

14. Weight:

   a. With Mount Plate: 1511g / 53.3oz

   b. Without Mount Plate: 1478g / 52.13oz

15. Operating Power:

   a. With IR: IEEE 802.3at Type 2 PoE+

   b. Without IR: IEEE 802.3af Type 1 PoE

   c. Extended temperature range: IEEE802.3at Type 2 PoE+

16. Operating Temperature: -40°C to 50°C / -40°F to 122°F

17. Operating Humidity: 0% to 90%

18. Connectivity: Ethernet 10/100Mb RJ-45 Cable Connector for Network/PoE Connection

2.8 FISHEYE SERIES

A. CF81-E Fisheye Camera by Verkada Inc.

1. Onboard Storage: 1TB

2. Sensor Resolution: 12MP (4056 x 3040 pixels)

3. Lens Type: Fixed Zoom

4. Image Sensor: 1/2.3” Progressive CMOS

5. Focal Length: 1.18mm
6. Iris: Fixed
7. Aperture: F2.18
8. Lens Distortion Correction (LDC): LDC crops the sensor field of view to deliver a rectified, undistorted output image.
9. Field of View after LDC:
    a. Horizontal: 180°
    b. Vertical FoV: 180°
    c. Diagonal: 180°
10. IR Range: 20m / 66ft in low light
11. Audio: Yes
12. Resistance:
    a. FCC
    b. CE - EN55035
    c. IK10
    d. IP67
13. Dimensions
    a. With Mount Plate:
        1) Length: 155mm / 6.1in
        2) Width: 155mm / 6.1in
        3) Height: 71.62mm / 2.82in
    b. Without Mount Plate:
        1) Length: 155mm / 6.1in
        2) Width: 155mm / 6.1in
        3) Height: 64.42mm / 2.54in
14. Weight:
    a. With Mount Plate: 1202g / 42.4oz
    b. Without Mount Plate: 1023g / 36.1oz
15. Operating Power:
    a. With IR: IEEE 802.3af Type 1 PoE/IEEE 802.3at Type 2 PoE+
    b. Extended temperature range: IEEE802.3at Type 2 PoE+

16. Operating Temperature: -40°C to 50°C / -40°F to 122°F

17. Operating Humidity: 0% - 90%

18. Connectivity: Ethernet RJ-45 cable connector for network/PoE connection; 10/100 Mbps

2.9 MULTISENSOR SERIES

A. CH52-E Multisensor Camera by Verkada Inc.

1. Onboard Storage: 4TB

2. Sensor Resolution: 4 x 5MP (2688 x 1944 pixels)

3. Lens Type: Varifocal; motorized zoom

4. Image Sensor: 4 x 1 / 2.8” Progressive CMOS

5. Focal Length: 3.7-7.7mm

6. Iris: N/A

7. Aperture: F1.9 - F2.9

8. Sensor Movement:

   a. Tilt: +0°-105° for each lens from horizon

   b. Pan: +/- 90° for each lens

   c. Rotation: +/- 90° for each lens

9. Lens Distortion Correction (LDC): LDC crops the sensor field of view to deliver a rectified, undistorted output image.

10. Field of View (FoV after LDC):

    a. Horizontal: 37° to 89° (35° to 82°)

    b. Vertical: 29° to 65° (26° to 60°)

    c. Diagonal: 46° to 99° (43° to 92°)

11. IR Range: 30m / 98ft

12. Audio: Not supported

13. Resistance:

    a. FCC

    b. CE - EN55035

    c. IK10

    d. IP67

14. Dimensions

    a. With Mount Plate:

1) Length: 275mm / 10.83in

2) Width: 275mm / 10.83in

3) Height: 118mm / 4.65in

b. Without Mount Plate:

1) Length: 267mm / 10.51in

2) Width: 267mm / 10.51in

3) Height: 114mm / 4.49in

15. Weight:

a. With Mount Plate: 3436g / 121.2oz

b. Without Mount Plate: 2900g / 102.29oz

16. Operating Power:

a. With IR: IEEE 802.3bt Type 3 PoE++

b. Without IR: IEEE 802.3at Type 2 PoE+

c. Extended temperature range: IEEE 802.3bt Type 3 PoE++

17. Operating Temperature: -40°C to 50°C / -40°F to 122°F

18. Operating Humidity: 0% to 90%

19. Connectivity: Ethernet RJ-45 cable connector for network/PoE connection; 10/100 Mbps

2.10 VIEWING STATION

A. VX52 Video Surveillance Viewing Station by Verkada Inc.

1. Description:

a. The VX52 is a dedicated device that streams up to 300 camera feeds (30 cameras per page, up to 10 pages) to any display with ultra-low latency, crisp video playback, customizable Smart Tiles and layouts. Built on the powerful Apple TV 4K platform, the VX52 is the viewing platform of choice for customers with mission-critical real-time viewing requirements.

b. Administrator Managed Device – Admins can remotely manage the VX52, select video feeds and Smart Tiles to display as well as customize layouts. Non-admin viewers do not need accounts, cannot access historical footage, and cannot modify display settings.

c. Plug-and-Play by Design – Simply connect the device to your network via ethernet or WiFi and project on a display. The VX52 is ready to stream in minutes with zero configuration needed.

d. Stable and Resilient – Streams play continuously without interruption for both local and remote streaming. There is no need to reset the device or relaunch a browser or application, streams restart automatically after a power outage.

e. Supported by Verkada – Admins configure the VX52 in Command, just like their cameras. The VX52 is backed by our industry-leading 10-year warranty and the dedicated Verkada customer support team.

2. Key Features

    a. Stream up to 300 cameras across 10 pages on a single display

    b. Ultra-low latency with crisp video playback

    c. Administrator managed device without requiring additional accounts

    d. Plug-and-play with zero local configuration needed

    e. Easily configure Smart Tiles and layout display from Command

    f. Automatically restarts after a power outage

    g. 10-year warranty

3. Technical Specifications

    a. Supported Displays: One display per station

    b. Number of Streams:

        1) 30 streams per page

        2) 300 streams total

    c. Processor: A12 Bionic chip

    d. Dimensions:

        1) Length: 99.1mm / 3.9in

        2) Width: 99.1mm / 3.9in

        3) Height: 35.6mm / 1.4in

    e. Weight: Weight: 425g / 15oz

    f. Operating Temperature: 0° to 35° C / 32°F to 95°F

    g. Operating Humidity: 0% to 95%

    h. Operating altitude: Up to 3,000m / 10,000ft

    i. Display Resolution Supported: Up to 4096 x 2160 pixels

    j. Included accessories:

        1) HDMI cord

        2) setup guide

        3) power cord

        4) Apple TV remote

    k. Connectors:

        1) HDMI 2.1 port

        2) Gigabit Ethernet

l. Connectivity: 10/100/1000BASE-T Gigabit Ethernet (RJ-45), 802.11 ax WiFi 6

2.11 POE INJECTORS

A. INJ-POE-PLUS Power over Ethernet+ Injector by Verkada Inc.

1. Description: Verkada's INJ-POE-PLUS is a single port, high-power solution for remote powering of PoE enabled hardware, including Verkada security cameras, access control, and environmental sensors. Generating up to 30W, the INJ-POE-PLUS enables remote power for a new range of applications including 802.11n Access Points and pan-tilt-zoom (PTZ) cameras. It complies to IEEE 802.3at PoE standard and is backward compatible to IEEE802.3af. It can power both existing 10/100Base-T network devices and emerging wireless 1000Base-T devices such as WiMAX and wireless IEEE 802.11n access points.

2. Key Features:

a. IEEE 802.3at compliant with 2-event classification

b. IEEE 802.3af backward compatible

c. Output power of 30W is guaranteed

d. Supports 10/100/1000Base-T applications

e. Compatible with IEEE 802.3af devices

f. Safe – low power devices receive only the power they need

g. Automatic Detection and Protection of non-standard Ethernet terminals

h. Compact design fits easily in WLAN Access Point and IP Cameras installations

3. Technical Specifications

a. Data Rates: 10/100/1000 Mbps

b. Power over Ethernet Output:

c. Pin Assignment and Polarity: Spare Pairs 7/8 (-) and 4/5 (+)

d. Output Power Voltage: 55 VDC

e. User Port Power: 30W (Guaranteed)

f. Input Power Requirements:

1) AC Input Voltage: 100VAC to 240VAC (±10%)

2) AC Input Current: 0.67A @ 100VAC to 240VAC

3) AC Frequency: 50 to 60Hz

g. Dimensions:

1) Length: 160.5mm / 6.32in

2) Width: 51.8mm / 2.04in

3) Height: 34.8mm / 1.37in

h. Weight: 200g / 7.05oz

i. Connectors:

1) Shielded RJ-45

2) EIA 568A

3) EIA 568B

j. Environmental Conditions:

1) Operating Ambient Temperature:

a) -4°F to 104°F (-20 °C to 40°C) @30W

a) -4°F to 131°F (-20 °C to 55°C) @22.5W

k. Operating Humidity: 0% to 90%

l. Operating Altitude: -304.8m to 3,048m / -1,000ft to 10,000 ft

m. MTBF: 100,000 hrs @ 25°C

n. Thermal Rating: 20 BTU/Hr (@240VAC)

o. Regulatory Compliance:

1) IEEE 802.3af (PoE)

2) RoHS Compliant

3) WEEE Compliant

4) CE

p. Electromagnetic Emission and Immunity:

1) FCC Part 15, Class B

2) EN 55032 Class B (Emissions)

3) EN 55024 (Immunity)

4) VCCI

q. Safety: UL/EN/IEC 60950-1 (Ed.2)

B. ACC-POE-60W Power over Ethernet++ Injector by Verkada Inc.

1. Description: Verkada's ACC-POE-60W converts two inputs – a power cable and an Ethernet cable – to a single PoE ++ port (IEEE 802.3bt standard, type 3 compliant) with up to 60W of power. The ACC-POE-60W is designed to power the CH52-E Multisensor camera, but it is also backwards compatible and safe to use with any IEEE 802.3af/at terminals in other Verkada devices. The ACC-POE-60W comes with a US power cord (for US customers) and a UK power cord (for Europe customers) and is wall mountable.

2. Key Features

a. IEEE 802.bt Type 3 compliant

b. IEEE 802.3af/at backward compatible

c. Output power of 60W over 4–pairs

d. Supports 10/100/1000 Base–T applications

e. Safe: low–power devices receive only the power they need

f. Automatic detection and protection of non–standard Ethernet terminals

g. Compact design fits easily in WLAN access point and IP camera installations

3. Technical Specifications

a. Data Rates: 10/100/1000 Mbps

b. Power over Ethernet Output:

1) Data Pairs:

a) 1/2 (-)

b) 3/6 (+)

2) Spare Pairs:

a) 7/8 (-)

b) 4/5 (+)

3) Output Voltage: 55 V nominal

c. Output Power Voltage: 55 VDC

d. User Port Power: 30W (Guaranteed)

e. Input Power Requirements:

1) AC Input Voltage: 100 to 240V

2) AC Input Current: 1.5A

3) AC Frequency: 50 / 60Hz

f. Dimensions:

1) Length: 151mm / 5.94in

2) Width: 62mm / 2.44in

3) Height: 38mm / 1.5in

g. Weight: 500g / 17.64oz

h. Connectors:

1) Shielded RJ-45

2) EIA 568A

3) EIA 568B

i. Environmental Conditions:

1) Operating Ambient Temperature:

a) -20°C to 40°C / 14°F to 104°F @ 60W

b) -20°C to 55°C / 14°F to 131°F @ 30W

j. Operating Humidity: 0% to 90%

k. Operating Altitude: -400m to 3,048m / -1,312ft to 10,000 ft

l. MTBF: 240,000 hrs @ 25°C

m. Thermal Rating: 34 BTU/Hr

n. Regulatory Compliance: IEEE 802.3bt

o. Electromagnetic Emission and Immunity:

1) FCC Part 15, Class B

2) EN 55032 Class B

3) EN 55024

4) VCCI

p. Safety: CE/UL/IEC/EN 62368-1

2.12 ACCESSORIES

A. ACC-MNT-2 Mounting Arm Kit by Verkada Inc.

1. Description: Wall mounted extender arm with built-in 1.5” female NPT thread.

2. Material: Aluminum Alloy

3. Dimensions:

a. Length: 230.5mm / 9.07in

b. Width: 86mm / 3.39in

c. Height: 117mm / 4.61in

4. Color: White

5. Weight: 700g / 24.69oz

B. ACC-MNT-3 Wall Mounted L-Shaped Bracket Kit by Verkada Inc.

1. Description: Compact bracket for mounting camera perpendicular to wall.

2. Material: Aluminum Alloy

3. Dimensions:

a. Length: 170mm / 6.69in

b. Width: 150mm / 5.91in

c. Height: 110mm / 4.33in

4. Color: White

5. Weight: 577g / 20.35oz

C. ACC-MNT-5 Mini Pendant Cap Mount Kit by Verkada Inc.

1. Description: Two-piece threaded cap for mounting a Mini camera to 3/4” NPT threaded drop pipe. Cap piece can be removed and mounted independently with its 1.5” male NPT thread.

2. Material: Aluminum Alloy

3. Dimensions:

a. Length: 100mm / 3.94in

b. Width: 100mm / 3.94in

c. Height: 102.8mm / 4.05in

4. Color: Dark grey

5. Weight: 240g / 8.47oz

6. Included Accessories:

a. Fasteners

b. Set screw

c. Hex key

D. ACC-MNT-6 Mini Camera Junction Box Mount Adapter by Verkada Inc.

1. Description: For mounting a Mini camera to a standard junction box.

2. Material: Steel Mount Plate, Plastic Cover

3. Dimensions:

a. Length: 130mm / 5.12in

b. Width: 130mm / 5.12in

c. Height: 7.5mm / 0.3in

4. Color: Grey Mount Plate, White Plastic Cover

5. Weight: 160g / 5.64oz

6. Included Accessories:

a. Fasteners

E. ACC-MNT-7 Angle Mount by Verkada Inc.

1. Description: Mounts fisheye and dome cameras 30° from wall for improved field of view.

2. Material: Aluminum Alloy

3. Dimensions:
    a. Length: 155mm / 6.1in
    b. Width: 149mm / 5.87in
    c. Height: 82mm / 3.23in
4. Color: White
5. Weight: 390g / 13.76oz
6. Included Accessories:
    a. Metal mount ring
    b. 3x countersink screws
    c. 3x thumbscrews
    d. Rubber plug

F. ACC-MNT-8 Pendant Cap Mounting Adapter Kit by Verkada Inc.

1. Description: Threaded cap adapter enables mounting of Indoor Dome Series, Outdoor Dome Series, Fisheye Series, and Multisensor Series cameras to hardware with 3/4" female NPT and 1.5" male NPT threads, including ACC-MNT-2 Mounting Arm Kit by Verkada Inc.
2. Material: Aluminum Alloy
3. Dimensions:
    a. Length: 155mm / 6.1in
    b. Width: 155mm / 6.1in
    c. Height: 42mm / 1.65in
4. Color: White
5. Weight: 300g / 10.58oz
6. Included Accessories:
    a. Set screw
    b. 3x thumbscrews.

G. ACC-MNT-9 Pole Mount Adapter by Verkada Inc.

1. Description: For mounting a camera to a circular pole.
2. Mounting Pole Diameter: 32mm to 152.4mm / 1.25in to 6in
3. Material: Steel
4. Dimensions:
    a. Length: 160mm / 6.3in

b. Width: 160mm / 6.3in

c. Height: 68mm / 2.68in

5. Color: White

6. Weight: 742g / 26.17oz

7. Included Accessories:

a. Adapter plate

b. 2x Metal strap set

c. Fasteners for compatible mounts

H. ACC-MNT-10 Corner Mount by Verkada Inc.

1. Description: Versatile bracket for mounting a range of accessories and cameras on corners.

2. Material: Steel

3. Dimensions:

a. Length: 190mm / 7.48in

b. Width: 263mm / 10.35in

c. Height: 170mm / 6.69in

4. Color: White

5. Weight: 1,890g / 66.67oz

I. ACC-MNT-11 Square Junction Box

1. Description: Square junction box for mounting Bullet Series cameras.

2. Material: Aluminum alloy

3. Dimensions:

a. Length: 128mm / 5.04in

b. Width: 128mm / 5.04in

c. Height: 40mm / 1.57in

4. Color: White

5. Weight: 303g / 10.69oz

6. Included Accessories:

a. 2x ¾in NPT plugs

b. 4x buttonhead screws

J. ACC-CAM-SHIELD-1

1. Description: Weather shield for protecting Dome Series and Fisheye Series cameras.
2. Material: Steel mount plate, polycarbonate visor
3. Dimensions:
    a. Length: 192mm / 7.56in
    b. Width: 185mm / 7.28in
    c. Height: 78mm / 3.07in
4. Color:
    a. Black mount plate
    b. White and black visor
5. Weight: 173g / 6.1oz
6. Included Accessories:
    a. Mounting fasteners

PART 3 - EXECUTION

3.1 INSTALLERS

A. Installation shall be performed by technicians that have successfully completed the Verkada Certified Engineer (VCE) program. For more information, visit www.verkada.com/partners/trainings.

3.2 EXAMINATION

A. Installation surfaces shall be clean and free from dust, dirt, and obstructions.

B. Examine pathway elements intended for cables. Check raceways, cable trays, and other elements for compliance with space allocations, installation tolerances, hazards to cable installation, and other conditions affecting installation.

C. Examine rough-in for LAN and control cable conduit systems to server, PCs, controllers, cameras, and other cable-connected devices to verify actual locations of conduit and back boxes before device installation.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.3 PREPARATION

A. Refer to the Verkada Quick Start Guide applicable to each product.

B. Pre-Installation Conference: Prior to installation arrange conference between supplier, Owner, and related trades to review materials, procedures, and coordinating related work.

C. Furnish or coordinate any inserts required for building into concrete, masonry, and other work, to support and attach work of this Section. Furnish or coordinate in ample time to comply with schedule of work into which inserts are built.

D. Verify that power and outlets are in correct locations.

E. Verify that building structure is properly prepared for mounting, attachment, and support of equipment.

F. Prior to installation of systems components and devices, verify all required preparations have been properly performed and that substrates are acceptable for installation.

1. Verify all rough-ins and field dimensions.

G. Report in writing to the Owner's representative any prevailing conditions that will adversely affect satisfactory execution of work in this Section.

1. Owner or their representative reserves the right to review proposed methods of construction and installation, reject proposed methods, and have the installation done in a satisfactory method at the Contractor's cost.

3.4 INSTALLATION

A. Refer to the Verkada Quick Start Guide applicable to each product.

B. For support, proceed to www.verkada.com/support.

C. Sequencing: The work shall be performed in the following sequence, unless directed otherwise by Owner or their representative:

1. Installation of cables and network.

2. Installation of new cameras.

3. Installation of front-end equipment.

4. Commissioning of the new system components.

5. End User training

D. Install work in accordance with manufacturer's recommendations and instructions as well as final shop drawings. All components should be installed so as to allow easy access for service in the future.

E. Anchor components securely in place, plumb, level, and accurately aligned.

F. For solution products located in equipment traffic areas, and that are exposed to damage due to collision or impact from forklifts, or manually moved carts, carriers, or other equipment used by the Owner, provide protective bollards, railings, coverings etc. to ensure that all products installed are properly protected from such damage.

G. Provide fastenings, plates, and other incidental items required for complete and operational installation.

H. Provide required electrical work in accordance with Code requirements.

I. Security and protection:

1. Maintain strict security during the installation of equipment and software. Rooms housing the control station, and workstations that have been powered up shall be locked and secured during periods when a qualified operator in the employ of Contractor is not present.

2. Equipment protection: Provide protective covers, fenders, and barriers as necessary to maintain work of this Section in same condition as installed until time of substantial completion.

J. Cable requirements:

1. Twisted, shielded, plenum-rated type cable shall be used.

2. All exposed cables shall be in rigid conduit, electrical metallic tubing (EMT) raceway, or wire mold as approved by the Owner.

3. All concealed cables routed in j-hook pathways shall be fastened to the structure at least every four feet.

3.5 LABELING

A. Equipment and product labels shall be printed on self-adhesive labels. Handwritten labels or writing directly on the equipment enclosures is not acceptable.

B. Label equipment and products with the device address as programmed into the security systems and as reflected on the “As-Built” Record Drawings.

C. Label networked equipment enclosures with the IP address.

D. Cables shall be individually labeled at origin and termination.

3.6 PROGRAMMING

A. Complete all Verkada Command configuration programming.

B. Add all Verkada Cameras to Command via serial number.

C. Contract will coordinate with the Owner to ensure that new components have appropriate network connections.

D. Coordinate with the Owner to ensure that new components will be properly programmed into the system.

E. Change default passwords to new custom secure passwords as directed by the Owner.

3.7 ACCEPTANCE TESTING

A. Final Test and Acceptance Plan

1. Develop a final test and acceptance plan to identify each new system component, intent of test, test method, and expected results.

2. Each component listed in the plan shall include space for test part signatures, brief comments, time of test and pass/fail check boxes.

3. Test all equipment, products, and devices in accordance with the plan to ensure completely operational and fully functional security systems. Submit a written final test and acceptance report for review and approval.

4. The report shall be submitted to the Owner’s representative at least 30 days prior to the scheduled system acceptance test.

5. System acceptance of the access control system shall be conditioned upon successful completion and operational demonstration of all system functions and components as documented in the final test and acceptance report.

B. System Acceptance

1. System acceptance shall not occur until after the following activities have been successfully completed:

    a. Correction of all deficiencies and punch list items noted on the final test and acceptance report.

    b. Acceptance of final test and acceptance report.

    c. Acceptance of all project close-out submittals.

    d. Delivery of final project close-out documentation.

    e. Successful training and demonstration, including operation of systems, systems administration, and system management.

    f. Purging of Contractor user privileges and return of all credentials.

3.8 OWNER PERSONNEL TRAINING

A. On-site operator training:

1. Instruct operating staff in proper operation, including hands-on training.

2. Minimum of two, four-hour sessions covering the operations for each system installed.

3. Training sessions shall be provided to supervisors, end-user staff, security staff, maintenance personnel, IT personnel, and any other personnel designated by the Owner.

4. Provide training sessions on all work shifts, including day, evening, and night shifts.

B. On-site administrator training:

1. Instruct security system administrators for each system installed, including hands-on training.

2. Minimum of two, four-hour sessions covering the operations for each system installed.

3. Training shall cover all administrative and management functions, including features and controls, for each system.

END OF SECTION

SECTION 28 31 11 – FIRE ALARM WITH VOICE ALARM SYSTEM

PART 1 GENERAL

1.1 SCOPE

A. This specification document provides the requirements for the installation, programming and configuration of a complete Silent Knight 6820EVS digital protocol addressable fire alarm system with voice alarm.

B. This system shall include, but not be limited to, system cabinet, power supply, built in Signaling Line Circuit (SLC), 160-character LCD annunciator, six programmable Flexputs™, built in dual line, IP and optional cellular digital communicator associated peripheral devices, batteries, wiring, conduit and other relevant components and accessories required to furnish a complete and operational life safety system.

C. The 6820EVS has the interconnection capability for up to 17 panels with one panel acting as the communicator for panels in a link.

1.2 WORK INCLUDED

A. General Requirements

1. The contractor shall furnish and install a complete 24 VDC, electrically supervised, analog addressable fire alarm system as specified herein and indicated on the drawings. The system shall include but not be limited to all control panels, power supplies, initiating devices, audible and visual notification appliances, alarm devices, and all accessories required to provide a complete operating fire alarm system.

B. Listings

1. All fire alarm system equipment shall be listed for it’s intended purpose and be compatibility listed to assure the integrity of the complete system.

1.3 STANDARDS

A. The fire alarm equipment and installation shall comply with the current provisions of the following standards and shall be listed for it’s intended purpose and be compatibility listed to insure integrity of the complete system.

B. National Electric Code, Article 760

C. National Fire Protection Association Standards:

1. NFPA 70 National Electrical Code
2. NFPA 72 National Fire Alarm Code
3. NFPA 101 Life Safety Code

D. Local and State Building Codes

1. BOCA, National Building Code, Mechanical Code, Fire Prevention Code

E. Local Authorities Having Jurisdiction

1. City of Bellingham and Whatcom County Fire Marshal – This building will be reviewed by both Jurisdictions

F. Underwriters Laboratories Inc.

1. All equipment shall be approved by Underwriters Laboratories, Inc. for its intended purpose, listed as power limited by Underwriters Laboratories, Inc., for the following standards as applicable:

a. UL 864 UOJZ Control units for Fire Protective Signaling Systems

1) Local Signaling Unit

2) Central Station Signaling Protected Premises Unit

3) Remote Signaling Protected Premises Unit.

4) Water Deluge Releasing Unit

b. UL 268 Smoke Detectors for Fire Protective Signaling systems.

c. UL 268A Smoke Detectors for duct applications

d. UL 217 Smoke Detectors for Single Stations

e. UL 521 Heat Detectors for Fire Protective Signaling systems.

f. UL 228 Door Holders for Fire Protective Signaling systems.

g. UL 464 Audible Signaling appliances

h. UL 1638 Visual Signaling appliances

i. UL 38 Manually Activated Signaling Boxes

j. UL 346 Waterflow indicators for Fire Protective Signaling systems.

k. UL 1481 Power Supplies for Fire Protective Signaling systems.

l. UL 2572 Control and Communication Units for Mass Notification systems.

G. Americans with Disabilities Act (ADA).

1. All visual Notification appliances and manual pull stations shall comply with the requirements of the Americans with Disabilities Act.

1.4 GENERAL REQUIREMENTS

A. Manufacturers/Distributors Services:

1. The following supervision shall be provided by a factory trained service technician from the distributor of the fire alarm equipment. The technician shall be trained and shall have a minimum of two (2) years of service experience in the fire alarm industry. The technicians name shall appear on equipment submittals and a copy of his manufactures trained shall be sent to the project engineer. The technician shall be responsible for the following items:

a. A pre installation visit to the job site to review equipment submittals and to verify the method by which the system is to be wired.

b. During the installation the certified technician shall be on site or make periodic visits to verify installation and wiring of the system. He shall also supervise the completion of conduit rough, wires pulled into conduit and wiring rough, and ready for trim.

c. Upon completion of wiring, final checkout and certification of the system shall be made under the supervision of this technician.

d. At the time of the formal checkout, technician shall give operational instructions to the owner and or his representative on the system.

B. Submittals

1. The contractor shall submit complete sets of documentation within thirty (30) calendar days after award of the purchase order. Indicated in the document will be the type, size, rating, style, catalog number, manufacturers names, photos, and /or catalog data sheets for all items proposed to meet these specifications. The proposed equipment shall be subject to the approval of the Architect/Engineer and no equipment shall be ordered or installed on the premises without that approval.

2. NOTE: DOCUMENTATION - Submittal of shop drawings shall contain at least three (3) copies of original manufacturer specification and installation instruction sheets. Subsequent information may be copies. All equipment and devices on the shop drawings to be furnished under this contract shall be clearly marked in the specification sheets.

3. Suppliers qualifications shall be submitted indicating years in business, service policies, warranty definitions, NICET Level 4 certification, and completion of factory training program and a list of similar installations.

4. Contractor qualifications shall be supplied indicating years in business and prior experience with installations that include the type of equipment that is to be supplied.

5. The contractor shall provide hourly Service Rates, performed by a factory trained technician for this installed Life Safety System with the submittal. Proof of training and authorization shall be included with the submittal. These hourly service rates shall be guaranteed for a 1-year period.

6. Contract close-out Submittals

a. Deliver two (2) copies of the following to the owner’s representative within Thirty (30) days of system acceptance. The closeout submittals shall include:

b. Installation and Programming manuals for the installed Life Safety System.

c. Point to point diagrams of the entire Life Safety System as installed. This shall include all connected Smoke Detectors and addressable field modules.

d. All drawings must reflect device address as verified in the presence of the engineer and/or end user.

C. Warranty

1. Warranty all materials, installation and workmanship for a one (1) year period, unless otherwise specified. A copy of the manufacturer warranty shall be provided with the close out documentation.

D. Products

1. This Life Safety System Specification must be conformed to in its entirety to ensure that the installed and programmed Life Safety System will accommodate all of the requirements and operations required by the building owner. Any specified item or operational feature not specifically addressed prior to the bid date will be required to be met without exception.

E. General Equipment and Materials Requirements

1. All equipment furnished for this project shall be new and unused. All components shall be designed for uninterrupted duty. All equipment, materials, accessories, devices and other facilities covered by this specification or noted on the contract drawings and installation specification shall be best suited for the intended use and shall be provided by a single manufacturer. If any of the equipment provided under this specification is provided by different manufacturers, then that equipment shall be "Listed" as to its compatibility by Underwriters Laboratories (UL), if such compatibility is required by UL standards.

F. Satisfying the Entire Intent of these Specifications

1. It is the contractor's responsibility to meet the entire intent of these specifications.

2. Deviations from the specified items shall be at the risk of the contractor until the date of final acceptance by the architect, engineer, and owner's representative.

3. All costs for removal, relocation, or replacement of a substituted item shall be at the risk of the electrical contractor.

1.5 SYSTEM OPERATION

A. Alarm

1. When a device indicates any alarm condition the control panel must respond within 3 seconds. The General Alarm or Supervisory Alarm LED on the annunciator(s) should light and the LCD should prompt the user as to the number of current events. The alarm information must be stored in event memory for later review. Event memory must be available at the main and all remote annunciators.

2. When the alarmed device is restored to normal, the control panel shall be required to be manually reset to clear the alarm condition, except that the alarms may be silenced as programmed.

3. An alarm shall be silenced by a code or Firefighter key at the main or remote annunciators. When silenced, this shall not prevent the resounding of subsequent events if another event should occur (subsequent alarm feature). When alarms are silenced the silenced LED on the control panel, and on any remote annunciators shall remain lit, until the alarmed device is returned to normal

B. Troubles

1. When a device indicates a trouble condition, the control panel System Trouble LED should light and the LCD should prompt the user as to the number of current events. The trouble information must be stored in event memory for later review. Event memory must be available at the main and all remote annunciators.

2. When the device in trouble is restored to normal, the control panel shall be automatically reset, The trouble restore information must be stored in event memory for later review. Event memory must be available at the main and all remote annunciators. A trouble shall be silenced by a code or Firefighter key at the main or remote annunciators. When silenced, this shall not prevent the resounding of subsequent events if another event should occur.

3. Supervision methods

   a. Each SLC loop shall be electrically supervised for opens and ground faults in the circuit wiring, and shall be so arranged that a fault condition on any loop will not cause an alarm to sound. Additionally, every addressable device connected to the SLC will be supervised and individually identified if in a fault condition. The occurrence of any fault will light a trouble LED and sound the system trouble sounder, but will not interfere with the proper operation of any circuit which does not have a fault condition.

   b. Each indicating appliance circuit shall be electrically supervised for opens, grounds and short circuit faults, on the circuit wiring, and shall be so arranged that a fault condition on any indicating appliance circuit or group of circuits will not cause an alarm to sound. The occurrence of any fault will light the trouble LED and sound the system trouble sounder, but will not interfere with the proper operation of any circuit which does not have a fault condition.

4. The FACP shall support the following devices on the RS-485 data bus:

   a. 5815XL Signaling Line Circuit Expander (SLC) Module
   b. 5824 Printer Interface Module
   c. 5860 LCD Remote Annunciator
   d. 5865-3 LED Remote Annunciator
   e. 5865-4 LED Remote Annunciator with reset and silence switches
   f. 5880 LED I/O module
   g. 5895XL Intelligent Distributed Power Module
   h. 5496 Intelligent Remote Power Supply 6.0 Amp

PART 2 PRODUCTS

2.1 GENERAL

A. fire alarm control panel with emergency voice communications

1. The fire alarm control panel (FACP) shall be the Silent Knight 6820EVS analog addressable fire alarm control panel with emergency communication system. The audio amplifiers shall be the Silent Knight EVS-50W, EVS-125W, EVS-INT50W or EVS-DUAL50W units. The FACP must have a 6-amp power supply and be capable of expansion to a minimum of 384 total amps via bus connected expander modules that supervise low battery, loss off AC and loss of communication.

2. The system must contain at least one (1) Silent Knight ECS-50W, ECS-125W, ECS-INT50W or ECS-DUAL-50W amplifier and shall be expandable from 50 to 500 watts utilizing up to 3 additional amplifiers. The ECS-50W and ECS-125W amplifiers shall be able to support a 4-zone splitter (Silent Knight EVS-CE4) to distribute the audio

information to different locations in the installation. The system shall have the capability of controlling up to 32 notification zones. The amplifiers must contain the capability of being remotely located through a four-wire SBUS communications circuit and a two-wire VBUS voice circuit. The system shall have the capability of adding up to 4 EVS-LOCs local operating consoles.

3. The emergency communication system must have the capability of downloading fifteen (15) 60 second messages and utilize DSP technology for higher audio intelligibility.

4. The emergency communication system shall be capable of operating at 25vrms or 70.7vrms (EVS-50W and EVS-INT50W) and must be field selectable at the amplifier level. Systems that require additional modules for voltage conversion shall not be accepted.

5. The FACP must be able to support 159 detectors and 159 analog addressable modules and expandable to a maximum of 1,110 analog addressable points per FACP. This shall be accomplished via a maximum of 63 signaling line circuits (SLC) capable of supporting up to 159 detectors and 159 addressable module devices each.

6. The FACP must have Drift Compensation sensitivity capabilities on detectors and be able to support 159 detectors and 159 analog addressable modules. The communication protocol on the SLC loop must be digital.

7. The FACP must support a minimum of six programmable Flexput™ circuits. The panel must have a built in 160-character LCD annunciator with the capability of having additional supervised remote annunciators connected in the field.

8. The FACP must have a built in UL approved IP and digital communicator with the option of adding a cellular module for communications. The communicator must allow local and remote up/downloading of system operating options, event history, and detector sensitivity data.

9. The FACP must automatically test the smoke detectors in compliance with NFPA standards to ensure that they are within listed sensitivity parameters and be listed with Underwriters Laboratories for this purpose.

10. The FACP must compensate for the accumulation of contaminants that affect detector sensitivity. The FACP must have day/night sensitivity adjustments, maintenance alert feature (differentiated from trouble condition), detector sensitivity selection, auto-programming mode (Jumpstart) and the ability to upgrade the core programming software on site or over the telephone.

11. The main communication bus (SBUS RS485) shall be capable of class A or class B configuration with a total SBUS length of 6,000 feet.

12. The FACP shall have a Jumpstart feature that can automatically enroll all properly connected accessories into a functional system.

13. The FACP must have the ability to upgrade the firmware revision from a laptop where the FACP is installed.

14. Panels that do not have these capabilities will not be accepted.

B. System Wiring

1. The Signaling Line Circuit (SLC) and Data Communication Bus (SBUS) shall be wired with standard NEC 760 compliant wiring. No twisted, shielded or mid capacitance wiring is required for standard installations. All FACP screw terminals shall be able to accept 14-18 AWG wire. All system wiring shall be in accordance with the requirements of NFPA 70, the National Electrical Code (NEC), and also comply with article 760 of the NEC.

C. Signaling Line Circuits

1. Each SLC shall be capable of a wiring distance of 5,000 feet from the SLC driver module (6815) and be able to support127 addressable module devices. The communication protocol to SLC devices must be digital. Any SLC loop device, which goes into alarm, must interrupt the polling cycle for priority response from the FACP. The FACP must respond consistently to a device that goes into alarm on an SLC in under 10 seconds. The auxiliary 6815 SLC loop module must be capable of being located up to 6000 feet from the FACP on an RS-485 bus, which is separate from the SLC bus. The SLC shall be capable of functioning in a class A or class B configuration.

D. SLC Loop Devices

1. Devices supported must include photoelectric smoke detectors, heat detectors, combination fire and CO detectors, contact monitoring modules and relay output modules. There is to be no limit to the number of any particular device type, up to the maximum of 159 detectors and 159 modules that can be connected to the SLC.

2. Addressable detector functions

a. The products of combustion detectors must communicate analog values using a digital protocol to the control panel for the following functions:

3. Automatic compliance with NFPA 72 standards for detector sensitivity testing

a. Drift compensation to assure detector is operating correctly

4. Maintenance alert when a detector nears the trouble condition

a. Trouble alert when a detector is out of tolerance

5. Alert control panel of analog values that indicate fire.

E. Programmable Flexputs

1. The FACP shall support six programmable Flexput™ circuits that are capable of being programmed as supervised reverse polarity notification circuits or supervised auxiliary power circuits that can be programmed as continuous, resettable or door holder power. The circuits shall also be programmable as input circuits in Class A or B configurations to support dry contact or compatible two wire smoke detectors.

F. Addressable Notification Module

1. The contractor shall furnish and install where indicated on the plans, addressable notification modules, Honeywell Silent Knight Model SK-CONTROL. The modules shall be U.L. listed compatible with Honeywell Silent Knight 6820EVS fire alarm control panel. The notification module must provide one class A (Style Z) or class B (Style Y) notification output with one auxiliary power input. The notification module must be suitable for mounting in a standard 4 square electrical box and must include a plastic

cover plate. The notification module must provide an LED that is visible from the outside of the cover plate. The notification module must be fully programmable for such applications as required by the installation. The SK-CONTROL shall reside on the SLC loop and can be placed up to 5,000 feet from the control or 6815 SLC loop module.

G. Built-in Annunciators

1. The main control must have a built-in annunciator with a 160-character LCD display and feature LEDs for Alarm, Supervisory, Trouble, Silenced and Power. When in the normal condition the LCD shall display time and date based on a 200-year clock which is capable of automatic daylight savings time adjustments. All controls and programming keys are silicone mechanical type with tactile and audible feedback. Keys have a travel of .040 in. No membrane style buttons will be permissible. The annunciator must be able to silence and reset alarms. The annunciators must have twenty levels of user codes that will allow the limitation of operating system programming to authorized individuals.

H. Remote Annunciators

1. The project shall include a Kirkland Graphic annunciator at the front door with integral LCD annunciator. The annunciator shall use a CAD background and include LED alarm lights for sprinkler waterflow, main pull station, smoke detection by wing, a yellow light by mechanical room for duct detection and shall include a system trouble light. In addition combine a Silent Knight EVS-LOC at the annuciator location

2. The fire system shall be able to support remote annunciators. All annunciators must have an 80 - 160-character LCD/LED displays and must feature five LEDs for Alarm, Supervisory, Trouble, Silenced, and Power. All controls and programming keys are silicone mechanical type with tactical and audible feedback. Keys shall have a travel of .040 inches. No membrane style buttons will be permitted.

3. The annunciator must be able to silence and reset alarms. The annunciator must have twenty levels of user codes that will limit the operating system programming to authorized individuals. The control panel must allow all annunciators to accommodate multiple users input simultaneously. Remote annunciators shall be capable of operating at a distance of 6,000 feet from the main control panel on unshielded, non-twisted cable.

4. The fire system shall be able to support up to 16 remote annunciators. The exact number will be determined by type, LCD or LED. LED Remote annunciators shall have individually mapped LEDs and reset and silence input.

I. I/O LED Driver Module

1. The fire system shall be able to support up to eight I/O modules on the SBUS that shall be used to drive remote LED graphic style displays and accommodate up to eight dry contact type switch inputs. The I/O modules shall each drive up to 40 LEDs without requiring external power connections. The I/O module inputs shall be supervised and shall be suitable for alarm and trouble circuits as well as reset and silence switches. These driver boards shall contain 80 LED outputs that are powered by an external power source.

J. Serial/Parallel Interface

1. The fire system shall able to support up to two serial / parallel interfaces that drive standard computer-style printers (line printers only). The interface shall be programmable as to what information is sent to it and shall include the ability to print out Detector Status, Event History and System Programming.

K. Distributed Power Module

1. The contractor shall supply power modules, Models 5496 and 5895XL, compatible with the model 6820EVS fire alarm control panel. The power module must have 6 amps of output power, six Flexput® circuits rated at 3 amps each, and two Form C relay circuits rated at 6 amps at 24 volts DC. The six Flexput circuits shall be capable of being programmed as supervised reverse polarity notification circuits or supervised auxiliary power circuits that can be programmed as continuous, resettable or door holder power. The circuits shall also be programmable as input circuits in Class A or B configurations to support dry contact or compatible two wire smoke detectors.

2. The power module shall be capable of being connected via an RS-485 system bus (SBUS) at a maximum distance of 6,000 feet from the main control panel. It shall contain an additional RS-485 system bus that is completely compatible with all 6820EVS add-on SBUS modules, annunciators, serial/parallel modules and addressable devices. The power module will also act as a bus repeater so that additional RS-485 (modules) devices can be connected at a maximum distance of 6,000 feet from the power module.

3. The 5496 and 5895XL power modules must have 6 amps of output power and four circuits rated at 3 amps each. The four circuits can be programmed as notification outputs or auxiliary power outputs of door holder, constant, resettable and sounder base synchronization types.

4. The 6820EVS shall be able to support up to eight (8) of the Distributed Power Modules in any combination.

5. The power module’s RS-485 bus shall be electrically isolated providing ground loop isolation and transient protection.

L. Digital Communicator

1. The digital/IP communicator must be an integral part of the control panel and be able to report all zones or points of alarm, supervisory, and trouble as well as all system status information such as loss of AC, low battery, ground fault, loss of supervision to any remote devices with individual and distinct numeric codes to a central station or remote station. The communicator must also be able to up/download all system programming options, event history and detector sensitivity compliance information to a PC on-site through a USB or Ethernet cable. It shall transmit the information by one or more of the following means of communication – internet, cellular or standard telephone lines.

2. The communicator must be capable of reporting via SIA and Contact ID formats. The communicator shall have a delayed AC loss report function which will provide a programmable report delay plus a 10-25 min random component to help ease traffic to the central station during a power outage. No controls that use external modems for remote programming and diagnostics shall be accepted.

M. Dry Contacts

1. The FACP shall have three Form “C” dry contacts, one will be dedicated to trouble conditions, the other two will be programmable for alarm, trouble, supervisory, notification, pre-alarm, waterflow, manual pull, aux. 1 or aux. 2 conditions. The trouble contact shall be normal in an electrically energized state (fail-safe) so that any total power loss (AC and Backup) will cause a trouble condition. If the microprocessor on the FACP fails, the trouble contacts shall also indicate a trouble condition.

N. Ground Fault Detection

1. A ground fault detection circuit shall be employed which can detect a ground fault on both the positive and negative side of each circuit. The ground fault detector shall operate the general trouble devices as specified but shall not cause an alarm to be sounded. Ground faults shall not interfere with normal operation, such as alarm, or other trouble conditions.

O. Over-current Protection

1. All low voltage circuits will be protected by microprocessor controlled power limiting or have self-restoring polyswitches for the following: smoke detector power, main power supply, indicating appliance circuits, battery standby power and auxiliary output.

P. Test Functions

1. A “Lamp Test” mode shall be a standard feature of the fire alarm control panel and shall test all LEDs and the LCD display on the main panel and remote annunciators.

2. A “Walk Test” mode shall be a standard feature of the fire alarm control panel. The walk test feature shall function so that each alarm input tested will operate the associated notification appliance for six seconds. The fire alarm control panel (FACP) will then automatically perform a reset and confirm normal device operation. The event memory shall contain the information on the point tested, the zone tripped, the zone restored, and the individual points return to normal.

3. A “Fire Drill” mode shall allow the manual testing of the fire alarm system notification circuits. The “Fire Drill” shall be capable of being controlled at the main annunciator, remote annunciators and via a remote contact input.

4. A “Disable Mode” shall allow for any zone, point, group, or NAC circuit to be disabled without affecting the operation of the total fire system.

Q. Remote Input Capabilities

1. The control panel shall have provisions for supervised switch inputs, for the purpose of Alarm reset and Alarm and Trouble silence.

R. Notification Appliance Mapping Structure

1. All notification circuits and modules shall be programmable via a mapping structure that allows for a maximum of 999 output groups. Each of these groups shall be able to be triggered by any of the panels 999 zones. A group may be triggered from a zone individually, or may contain a global trigger for manual pull stations, fire drills and two different system alarms.

2. Each zone will individually control the cadence pattern of each of the groups that it is “Mapped” to so that sounders can indicate a variety of conditions. The zone shall able

to issue a different cadence pattern for each of the groups under its control. The mapping structure must also allow a group to be designated to “ignore cadence” for use with strobes and other continuous input devices.

3. Zones shall have eight different output categories; Detector alarm, Trouble, Supervisory, Pre-alarm, Waterflow, Manual pull, Zone auxiliary one and Zone Auxiliary two. Each of the categories shall be able to control from 1 to 8 output groups with a cadence pattern. The patterns are; March code, ANSI 3.41, Single Stroke Bell Temporal, California code, Zone 1 coded, Zone 2 coded, Zone 3 coded, Zone 4 coded, Zone 5 coded, Zone 6 coded, Zone 7 coded, Zone 8 coded, Custom output pattern 1, Custom output pattern 2, Custom output pattern 3, Custom output pattern 4 and Constant.

4. Each NAC circuit can also be configured to produce one of four synchronization patterns: AMSECO synchronization, Gentex synchronization, System Sensor synchronization, and Wheelock synchronization. This mapping/cadence pattern shall be supported by all system power supplies and Notification Expander Modules. This mapping/cadence pattern shall be supported by all system power supplies and Notification Expander Modules.

5. In addition, synchronization is built-in for Amseco®, Gentex®, System Sensor®, and Wheelock® devices. This mapping/cadence pattern shall be supported by all system power supplies and Notification Expander Modules.

S. Downloading Software

1. The fire alarm control panel must support up/downloading of system programming from a PC under Windows or NT environments. The FACP must also be able to upload the detector sensitivity test results and a 1000 event system event buffer to the PC.

2. Communication shall take place over a direct connection to the PC through a USB or Ethernet cable and shall not require an external modem to be connected to the panel. The downloading software shall contain a code that will block unauthorized persons from accessing the panel via direct connection or ethernet.

T. English Language Descriptions

1. The FACP shall provide the ability to have a text description of each system device input zone and output group on the system. The use of individual lights to provide descriptions will not be acceptable.

U. System Cabinet

1. Mounting

a. The system cabinet shall be red and can be either surface or flush mounted. The cabinet door shall be easily removable to facilitate installation and service.

2. Audible System Trouble Sounder

a. An audible system trouble sounder shall be an integral part of the control unit. Provisions shall also be provided for an optional supervised remote trouble signal.

3. Power Supply and Charger:

a. The entire system shall operate on 24 VDC, filtered switch mode power supply with the rated current available of 6 amps. The FACP must have a battery charging circuit capable of complying with the following requirements:

b. Twenty-four (24) hours of battery standby with five (5) minutes of alarm signaling at the end of this twenty-four (24) hour period (as required per NFPA 72 central station signaling requirements) using rechargeable batteries with automatic charger to maintain gel-cell batteries in a fully charged condition.

c. The power supply shall comply with UL Standard 864 for power limiting.

4. The FACP will indicate a trouble condition if there is a loss of AC power or if the batteries are missing or of insufficient capacity to support proper system operation in the event of AC failure. A “Battery Test” will be performed automatically every minute to check the integrity of the batteries. The test must disconnect the batteries from the charging circuit and place a load on the battery to verify the battery condition.

5. If it is necessary to provide additional power one or more of the model 5496 or 5895XL distributed power modules shall be used to accomplish this purpose.

V. Connections and Circuits

1. Connections to the light and power service shall be on a dedicated branch circuit in accordance with the National Electrical Code (NEC) and the local authority having jurisdiction (AHJ).

2. The circuit and connections shall be mechanically protected.

W. A circuit disconnecting means shall be accessible only to authorized personnel and shall be clearly marked “FIRE ALARM CIRCUIT CONTROL”.

2.2 DEVICES

A. Manual Fire Alarm Stations

1. Manual Fire Alarm Stations shall be non-coded, break glass, single or double action type, with a key operated test-reset lock in order that they may be tested, and so designed that after actual emergency operation, they cannot be restored to normal except by use of a key. The reset key shall be so designed that it will reset manual station and open FACP without use of another key.

2. An operated station shall automatically condition itself so as to be visually detected, as operated, at a minimum distance of fifty feet, front or side. Manual stations shall be constructed of LEXAN® with clearly visible operating instructions on the front of the stations in raised letters.

3. Stations shall be suitable for surface mounting on matching backbox, or semi-flush mounting on a standard single-gang box, and shall be installed within the limits defined by the Americans with Disabilities Act (ADA) dependent on manual station accessibility or per local requirements. Manual stations shall be Model SK-Pull. If using conventional pull stations they must be installed in conjunction with an Addressable Input Module (SK-Monitor) or Mini Input Module (SK-Minimon). Manual stations shall be Silent Knight Model PS-DATK, PS-SATK, PS-DA or PS-SA and Underwriters Laboratories listed when used with addressable modules.

B. Remote Power Supplies

1. The Remote Power Supplies for Notification appliances shall be the Silent Knight Models 5496 and/or 5895XL. The 5496 and 5895XL Intelligent Power Supplies shall hang on the main S-Bus and be programmed through the 5820XL control. The 5496 will support 6 amps of 24 volt DC power with 4 notification circuits rated at 3 amps each. The 5895XL will support 6amps of 24 volt DC power, with 6 Flexput circuits, rated at 3amps each. Two additional 5815 SLC loop expanders shall be capable of being installed in the cabinet, to allow an additional 396 points. The power supply will also regenerate the S-Bus for an additional 6000'.

2. The remote power supply model 5495 or 5499 may also be used on the system. These power supplies support 6amps or 9amps of 24VDC power with 4 notification circuits rated at 3amps each. These power boosters may also be activated from another notification circuit from either the fire alarm control or the Distributed Power Modules.

C. Smoke Detectors

1. Smoke detectors shall be Silent Knight model SK-Photo ceiling mounted, addressable photoelectric smoke detectors,. The combination detector head and twist lock base shall be U.L. listed compatible with the Silent Knight 5820XL fire alarm control panel.

2. The base shall permit direct interchange with Silent Knight's SK-Ion ionization smoke detector, SK-Acclimate multi-criteria smoke detector or the SK-Heat detector. The base shall be the appropriate twist lock base B210LP. The smoke detector shall have a flashing status LED for visual supervision. When the detector is actuated, the flashing LED will latch on steady at full brilliance. The detector may be reset by actuating the control panel's reset switch. The sensitivity of the detector shall be capable of being selected and measured by the control panel without the need for external test equipment. The vandal security-locking feature shall be used in those areas as indicated on the drawing. The locking feature shall be field selectable when required. It shall be possible to perform a sensitivity test of the detector without the need of generating smoke. The test method shall simulate the effects of products of combustion in the chamber to ensure testing of the detector circuits. Detectors shall have completely closed back to restrict entry of dust and air turbulence and have a 30 mesh insect screen. Electronics of the unit shall be shielded to protect against false alarms from E.M.I. and R.F.I.

D. Heat Detectors

1. Furnish and install analog/addressable heat detectors, Silent Knight model SK-Heat. The combination heat detector and twist lock base shall be U.L. listed compatible with the Silent Knight 5820XL fire alarm control panel. The base shall permit direct interchange with the Silent Knight SK-Ion smoke detector, SK-Acclimate smoke detector and the SK-Photo photoelectric smoke detector. The base shall be appropriate twist lock base B210LP. The heat detector shall have a flashing status LED for visual supervision. When the detector is actuated, the flashing LED will latch on steady at full brilliance. The detector may be reset by actuating the control panel's reset switch. The vandal security-locking feature shall be used in those areas as indicated on the drawings. Electronics of the unit shall be shielded to protect against false alarms from E.M.I. and R.F.I.

E. Duct Detectors

1. Duct Detector shall be Silent Knight Model SK-Duct Housing with the Model SK-Photo Smoke detectors.

F. Speaker/Strobes and Strobes

1. The visual and audio/visual signaling devices shall be compatible with the 5820XLEVS, 5495, 5496, 5499, or 5895XL as stated in the installation manuals and be listed with Underwriters Laboratories Inc. per UL 1971 and/or 1638. Each indicating appliance circuit shall be electrically supervised for opens, grounds and short circuit faults on the circuit wiring and shall be so arranged that a fault condition on any indicating appliance circuit or group of circuits will not cause an alarm to sound. The occurrence of any fault will light the trouble LED and sound the system trouble sounder, but will not interfere with the proper operation of any circuit which does not have a fault condition. The notification appliance (combination audio/visual units only) shall produce a peak sound output of 90 dba or greater as measured in an anechoic chamber. The appliance shall be capable of meeting the candela requirements of the blueprints presented by the Engineer and ADA. The appliance shall be polarized to allow for electrical supervision of the system wiring. The unit shall be provided with terminals with barriers for input/output wiring and be able to mount a single gang or double gang box or double workbox with the use of an adapter plate. The unit shall have an input voltage range of 16-33 volts

2. 24 VDC with wide UL “Regulated Voltage” using filtered DC or unfiltered VRMS input voltage

3. Synchronize with Wheelock DSM, Wheelock Power Supplies or other manufacturers panels, incorporating the Wheelock Patented Sync Protocol

4. Provide exterior type for outdoor installations. Provide wireguard on all gym devices.

G. Exterior Bell

1. Wheelock Series 43T AC Vibrating Fire Bells provide durable operation and dependable performance for indoor and outdoor installations. Wheelock Fire Bells are perfect for industrial uses including schools, hospitals, and commercial building

2.3 AES RADIO

A. Contractor shall provide an AES radio for remote monitoring of the system. Coordinate with owner and owner’s monitoring agency. AES#7707 UL listed

B. Provide remote antenna to roof to guarantee good radio reception.

2.4 ACCESSORY DEVICES

A. Provide relay for connecting all fire smoke dampers in the building. Upon any alarm in the building all dampers close

B. Provide relay to AV systems, connect to DSP to deliver Fire Alarm signal to allow system to be muted.

C. On panic lockdown button the fire alarm panel shall receive signals from the security and intercom systems

1. Upon receipt of lockdown signal fire alarm shall play a panic message for 15 seconds. After the 15 seconds send signal to the intercom system which will handle following lockdown messages.

PART 3 EXECUTION

3.1 CONNECTIONS AND CIRCUITS

A. Connections to the light and power service shall be on a dedicated branch circuit in accordance with the National Fire Alarm Code NFPA 72, National Electrical Code (NEC) NFPA 70, and the local authority having jurisdiction (AHJ).

B. The circuit and connections shall be mechanically protected.

C. A circuit disconnecting means shall be accessible only to authorized personnel and shall be clearly marked “FIRE ALARM CIRCUIT CONTROL”.

3.2 INSTALLER’S RESPONSIBILITIES

A. The installer shall coordinate the installation of the fire alarm equipment.

B. All conductors and wiring shall be installed according to the manufacturer’s recommendations.

C. It shall be the installer’s responsibility to coordinate with the supplier, regarding the correct wiring procedures before installing any conduits or conductors.

3.3 INSTALLATION OF SYSTEM COMPONENTS

A. System components shall be installed in accordance with the latest revisions of the appropriate NFPA pamphlets, the requirements contained herein, National Electrical Code, local and state regulations, the requirements of the fire department and other applicable authorities having jurisdiction (AHJ).

B. All wire used on the fire alarm system shall be U.L. Listed as fire alarm protection signaling circuit cable per National Electrical Code, Articles 760.

3.4 WARRANTY

A. The contractor shall warrant all equipment and wiring free from inherent mechanical and electrical defects for one year (365 days) from the date of final acceptance.

3.5 FINAL TEST

A. Before the installation shall be considered completed and acceptable by the awarding authority, a test of the system shall be performed as follows:

B. The contractor’s job foreman, a representative of the owner, and the fire department shall operate every building fire alarm device to ensure proper operation and correct annunciation at the control panel.

C. At least one half of all tests shall be performed on battery standby power.

D. Where application of heat would destroy any detector, it may be manually activated.

E. The communication loops and the indicating appliance circuits shall be opened in at least two (2) locations per circuit to check for the presence of correct supervision circuitry.

F. When the testing has been completed to the satisfaction of both the contractor's job foreman and owner, a notarized letter cosigned by each attesting to the satisfactory completion of said testing shall be forwarded to the owner and the fire department.

G. The contractor shall leave the fire alarm system in proper working order, and, without additional expense to the owner, shall replace any defective materials or equipment provided by him under this contract within one year (365 days) from the date of final acceptance by the awarding authority.

H. Prior to final test the fire department must be notified in accordance with local requirements.

3.6 AS BUILT DRAWINGS, TESTING, AND MAINTENANCE INSTRUCTIONS

A. As Built Drawings

1. A complete set of reproducible "as-built" drawings showing installed wiring, color coding, and wire tag notations for exact locations of all installed equipment, specific interconnections between all equipment, and internal wiring of the equipment shall be delivered to the owner upon completion of system.

B. Operating and Instruction Manuals

1. Operating and instruction manuals shall be submitted prior to testing of the system. Three (3) complete sets of operating and instruction manuals shall be delivered to the owner upon completion. User operating instructions shall be provided prominently displayed on a separate sheet located next to the control unit in accordance with U.L. Standard 864.

C. "Provide record as-built lock box" Possible part # Space age electronics SSU00625

3.7 ADDITIONAL MATERIALS

A. Provide an additional (5) smoke detectors with bases, (5) speaker/strobes each with 50 feet of EMT and appropriate fire alarm wire. Locate where directed by owner. Turn over any not used as spare at project completion.

3.8 WIRING

A. Wiring in EMT when in walls and above non-accessible ceilings

B. Cabling per manufacturer, plenum rated where passing through plenum

END OF SECTION

SECTION 31 00 00 - EARTHWORK

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes, but is not limited to:

1. Site grading, excavation, trenching, embankment, fill and backfill material and placement, and stabilization of areas.
2. Importing required materials.
3. Removing and disposing materials from the site that are either:
   a. Not approved for use, or;
   b. Are in excess of that required.
4. Moisture conditioning
5. Stockpiling and protection of materials.
6. Geotechnical information for the project site.

1.2 REFERENCES

A. Reference the following standards:

AHJ	Public Authority Having Jurisdiction AHJ is an abbreviation for public Authorities Having Jurisdiction. For this project the AHJ denotes Island County.
WSDOT	Washington Department of Transportation 2025 Standard Specifications and Standard Plans for Road, Bridge, and Municipal Construction
WISHA	Washington Industrial Safety and Health Act. Revised Code of Washington (RCW) Chapter 49.17
WAC 296-155	Washington Administrative Code (WAC) 296-155 Standards for Construction Work
RCW 39.04.180	Public Works/Trench Excavations – Safety Systems Required

1.3 SUBMITTALS

A. Submit the following documents in accordance with submittal procedures noted in Division 01:

1. Gradation and moisture-density relation test results for each type of fill and backfill material at least 10 working days prior to their delivery at the site. Test results shall demonstrate that materials meet the criteria defined in Part 2 of this Section.
2. Samples of materials proposed for use as fill or backfill and the source location of each material. Coordinate sample delivery location with Owner.
3. Field compaction test results to the Owner’s Representative at the end of each day.

4. Manufacturer certification that the organic compost material meets the Specifications in Part 2 of this Section, including certified laboratory test results dated within 90 days of submittal.
5. Organic content test results demonstrating the organic soil mixture meets the requirements specified.
6. Topographic survey of stormwater facility. Submit an AutoCAD file of the topography of stormwater detention pond including the invert elevations of pipes and other features of the pond facility.

1.4 NOTIFICATIONS

A. Notify the Owner's Geotechnical Engineer Representative five working days in advance of delivering fill and/or backfill materials to the site.

1.5 QUALITY ASSURANCE

A. Testing:

1. Contractor shall provide their own testing service to confirm compliance with Specifications and provide measures for confirming Quality Control at Contractor's expense. The Contractor is responsible for verifying the quality of the work to check compliance with these specifications. Contractor shall submit reports conducted by their own independent testing service to the Owner's Representative indicating observations and results of the tests, and indicating compliance or non-compliance with Contract Documents. A copy of Contractor's tests shall be furnished to the Owner within 1 calendar week of testing.
2. Owner's Geotechnical Engineer Representative will take samples and perform moisture content, gradation, compaction and density tests during placement of backfill materials to check compliance with these Specifications. Contractor shall coordinate with Owner's Geotechnical Engineer on schedule of Work and timing of testing.
3. The Contractor shall remove surface material at locations designated by the Owner's Geotechnical Engineer and provide such assistance as necessary for sampling and testing. The Owner's Geotechnical Engineer may direct the Contractor to construct inspection trenches in compacted or consolidated backfill to determine that the Contractor has complied with these Specifications.
4. Testing by the Owner's Geotechnical Engineer does not relieve the Contractor of responsibility to determine, to Contractor's own satisfaction, when and if Contractor's Work meets the Specification.
5. The minimum amount of testing to be performed and submitted by the Contractor, unless determined otherwise by Owner's Geotechnical Engineer, shall be as follows:

Item	Frequency of Tests
Utility Trenches	One density test per 200 cubic yards of backfill, OR one test for each lift of backfill for each 200 hundred lineal feet of utility trench, whichever results in the greater number of tests.

Backfilling and Paved Areas	One density test in every three hundred cubic yards of fill or backfill, OR one test for each lift of compacted fill over 1,000 square feet of compacted fill or backfill surface, whichever results in the greater number of tests.

Compaction tests are required to be performed the same day that the compaction effort is performed regardless of the volume or area of material.

This minimum amount of testing does not relieve the Contractor of responsibility to determine, to Contractor's own satisfaction, when and if Contractor's Work meets the Specifications.

6. The frequency of tests shown above shall govern the actual quantity of tests. Any re-testing that is required due to failure of initial test to show compliance with these Contract Documents shall be provided and paid for at the Contractor's sole expense.
7. Contractor shall submit reports (three copies) conducted by an independent firm to the Owner's Representative indicating observations and results of the tests, and indicating compliance or non-compliance with Contract Documents.
8. Coordinate testing requirements and scheduling with the Owner's Geotechnical Engineer Representative, and assist independent testing firm during field testing and sampling at no additional cost to Owner.

1.6 DIMENSIONS AND LAYOUTS

A. Contractor shall provide all dimensioning and layout required for construction.

B. Furnish, set and mark line and location stakes, including offsets and general construction staking. There shall be onsite at all times when Work requiring control is being performed, necessary equipment, supplies and instruments related thereto. A qualified layout engineer, professional Washington State Licensed Land Surveyor, or technical specialist must be assigned to the Contractor's crew for this Work. This equipment and personnel must be available, at no additional cost to the Owner, for the purpose of verifying layout and certifying the accuracy of Work on the site.

C. Preserve benchmarks and stakes, and replace any that are displaced or missing.

D. Review all utility purveyor, Owner and State records relative to the existing underground utilities. Avoid damage to these facilities and restore utilities at no cost to Owner.

E. Notify Owner's Representative immediately if underground utilities not shown on Plans or Record Documents are encountered.

F. Verify existing location and elevation at connection points of existing utility structures (including pipes) prior to construction of new system. If discrepancies are found, notify Owner's Representative.

1.7 GEOTECHNICAL REPORT

A. Contractor is responsible for reviewing available data for the site, including but not limited to Geotechnical Reports.

1. “Geotechnical Report, South Whidbey Aquatic and Recreation Center”, Palmer Geotechnical Consultants, January 9, 2024.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Structural Fill:

1. Imported Structural Fill per Geotechnical Report shall conform to WSDOT Section 9-03.14(2) - Select Borrow.

B. Common Fill: Conform to WSDOT Section 9-03.14(3) Common Borrow.

C. Gravel Backfill for Drains: Conform to WSDOT Section 9-03.12(4) Gravel Backfill for Drains with AASHTO grading No. 57.

D. Crushed Surfacing:

1. Crushed Surfacing Base Course shall conform WSDOT Section 9-03.9(3).
2. Crushed Surfacing Top Course shall conform to WSDOT Section 9-03.9(3).

E. Pipe Bedding shall conform to:

1. WSDOT Section 9-03.12(3) for flexible sanitary sewer and storm drain pipe.
2. WSDOT Section 9-03.12(3) for ductile iron water main and water service pipe.
3. WSDOT Section 9-03.12(3) for ductile iron sanitary sewer and storm drain pipe.
4. WSDOT Section 9-03.12(3) for flexible water service pipe.

F. Pipe Backfill shall conform to:

1. Trench Backfill shall conform to WSDOT Section 9-03.19, except in landscape areas trench backfill shall be WSDOT Section 9-03.19 or Structural Fill.
2. Initial backfill for overexcavated trenches in wet conditions shall conform to WSDOT Section 9-03.9(1)] or Shoulder Ballast in conformance with WSDOT Section 9-03.9(2).

G. Gravel Backfill for walls shall conform to WSDOT Section 9-03.12(2).

H. Conductive Warning Tape: Shall be manufacturer’s standard, permanent, brightly colored, continuous printed plastic tape with aluminum backing; intended for burial in pipe backfill; and not less than six inches wide and four mils thick. Tape schedule shall be:

Pipe Type	Color	Wording
Domestic Water	Blue	Caution Domestic Water
Irrigation Water	Blue	Caution Irrigation Water

Storm Drain	Green	Caution Storm Drain
Sanitary Sewer	Green	Caution Sanitary Sewer

I. Geotextile:

1. Geotextile for Separation shall be nonwoven and conform to WSDOT Section 9-33.2(1) Table 3.
2. Geotextile Liner at stormwater facility shall conform to WSDOT Section 9-33.2(2) Table 7 Nonwoven.

J. Cobbles: Conform to 8-inch cobbles per WSDOT Section 9-03.11(2). Use four-inch minimum to 8 inch maximum well-graded washed cobblestone rock or an approved equivalent product. Cobbles shall not be procured from natural stream bed channels.

K. Quarry Spalls: Conform to WSDOT 9-13.1(5).

L. Sand Medium: Conform to gradation on Plan and per Ecology SWMMWW Volume V, Chapter 6, BMP T8.10, Table V-6.1.

PART 3 - EXECUTION

3.1 GENERAL

A. Furnish, set and mark all alignments, line and location stakes, including offsets and other construction staking.

1. Assign a licensed surveyor to complete this work and certify the accuracy of work.
2. Have necessary equipment, supplies and instruments onsite at all times when work requiring control is being performed.

B. During the performance of earthwork, the Contractor may encounter unanticipated obstructions including but not limited to boulders, glacial erratics, concrete, masonry or other subsurface obstructions. No changes in the Contract Sum or the Contract Time are authorized for mitigating procedures performed by the Contractor to address unanticipated obstructions in performance of the Work if mitigation can be accomplished with the use of mechanical equipment, such as shovels, loaders, bulldozers, graders, rippers, excavators, etc. Should mitigation require drilling and blasting or drilling and line breaking changes to the Contract Sum or the Contract Time will be considered by the Owner.

3.2 EXCAVATION

A. Excavate to the lines and grades and at the locations shown on the drawings, including trenches for piping.

1. Conform to elevations and dimensions shown within a tolerance of 0.10-foot.
2. Properly prepare subgrade by removing unstable, soft, weak, or loose debris, clods, and other deleterious materials from excavations to expose firm soil. Replace with compacted Structural Fill unless otherwise specified by the Owner's Representative.
3. Slope and/or shore the sides of excavations and trenches to comply with WISHA, WAC 296-155 and local codes and ordinances having jurisdiction. Maintain sides and slopes of excavations in a safe manner until backfilling is complete.

B. Trench Subgrade Preparation:

1. Grade and smooth bottoms of trenches to provide uniform bearing and support of pipe.
2. Remove rocks and other materials that could cause point loads on the pipes.
3. Form bell holes and depressions sized only as needed to fit the particular type of pipe joint.

C. Catch basins, maintenance holes/manholes, and similar embedded structures:

1. Excavate a minimum 12 inches between excavation walls and sides of structures and, if prefabricated, four inches below the base of structures to allow for leveling.
2. Remove unsuitable material as described in this Section.
3. Backfill overexcavations in the subgrade with compacted Structural Fill.

D. Trench excavations for water main pipe installation pipe per WSDOT Section 7-09.3(7).

E. Trench excavations for storm drain and sanitary sewer pipe per WSDOT Section 7-17.3.

F. Dewater as necessary to keep excavations and construction areas in a dry condition. Promptly remove water to prevent softening or disturbance of subgrade surfaces.

G. Where final excavation grades are disturbed by construction activities, overexcavate disturbed material and backfill to grade using compacted Structural Fill at no additional cost to the Owner.

H. Remove and properly dispose of excess excavated material and debris offsite at no additional cost to Owner.

I. Backfill excavations as promptly as construction work allows and after the Owner's Geotechnical Engineer Representative has viewed the prepared subgrade surfaces.

J. Form stormwater facility cell and pond per grading plan, geotechnical recommendations in report, and per Owner's Geotechnical Engineer on site.

K. Protect infiltrative surfaces of stormwater facility cell and pond from compaction and sedimentation. If areas become compacted and/or contaminated, remediate and till soil in accordance with Owner's Geotechnical Engineer's requirements.

L. Provide infiltration pond bottom area and presettling cell areas per Plan. Provide topographic survey of installed pond and cell to verify areas and volumes. Revise grading as required until minimum areas and volumes are formed.

M.

3.3 FILL AND BACKFILL PLACEMENT

A. General:

1. Lightly scarify properly prepared subgrade surfaces that will receive backfill or fill, except for trenches. Moisture-condition the scarified soil to obtain soil moisture near optimum moisture content.

2. Do not place backfill or fill material on surfaces that are soft, muddy, frozen, or containing frost, ice or loose debris or soil.
3. Place backfill and fill in controlled layers of the thickness that is compatible with the type of compaction equipment used.
4. The loose thickness of each fill or backfill layer shall not exceed 12 inches.
5. Compact each layer to the minimum relative compaction as listed in this Section.
6. When placing fill on sloped surfaces, notch fill lifts into subgrade and work thoroughly to destroy interfaces that may otherwise develop.

B. Pipe Bedding:

1. Place and compact pipe bedding in accordance with WSDOT to provide uniform support along the entire pipe barrel, without load concentrations at joint collars or bells. Do not use blocking to adjust the pipe to grade except when the pipe is embedded in concrete.
2. Form bell holes and depressions in the bedding only as needed to provide uniform support along the pipe barrel.
3. Take special care to provide uniform and adequate bedding support at pipe connections and adjacent to manholes or other structures to avoid inducing stresses that could damage the pipe or adjacent manhole or other structure.
4. Recompact, or replace and recompact if necessary, bedding that is disturbed or contaminated by removal of temporary shoring, trench boxes or other construction activity at no additional cost to the Owner.

C. Pipe Backfill:

1. Backfill utility pipe trenches as soon as possible after pipe installation.
2. Place and compact pipe backfill in accordance with WSDOT Section 7 for the specific type of pipe and conditions.
3. Protect the pipe from damage or shifting alignment during backfill placement.
4. Do not backfill near catch basins, manholes or similar structures until mortar has thoroughly hardened.
5. Carefully place backfill over the pipe to a depth of two feet above the pipe crown before beginning compaction.
6. Subsequent lifts shall not exceed 12 inches loose thickness. Each lift shall be compacted with mechanical equipment.
7. Do not walk on the pipe until the backfill has reached a uniform depth of one-foot above the crown of the pipe.
8. Pipe damaged during backfill placement shall be replaced at no additional cost to the Owner.
9. Place conductive warning tape continuously along the alignment of the pipe crown at a depth no less than two feet above the pipe and embedded in backfill at least one-foot below finished grade.

D. Moisture Conditioning

1. Shall be performed for fill and backfill materials as needed to meet the compaction requirements specified in this Section. Moisture conditioning includes drying and wetting of fill and backfill materials as needed, and it shall be performed at no additional cost to the Owner.
2. Chemical soil amending such as soil cements, fly ash, lime, etc. shall not be used to moisture condition.

3. Apply water uniformly to soil where subgrade or fill material is moisture conditioned before compaction. Prevent free water from appearing on surface during or subsequent to compaction operations.
4. Remove, replace, scarify or air dry soil material too wet to permit compaction to specified density.
5. Removed soil material that is too wet for compaction may be temporarily stockpiled until removed from site, or spread to allow for drying. However, if material cannot be adequately moisture conditioned, the Contractor shall be responsible for removing material from site at no additional cost to Owner.

E. POND EMBANKMENT

1. Pond embankment as required shall be placed and compacted in accordance with WSDOT 2-03.3(14)B and per Owner's Geotechnical Engineer.

F. Compaction:

1. Compact fill and backfill using compaction equipment that can achieve the specified compaction criteria and that is appropriate to the soil type being compacted.
2. Water settling or jetting is not permitted as a means of compaction.
3. Around foundation and subgrade drains, compact backfill to a non-yielding condition without damaging the filter fabric or pipe. Repair damaged filter fabric or pipe at no additional cost to the Owner.
4. Within five feet of retaining walls or foundations, use hand-operated equipment to avoid overstressing the walls. Repair or replace walls damaged by improper compaction or other construction activities at no cost to the Owner and as directed by the Owner's Geotechnical Engineer Representative.
5. Compact fill and backfill to a dense and unyielding condition and to the following minimum relative compaction based on the percentage of maximum dry density as determined in accordance with ASTM D 1557, unless otherwise specified.

Locations	Relative Compaction
Pipe bedding	95%
Pipe backfill (non-vehicle areas)	90%
Pipe backfill (in vehicle and/or paved areas)	95%
Under slabs-on-grade	95%
Under foundations	95%
Retaining Walls and foundations (beyond 5 feet of wall face)	95%
Under driveways, aprons and vehicle areas	95%
Under walks	92%
Landscape areas	80-85%*
Other structural-bearing areas	95%

* For landscape areas the relative compaction shall be within the range noted above and not exceed the maximum.

3.4 SOIL STOCKPILES

A. Maintain separate stockpiles for various soil materials. Label each stockpile with weatherproof sign as to material type.

B. Shape and arrange soil stockpiles to promote drainage.

C. Use TESC measures to filter sediment from stormwater runoff from stockpiles and implement flow diversion and energy dissipation measures to safely direct water downstream to TESC treatment system. Runoff from stockpiles shall under no circumstances sheet-flow or direct-flow to existing trees to remain, to adjacent offsite properties, and to new and existing facilities to remain.

D. Cover temporary stockpiles in accordance with Section 01 57 13 – Temporary Erosion and Sediment Control. Material that becomes unsuitable due to lack of protection measures being installed by Contractor shall be hauled and legally disposed of offsite and replaced with suitable material at no additional expense to the Owner.

E. Unsuitable material stockpiles shall be removed, hauled and properly disposed of offsite.

3.5 GRADING

A. Shape surface of site to match contours, grades, spot elevations, profiles and slopes shown on the Contract Documents to a tolerance of 0.05-foot plus or minus over a 10-foot horizontal distance and to maintain positive drainage.

1. Should indicated figures conflict with actual conditions, notify Owner's Representative and obtain direction before proceeding with grading of affected area.
2. In landscaped areas, leave final surfaces rough or scarified to a depth of at least four inches to prepare for topsoil placement. Coordinate with landscape planting soil preparation requirements.
3. Remove all concrete, rocks, rubble and debris larger than four inches from finished surfaces.
4. Finish grades flush with adjacent surfaces unless otherwise specified.
5. Adjust finished grades as necessary to provide depth for soil amendments and other components of landscaping.
6. Construct finish grades adjacent to sidewalks to be ½-inch below elevation of sidewalk unless otherwise specified.
7. Grade transition areas to provide a smooth surface free of discontinuities.
8. Do not allow grades to exceed maximum slopes in ADA accessible routes and areas.

B. Protect finished surfaces.

1. Where finished surfaces are disturbed (e.g. loosened soil, ruts, holes, etc.) by construction activities, over-excavate disturbed material and backfill to final grade at no additional cost to the Owner.
2. Overexcavate to the depth and extent as directed by the Owner's Geotechnical Engineer's Representative.
3. Backfill with Structural Fill or other material as directed by the Owner's Representative, and in lift thickness and to the compaction criteria established by the Owner's Geotechnical Engineer's Representative.
4. Repair areas showing settlement at no cost to Owner.
5. Repair areas with any obstructions to positive drainage.

3.6 WET WEATHER PROVISIONS

A. Schedule earthwork operations to minimize the potential for erosion, siltation, and disturbance of site soils.

B. Perform earthwork operations in discrete areas to minimize the exposure of disturbed soils to wet weather.

C. Protect exposed subgrade for utility trenches, structures and paving.

1. Compact exposed soil to reduce the infiltration of rainwater.
2. Implement measures to protect suitable exposed road, paving and structure subgrade from wet and/or rainy weather. If exposed subgrade is left unprotected to wet and/or rainy weather and becomes unsuitable as determined by Owner's Geotechnical Engineer's Representative, unsuitable material shall be over-excavated and properly hauled and disposed of offsite and replaced with Structural Fill at no additional expense to the Owner.

D. Direct surface water away from fill areas, protected trees, structure, trench excavations, buildings, excavations, adjacent properties and public right-of-way.

E. Protect and cover soil stockpiles with plastic or other measures to prevent infiltration and erosion.

F. Dewater as needed to keep excavations and construction areas free of water.

G. Replace or rework soil that has not been protected in accordance with the requirements of these Contract Documents; and remove and replace, as specified in this Section, soil that becomes too wet for compaction, as directed by the Owner's Geotechnical Engineer's Representative and at no additional cost to the Owner

3.7 DISPOSAL OF EARTH MATERIALS

A. Remove all excavated material not acceptable for use as fill onsite. Legally dispose of excess material offsite at Contractor's expense.

END OF SECTION 31 00 00

SECTION 31 10 00 – SITE PREPARATION

PART 1 - GENERAL

1.1 SUMMARY

A. Work includes, but is not limited to:

1. Verification of project limits.
2. Clearing and grubbing.
3. See Landscape for Tree Protection.
4. Protection of existing features and structures.
5. Remove and dispose of materials from site per Plan.
6. Identify, disconnect, cap and remove utilities as required.

1.2 REFERENCES

A. Reference the following standards:

AHJ	Public Authority Having Jurisdiction AHJ is an abbreviation for public Authorities Having Jurisdiction. For this project the AHJ denotes Island County.
WSDOT	Washington Department of Transportation 2025 Standard Specifications and Standard Plans for Road, Bridge, and Municipal Construction

1.3 SUBMITTALS

A. Submit the following documents in accordance with submittal procedures noted in Division 01:

1. Copies of permits for transport and disposal of debris as required.

1.4 COORDINATION

A. Protection of existing conditions: Provide, erect, and maintain barricades, coverings and other types of protection measures necessary to prevent damage to existing trees, structures, utilities, and other features to remain in place. Restore any improvements damaged by this Work to their original condition or better, as acceptable to the Owner.

B. Verify existing utility locations and elevations at least 10 working days in advance of construction and demolition.

1. Contact the underground location center to locate and mark utilities not less than four business days, and not more than ten business days before beginning demolition or Earthwork.
2. Compare existing utility locations and elevations with drawings and new utilities.

3. Immediately notify Owner's Representative of potential conflicts to allow for mitigation without down time.

C. Construct temporary erosion and sediment control (TESC) plan in accordance with Section 01 57 13 – Temporary Erosion and Sedimentation Control.

PART 2 - PRODUCTS

PART 3 - NOT APPLICABLEEXECUTION

3.1 GENERAL

A. Obtain required permits and permission from AHJ, local governing authorities and Owner prior to commencing Work.

B. Before construction and mobilizing to the site, meet with the Owner's Representative and review Contract Documents on site.

1. Identify existing trees, utilities, and other site improvements that may be affected by construction.

C. Provide, erect and maintain barricades, coverings, flagging or other types of protection necessary to prevent damage to existing structures, areas, utilities, vegetation, and other facilities or features.

D. Install temporary erosion and sediment control in accordance with Section 01 57 13 - Temporary Erosion and Sediment Control and the Contract Documents.

E. Verify that clearing, grubbing, stripping and demolition and site improvements may safely and appropriately begin.

F. Locate existing utilities within the project limits.

G. Maintain hauling routes clean and free of debris resulting from Work on this Project.

H. Sprinkle water as necessary to limit dust to the lowest practicable level. Do not use water to such an extent to cause flooding or icing.

I. Properly recycle and dispose of refuse, debris and excess materials resulting from work in accordance with applicable federal, state, and local regulations and requirements. Do not leave these materials on the project site, unless authorized in writing by Owner's Representative.

3.2 PROTECTION OF INFILTRATION FACILITIES

A. Do not stockpile materials, vehicles and equipment within footprint of proposed infiltration facilities.

B. Do not locate haul routes within footprint of infiltration facility. See Section 01 57 13 - Temporary Erosion and Sedimentation Control.

3.3 EROSION CONTROL

A. Construct and maintain the TESC system in accordance with Section 01 57 13 Temporary Erosion and Sedimentation Control.

3.4 CLEARING AND GRUBBING

A. Remove surface debris, vegetation, underbrush and other deleterious material within areas to be graded, as required for new construction in accordance with WSDOT 2-01.3.

1. Disposal Method shall not include open burning.

B. Protect all offsite trees along adjacent roadways and on surrounding properties.

C. Do not strip and grub within tree protection areas or areas to remain undisturbed.

3.5 DISPOSAL OF MATERIALS

A. The Contractor, in a manner consistent with all government regulations, shall dispose of the refuse resulting from clearing, stripping and grubbing. In no case shall refuse material be left on the Project Site, shoved onto abutting private properties, or be buried in embankments or trenches on the Project Site. Debris shall not be deposited in any stream or body of water, stormwater facility, infiltration facility or in any street or alley, or upon any private property except by written consent of the private property owner. Maintain hauling routes clean and free of any debris resulting from Work of this Section.

END OF SECTION 31 10 00

31 05 16 – AGGREGATES FOR EARTHWORK (SANITARY SEWER)

PART 1 - GENERAL

1.1 DESCRIPTION

A. The WORK under this Section includes Scope providing and installing aggregate materials of the types and sizes noted in this section where required by applicable codes, good standard engineering practice, and the approved site design.

B. This WORK includes Coarse aggregate materials and fine aggregate materials for use throughout the site as indicated on plans.

1.2 REFERENCES

A. Washington State Department of Transportation Standard Specifications for Road, Bridge, and Municipal Construction (2025 Edition).

1.3 SUBMITTALS

A. Pipe Zone Material (Bedding): Name and location of source, and sieve test results.

B. Trench Backfill: Name and location of source, and sieve test results.

C. Structural Backfill: Name and location of source, and sieve test results.

D. Other Aggregates: Name and location of source, and applicable test results.

E. Excavation Procedure: Submit a layout drawing or detailed outline of intended excavation procedure for Owner’s information. This submittal will not relieve the Contractor of responsibility for the successful performance of intended excavation methods.

PART 2 - PRODUCTS

2.1 AGGREGATE MATERIALS (FLEXIBLE PIPE)

A. Gravel backfill for pipe zone bedding shall consist of crushed, processed, or naturally occurring granular material. It shall be free from various types of wood waste or other extraneous or objectionable materials. It shall have such characteristics of size and shape that it will compact and shall meet the following Specifications for grading and quality:

Sieve Size	Percent Passing
1-1/2”	99-100
1”	75-100
5/8"	50-100

No. 4	20-80
No. 40	55-75
No. 200	3-24
Sand Equivalent	35 min.

B. Native Material for Trench Backfill: Trench backfill outside the roadway prism may be excavated material free of wood waste, debris, clods or rocks greater than 6 inches in any dimension when approved by the Owners representative.

C. Bank Run Gravel for Trench Backfill: Gravel backfill shall consist of granular material, either naturally occurring or processed. It shall be essentially free from various types of wood waste or other extraneous or objectionable materials. It shall have such characteristics of size and shape that it will compact readily, and the maximum particle size shall not exceed ⅔ of the depth of the layer being placed. Gravel backfill shall meet the following requirements for grading and quality:

Sieve Size	Percent Passing
2”	100
No. 4	22-100
No. 200	0-10
Dust Ratio	2/3 max.
Sand Equivalent	30 min.

2.2 AGGREGATE MATERIALS (SEPTIC TANK)

A. Bedding: Bedding material shall be primarily sand and gravel, having a plasticity index less than 6. Gradation shall limit the amount passing the No. 200 sieve to 10 percent maximum. Bedding material must comply with the grading requirements for the sieve sizes shown in the following table:

Sieve Size	Percent Passing
1 1/2”	99-100
1"	75-100
5/8”	50-100
No. 4	20-80
No. 40	3-4
No. 200	10 Max
Sand Equivalent	35 Min

B. Primary Backfill: Primary backfill must be clean, fee flowing, and free of dirt, sand, large rocks, roots, organic materials, debris, ice and snow and consist of one of the following:

1. Course aggregate – Rounded Stone

2. Course aggregate – Crushed Stone

Aggregate must comply with the grading requirements for the sieve sizes shown in the following table:

Rounded Stone			
ASTM C 33 Size #	#6 Stone	#67 Stone	#7 Stone
1" (25 mm)	100	100	-
3/4" (19 mm)	90–100	90–100	100
1/2" (12.5 mm)	10 - 55	-	90 - 100
3/8" (9.5 mm)	0 - 15	20 - 55	40 - 70
No. 4 .0187” (4.75 mm)	0 - 5	0 - 10	0 - 15
No. 8 .094” (2.36 mm)	-	0 - 5	0 - 5

Crushed Stone		
ASTM C 33 Size #	#7 Stone	#8 Stone
1" (25 mm)	-	-
3/4" (19 mm)	100	-
1/2" (12.5 mm)	90 - 100	100
3/8" (9.5 mm)	40 - 70	85 - 100
No. 4 .0187” (4.75 mm)	0 - 15	10 - 30
No. 8 .094” (2.36 mm)	0 - 5	0 - 10

C. Secondary Backfill: Secondary Backfill shall consist of granular material, either naturally occurring or processed (native material shall be used as available and appropriate prior to importing material), and shall be free draining and meet the following requirements for grading and quality:

Sieve Size	Percent Passing
6"	75 - 100
3"	100
No. 40	50 max
No. 200	10 max
Sand Equivalent	30 min

2.1 SOURCE QUALITY CONTROL

A. All Aggregates shall be from a borrow pit approved by the Owner.

PART 3 - EXECUTION

3.1 EXCAVATION

A. Stockpile excavated material meeting requirements for aggregate materials.

B. Remove excess excavated materials not intended for reuse from site.

C. Place aggregate at locations approved by Owner's representative.

3.2 STOCKPILING

A. Stockpile materials at locations designated by Owner's representative.

B. Stockpile in sufficient quantities to meet Project schedule and requirements.

C. Separate different aggregate materials with dividers or stockpile individually to prevent mixing.

D. Direct surface water away from stockpile site to prevent erosion or deterioration of materials.

3.3 STOCKPILE CLEANUP

A. Remove stockpile; leave area in clean and neat condition. Grade site surface to prevent Free-standing surface water.

END OF SECTION 31 05 16

SECTION 31 10 00 – SITE PREPARATION

PART 1 - GENERAL

1.1 SUMMARY

A. Work includes, but is not limited to:

1. Verification of project limits.
2. Clearing and grubbing.
3. See Landscape for Tree Protection.
4. Protection of existing features and structures.
5. Remove and dispose of materials from site per Plan.
6. Identify, disconnect, cap and remove utilities as required.

PART 2 - PRODUCTS

PART 3 - NOT APPLICABLEEXECUTION

3.1 GENERAL

A. Obtain required permits and permission from AHJ, local governing authorities and Owner prior to commencing Work.

B. Before construction and mobilizing to the site, meet with the Owner's Representative and review Contract Documents on site.

1. Identify existing trees, utilities, and other site improvements that may be affected by construction.

C. Provide, erect and maintain barricades, coverings, flagging or other types of protection necessary to prevent damage to existing structures, areas, utilities, vegetation, and other facilities or features.

D. Install temporary erosion and sediment control in accordance with Section 01 57 13 - Temporary Erosion and Sediment Control and the Contract Documents.

E. Verify that clearing, grubbing, stripping and demolition and site improvements may safely and appropriately begin.

F. Locate existing utilities within the project limits.

G. Maintain hauling routes clean and free of debris resulting from Work on this Project.

H. Sprinkle water as necessary to limit dust to the lowest practicable level. Do not use water to such an extent to cause flooding or icing.

I. Properly recycle and dispose of refuse, debris and excess materials resulting from work in accordance with applicable federal, state, and local regulations and requirements. Do not leave these materials on the project site, unless authorized in writing by Owner's Representative.

3.2 PROTECTION OF INFILTRATION FACILITIES

A. Do not stockpile materials, vehicles and equipment within footprint of proposed infiltration facilities.

B. Do not locate haul routes within footprint of infiltration facility. See Section 01 57 13 - Temporary Erosion and Sedimentation Control.

3.3 EROSION CONTROL

A. Construct and maintain the TESC system in accordance with Section 01 57 13 Temporary Erosion and Sedimentation Control.

3.4 CLEARING AND GRUBBING

A. Remove surface debris, vegetation, underbrush and other deleterious material within areas to be graded, as required for new construction in accordance with WSDOT 2-01.3.

1. Disposal Method shall not include open burning.

B. Protect all offsite trees along adjacent roadways and on surrounding properties.

C. Do not strip and grub within tree protection areas or areas to remain undisturbed.

3.5 DISPOSAL OF MATERIALS

A. The Contractor, in a manner consistent with all government regulations, shall dispose of the refuse resulting from clearing, stripping and grubbing. In no case shall refuse material be left on the Project Site, shoved onto abutting private properties, or be buried in embankments or trenches on the Project Site. Debris shall not be deposited in any stream or body of water, stormwater facility, infiltration facility or in any street or alley, or upon any private property except by written consent of the private property owner. Maintain hauling routes clean and free of any debris resulting from Work of this Section.

END OF SECTION 31 10 00

SECTION 31 23 33 – RESTORATION OF SURFACES (WATER SUPPLY)

PART 1 – GENERAL

1.1 DESCRIPTION

A. The work covered by this Section includes restoration to all types of surfaces disturbed, damaged or destroyed during the performance of the work under or as a result of the operations of the contract.

B. This work does not include water main and service work within the Aquatic Center site. Water piping work within the Aquatic Center site shall be in accordance with Section 33 10 00 – Water Service.

1.2 RELATED SECTIONS

A. Section 31 00 00 – Earthwork

B. Section 32 12 16 – Hot Mix Asphalt Pavement

1.3 SCHEDULE OF RESTORATION

A. A schedule of restoration operations shall be submitted by the Contractor for review.
   1. After an accepted schedule has been agreed upon it shall be adhered to unless otherwise revised with the approval of the Contracting Officer Representative (COR).

B. The replacement of surfaces at any time, as scheduled or as directed, shall not relieve the Contractor of responsibility to repair damages by settlement or other failures.

1.4 SUBMITTALS

A. Schedule of Restoration Operations

PART 2 - PRODUCTS (Not Used)

PART 3 - EXECUTION

3.1 GENERAL

A. The quality of materials and the performance of work used in the restoration shall produce a surface or feature equal to or better than the condition of each before the work began.

3.2 NATIVE UNDEVELOPED AREAS

A. All native undeveloped areas disturbed shall be replaced with material to match the existing surface unless otherwise specified.
   1. The depth of the soil, stone or gravel shall be at least equal to the existing.
   2. After compaction the surface shall conform to the slope and grade of the area being replaced.

3.3 OTHER TYPES OF RESTORATION

A. Watercourses shall be reshaped to the original grade and cross-section and all debris removed. Where required to prevent erosion, the bottom and sides of the watercourse shall be protected.

B. Flow lines indicated on the topographical survey shall not be altered by construction activity except where indicated on the Drawings. The Contractor is responsible for re-establishing flow lines that have been affected by construction equipment or personnel under the supervision of the Contractor.

C. Trails and slopes shall be restored to their original condition upon completion of construction activity at a given area. The Contractor must ensure that no new channel flow lines or watercourses have been created as a result of construction activity except where indicated on the Drawings.

D. Gravel roadways shall be shaped to the original grade and cross-section and all debris removed. Utility trench sections within the existing asphalt or gravel roadway corridors, or their shoulders, shall be repaired in accordance with the project Drawings and applicable specifications.

E. Asphalt pavement shall be restored in accordance with the Drawings and Section 32 12 16 – Hot Mix Asphalt Pavement.

END OF SECTION 31 23 33.10

SECTION 32 12 16 - HOT MIX ASPHALT PAVING

PART 1 - GENERAL

1.1 SUMMARY

A. Work includes but is not limited to the following:

1. New hot mix asphalt (HMA) pavement including crushed surfacing courses.
2. Temporary and permanent pavement patching.

1.2 REFERENCES

A. Reference the following standards:

AHJ	Public Authority Having Jurisdiction AHJ is an abbreviation for public Authorities Having Jurisdiction. For this project the AHJ denotes Island County.
MUTCD	Manual on Uniform Traffic Control Devices, current edition
WSDOT	Washington Department of Transportation 2025 Standard Specifications and Standard Plans for Road, Bridge, and Municipal Construction

1.3 SUBMITTALS

A. Submit the following information in accordance with Division 01:

1. Product information.
2. Documentation verifying mixing plant shall be a member of the Washington Asphalt Pavement Association (WAPA).
3. Certified test results that demonstrate conformance with specifications. Tests shall have been performed within twelve months of anticipated use of materials.

PART 2 - PRODUCTS

2.1 CRUSHED SURFACING TOP COURSE

A. Crushed Surfacing Top Course in accordance with Section 31 00 00 – Earthwork.

2.2 CRUSHED SURFACING BASE COURSE

A. Crushed Surfacing Base Course in accordance with Section 31 00 00 – Earthwork.

2.3 HOT MIX ASPHALT (HMA)

A. HMA Class ½" conforming to WSDOT Section 5-04.

2.4 TACK COAT

A. Tack Coat shall conform to WSDOT 5-04.3(4).

2.5 CRACK SEALING

A. Crack sealing shall conform to WSDOT 5-03 and 5-04.3(4).

PART 3 - EXECUTION

3.1 GENERAL

A. Verify site conditions are suitable to receive the work covered in this Section.

B. Weather limitations for placement of HMA shall conform to WSDOT Section 5-04.3.

C. Conform to the details, dimensions and grades specified on the plans.

1. Prepare subgrade in all areas to be paved in accordance with Section 31 00 00 Earthwork, and WSDOT 2-06.
2. Maximum allowable slope in Accessible Routes parking stalls and access aisles is two-percent in any direction (zero tolerance for maximum allowable slopes). The finished slope and cross slope in Accessible Routes and areas shall not exceed the maximum slope allowed by Americans with Disability Act (ADA) and U.S. Access Board's Public Rights-of-Way Accessibility Guidelines.
3. Maximum variations in finished grade of all paving except Accessible parking and Accessible Routes and areas shall be in accordance with WSDOT 5-04.3(13).
4. Slope all paved surfaces to prevent standing water.

D. Protect surrounding areas, structures, features, and surfaces from damage.

1. Should any defacement or damage occur, repair or replace damaged areas or structures at no cost to the Owner.

3.2 CRUSHED SURFACING COURSES

A. Place crushed surfacing courses in accordance with WSDOT Section 4-04 and compact to a minimum of 95-percent of maximum dry density as determined in accordance with ASTM D1577 and as measured in the field using ASTM D2922.

B. Prior to placing the HMA, treat the prepared surface in accordance with WSDOT Section 5-04.3.

3.3 HOT MIX ASPHALT

A. Spread, finish and compact HMA in accordance with WSDOT Section 5-04.3.

1. HMA three inches or thicker shall be placed in layers not exceeding two inches in thickness. HMA less than three inches thick may be placed in one layer.
2. Do not pave in rain or when subgrade or base is wet or frozen. Weather limitations per WSDOT Section 5-04.3(1).

B. Construct joints and connections with existing facilities in accordance with WSDOT Section 5-04.3.

3.4 TACK COAT

A. Apply tack coat per WSDOT Section 5-04.3. Do not apply tack coats when temperature is below 50 degrees Fahrenheit or when base is wet.

3.5 RIGHT-OF-WAY RESTORATION

A. Restore pavement in public right-of-way in accordance with AHJ requirements. Pavement extents shown on plans are approximate only for permitting purposes. Confirm extents with AHJ Inspector.

3.6 CLEANING

A. After paving operations, clean surfaces of excess or spilled asphaltic materials.

B. Do not permit vehicular traffic on asphalt paving until it has cooled and hardened, and in no case sooner than six hours after placing.

C. Provide barricades and warning devices as required and in accordance with MUTCD.

END OF SECTION 32 12 16

32 13 13 – SUMMARY

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Concrete Paving (Pedestrian)
   2. Concrete Paving (Vehicular)
   3. Extruded Concrete Curbs
   4. Cast-in-Place Concrete Steps

B. Related Requirements:
   1. 05 52 00 Exterior Metal Railings
   2. WSDOT Standard Specification for Road, Bridge, and Municipal Construction.
   3. WSDOT Standard Plans
   4. Civil Engineering Plans, Notes, and Details
   5. International Building Code (IBC), Section 1011 – Stairways
   6. Americans with Disabilities Act (ADA) – Accessibility Guidelines

1.3 DEFINITIONS

A. *Cementitious Materials:* Portland cement alone or in combination with one or more of blended hydraulic cement, expansive hydraulic cement, fly ash and other pozzolans, ground granulated blast-furnace slag, and silica fume.

1.4 SUBMITTALS

A. Product Data: For each type of manufactured material and product indicated:
   1. Joint Filler.
   2. Joint Sealant.
   3. Curing Compound.

B. Design Mixes: For each concrete pavement mix. Include alternate mix designs when characteristics of materials, product conditions, weather test results, or other circumstances warrant.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: An experienced installer who has completed pavement work similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.

B. Manufacturer Qualifications: Manufacturer of ready-mixed concrete products complying with ASTM C94M-19a requirements for production facilities and equipment.

1. Manufacturer must be certified according to the National Ready Mix Concrete Association's Plant Certification Program.

C. ACI Publications: Comply with ACI 301, "Specification for Structural Concrete," unless modified by the requirements of the Contract Documents.

D. Pre-installation Conference: Conduct conference at Project site to comply with requirements in Division 1 Section 'Project Meetings'.
1. Require representatives of each entity directly concerned with concrete pavement to attend, including the following:
a. Contractor's superintendent.
b. Concrete subcontractor.

1.6 Concrete Mock-Up: Provide 6’ x 6’ concrete mock-up indicating all finishes, sawcuts, joints, and sealant for approval prior to construction to become standard for all concrete paving. Approved mock-up to remain on site until all concrete work is accepted.

1.7 PROJECT CONDITIONS

A. Traffic Control: Maintain access for vehicular and pedestrian traffic as required for other construction activities.

PART 2 - PRODUCTS

2.1 FORMS

A. Form Materials: Plywood, metal, metal-framed plywood, or other approved panel-type materials to provide full-depth, continuous, straight, smooth exposed surfaces.
1. Use flexible or curved forms for all curved pavement edges.

B. Formwork for Vertical Surfaces: Use well-braced vertical forms for curbs and concrete steps. Forms shall be aligned, tight, and capable of resisting movement or deformation during placement and consolidation.

C. Form-Release Agent: Commercially formulated form-release agent that will not bond with, stain, or adversely affect concrete surfaces and will not impair subsequent treatments of concrete surfaces.

2.2 CONCRETE PAVING (PEDESTRIAN)

A. General: Use the same brand and type of cementitious material from the same manufacturer throughout the Project.

B. Portland Cement: ASTM C150, Type I or Type II.

C. Aggregate: ASTM C33, uniformly graded, from a single source, with coarse aggregate as follows:
1. Maximum Aggregate Size: Three-quarter inch (¾”) nominal.
2. Do not use fine or coarse aggregates containing substances that cause spalling.

D. Water: Potable and in conformance with ASTM C94.

E. Fiber Reinforcement:
   1. Synthetic Fibers: ASTM C116C/C116M, Type III

2.3 CONCRETE PAVING (VEHICULAR)

A. Refer to Civil Drawings and WSDOT Standard Specifications.

B. Jointing and mix for vehicular concrete paving are governed by the Civil Engineering plans and WSDOT Standard Specifications. Refer to landscape drawings to align with the jointing layout.

2.4 EXTRUDED CONCRETE CURBS

A. Refer to Civil Drawings and WSDOT Standard Specifications.

B. Jointing and mix for extruded concrete curbs are governed by the Civil Engineering plan and WSDOT Standard Specifications.

2.5 CAST-IN-PLACE CONCRETE STEPS

A. General: Use the same brand and type of cementitious material from the same manufacturer throughout the Project.

B. Portland Cement: ASTM C150, Type I or Type II.

C. Aggregate: ASTM C33, uniformly graded, from a single source, with coarse aggregate as follows:
   1. Maximum Aggregate Size: Three-quarter inch (¾") nominal.
   2. Do not use fine or coarse aggregates containing substances that cause spalling.

D. Water: Potable and in conformance with ASTM C94.

E. Steel Reinforcement:
   1. Reinforcement bars: ASTM A615M-18e1, Grade 60, Deformed

F. Finish: Smooth trowel finish with uniform risers / treads per IBC Section 1011

2.6 ADMIXTURES

A. General: Admixtures certified by manufacturer to contain not more than one-tenth percent (0.1%) water-soluble chloride ions by mass of cement and to be compatible with other admixtures.

B. Air-Entraining Admixture: ASTM C260.

C. Synthetic Fiber Reinforcement: Master Fiber M100 or approved equal meeting the requirements of ASTM C1116 / C1116M 4.1.3. Type III and ICC ES AC 32 3.1.1.

2.7 CURING MATERIALS

A. Moisture-Retaining Cover: ASTM C171, polyethylene film or white burlap-polyethylene sheet.

B. Water: Potable.

C. Clear Waterborne Membrane-Forming Curing Compound: ASTM C309, Type 1, Class B.

2.8 RELATED MATERIALS

A. Expansion and Isolation Joint Filler Strips: ASTM D1751, asphalt-saturated cellulosic fiber three-eighths inch (3/8") thick. Premolded expansion joint filler shall be of sufficient size to cover the full depth of the concrete section.

B. Joint Sealant: ASTM C920, Type S, Class 35, Grade NS. Sikaflex-1A or approved equal.

C. Provide gray joint sealant, and coat with silica sand.

D. Carefully apply sealant. Any joints not fully covered with sealant and/or flowing beyond the joint will require the sealant to be removed and reapplied across the entirety of the joint.

2.9 CONCRETE MIXES

A. Prepare design mixes, proportioned according to ACI 211.1 and ACI 301, for each type and strength of normal-weight concrete determined by either laboratory trial mixes or field experience.

B. Use a qualified independent testing agency for preparing and reporting proposed mix designs for the trial batch method.
   1. Do not use Owner's field quality-control testing agency as the independent testing agency.

C. Proportion mixes to provide concrete with the following properties:
   1. Compressive Strength (28 Days): 4000 psi
   2. Slump Limit: Four (4) inches.

D. Add air-entraining admixture at manufacturer's prescribed rate to result in concrete at point of placement having an air content as follows:
   1. Air Content: No less than four point five percent (4.5%) and no more than seven point five percent (7.5%) for three-quarter inch (¾”) maximum aggregate.

2.10 CONCRETE MIXING

A. Ready-Mixed Concrete: Comply with requirements and with ASTM C94.

B. Admixtures: Add admixtures within an accuracy of three percent (3%). Where two (2) or more admixtures are used in the same batch, they shall be added separately and must be compatible. Approved admixtures must be added at the appropriate time in strict compliance with manufacturer’s directions. Concrete that shows evidence of total collapse or segregation caused by the use of admixture shall be removed from the site.

C. Synthetic Fiber: Add one-half (½) pound per cubic yard.

2.11 CRUSHED SURFACING BASE

A. Refer to plans and geotechnical report.

PART 3 - EXECUTION

3.1 SUBGRADE PREPARATION AND CRUSHED SURFACING BASE

A. Verify the subgrade is correct to line and grade before beginning subsequent work.

B. Proof-roll prepared subbase surface to check for unstable areas and verify need for additional compaction. Proceed with pavement only after nonconforming conditions have been corrected and subgrade is ready to receive pavement.

C. Remove loose material from compacted subbase surface immediately before placing crushed surfacing base.

D. Place crushed surfacing base in one (1) lift and compact.

3.2 EDGE FORMS AND SCREED CONSTRUCTION

A. All curved edges shall be formed with flexible forms and formwork shall be approved by the Owner's Representative prior to placing any concrete.

B. Set, brace, and secure edge forms, bulkheads, and intermediate screed guides for pavement to required lines, grades, and elevations. Install forms to allow continuous progress of work and so forms can remain in place at least twenty-four (24) hours after concrete placement.

C. Clean forms after each use and coat with form release agent to ensure separation from concrete without damage.

3.3 STEEL REINFORCEMENT

A. General: Comply with CRSI's *"Manual of Standard Practice"* for fabricating reinforcement and with recommendations in CRSI's *"Placing Reinforcing Bars"* for placing and supporting reinforcement.

B. Clean reinforcement of loose rust and mill scale, earth, ice, or other bond-reducing materials.

C. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position during concrete placement. Maintain minimum cover to reinforcement.

3.4 JOINTS

A. General: Place joints where shown on Contract Drawings. Construct construction, isolation, and contraction joints and tool edgings true to line with faces perpendicular to surface plane of concrete. Construct transverse joints at right angles to centerline, unless otherwise indicated.
   1. When joining existing pavement, place transverse joints to align with previously placed joints, unless otherwise indicated.

B. Construction Joints: Set construction joints at side and end terminations of pavement and at locations where pavement operations are stopped for more than one-half (½) hour, unless pavement terminates at isolation or expansion joints.
   1. Provide preformed galvanized steel or plastic keyway-section forms or bulkhead forms with keys, unless otherwise indicated. Embed keys at least one and one-half inches (1½") into concrete.
   2. Continue reinforcement across construction joints, unless otherwise indicated. Do not continue reinforcement through sides of pavement strips, unless otherwise indicated.

3. Provide tie bars at sides of pavement strips where indicated.
4. Use a bonding agent at locations where fresh concrete is placed against hardened or partially hardened concrete surfaces.

C. Isolation and Expansion Joints: Form isolation and expansion joints of preformed joint-filler strips abutting concrete curbs, catch basins, manholes, inlets, structures, walks, other fixed objects, and where indicated.
1. Locate expansion joints at intervals indicated.
2. Extend joint fillers full width and depth of joint.
3. Terminate joint filler no less than one-half inch (½") nor more than one inch (1") below finished surface if joint sealant is indicated.
4. Furnish joint fillers in one-piece lengths. Where more than one (1) length is required, lace or clip joint-filler sections together.
5. Protect top edge of joint filler during concrete placement with metal, plastic, or other temporary preformed cap. Remove protective cap after concrete has been placed on both sides of joint.

D. Contraction Joints:
1. Provide one-eighth inch (1/8") sawcut to one-quarter (¼) of slab depth. Sawcut within four (4) to twelve (12) hours of pouring slab.
2. Fill with mastic where required.

E. Edging: Tool edges of joints in concrete after initial floating with an edging tool to the radius indicated on the Contract Drawings. Repeat tooling of edges after applying surface finishes. Eliminate tool marks on concrete surfaces.

3.5 CONCRETE PLACEMENT

A. Inspection: Before placing concrete, inspect and complete formwork installation, reinforcement steel, and items to be embedded or cast in. Notify other trades to permit installation of their work.

B. Remove snow, ice, or frost from subbase surface and reinforcement before placing concrete. Do not place concrete on frozen surfaces.

C. Moisten subbase to provide a uniform dampened condition at the time concrete is placed. Do not place concrete around manholes or other structures until they are at the required finish elevation and alignment.

D. Comply with requirements and with recommendations in ACI 304R for measuring, mixing, transporting, and placing concrete.

E. Deposit and spread concrete in a continuous operation between transverse joints. Do not push or drag concrete into place or use vibrators to move concrete into place.

F. Consolidate concrete by mechanical vibrating equipment supplemented by hand-spading, rodding, or tamping. Use equipment and procedures to consolidate concrete according to recommendations in ACI 309R.

G. Consolidate concrete along face of forms and adjacent to transverse joints with an internal vibrator. Keep vibrator away from joint assemblies, reinforcement, or side forms. Use only square-faced shovels for hand-spreading and consolidation. Consolidate with care to prevent dislocating reinforcement, dowels, and joint devices.

H. Screed pavement surfaces with a straightedge and strike off. Commence initial floating using bull floats or darbies to form an open textured and uniform surface plane before excess moisture or bleed water appears on the surface. Do not further disturb concrete surfaces before beginning finishing operations.

I. Cold-Weather Placement: Comply with ACI 306.1 and as follows when cold weather conditions exist:
   1. Protect concrete work from physical damage or reduced strength that could be caused by frost, freezing actions, or low temperatures.
   2. When air temperature has fallen to or is expected to fall below forty (40) degrees F uniformly heat water and aggregates before mixing to obtain a concrete mixture temperature of not less than fifty (50) degrees F and not more than eighty (80) degrees F at point of placement.
   3. Do not use frozen materials or materials containing ice or snow.
   4. Do not use calcium chloride, salt, or other materials containing antifreeze agents or chemical accelerators, unless otherwise specified and approved in mix designs.

J. Hot-Weather Placement: Place concrete according to recommendations in ACI 305R and as follows when hot-weather conditions exist:
   1. Cool ingredients before mixing to maintain concrete temperature at time of placement below ninety (90) degrees F. Chilled mixing water or chopped ice may be used to control temperature, provided water equivalent of ice is calculated to total amount of mixing water. Using liquid nitrogen to cool concrete is Contractor's option.
   2. Cover reinforcement steel with water-soaked burlap so steel temperature will not exceed ambient air temperature immediately before embedding in concrete.
   3. Fog-spray forms, reinforcement steel, and subgrade just before placing concrete. Keep subgrade moisture uniform without standing water, soft spots, or dry areas.

3.6 CONCRETE FINISHING

A. General: Wetting of concrete surfaces during screeding, initial floating, or finishing operations is prohibited.

B. Float Finish: Begin the second floating operation when bleed-water sheen has disappeared and the concrete surface has stiffened sufficiently to permit operations. Float surface with power-driven floats, or by hand floating if area is small or inaccessible to power units. Finish surfaces to true planes. Cut down high spots, and fill low spots. Refloat surface immediately to uniform granular texture. Finishes to be approved on mock-up prior to construction.

   1. Medium-to-Light-Textured Broom Finish: Draw a soft bristle broom across float-finished concrete surface perpendicular to line of traffic to provide a uniform, fine-line texture.

C. Vertical Surfaces: Class 1 sack finish on all exposed vertical surfaces in accordance with WSDOT Standard Specifications – Section 602.3(14)A.

3.7 CONCRETE PROTECTION AND CURING

A. General: Protect freshly placed concrete from premature drying and excessive cold or hot temperatures. Comply with ACI 306.1 for cold-weather protection and follow recommendations in ACI 305R for hot-weather protection during curing.

B. Evaporation Retarder: Apply evaporation retarder to concrete surfaces if hot, dry, or windy conditions cause moisture loss approaching 0.2 lb/sq. ft. x h before and during finishing operations. Apply according to manufacturer's written instructions after placing, screeding, and bull floating or darbying concrete, but before float finishing.

C. Begin curing after finishing concrete, but not before free water has disappeared from concrete surface.

D. Curing Methods: Cure concrete by moisture curing, moisture-retaining-cover curing, curing compound, or a combination of these as follows:
   1. Moisture Curing: Keep surfaces continuously moist for not less than seven (7) days with the following materials:
      a. Absorptive cover, water saturated, and kept continuously wet. Cover concrete surfaces and edges with twelve-inch (12") lap over adjacent absorptive covers.
   2. Moisture-Retaining-Cover Curing: Cover concrete surfaces with moisture-retaining cover for curing concrete, placed in widest practicable width, with sides and ends lapped at least twelve inches (12"), and sealed by waterproof tape or adhesive. Immediately repair any holes or tears during curing period using cover material and waterproof tape.
   3. Curing Compound: Apply uniformly in continuous operation by power spray or roller according to manufacturer's written instructions. Recoat areas subjected to heavy rainfall within three (3) hours after initial application. Maintain continuity of coating and repair damage during curing period.

3.8 PAVEMENT TOLERANCES

A. Comply with tolerances of ACI 117 and as follows:
   1. Elevation: One-quarter inch (¼").
   2. Thickness: Plus three-eighths inch (3/8"), minus one-quarter inch (¼").
   3. Surface: Gap below ten foot (10') long, unleveled straightedge not to exceed one-quarter inch (¼").
   4. Lateral Alignment and Spacing of Tie Bars and Dowels: One inch (1").
   5. Vertical Alignment of Tie Bars and Dowels: One-quarter inch (¼").
   6. Joint Spacing: As shown on Contract Drawings.
   7. Joint Width: Plus one-eighth inch (1/8"), minus zero (0) inch.

3.9 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified testing and inspection agency to sample materials, perform tests, and submit test reports during concrete placement. Sampling and testing for quality control may include those specified in this Section.

B. Test results shall be reported in writing to Owner's Representative, concrete manufacturer, and Contractor within twenty-four (24) hours of testing. Reports of compressive-strength tests shall contain Project identification name and number, date of concrete placement, name of concrete testing agency, concrete type and class, location of concrete batch in pavement, design compressive strength at twenty-eight (28) days, concrete mix proportions and materials, compressive breaking strength, and type of break for both seven (7-) and twenty-eight (28-) day tests.

C. Additional Tests: Testing agency shall make additional tests of the concrete when test results indicate slump, air entrainment, concrete strengths, or other requirements have not been met, as directed by Owner's Representative. Testing agency may conduct tests to determine adequacy of concrete by cored cylinders complying with ASTM C42, or by other methods as directed.

3.10 REPAIRS AND PROTECTION

A. Remove and replace concrete pavement that is broken, damaged, or defective, or does not meet requirements in this Section.

B. Drill test cores where directed by Owner's Representative when necessary to determine magnitude of cracks or defective areas. Fill drilled core holes in satisfactory pavement areas with Portland cement concrete bonded to pavement with epoxy adhesive.

C. Protect concrete from damage. Exclude traffic from pavement for at least fourteen (14) days after placement. When construction traffic is permitted, maintain pavement as clean as possible by removing surface stains and spillage of materials as they occur.

D. Maintain concrete pavement free of stains, discoloration, dirt, and other foreign material. Sweep concrete pavement not more than two (2) days before date scheduled for Substantial Completion inspections.

END OF SECTION 32 13 13

32 14 43 – POROUS UNIT PAVING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Porous Pavement System

B. Related Requirements:
   1. 32 80 00 – Irrigation System
   2. 32 91 13 – Soil Preparation
   3. 32 92 23 – Hydroseed
   4. 32 93 00 – Plants

1.3 SUBMITTALS

A. Shop Drawings: Submit design detail showing proper cross section.

B. Samples: Submit manufacturer's sample 10inch x 10inch section.

C. Installation Instructions: Installation instructions and maintenance methodology.

D. Manufacturer's Product Information: Product manufacturers shall have a minimum of twenty (20) years of experience producing products for porous pavement systems.

E. Sieve Analysis

1.4 DELIVERY, STORAGE, AND HANDLING

A. Store products in manufacturer's unopened package until ready for installation.

B. Protect units / rolls from damage during delivery and store rolls uprights, under tarp, to protect from sunlight, when time for delivery to installation exceeds one (1) week.

C. Handling: Protect materials during handling and installation to prevent damage.

1.5 PROJECT CONDITIONS

A. Maintain environmental conditions within limits recommended by manufacturer for optimum results.

B. Do not begin installation of porous pavements until all hard surface paving adjacent to porous pavement areas is complete.

C. Install turf when ambient air temperatures is at least fifty-five (55) degrees F.

D. In cold weather, do not use frozen materials or materials mixed or coated with ice or frost, and do not build on frozen, wet, saturated, or muddy subgrade.

E. Protect partially completed paving against damage from other construction traffic when work is in progress.

F. Adequately water sod or grass seed to assure germination of seed and growth of root system.

G. Grass coverage on the sand-filled rings must be completed within one (1) week.

H. DO NOT DRIVE, PARK ON, or use Grasspave system for two (2) or three (3) mowing cycles until grass root system has matured (6-8 weeks for seeded areas)

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Invisible Structures, Inc, www.invisiblestructures.com, 302.233.8383, or equal.

2.2 GRASSPAVE2

A. Composition:
1. High density polyethylene (HDPE): 100 percent recycled materials.
2. Color: Black
3. Color Uniformity: Uniform color throughout all units rolls.
4. Carbon Black for ultraviolet light stabilization.
5. Hydrogrow soil amendment and fertilizer, provided with Grasspave2.

B. Performance Properties:
1. Maximum Loading Capability: 15,940 psi when filled with sand.
2. Tensile Strength: 458 lbf/in from ASTM D638 Modified.
3. System Permeability: 2.63 to 38.55 inches of water per hour.
4. Effective Imperviousness: 10%

C. Dimensions (individual units are assembled and distributed into rolls):
1. Roll Area: From 108 sq ft to 538 sq ft, in 108 sq ft increments.
2. Roll Width: From 3.3 ft to 8.2 ft in 1.6ft increments.
3. Roll Lengths: From 32.8 ft to 65.6 ft in 3.3 ft increments.
4. Roll Weights: From 41 lbs to 205lbs in 41 lb increments.
5. Unit Nominal Width by Length: 20 inches by 20 inches or 40 inches by 40 inches.
6. Nominal Depth: 1 inch for rolls and individual units.
7. Unit Weight: 18 oz or 5 lbs.
8. Volume Solid: 8 percent.

2.3 SYSTEM MATERIALS

A. Base Course: Sandy gravel material from local sources commonly used for road base construction (recycled materials such as crushed concrete or crushed asphalt are not acceptable).
1. Conforming to the following sieve analysis and requirements:
a. 100 percent passing – sieve size 1 inch
b. 80-100 percent passing – sieve size ¾ inch.

c. 60-80 percent passing – sieve size 3/8 inch
d. 40-60 percent passing – sieve size #4.
e. 25-40 percent passive – sieve size #10.
f. 5-25 percent passing – sieve size #40.
g. 0-5 percent passive – sieve size #200.

2. Provide a base course material nearly neutral in PH (range 6.5 to 7.2) to provide adequate root zone development for turf.
3. Material may be either “pit run” or “crusher run”. Avoid using clay-based crusher run/pit run. Crusher run material will generally require coarse, well-draining sand conforming to AASHTO M6 to be added to mixture (20 to 30 percent by volume) to ensure long-term porosity.

B. Sand Fill for Rings and Spaces Between Rings:
1. Coarse, well-draining sand, such as washed concrete sand conforming to AASHTO M6 or ASTM C33.

C. Turf Conditioner:
1. Hydrogrow a proprietary soil amendment manufactured by Invisible Structures, Inc. and provided with Grasspave, or equal.

D. Grass:
1. Seed: Refer to Contract Dreawings. Seed shall be provided in containers clearly labeled to show seed name, lot number, net weight, % weed seed content, and guaranteed % of purity and germination. Pure Live Seed types and amount shall be as shown on plans.
a. Mulch – Wood or paper cellulose commercial mulch materials compatible with hydroseeding operations. Mulch depth according to mulch manufacturer’s recommendations. DO NOT use mulch of straw, pine needles, etc, because of their low moisture holding capacity.
b. Topsoil – Obtain topsoil for a light “dusting” (no more than ½ inch) above rings filled with sand for seeding germination.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine subgrade and base course conditions. Do not start porous paving installation until unsatisfactory conditions are corrected. Check for improperly compacted trenches, debris, and improper gradients.

B. Start of installation constitutes acceptance of existing conditions and responsibility for satisfactory performance. If existing conditions are found unsatisfactory report to Owner’s Representation.

3.2 PREPARATION

A. Subgrade Preparation:
1. Prepare subgrade to 90% compaction. Verify subgrade in accordance with porous paving system manufacturer’s instructions.
2. Proper subgrade preparation will enable the Grasspave2 rolls/units to connect properly and remain level and stationary after installation.
3. Excavate area allowing for unit thickness, the engineered base depth (where required), and 0.5 inch for depth of sod root zone or topsoil germination area (when applicable).

4. Provide adequate drainage from excavated area if area has potential to collect water, when working in-place soils that have poor permeability.
5. Ensure in-place soil is relatively dry and free from standing water.
6. Uniformly grade base.
7. Level and clear base of large objects, such as rock and pieces of wood.

B. Base Preparation:
1. Provide six-inch (6”) compacted sandy gravel road base in alignment with porous paving system manufacturer’s instructions to ninety-five percent (95%) compaction.
2. Provide geotextile separation layer between the natural ground and engineered base.
3. Coordinate base installation and preparation with irrigation lines.
4. Pace engineered base in lifts not to exceed six inches (6”), compacting each lift separately to ninety-five percent (95%) Modified proctor.
5. Leave one-inch (1”) of depth below final grade for porous paver unit and sand fill and one-half inch (½”) for depth of root zone or topsoil germination (when applicable).

3.3 HYDROGROW INSTALLATION

A. Spread all Hydrogrow mix provided (spreader rate = 10 lbs per 1076 ft2) evenly over the surface of the base course with a hand-held, or wheeled rotary spreader.

B. The Hydrogrow mix should be placed immediately before installing the Grasspave2.

3.4 GRASSPAVE2 INSTALLATION

A. Install the Grasspave2 units by placing units with rings facing up, and using snap-fit connectors, pegs and holes, provided to maintain proper spacing and interlock the units. Units can be easily shaped with pruning shears or knife. Units placed on curves, slopes, and high traffic areas shall be anchored to the base course, using 40d common nails with fender washer, as required to secure units in place. Tops of rings shall be between one-quarter inch (¼”) to one-half inch (½”) below the surface of adjacent hard surface pavements.

B. Install sand in rings as they are laid in section by “back-dumping” directly from a dump truck, or from buckets mounted on tractors, which then exit the site by driving over rings filled with sand. The sand is then spread laterally from the pile using flat bottomed shovels and/or wide “asphalt rakes” to fill the rings. A stiff bristled broom should be used for final “finishing” of the sand. The sand must be “compacted” by using water from hose, irrigation heads, or rainfall, with the final grade no less than the top of rings and no more than one-quarter inch (¼”) above top of rings.

3.5 HYDROSEED INSTALLATION

A. Grass coverage on the sand-filled rings must be completed within one (1) week. Sand must be re-installed and leveled and Grasspave2 check for integrity if rings become exposed due to wind, rain, traffic, or other factors.
1. Hydroseeding – Spray seed mixture onto site at rates shown on Contract Drawings and per hydroseeding manufacturer’s recommendations. Coverage must be uniform and complete. Following germination of the seed, areas lacking germination larger than 8in x 8in must be reseeded immediately. Seeded areas must be fertilized and kept moist during development of turf plants. DO NOT DRIVE ON SYSTEM: Hydroseeded areas must be protected from all traffic for a period of six (6) to eight (8) weeks, or until the root system has penetrated and established well below the Grasspave2 units.

B. Adequately water sod or grass seed to assure germination of seed and growth of root system.

3.6 PROTECTION

A. Seeded areas must be protected from any traffic, other than emergency vehicles, for a period of four (4) to eight (8) weeks, or until the grass is mature to handle traffic.

3.7 FIELD QUALITY CONTROL

A. Remove and replace segments of Grasspave2 units where three or more adjacent rings are broken or damaged, reinstalling as specified, so no evidence of replacement is apparent.

B. Perform cleaning during the installation of work and upon completion of the work. Remove all excess materials, debris, and equipment from site. Repair any damage to adjacent materials and surfaces resulting from installation of this work.

3.8 MAINTENANCE

A. Maintain grass in accordance with manufacturer's instructions and as specified in Section 32 92 23 Hydroseed.

B. Lawn Care: Normal turf care procedures should be followed, including de-thatching.

C. DO NOT AERATE: Aerator will damage the Grasspave2 units. Aeration is not necessary in a sand root zone.

D. When snow removal is required, keep a metal edged plow blade a minimum of one-inch (1") above the surface during plowing operations to avoid causing damage to the Grasspave2 units.

END OF SECTION 32 33 00

32 15 40 – SUMMARY

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Crushed Surfacing Base Course (CSBC)
   2. Crushed Surfacing Top Course (CSTC)
   3. Geotextile fabric.

B. Related Requirements:
   1. WSDOT Standard Specification for Road, Bridge, and Municipal Construction.
   2. Civil Engineering Plans, Notes, and Details

1.3 REFERENCE STANDARDS

A. Standard Specifications: All construction shall be in accordance with the Standard Specification for Road, Bridge, and Municipal Construction, prepared by the Washington State Department of Transportation (WSDOT) and the American Public Works Association, Washington State Chapter.

1.4 SUBMITTALS

A. Provide one-half (½) cubic foot sample and sieve analysis for:
   1. Crushed Surfacing Base Course (CSBC)
   2. Crushed Surfacing Top Course (CSTC)

B. Submit product data sheets on Geotextile Fabric.

PART 2 - PRODUCTS

2.1 CRUSHED SURFACING

A. Base Course: Crushed Surfacing Base Course (CSBC) shall meet the requirements as outlined in Section 9.03.9(3) of the WSDOT Standard Specifications.

B. Top Course: Crushed Surfacing Top Course (CSTC) shall meet the requirements as outlined in Section 9.03.9(3) of the WSDOT Standard Specifications.

C. Compacted Depth: See details on Contract Drawings.

2.2 NONWOVEN GEOTEXTILE FABRIC

A. Nonwoven geotextile meeting or exceeding mullen burst of 220 psi (ASTM D3786 / D3786M), trapezoidal tear of 40lbs. (ASTM D4533 / D4533M), and puncture strength of 65lbs. (ASTM D4833 / D4833M). Mirafi 140N or approved equal.

PART 3 - EXECUTION

3.1 SUBGRADE

A. Prepare subgrade in conformance with Section __ __ __ – Earthwork.

B. Verify that the subgrade is completed to correct line and grade before starting work.

3.2 CRUSHED SURFACING

A. Crushed Surfacing Base Course (CSBC)
   1. Compaction: Compact the CSBC to at least ninety-five percent (95%) of the maximum dry density as determined by ASTM D698 (Standard Proctor Test).

B. Crushed Surfacing Top Course (CSTC)
   1. Compaction: Compact the CSTC to at least ninety-two percent (92%) of the maximum dry density as determined by ASTM D698 (Standard Proctor Test).

END OF SECTION 32 15 40

SECTION 32 17 00 - PAVEMENT MARKINGS AND SIGNAGE

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes, but is not limited to:

1. Furnishing and installing painted striping and symbols on pavement surfaces.
2. Furnishing and installing posts, poles, sign supports, signs and accessories.
3. Furnishing and installing all permanent traffic signs specified on the Contract documents.
4. Coordination with AHJ for traffic channelization restoration in the public right of way.
5. Furnishing and installing wheelstops.

1.2 REFERENCES

A. Reference Standards:

AHJ	Public Authority Having Jurisdiction AHJ is an abbreviation for public Authorities Having Jurisdiction. For this project the AHJ denotes Island County.
WSDOT	Washington State Department of Transportation 2025 Standard Specifications and Standard Plans for Road, Bridge, and Municipal Construction.
MUTCD	Manual on Uniform Traffic Control Devices

1.3 SUBMITTALS

A. Submit the following information in accordance with submittal procedures noted in Division 01.

1. Product data, specifications and application instructions for materials listed in Part 2 Products and/or noted on Plans.

PART 2 - PRODUCTS

2.1 PAINT

A. Paint for pavement marking shall conform to WSDOT Section 9-34. The paint shall be homogeneous, easily stirred to a smooth consistency, and shall show no hard settlement or other objectionable characteristics.

2.2 SIGNS

A. Signage materials and posts shall conform to Section 9-28 and the details shown on the drawings.

2.3 WHEELSTOPS

A. Wheelstops shall be per details shown on the drawings.

PART 3 - EXECUTION

3.1 GENERAL

A. Verify installation conditions as satisfactory to receive work of this Section. Do not install until unsatisfactory conditions are corrected. Beginning work constitutes acceptance of conditions as satisfactory.

B. Place warning signs to alert approaching traffic. Place traffic cones, markers or other measures along newly installed paint and thermoplastic markings to control traffic and prevent damage to newly installed markings in accordance with AHJ traffic control requirements.

3.2 PREPARATION

A. Thoroughly clean pavement surfaces to be marked before application of the paint to remove dust, dirt, rubber deposits, surface laitance, and other coatings or deposits.

3.3 APPLICATION OF PAINT

A. Apply pavement markings in accordance with WSDOT Section 8-22.3.

1. Provide guidelines and templates as necessary to control paint application. Sharply outline edges of marking.
2. Apply paint to clean, dry surfaces, and unless otherwise approved, only when air and pavement temperatures are above 40 degrees and less than 95 degrees Fahrenheit. Maintain paint temperature within these same limits.
3. Complete two full applications of paint for pavement markings.

B. Do not allow traffic or other disturbance until markings have thoroughly dried in accordance with the manufacturer’s recommended maximum drying time.

1. Discontinue application of markings if drying times exceed the recommended manufacturer’s drying times. Determine and correct the cause before restarting work.
2. Correct deficient or disturbed markings as directed by the Owner’s Representative at no additional cost to the Owner.

3.4 INSTALLATION OF SIGNS

A. Signage and posts: Install, relocate and/or reinstall signs and posts per WSDOT Section 8-21.3.

B. Wheelstops: Install per manufacturer's recommendation and per the Drawings.

3.5 CLEANING

A. Remove excess materials and debris and leave premises clean and free of residue in accordance with the requirements of Division 01 of this Project Manual.

END OF SECTION 32 17 00

32 21 39 – WOOD FENCE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 REFERENCES

A. AWPA (American Wood Preservers Association) Book of Standards.

B. WCLIB (West Coast Lumber Inspection Bureau).

1.3 DELIVERY, STORAGE, AND PROTECTION

A. See Section 01 60 00 – Product Requirements. Transport, handle, store, and protect from damage all products.

1.4 SUBMITTALS

A. Product Data: Material and equipment composite data sheets shall be submitted for the following:
   1. Pressure Treated Posts
   2. Cedar Fence Planks
   3. Galvanized Fence Post Bases
   4. Galvanized Fence Brackets
   5. Site Applied Wood Treatment
   6. Stain

B. Submit manufacturer’s certification that all lumber meets the specified grading and standards.

PART 2 - PRODUCTS

2.1 LUMBER MATERIALS

A. Lumber Grading Rules: WCLIB.

B. Fence Posts and Rails: Lumber shall be #1 and better Hem Fir. Each piece of lumber shall bear stamp of West Coast Lumber Inspection Bureau (WCLIB) and/or Western Wood Products Association (WWPA) showing grade mark. Treat all wood in accordance with AWPA specifications for the pressure treatment of Western Woods, latest edition. Where possible, pre-cut material before treatment. All field cuts and drilled holes shall be field treated in accordance with AWPA M-4.

C. Fence Planks: Shall be #3 or better grade Western Red Cedar, four-inch (4”) wide planks with a nominal thickness of one-inch (1”) and a length of six feet (6’). Planks shall not have any open or loose knots holes, cracks, stains, warps, or other visible defects.

2.2 ACCESSORIES

A. Fasteners: Use hot-dipped galvanized steel.

B. Fence Post Bases: Simpson MPB44Z galvanized steel or approved equal.

C. Fence Brackets: Simpson FB24Z galvanized steel or approved equal.

D. Steel straps, screws, bolts, nuts, and washers shall conform to ASTM A307, hot-dipped galvanized.

2.3 PRESERVATIVE TREATMENT

A. All lumber shall be pressure treated as follows:

Species/Type	Treatment	Retention
Hem / Fir	ACQ	0.25 lbs per CF (rails)
Hem / Fir	ACQ	0.40 lbs per CF (posts)

AWPA Standards C2 & C16

B. All treatment shall be in accordance with AWPA C2 & C16 and all lumber shall bear the appropriate AWPA quality mark designation. After treatment, dry all wood to a maximum moisture content of nineteen percent (19%).

C. ACQ treated lumber shall not be stained brown with factory-applied stain.

2.4 CONCRETE FOOTINGS

A. Class 3000 psi (see Concrete specification section).

PART 3 - EXECUTION

3.1 PREPARATION

A. Locate and mark all existing buried utilities near fence location and adjust post locations as required to avoid damage to utilities.

3.2 VERIFICATION OF FINISH GRADE & ALIGNMENT

A. Prior to beginning excavation for post footings, verify that the finish grade is correct and alignment is approved.

3.3 CONCRETE FOOTING

A. Construct as detailed on Contract Drawings.

3.4 FENCE

A. Set posts plumb, in approved galvanized fence post bases. Attach posts to post bases per base manufacturer’s recommendations.

B. Set rails parallel, and parallel with the ground slope. Affix rails to posts using approved galvanized steel fence brackets. Attach fence brackets to posts and rails per bracket manufacturer's recommendations.

C. Attach cedar fence planks to rails with two (2) galvanized wood screws per plank at each rail. Tighten all screws so that heads are flush with the face of the plank.

D. Retighten all nuts and bolts after fence construction is complete.

3.5 SITE APPLIED WOOD TREATMENT

A. Apply preservative treatment in accordance with manufacturer's instructions.

B. Treat all site-sawn cuts.

C. Allow preservative to dry prior to erecting members.

3.6 TOLERANCES

A. Faces of Rails: Flush alignment with plank-side face of post.

B. Posts: One-eighth inch (1/8") maximum from true position.

3.7 STAINING

A. Stain all fence lumber "Cedarcolor" as shown on the Contract Drawings.

END OF SECTION 32 21 39

32 31 00 – FENCES AND GATES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Chain Link Fencing and Gates
   2. Welded Wire Mesh Fencing and Gates

B. Related Requirements:
   1. 03 30 00 – Cast-In-Place Concrete
   2. ASTM A653/A653M – Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process
   3. ASTM A641/A641M – Standard Specification for Zinc-Coated (Galvanized) Carbon Steel Wire (for Galvanized Before Welding wire)
   4. ASTM F2453/F2453M – Standard Specification for Welded Wire Mesh Fence Fabric
   5. ASTM D3359 – Standard Test Methods for Rating Adhesion by Tape Test
   6. ASTM D2794 – Standard Test Method for Resistance of Organic Coatings to the Effects of Rapid Deformation (Impact)
   7. ASTM B117 – Standard Practice for Operating Salt Spray (Fog) Apparatus (for corrosion resistance testing)
   8. ASTM D714 – Standard Test Method for Evaluating Degree of Blistering of Paints
   9. ASTM D1654 – Standard Test Method for Evaluation of Painted or Coated Specimens Subjected to Corrosive Environments
   10. ASTM D2244 – Standard Test Method for Calculation of Color Differences from Instrumentally Measured Color Coordinates
   11. ASTM D523 – Standard Test Method for Specular Gloss
   12. ASTM D6695 – Standard Practice for Xenon-Arc Exposure of Paint and Related Coatings (for UV resistance/weatherability)

1.3 SUBMITTALS

A. Product Data & Shop Drawings: Material descriptions, construction details, dimensions of individual components and profiles, and finishes for the following:
   1. Fence and gateposts, rails, and fittings.
   2. Chain link fabric, reinforcements, and attachments.
   3. Welded wire mesh, and attachments.
   4. Submit shop drawings. Include confirmation of panel height, layout, and fabrication method per Contract Drawings.

B. Product Certificates: Signed by manufacturers of chain link fences and gates certifying that products furnished comply with requirements.

C. Qualification Data: For firms and persons specified in "Quality Assurance" Part to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.

1.4 QUALITY ASSURANCE

A. Installer Qualifications: An experienced installer who has completed chain link fencing similar in material, design, and extent to those indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.

B. All welding shall be by a WABO certified welder.

C. American Made Steel Products: All products shall be American made.

1.5 PROJECT CONDITIONS

A. Existing Utilities: Locate all buried utilities prior to beginning work. Exercise caution in the vicinity of the buried utilities.

B. Field Measurements: Verify layout information shown on Contract Drawings in relation to property survey and existing structures. Verify dimensions by field measurements.

1.6 MANUFACTURER

A. Welded Wire Mesh Fencing System: Ameristar WireWorks Anti-Climb, or approved equal meeting the performance specifications herein. System shall be custom-fabricated to match height and configuration indicated on the Contract Drawings. www.ameristarfence.com, 1.888.333.3422

PART 2 - PRODUCTS

2.1 CHAIN LINK FENCE FABRIC

A. Steel Chain Link Fabric: Provide fabric fabricated in one-piece widths. Comply with Chain Link Fence Manufacturers Institute "Product Manual" and with requirements indicated below:
1. Mesh and Wire Size: 1¾" inch mesh, 9 gauge (0.148 inch diameter) core wire.
2. Knuckle selvage top and bottom.
3. Fabric galvanizing thickness:
   a. 0.30 oz per SF on vinyl coated wire.

2.2 WELDED WIRE MESH FABRIC

A. Welded Wire Mesh: Provide factory-fabricated, one-piece welded mesh panels from pre-galvanized steel wire welded at every intersection.
1. Mesh: 3” x 0.5” (nominal) openings.
2. Wire Size: 10.5 gauge (0.128 inches)
3. Wire Tensile Strength: 74,000 psi
4. Wire Shear Strength: 68,000 psi
5. Wire Coating: Galvanized Before Welding (GBW), zinc-coated at 0.50 oz/ft² in accordance with ASTM A641.
6. Finish:
   a. Pre-galvanized per ASTM A653/A653M, G90 Minimum Coating
   b. Thermal stratification coating system:
      1) Epoxy powder base coat (minimum 2 mils thickness)
      2) Polyester TGIC powder coat finish (minimum 2 mils thickness)
      3) Coating performance to meet ASTM D3359 (adhesion), ASTM B117 (corrosion resistance > 3,500 hours), ASTM D2794 (impact resistance > 60 in-lbs), ASTM D2244 (color retention), and ASTM D523 (gloss retention).
7. Color: Black

2.3 CHAIN LINK FENCE FRAMEWORK

A. Round Steel Pipe: Standard weight, Schedule 40, galvanized steel pipe complying with ASTM F1083. Comply with ASTM F1043, Material Design Group IA, external and internal coating Type A, consisting of not less than 1.8-oz./sq. ft. zinc; and the following strength and stiffness requirements:
   1. Posts:
      a. All posts shall be standard hot-dip galvanized steel pipe; straight, true as to section and unspliced.
      b. Line posts shall be 2.375 inch outside diameter, Schedule 40 pipe, and 5.79 pounds per linear foot.
      c. Terminal and Corner Posts shall be 2.875” outside diameter, Schedule 40 pipe, and 7.58 pounds per linear foot.
      d. All post finials shall be standard moisture proof, heavily galvanized, malleable iron securely fastened to posts.
   2. Rails:
      a. Fences shall have top and bottom rails. See Contract Drawings for rail height.
      b. Rails shall be 1.66 inch outside diameter, Schedule 40 pipe, and 2.27 pounds per linear foot.
      c. Top rail shall be securely fastened to terminal posts and pass through tops of line post fittings, forming a continuous rail for the full length of fence. Top rail shall be furnished in random lengths from 18 to 20 feet long and with standard hot-dip galvanized steel expansion couplings not less than six inches (6") in length. Short lengths shall not be used adjacent to terminal posts. Couplings shall not be further than twelve inches (12") from a post. No exceptions.
   3. Brace Assembly:
      a. All terminal pull posts, corner posts, and gate posts shall be furnished with double adjustable brace assembly as specified by the fence manufacturer.
   4. Tension Bars & Wire Ties:
      a. Tension bars shall be used at all terminal posts and both sides of pull posts, corner posts, and gates. Tension bars shall be of full height of fabric 3/16" x ¾".
      b. Wire ties shall be 11-gauge steel with a minimum of 0.9 oz per sf of zinc coating.
   5. Tension Wire:
      a. Galvanized steel wire, 7 gauge (0.177 inch diameter) core.
   6. Swing Gates:
      a. Gates shall be provided where shown on Contract Drawings and hinged to swing 90º each way. Frames shall be 1.9 inch outside diameter, Schedule 40 pipe, and 2.72 pounds per linear foot.
      b. All joints shall have welded corner fittings to make a rigid frame. Welded frames shall be galvanized after welding. Gate, hinges, latches, keepers, brace, and all other fittings shall be heavy duty as specified by the fence manufacturer and approved.
      c. Provision shall be made for padlocking all gates in an open (full open to the inside) and closed position. The device shall be subject to approval.

2.4 WELDED WIRE MESH FENCE FRAMEWORK

A. SQUARE STEEL PIPE
   1. Posts:
      a. Fabricate from 2.5" square steel tube, 16 gauge minimum wall thickness.
      b. Posts shall be continuously welded or joined per manufacturer’s recommendations.
   2. Rails
      a. Fabricate from 2" square steel tube, 16 gauge minimum wall thickness.

b. Rails shall be continuously welded or mechanically joined to posts with brackets and tamper-resistant fasteners at all panel attachment points.

3. Fasteners:
   a. Provide tamperproof fasteners for mesh panel attachment at maximum eighteen inches (18”) on center.
   b. All fasteners shall be stainless steel or coated for corrosion resistance.
4. Swing Gates:
   a. Fabricate swing gate frames from 2" square steel tube, 16 gauge minimum wall thickness.
   b. Weld all frame intersections fully around the perimeter unless otherwise indicated by manufacturer standard practices.
   c. Provide hardware and attachments allowing gates to be secured in both the fully open and fully closed positions.
   d. Provide lockable latch hardware capable of accepting Owner’s padlock.
5. Finish:
   a. Framework shall be pre-galvanized per ASTM A653/A653M, minimum G90 coating weight.
   b. Framework shall receive a polyester powder coat finish over an epoxy base coat as specified for welded wire mesh panels.
   c. Color shall be black, matching the welded wire mesh panels

2.5 CHAIN LINK FENCE COATING

A. Vinyl Coating:
   1. Chain link fabric shall be hot dipped galvanized prior to vinyl coating.
   2. Vinyl coating shall be thermally fused and bonded, Class 2B.
   3. Thickness of vinyl coating fabric shall be 6-10 mil.
   4. Color: Black.

B. TGIC Polyester Coating:
   1. All chain link fencing components other than fabric shall also be vinyl-coated or be polymer coating, PVC, or polyolefin elastomer 10-mils (0.254-mm) minimum or polyester 3-mils (0.0076-mm) minimum coating can be applied to the exterior surface of tubular shapes. Color of the coating shall be in accordance with ASTM F934 and Black to match fabric.

C. Paint
   1. All nuts, bolts, and washers not coated shall be painted to match vinyl coating.

2.6 CAST-IN-PLACE CONCRETE FOOTINGS

A. General: Comply with ACI 301 for cast-in-place concrete.

B. Materials: Portland cement complying with ASTM C150 / C150M aggregates complying with ASTM C33 / C33M, and potable water.
   1. Concrete Mixes: Normal-weight concrete air entrained with not less than 3000-psi compressive strength (28 days), three-inch (3”) slump, and one-inch (1”) maximum size aggregate.

C. Materials: Dry-packaged concrete mix complying with ASTM C387 / C387M for normal-weight concrete mixed with potable water according to manufacturer's written instructions.

PART 3 - EXECUTION

3.1 SEQUENCING

A. Layout all fence lines and gates for approval by Owner's Representative prior to beginning any work.

3.2 CHAIN LINK FENCE

A. Posts:
   1. Space line posts uniformly and plumb as shown.

B. Top Rail: Install alignment. Run rail continuously on top of posts.

C. Bottom Rails: Install, spanning between posts, attaching at posts.

D. Chain Link Fabric: Apply fabric to inside of framework. Leave the space showing on the Contract Drawings between finish grade or surface and bottom selvage. Pull fabric taut and tie to posts, rails, and stretcher rod. Anchor to framework so fabric remains under tension after pulling force is released.

E. Tension or Stretcher Rod: Thread through fabric and secure.

F. Tie Wires: Use wire of proper length to double wrap both ends and firmly secure fabric to line posts and rails as follows:
   1. Attach wire at one end to chain-link fabric, wrap wire around post a minimum of one-hundred eighty (180) degrees, and attach other end to chain-link fabric per ASTM F626 using standard round wire ties with either a preformed hook or pigtail at one end, designed to engage on picket of the chain link fabric at the preformed end.
   2. Wrap around the rail and wrap around one (1) picket of the chain link fabric at least two (2) full turns at the other end in a manner that will draw up tightly around the rail or post.
   3. Both ends shall be double wrapped with at least two (2) full turns.
   4. Bend ends of wire to minimize hazard to individuals and clothing.
   5. Maximum Spacing: Tie fabric to line posts, rails and stretcher rod at twelve inches (12") o.c. maximum.

G. Fasteners: Install nuts for tension bands and carriage bolts on the side of the fence opposite the fabric side.

3.3 WELDED WIRE MESH FENCE

A. Posts:
   1. Set line, end, corner, and gate posts plumb and aligned as shown on the Contract Drawings.
   2. Posts shall be installed in concrete footings to minimum depth indicated on Contract Drawings or twenty-four inches (24”) minimum unless otherwise noted.
   3. Space line posts at six-foot (6’) maximum centers (or as recommended by manufacturer).
   4. Posts shall not deviate more than one-quarter inch (¼”) from plumb or alignment.

B. Rails:
   1. Install top and bottom rails level and aligned between posts.
   2. Secure rails to posts with manufacturer’s brackets or predrilled fittings using tamper proof fasteners.
   3. Welded or bracketed joints shall be tight and uniform.

C. Welded Wire Mesh Panels:
   1. Attach panels to rails and posts using tamperproof fasteners at eighteen inches (18”) maximum on center.
   2. Install panels on secure side of framework unless otherwise indicated.
   3. Panels shall be installed taut without bowing, sagging, or deformation.
   4. Maintain panel height above grade as shown on Contract Drawings; panels shall not touch finish grade unless specifically detailed.

D. Swing Gates:
   1. Install swing gates plumb, level, and aligned with adjacent fence.
   2. Gate frames shall be fabricated of square tube with welded intersections, and attached to posts using manufacturer’s approved hinges and latch hardware.
   3. Install gates to allow smooth opening and closing without binding.
   4. Set gates to provide uniform clearances per manufacturer’s instructions.
   5. Provide gates with means to secure them in both the fully open and fully closed positions.
   6. Provide gates with locking latches capable of Owner-supplied padlock installation.

E. Fasteners:
   1. Tighten all nuts, bolts, and tamper proof fasteners securely.
   2. Install all nuts and bolt heads on secure side of fence unless otherwise indicated.
   3. Install tamper proof security fasteners per manufacturer’s recommendations.

F. Field Touch-Up:
   1. After installation, clean and field touch-up all minor nicks, scratches, or exposed steel caused during handling and installation using manufacturer-supplied zinc-rich primer and matching powder coat touch-up paint.
   2. Follow manufacturer's three-step repair process:
      a. Remove all metal shavings and burrs.
      b. Apply zinc-rich primer to all cut or abraded surfaces.
      c. Apply two coats of matching color finish paint.

G. Cleaning and Final Alignment:
   1. Clean the fence and gate system of all dirt, dust, and construction debris.
   2. Adjust and align fence and gates to ensure tight, uniform installation.
   3. Protect fence from damage until final acceptance.

3.4 CLEANUP

A. Contractor shall leave grounds in good condition, remove all sand, gravel, debris, dirt, and leave fence complete and workable in all details.

B. Contractor shall resolve any safety issues related to protruding bolts, sharp edges, tripping hazards, or similar conditions that are deemed a safety risk to public park users.

3.5 WARRANTY

A. GENERAL WARRANTY
   1. The Contractor shall guarantee the workmanship and installation of all fencing and gate systems for a period of one (1) year from the date of final acceptance.
   2. Any defects which develop within the warranty period shall be repaired or replaced at the Contractor’s sole expense.

B. CHAIN LINK FENCING AND GATES

1. Chain link fence framework, fabric, fittings, and gates shall be warranted against defects in materials and workmanship for a period of one (1) year from the date of final acceptance.
2. Warranty shall cover failure of structural integrity, corrosion of framework, loosening of fittings, and improper gate operation.

C. WELDED WIRE MESH FENCING AND GATES

1. Welded wire mesh panels, framework, coatings, fasteners, and gates shall be warranted against defects in materials and workmanship for a period of one (1) year from the date of final acceptance.
2. Warranty shall cover failures including, but not limited to, panel detachment, structural failure, excessive corrosion, and failure of powder coating (i.e., peeling, cracking, or significant fading).
3. Warranty shall be contingent upon proper installation and field touch-up of any cuts or abrasions in accordance with manufacturer recommendations.

END OF SECTION 32 31 00

32 33 00 – SITE FURNISHINGS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Bike Racks
   2. Bollards

B. All items are to be provided complete ‘in-place’

C. Related Requirements:
   1. 03 30 00 – Cast-In-Place Concrete

1.3 SUBMITTALS

A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, finishes, field-assembly requirements, and installation details.

PART 2 - PRODUCTS

2.1 BIKE RACKS

A. Description:
   1. Frame: 2” Schedule 40 Steel Tubing
   2. Finish: Stainless Steel Finish
   3. Dimensions: 40” Diameter, 32.5” Height
   4. Mounting: Fixed, in-ground mounting, provide 12” dia x 18” deep concrete footing min.

B. Quantity: Eight (8)

C. Approved Manufacturers:
   1. Wabash Valley, wabashvalley.com, 1.800.253.8619
   2. Reliance Foundry, reliance-foundry.com, 1.877.789.3245
   3. Uline, uline.com, 1.800.295.5510
   4. Or approved equal.

D. Warranty:
   1. Minimum five (5) year manufacturer’s warranty covering finish, defects, and corrosion.

2.2 BOLLARDS

A. Description:
   1. Model: Reliance Foundry; R-8464-30

2. Height: 30 1/8 inches
3. Diameter: 4 1/2 inches body, 6 1/2 inches base
4. Weight: 17 lbs
5. Material: Stainless Steel
6. Pipe: ASTM A312, Grade TP 316
7. Plate: ASTM A959, Grade TP 316
8. Installation: Removable, new concrete, receiver with key

B. Quantity: Two (2)

C. Approved Manufacturers:
1. Reliance Foundry, reliance-foundry.com, 1.877.789.3245
2. Or approved equal.

D. Warranty:
1. Minimum five (5) year manufacturer’s warranty covering finish, defects, and corrosion.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for correct and level finished grade, mounting surfaces, installation tolerances, and other conditions affecting performance.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION, GENERAL

A. Comply with manufacturer's written installation instructions, unless more stringent requirements are indicated. Complete field assembly of site furnishings, where required.

B. Install ground mounted site furnishings and footings prior to paving.

C. Install site furnishings level, plumb, true, and securely anchored at locations indicated on the Contract Drawings.

D. Contractor shall resolve any safety issues related to protruding bolts, sharp edges, tripping hazards, or similar conditions that are deemed a safety risk.

3.3 CLEANING

A. After completing site furnishing installation, inspect components. Remove spots, dirt, and debris. Repair damaged finishes to match original finish or replace component.

END OF SECTION 32 33 00

32 80 00 – IRRIGATION SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This section includes, but is not limited to the following:
   1. To furnish and install a new, complete and electronically operated irrigation system, as indicated on the Contract Drawings and specified herein including, but not limited to, piping, valves, sprinklers, specialties, controls, and wiring.
   2. The irrigation system will be supplied with potable water. The water source is the irrigation point of connection to the domestic water line location as indicated on the Contract Drawings.
   3. Coordinate work with other trades as applicable to avoid conflicts and to maintain schedule.

B. Related Requirements:
   1. Section 32 92 23 – Lawn and Hydroseed
   2. Section 32 93 00 – Plants

C. References:
   1. Island County Standards.
   2. American Society for Testing and Materials (ASTM).
   3. American Water Works Association (AWWA).
   4. State of Washington Standards
   5. National Electrical Code (NEC).
   6. Standard Specifications for Municipal Public Works Construction - Washington State Chapter (latest edition).
   7. State of Washington - Department of Health.
   8. Water District Standards.

1.3 DEFINITIONS

A. Mainline Piping: Downstream from point of connection to water distribution piping up to and including the control valves and quick couplers. Piping is under constant pressure when the system is activated.

B. Lateral Line Piping: Downstream from control valves and quick couplers to sprinklers and specialties. Piping is under pressure during individual zone operation.

C. The "Owner" may be the actual project owner or an owner-selected representative.

D. The following are industry abbreviations for plastic materials:
   1. ABS: Acrylonitrile butadiene styrene plastic
   2. FRP: Fiberglass reinforced plastic
   3. PA: Polyamide (nylon) plastic
   4. PP: Polypropylene plastic

5. PE: Polyethylene plastic
6. PTFE: Polytetrafluoroethylene plastic
7. PVC: Polyvinylchloride plastic
8. TFE: Tetrafluoroethylene plastic

1.4 QUALITY ASSURANCE

A. Prior to construction of this project, Contractor shall provide the Owner's Representative with written evidence that all Contractor staff assigned to solvent welding duties of PVC pipe or fittings are in possession of an up-to-date certification card issued by manufacturer representative of specified solvent cement. If Contractor's staff are not in possession of current certification cards, the Contractor shall schedule and complete a training seminar (conducted by solvent cement manufacturer representative) and provide written evidence of training completion for each staff member, to the Owner's Representative prior to construction. Only staff that are certified shall be permitted to solvent weld pipe and fittings.

1.5 PERFORMANCE REQUIREMENTS

A. Location of Sprinklers and Specialties: Design location is approximate. Make minor adjustments as required to avoid obstructions such as site furnishings, signs, and light standards. Maintain the overlap coverage designated by the sprinkler spacing shown on the Contract Drawings. Avoid overspray onto walks and structures as practical.

B. The Contractor shall perform all system layout. The Owner’s Representative may or may not inspect the system layout prior to installation. System components not properly located shall be reinstalled by the Contractor at no additional cost to the Owner.

C. Minimum Working Pressures: The following are minimum pressure requirements for piping, valves, and specialties, unless otherwise indicated:
1. Mainline Piping: 300 psi.
2. Lateral Line Piping: 200 psi.

1.6 SUBMITTALS

A. Product Data: Material and equipment composite data sheets shall be submitted for the following:
1. Solvent Weld Certification per Part 1.4 A. above
2. PVC pipe
3. Primer and Pipe Cement
4. Detectable Marking Tape
5. Gate valves
6. Pressure gauges
7. Manual drain valve
8. Quick coupling valves (incl. key and hose swivel)
9. Irrigation Controller
10. Rain sensor
11. Remote control valves
12. Control and trace wire
13. Wire splices (all types)
14. Swing joints (for both shrub sprays and turf rotors)
15. Sprinkler heads / nozzles
16. Valve boxes

B. Submit the number of copies required by the Contract Documents. Clearly index, label, and highlight products to be utilized.

C. Operation and Maintenance Manuals: The Contractor shall provide four (4) sets of the following:
   1. Guarantee/warranty certificates for all equipment used.
   2. Contractors written one (1) year guarantee/warranty for the entire system.
   3. List of authorized distributors and service centers for all products installed on the project. Include contact names, addresses, and phone numbers.
   4. Instruction manuals for all equipment used.
   5. Parts lists and "exploded" view drawings showing part numbers for each item.
   6. Detail drawings of all areas that were unable to be shown clearly on the "as-builts".
   7. Reduced and laminated zone chart.

   Provide the above information in three ring binders, clearly indexed, tabbed, and highlighted, with the project title, location, address, and date clearly typed in bold lettering (minimum 24 pt. Arial) on the front cover.

D. The Contractor shall submit the following items to the Owner's Representative prior to final acceptance:
   1. Warranty Cards on all equipment so warranted.
   2. Contractor's "As-Built" plans as detailed in these Specifications.
   3. Operations and Maintenance Manuals per Part 1.6 C. above.
   4. Extra Materials per Part 1.9 A. below.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Protect stored PVC piping from direct sunlight. Support pipe as necessary to prevent sagging and bending.

B. Provide safe and secure storage of all material required for system installation.

1.8 PROJECT CONDITIONS

A. Contractor shall bear all costs to locate and verify all underground utility locations within the site. Avoid damage to existing utilities, plant material, and structures. Contact Utility Locate Services at 1-800-424-5555 and/or a private locating service prior to any work, to have existing utilities located and marked on site. Contractor is responsible for any damage that is caused.

B. Interruption of Existing Water Service: Do not interrupt water service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary water service according to requirements indicated:
   1. Notify Owner no fewer than two (2) working days in advance of any proposed interruption of water service. Do not proceed with interruption of water service without Owner's written permission.

C. Utilities and Existing Structures: The exact location of existing structures, equipment, and overhead or underground utilities, shall be solely the responsibility of the Contractor. Contractor shall conduct all work so as to prevent interruption of service or damage to them. Protect existing structures, equipment, and utility services and repair any damages.

D. Finish Grades: Verify the correctness of all finish grades within the work area to insure the proper soil-coverage depth over pipe lines and the finished elevations of all sprinkler heads, valve boxes, and irrigation equipment.

E. Adjustments: Make minor adjustments to avoid fixed obstructions and to ensure the overlap coverage designated by the sprinkler spacing on the Contract Drawings.

F. Product Storage: During construction and storage, protect materials from damage and prolonged exposure to sunlight.

G. Keep premises free from rubbish, debris, and excavated trench material, at all times. Store materials so as not to interfere with the operation of the Project.

H. System Operation: Irrigation system shall be under fully automatic operation for three (3) days prior to the start of grassing operations.

I. Timing and Scheduling: The Contractor shall determine application rates and timer cycling. Adjustments, repairs, etc., other than programming, are the responsibility of the Irrigation Contractor.

J. Provide hand watering of all existing and proposed planting areas as required at any time during the project at Contractor's expense.

1.9 EXTRA MATERIALS

A. Prior to final acceptance, the Contractor shall provide to the Owner (at no additional cost to the Owner), the keys and/or other tools necessary to activate, operate, and drain the irrigation system, including:
1. Two (2) quick coupling valve keys w/ hose swivels.
2. Two (2) controller enclosure padlock keys.
3. One (1) manual gate valve key.
4. Two (2) of each type of rotor head body and nozzles installed.
5. Five (5) of each type of spray head body and nozzles installed.
6. All extra nozzle sets not utilized during the installation.
7. Two (2) valve box cover keys.

1.10 CONTRACTOR AS-BUILT DRAWINGS

A. The Contractor shall maintain a current record of all facilities / equipment installed and record any deviations (including horizontal and vertical dimensions) on the Contract Drawings (all deviations to the Contract Drawings shall be pre-approved by the Owner’s Representative).

B. Upon completion of the irrigation system installation and prior to final acceptance, the Contractor shall provide the Owner’s Representative with a NEAT, CLEAN, and LEGIBLE, reproducible set of Contractor "As-Built" drawings of the completed irrigation system. Any irrigation system pipe or components not installed in accordance with the Contract Drawings, shall be dimensioned to a permanent structure for location after burial. Locations of all quick coupling valves, automatic control valves, manual valves, electrical splice boxes, etcetera, shall be dimensioned on the Contractor "As-Builts" to two (2) permanent monuments (preferably buildings or hardscapes).

C. Contractor "As-Built" records shall be updated daily and shall be available daily for review by the Owner's Representative.

D. At the irrigation controller, provide a reduced-scale, "As-Built", schematic drawing of the irrigation system layout with irrigation zones clearly noted. Laminate the drawing in plastic and mount inside of the controller cabinet door or on/adjacent to the control panel.

1.11 SYSTEM PROTECTION

A. As part of the warranty, the Contractor shall be responsible for winterizing the irrigation system prior to the onset of the freezing season. The Contractor will also be required to reactivate the system in the spring season. Each event must be accomplished within the one (1) year maintenance period. The Contractor will notify the Owner in writing (with at least seventy-two (72) hours notice) when this work will be performed. Winterizing and spring start-up shall be done in the presence of the Owner's maintenance staff. The Contractor will be liable for all damages resulting from failure to comply.

B. When using compressed air to winterize the irrigation system, do so in two (2) short cycles at no more than seventy-five (75) psi pressure. Do not use a compressor with high pressure and low volume or allow the pipe connected to the compressor to get hot to the touch. The Contractor shall winterize the system prior to irrigation system substantial completion approval and acceptance if freezing weather occurs or is forecast. In such an event, the Contractor shall, as directed by the Owner's Representative, reactivate the system for final inspection and acceptance after the winter season. If the irrigation system is reactivated for final inspection prior to Spring, a sufficient period of warm weather that presents or is forecast will be required for reactivation, inspection, and subsequent re-winterization prior to the return of freezing weather.

C. Winterization and reactivation prior to final acceptance will not satisfy the warranty period requirement to deactivate (winterize) and reactivate the irrigation system.

D. Fill and repair depressions and replace construction materials damaged from settlement or repair of irrigation trenches, throughout the warranty period.

E. Adjust sprinkler heads as necessary to maintain overlap coverage designated by the sprinkler spacing on the Contract Drawings and to keep spray off structures, out of roadways, and off pavements as much as possible throughout the warranty period.

F. Replace defective parts throughout the warranty period.

1.12 TRAINING

A. Contractor shall provide on-site, hands-on training for Owner's maintenance staff. Training shall include proper procedures for irrigation system operation, maintenance, and winterizing. Duration and content of training shall be sufficient to ensure adequate understanding of system operation and maintenance to enable the Owner to operate, maintain, and winterize the system after the departure of the Contractor. The Owner's Representative shall be notified of this session at least seventy-two (72) hours in advance. Contractor shall coordinate a mutually agreeable training schedule with the Owner.

1.13 FINAL APPROVAL

A. Final approval will be considered upon satisfactory completion of the following: all performance tests, receipt of acceptable Contractor's "As-Built" documents and extra materials; training session; receipt of signed and approved permits; and substantial completion approval from the Owner's Representative.

PART 2 - PRODUCTS

2.1 PIPE THREAD TAPE / COMPOUND

A. All mainline pressure fittings and pipe threads shall be wrapped at least three (3), but no more than four (4), times with Teflon tape.

2.2 POLYVINYL CHLORIDE (PVD) PIPE, FITTINGS, AND CEMENT

A. Polyvinyl chloride pipe shall be PVC 1120 or 1220.
1. Mainline Pipe up to and including three-inch (3") diameter: Schedule 40 PVC.
2. Lateral Line Pipe up to and including two-inch (2") diameter: Schedule 40 PVC.
3. Sleeves: CL 200 PVC.

B. Risers on swing joints shall be Schedule 80, conforming to ASTM D1784.

C. Solvent weld fittings shall be manufactured by Lasco, Spears, or approved equal and installed as follows:
1. Mainline Fittings: Schedule 40/80.
2. Lateral Line Fittings: Schedule 40.
3. Valve and Quick Coupler Fittings: Schedule 40/80.
4. Swing Joints: Schedule 40/80.

D. Solvent welding compounds shall be IPS "Weld-On" products:
1. Primer: P-70 - purple.
2. Cement: P-711 - gray (heavy bodied).

2.3 PIPE AND WIRE SLEEVES

A. Pipe sleeves shall be twice the size of the insert pipe traveling through it. No more than one pipe shall be installed in each sleeve.

B. Install separate sleeves for control and communication wires (min. 2" diameter).

C. Sleeve under all paved surfaces whether indicated on the plan or not.

D. Where practical, extend all sleeves twelve inches (12") past any pavement edge.

E. Mark sleeve ends with a temporary 2x4 wooden stake driven eighteen inches (18") into grade with twenty-four inches (24") exposed. "IR Sleeve" shall be imprinted in on each stake in black, waterproof ink. The top of each stake shall be painted with fluorescent pink marking paint and shall be further marked with three (3) wraps of fluorescent pink flagging tape. Remove stakes after irrigation lines have been installed.

F. No additional payment shall be made under any circumstances for locating sleeves.

2.4 BACKFLOW PREVENTOR ASSEMBLY

A. Backflow preventor assembly is located within Riser Room 129, see mechanical / plumbing plans for specifics.

2.5 GATE VALVES

A. Gate valves shall be Kennedy KS-FW Valve #8057SS (up to 2½") or #8561ANSS (3" and larger), sized per plan, with a fusion-coated cast-iron body, non-rising stem, and resilient-coated wedge, with a minimum two-hundred (200) psi operating pressure rating. Mainline isolation valves shall be the same size as the mainline.

B. Provide one (1) valve-operating key per Part 1.9 A. above. Keys shall be thirty-six inches (36") long, three-quarters inch (¾") stock with "tee" handle, and painted with rust-resistant paint.

2.6 PRESSURE GAUGES

A. Pressure gauge shall be Ashcroft Duralife Type 1009 or approved equal.

B. Provide one (1) #251009-SW-L04L-100# (100 psi). Gauge shall be liquid filled and rated as shown with gauge cock and shall be provided with appropriate fittings to adapt to a quick coupling valve key.

2.7 MANUAL DRAIN VALVE

A. Manual drain valve shall be Champion #200-1.00" RS one-inch (1") manual brass angle valve with rising swivel – locate at lowest points in the irrigation system mainline and provide a three (3) cu. Ft. gravel sump, surrounded with filter fabric, equal to Mirafi or Amoco.

B. Contact Owner's Representative before installing equipment if low points in system are located within a critical area or within the field of play of the turf lawn area.

C. Record all locations on Contractor's "As-Built" drawings.

2.8 MASTER VALVE

A. Master Valve shall be Superior 3200 2" normally closed, brass, two-inch (2") master valve w/ dirty water protection and no minimum flow feature.

2.9 QUICK COUPLING VALVES

A. Quick coupling valves shall be Rainbird 44-LRC. Valve shall have brass construction, two-piece body design, stainless steel spring, locking thermoplastic cover, and pressure rated to one-hundred twenty-five (125) psi. The valve shall have a manufacturer's limited warranty of not less than five (5) years.

B. Provide two (2) 44K keys and two (2) SH-1 hose swivels per Part 1.9 A. above.

2.10 DRAIN ROCK

A. Drain rock shall be five-eighths inch (5/8") washed pea gravel.

2.11 AUTOMATIC CONTROL VALVES

A. Automatic control valves shall be as follows:
   1. Rain Bird PEB series, glass-filled, nylon construction, normally closed, forward flow design, with flow-control handle, internal bleed, low flow operating capability, globe configuration, and 200 psi rated. Size valves as noted in the Valve Data Table.

B. Install Rain Bird PRS-D dial pressure regulating modules on all valves as indicated in the Valve Data Table on Contract Drawings.

C. Each valve shall be tagged with a Rain Bird VID Series or Christy's ID-STD-Y2 valve i.d. tag (yellow).

2.12 SPRINKLER HEADS (SHRUB SPRAY / TURF ROTOR)

A. As noted on Contract Drawings.

2.13 SPRINKLER AND QUICK COUPLING VALVE SWING JOINTS (RISERS)

A. Swing joints for sprinkler heads shall be described on Contract Drawings.

B. Swing joints for quick coupling valves shall be described on Contract Drawings.

C. Swing joints shall not be installed perpendicular to or parallel with the supply line.

2.14 VALVE BOXES AND VAULTS

A. Valve Boxes shall be a combination of polyolefin and fibrous material. Extensions may be required to bring the valve box to the proper level. Utilize "tee" style covers unless specified otherwise. All unions shall be accessible within the box. Boxes shall be as follows:
1. Automatic Valves: Carson 1324-18 with bolt-down cover or equal. The cover shall be bolted down with stainless steel pentagonal bolts. Box and cover shall be green.
2. Quick Coupling Valves: Carson 910 with 910-4B cover. Box and cover shall be green.
3. Mainline Gate Valves: Six-inch (6") diameter PVC pipe or Ametek or Carson Roadway Extension with a ten-inch (10") valve box on top per detail. Carson 910 with 910-4B cover. Box and cover shall be green.
4. Control wire Splice Box: Carson 1419-12 with bolt-down cover or equal. The cover shall be bolted down with stainless steel pentagonal bolts. Box and cover shall be green.

2.15 IRRIGATION CONTROLLER

A. Irrigation Controller
1. Rain Bird twenty-four (24) station, traditionally wired, pro smart, ESPLXME2P 12-Station w/ (1) ESPLXMSM12 – 12-Station expansion module, indoor/outdoor commercial controller in plastic wall mount enclosure. Mount where shown on Contract Drawings.

2.16 RAIN SENSOR

A. Rain sensor shall be Rain Bird RSD-BEX with metal latching bracket and ext. wire routed in conduit from controller to rain sensor location as noted on Contract Drawings.

2.17 CONTROL WIRES AND PIPE LOCATOR WIRE

A. Control wires between the controller and the master valve and automatic control valves, shall be AWG direct burial, #14 single strand copper wire designed for twenty-four to fifty (24-50) volts and shall be UL approved for UF (underground feeder). UL and UF designations must be clearly marked on the insulation jacket of the wire. Copper conductor must exceed ASTM B3 or B8 specifications. The white colored wire will always be the common wire and the yellow-colored wire will always be the spare leads (auxiliary wires). Hot (signal) leads to each individual valve shall be red. Wire shall be Paige, Service Wire Co. 7079D, or approved equal.

B. Locator wires for below-grade piping shall be #14 bare copper, U.L. approved as UF, ASTM B3 or B8 rated.

C. Control wires between the controller and the flow sensor shall be two (2) AWG direct burial, #14 single strand copper wire designed for twenty-four to fifty (24-50) volts and shall be UL approved for UF (underground feeder). UL and UF designations must be clearly marked on the insulation jacket of the wire. The copper conductor must exceed ASTM B3 or B8 specifications. The color shall be black for the common and orange for the hot (signal) lead. Provide two (2) spare wires colored blue. Wire shall be Paige, Service Wire Co. 7079D, or approved equal.

2.18 DETECTABLE MARKING TAPE

A. Marking tape shall be detectable, three-inch (3”) wide, blue color, reading “Caution Irrigation Water Line Buried Below” and three-inch (3”) wide, yellow color, reading “Caution Irrigation Wire Buried Below”. Manufactured by Christy Enterprises, (800) 258-4583.

B. Place as detailed on Contract Drawings.

2.19 ELECTRICAL TAPE

A. Electrical tape shall be black plastic, three-quarter inch (¾") wide, minimum 0.007-inch thick, and all-weather type.

2.20 ELECTRICAL WIRE SPLICES

A. Automatic control valve wire splices shall be 3M DBY, or DBR, no substitutions. All splices shall be made within a valve box. At each splice, the wire is to be tagged with a non-fading plastic marker with the zone number permanently marked on the tag. An identical tag shall be attached to the zone control valve. Doublers or devices which split or share zones shall not be used.

2.21 ELECTRICAL CONDUIT

A. This specification pertains only to low voltage irrigation system wiring. All one-hundred twenty (120) volt power specifications are referred to in Electrical Specifications Sections.

B. Conduit above finish grade shall be rigid galvanized steel with zinc-protected threads. Fittings shall be of the same material with hot dipped galvanized finish.

C. Conduit within a building shall be EMT where permitted by Code. Fittings shall be suitable for this product.

D. Conduit within the ground shall be gray, Schedule 40 rigid PVC. Fittings shall be suitable for this product.

E. All equipment furnished and installed shall be in accordance with National, State, and County Electrical Codes, established safety codes, and applicable local codes and ordinances.

2.22 CONCRETE THRUST BLOCKING

A. Concrete thrust blocking shall be required on all sections of the mainline piping.

PART 3 - EXECUTION

3.1 EXISTING CONDITIONS

A. Verify that the proper flow and static pressure is available at the irrigation system point of connection prior to beginning any irrigation work.
   1. Flow = 113.4 gallons per minute (gpm).
   2. Static Pressure @ 50 psi.

B. Immediately notify the Owner's Representative in writing if flow and pressure vary from Part 3.1 A. above.

C. Prior to beginning any trenching, verify that the subgrade is at the correct design grade and has been approved by the Owner's Representative.

3.2 PREPARATION

A. Stake the locations of all irrigation components and obtain Owner's Representative's approval before commencing installation. Bring any potential discrepancies to the attention of the Owner's Representative before installation.

B. Locations of irrigation equipment shown on Contract Drawings are approximate. Actual placement may vary as required to achieve the full, overlap coverage required on the plans without spraying onto buildings, sidewalk, fences, adjacent pavements, etc.

C. Make necessary adjustments in layout as required to connect to the point of connection should such equipment not be located as shown, and as may be required to work around new construction, at no increase in contract award.

3.3 GENERAL CONSIDERATIONS

A. Install unions adjacent to valves and to final connections to other components with two and one-half inch (2½") or smaller pipe connections.

B. Install flanges adjacent to valves and to final connections to other components with three-inch (3") or larger pipe connections.

C. Install dielectric fittings to connect piping of dissimilar metals.

D. Transition Fittings: Use transition fittings for plastic-to-metal pipe connections.

E. If reassembly work has to be done after the fittings have been coated, a new coat shall be applied to the disturbed surface.

3.4 PVC PIPE TRENCHING AND BACKFILLING

A. Install PVC piping in dry weather when temperature is above forty (40) degrees Fahrenheit. Allow joints to cure at least twenty-four (24) hours at temperatures above forty (40) degrees Fahrenheit before testing unless otherwise recommended by manufacturer.

B. Mainline pipe shall be installed with a minimum of eighteen inches (18"), and a maximum of twenty-four inches (24"), of cover with blue, detectable marking tape six-inches (6") below finish grade.

C. Lateral line pipe shall be installed with a minimum of twelve inches (12"), and maximum of eighteen inches (18"), of cover.

D. Install pipe with manufacturer's markings facing up (12 o'clock).

E. If the existing soils are determined by the Owner's Representative to be unacceptable for use as backfill material, the pipes shall be sand bedded. Sand shall be placed to a minimum depth of two inches (2") below the pipe and four inches (4") above and alongside the pipe (approx. one (1) CF of sand per LF of trench). The Contractor will be compensated for sand bedding per Section 7.01 of the General Conditions. Do not proceed with any sand bedding prior to inspection / approval by the Owner's Representative

F. Pipe shall be laid on stable soil with trench bottom evenly graded (without humps or depressions). Ledge rock, boulders, and cobbles one inch (1") or larger shall be removed so that there is no contact with any piping. Voids remaining from the removal of large rocks shall be filled and compacted with select material. Install piping free of sags or bends.

G. Where multiple irrigation pipes share a common trench, trench shall be sufficiently wide (or piping shall be arranged) to allow four inches (4") minimum of horizontal separation and six inches (6") minimum of vertical separation between piping, while maintaining specified minimum and maximum cover over piping. Irrigation pipes shall be located in a separate trench from any domestic water piping.

H. Backfill around pipe and fittings shall be free from large rocks and shall be well tamped. Trenches shall be backfilled in compacted, six-inch (6") maximum thickness lifts to a level that is even with subgrade (or surrounding grade). Raise backfill to a slight mound and compact with an approved compactor or vibrator. Compaction by vehicle or equipment wheels is prohibited. All roots, rocks, and surplus excavations shall be removed from the site. Contractor is responsible for correcting all trench settlement during the warranty period of the Contract.

I. The trenches shall be thoroughly compacted to ninety percent (90%) density at optimum moisture content. Submit compaction test results from one (1) location in each lateral trench and three (3) random locations in each mainline. Cost for testing shall be the Contractor's responsibility.

3.5 WELDING OF PLASTIC PIPE AND FITTING

A. All gasketed and solvent weld plastic pipe shall be installed in accordance with manufacturer's installation instructions. Great care shall be taken to ensure that the inside of the pipe is absolutely clean. Pipe ends (not being worked) shall be protected and not left open. Cleaning of cutting burrs is mandatory.

B. For solvent weld pipe, PVC pipe ends shall be cut at a ninety (90) degree angle to the pipe length and shall be cleaned (use approved reaming tool) of all burrs prior to cementing. Pipe ends shall be wiped clean with a rag that has been lightly wetted with PVC thinner. Joints shall be completely free of moisture or condensation.

C. Cement shall be applied with a light coat on the inside of the fitting and a heavier coat on the outside of the pipe (no further back from the end of pipe than the fitting would slip). Application of cement on the interior of the fittings shall be quantified to ensure no cement shall be pushed into the flow stream of the pipe. Pipe shall be inserted into the fitting and given a quarter turn to seat the cement. Excess cement shall be wiped from the outside of the pipe. Cement that becomes unduly thick or heavy shall not be thinned and re-used. CONTRACTOR SHALL DISPOSE OF SAME. Pipe shall be tested as indicated elsewhere in these specifications.

D. Allow fifteen (15) minutes (minimum) set-up time for solvent weld joints before moving or handling. Pipe shall be partially center-loaded to prevent arching or slipping. No water shall be permitted in the pipe for at least ten (10) hours to permit solvent weld set and cure. Backfilling shall be done when the pipe is not in an expanded condition due to heat or pressure. Cooling of the pipe can be accomplished by operating the system for a short period of time before backfilling, or by backfilling in the early part of the morning before the heat of the day. Before pressure testing, allow twenty-four (24) hours cure time for solvent weld joints.

E. Lateral line pipe may be longitudinally bent at a ratio of two-hundred (200) times the outside diameter (o.d.) of the pipe over the length of one (1) full stick of pipe [i.e.: 1½" pipe (1.9" o.d.) can be bent to a minimum radius of 1.9 x 200 or 380 inches (31.7') over 20' length of pipe].

3.6 PIPE AND WIRE SLEEVES

A. Pipe Sleeves: Provide pipe sleeves under paved areas as required whether or not they are shown on the Contract Drawings. Provide multiple parallel pipe sleeves where shown on Contract Drawings or as specified.

B. Wire Sleeves: Install electrical / control wiring in a separate sleeve from irrigation piping. Provide as many conduits as required to accommodate all power and low-voltage control wires to the controller.

3.7 PRESSURE TESTS

A. Before any testing, all piping shall be thoroughly flushed. Center loading of the pipe is permissible prior to testing, but all pipe end joints, fittings, gate valves, and automatic valve stub outs shall be exposed for inspections during the pressure test.

B. Mainlines shall be filled from the point of connection until all air is removed from the mainline. Smaller sections of the mainline can be tested by closing the gate valves that isolate that particular section of piping. All mainline pipe, fittings, gate, and automatic valves shall be subjected to a hydrostatic pressure test of one hundred twenty-five (125) psi for a minimum of four (4) continuous hours, with no allowable pressure loss.

C. Lateral lines shall be tested at seventy-five (75) psi. Test following swing joint or riser installation. All swing joints and fixed risers shall be capped. All pipe end joints, fittings, and swing joints shall be left exposed for inspection. Prior to inspection, lines shall be filled with water and all air shall be purged from the lateral. Inspection of lateral lines will be done visually.

D. Rejected systems or any portions thereof shall be repaired and re-tested as specified.

E. Contractor shall furnish all equipment, materials, and labor for all testing. The Contractor shall notify the Owner's Representative at least seventy-two (72) hours prior to the test so an inspector may witness the test.

3.8 GATE VALVES

A. Gate valves shall be installed per detail at mainline depth. Valves shall be installed in a six-inch (6") PVC pipe collar or plastic roadway valve box (depending upon actual depth), topped with a ten-inch (10") valve box with locking lid.

3.9 PRESSURE GAUGES

A. One (1) pressure gauge shall be provided to Owner with appropriate fitting to adapt onto the quick coupling valve keys.

3.10 MANUAL DRAIN VALVE

A. Install manual drain valve per detail shown on Contract Drawings at low point(s) on mainline only. Record all locations.

3.11 QUICK COUPLING VALVES

A. Owner shall approve all QCV locations prior to construction. Quick coupling valves shall be installed per detail on unibody swing joints.

B. Quick Coupling Valves shall be installed a minimum of twelve inches (12"), and maximum of thirty-six inches (36") from pavement or lawn edge (except at point of connection). The maximum distance from the top of the quick coupler to the top of the valve box shall be three inches (3"). Ensure quick coupler key easily passes the top of the valve box when fully engaged. The valve shall be installed inside a ten-inch (10") round valve box. Care must be taken to prevent excessive water backup within the valve box.

C. A six-inch (6") layer of washed drain rock shall be placed in the bottom of the valve box, encased in a layer of geotextile fabric.

D. Thoroughly flush mainline before installing Quick Coupling Valves.

3.12 MASTER VALVE

A. Install master valve in a rectangular valve box as detailed on Contract Drawings. Wire connections shall be made with proper splices. Care shall be taken to prevent excessive water backup inside the valve box. A six-inch (6”) bed of drain rock shall be placed under the master valve.

3.13 FLOW SENSOR

A. Install flow sensor in a rectangular valve box as detailed on Contract Drawings. Wire connections shall be made with proper splices. Care shall be taken to prevent excessive water backup inside the valve box. A six-inch (6”) bed of drain rock shall be placed under the flow sensor.

B. Provide a minimum length straight pipe section of ten (10) pipe diameters upstream of the flow sensor to any fittings and minimum length straight pipe section of five (5) pipe diameters downstream of the flow sensor to any fittings.

3.14 AUTOMATIC CONTROL VALVES

A. Automatic Control Valves shall be installed per detail in specified valve boxes, one valve per valve box. Provide Schedule 80 PVC Unions, per detail. Flush supply lines before installing automatic control valves. Use valve-box extensions as necessary to extend box completely below bottom of valve.

B. Before installation of automatic control valves, the mainline shall be flushed and pressure tested. Begin installation only after mainline test has been certified by Owner's Representative. Install only one (1) automatic control valve per valve box.

C. Use Schedule 80 TOE nipple and Schedule 80 fittings and pipe from the mainline to the valve. Use valve box extensions to ensure that the valve box extends at least ten inches (10") below the bottom of the valve. The maximum distance from the flow control handle to the top of the

valve box shall be six inches (6"). Care must be taken to prevent excessive water backup within the valve box. A six-inch (6") layer of drain rock shall be placed in the bottom of the valve box. Group valves where practical. Locate valve boxes six inches (6") from and perpendicular or parallel to walk edge, building, and/or walls. Provide twelve inches (12") between boxes where valves are grouped together.

D. For pressure regulating valves (Dial-PRS), set downstream pressure using a pressure gauge assembly to obtain optimum sprinkler performance.

3.15 SPRINKLER HEADS

A. Install pop-up sprinklers as shown on the Contract Drawings (Contractor shall take steps necessary to avoid filling the sprinkler cavity with back-washed sand or soil). Sprinklers in turf areas shall be installed in a manner that permits reel type mowers (reels and rollers) to pass over sprinklers without interference. Install all pop-up sprinkler bodies perpendicular (90 deg. angle) to slope. Adjust radii of sprinklers to obtain optimum overlap coverage required on the Contract Drawings.

B. Backfill around heads shall be approved native or import topsoil, well compacted. Sprinklers shall be installed flush with sidewalks and curbs and exactly two inches (2") from any paved edge. All heads shall be set perpendicular to finish grade unless otherwise specified on the Contract Drawings. Refer to details.

C. Thoroughly flush all lateral lines before installing sprinkler heads.

D. Refer to installation details on Contract Drawings for all sprinkler heads.

3.16 SPRINKLER AND QUICK COUPLING VALVE SWING JOINTS (RISERS)

A. On rotor, spray, and quick coupling valve, use triple swing joints as shown on Contract Drawings. Apply two (2) wraps of Teflon tape around threaded outlet connection (to sprinkler or quick coupling valve). Threaded connections shall be watertight. Do not over tighten.

3.17 VALVE BOXES

A. Install valve boxes plumb and flush with finish grade, so that a reel type mower may pass over without interference. Valves boxes shall be supported on continuous brick foundation per detail. Valve box archway shall not rest on piping - provide a minimum of one-inch (1") clearance around any piping.

B. Provide filter fabric cover over all below grade openings to prevent debris from contaminating the valve box drain rock.

C. If construction debris washes into the automatic valve or quick coupling valve boxes prior to project completion, remove existing drain rock and replace with new drain rock.

3.18 IRRIGATION CONTROLLER

A. The irrigation controller shall be wall mounted in the building Riser Room 129 where directed by Owner. Coordinate with electrical and/or plumbing contractor on controller placement and any connection needed between controller and domestic water booster pump. Include all fittings, conduit, wiring, components, appurtenances, and labor for complete 100% operation of all automatic control valves.

B. Exposed wires shall be strapped or channeled in such a way that they can be easily traced. Enclose exposed control wires inside the building within specified conduit.

C. Coordinate hook up of automatic control valves and sequencing with Owner's Representative to assure irrigation system operates according to the Owner's requirements.

D. Install the rain sensor where indicated on the Contract Drawings and connect to controller.

E. All 120-volt connections within the controller enclosure are subject to local electrical codes and permitting. A licensed electrician shall perform all work with power wiring. Low voltage wiring may be installed and connected by the irrigation contractor.

F. Ground controller per manufacturer's recommendations. Install conduit as required for ground wire. Verify that the controller is grounded.

G. Control wiring shall be installed in a neat and orderly manner and sequenced as per the Owner's Representative's request.

H. Contractor will be responsible for all required permits and permit fees and the installation of any required conduits.

3.19 CONTROL WIRES AND SPLICES

A. Control wires shall be taped together at fifteen foot (15') intervals and shall then placed at the side of the mainline as detailed. Provide thirty-six inch (36") expansion loops at all directional changes. Any control wires not installed along mainline shall be housed inside a three-inch (3") PVC conduit. All ninety (90) degree fittings shall be long radius type only.

B. There shall be a separate "hot" lead for each automatic control valve. A single common wire may be used to reach all valves on an individual controller. Spare wires shall be installed as noted on the Contract Drawings. Install auxiliary wires to pass through each intermediate valve box, providing an eighteen-inch (18") minimum loop within each valve box. Seal ends of spare wires.

C. Minimum size of copper wire for this project is #14 UF. The control wires shall be color coded as follows:
   1. Automatic Control Valve Wire
      a. Neutral Wire (common): WHITE
      b. Signal Wire (control): RED
      c. Auxiliary Wires (spare): YELLOW
   2. Flow Sensor Wire
      a. Neutral Wire (common): BLACK
      b. Signal Wire (control): ORANGE
      c. Auxiliary Wires (spare): BLUE

D. All wire from controller to valves and flow sensor shall be rated Underground Feeder (UF).

E. All splices shall be within a valve box. No splices are permitted between the controller and the valves. At each splice, the wire is to be tagged with a non-fading plastic marker with the zone number permanently marked on the tag. A second, matching tag must also be included at the control valve itself. All splices shall be encapsulated in the device specified in "Electrical Wire Splices", Part 2.20 above and shall be contained in a plastic valve box where a valve is installed.

3.20 TRACER WIRE AND MARKING TAPE

A. Tracer Wire: Install one (1) #14 bare copper locator (trace) wire, taped to top of pipe, along all mainline and lateral piping as detailed on Contract Drawings. Tie all bare coper wire together in cone continuous web. Trace wire shall be visible and accessible in all valve boxes at point of connection, gate valves, quick coupling valves, and automatic control valves.

B. Marking Tape: Install detectable marking tape as detailed on Contract Drawings.

3.21 CONCRETE THRUST BLOCKING

A. The concrete thrust blocking as detailed on the Contract Drawings at every location the mainline changes direction or terminates.

3.22 SYSTEM FLUSHING

A. The entire irrigation system shall be flushed prior to the installation of the sprinkler heads. After capping all risers, Contractor shall remove the cap nearest the automatic valve, flush and recap. Contractor shall then repeat this process by removing the next nearest cap. Repeat this process until the last head on the circuit is flushed.

3.23 PRELIMINARY COVERAGE TEST

A. Prior to any seeding or sodding, the system shall be tested to ensure full coverage of any proposed irrigated areas. The test shall be of sufficient duration so that moisture is visibly apparent on the bare soil or sand areas and that the irrigation system is covering as specified.

3.24 LABELING AND IDENTIFYING

A. Install all valve I.D. tags as specified herein.

B. Provide a reduced and laminated version of the irrigation system layout and mount per the Owner's direction next to the controller panel.

3.25 FINAL REVIEW

A. Prior to request for final review, accomplish the following:
1. Complete the installation.
2. Balance the system by adjusting pressure-regulating devices and flow controls on valves.
3. Confirm proper operation of controller. Perform diagnostic test for communication of the master valve, flow sensor, and rain sensor with controller.
4. Test for proper operation of all equipment.
5. Clean sediment from valve boxes so that drain rock (below valves) and wiring (including auxiliary and trace wire) is clearly visible inside valve box.
6. Submit Operation and Maintenance manuals to the Owner’s Representative for review.
7. Complete Contractor’s "As Built" documents and submit for review by the Owner’s Representative.
8. Submit specified extra materials, miscellaneous keys, spare parts, and required tools and deliver them to the Owner's Representative.

3.26 PERFORMANCE TEST

A. A performance test is part of the final review.

B. Upon completion of the system installation and after the pressure tests have been completed and the system has been adjusted, the Contractor shall operate the system in the presence of the Owner's Representative.

C. Coverage Check: Each automatic control valve shall be operated to determine proper sprinkler coverage. Excessive water on non-landscaped areas will be checked carefully. If applicable, during the coverage check, check operation via the remote control device.

D. Controller shall be tested for manual and automatic operation and for operation of the hand-held remote(s).

E. After the system performance test, the Owner's Representative may request up to five percent (5%) of the total sprinkler nozzles be substituted at no additional cost.

3.27 CLEAN-UP

A. The Contractor is responsible for maintaining a clean and safe working environment throughout the project site. Regular policing of the project site of trash and project debris will be required.

B. Disposal of all trash will be the Contractors' responsibility.

END OF SECTION 32 80 00

32 91 13 – SOIL PREPARATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Subgrade Preparation
   2. Topsoil for lawn, meadow, and hydroseed areas

B. Related Requirements:
   1. Section 32 80 00 – Irrigation System
   2. Section 32 92 23 – Hydroseed
   3. Section 32 93 00 – Plants

1.3 REFERENCES

A. ASTM D 1557: Method for Laboratory Compaction Characteristics of Soil using Modified Effort.

1.4 DEFINITIONS

A. Percent Compaction: The required in-place dry density of the material, expressed as a percentage of the maximum dry density of the same material determined by ASTM D1557 test procedure.

B. Soil Subgrade: The soil surface on which compost material is placed.

C. Finished Grades: The final grade elevations indicated on the Grading Drawings.

D. Aesthetic Acceptance of Grades: Acceptance by the Owner's Representative in writing of the Aesthetic Correctness of the contours as observed without a survey instrument. Aesthetic Acceptance does not address whether an area drains properly, whether the areas are at the correct elevation, or whether it has been compacted properly.

E. Acceptance: Wherever the terms "acceptance" or "accepted" are used herein, they mean acceptance of Owner's Representative in writing.

F. Grading Drawings: Contract Drawing plans, sections, and profiles showing finished surface grades.

G. Elements with Fixed Elevations: Paths, paving, concrete pads, headers, footings, foundations, walls, and other structures with fixed-spot elevations.

1.5 SUBMITTALS

A. Submit product data and one-gallon sample of Type I and Type II Topsoil material.

1.6 SITE CONDITIONS

A. Environmental Protection:
1. Soil Moisture Content: Do not work soil when moisture content is so great that excessive compaction will occur, nor when it is so dry that dust will form in air or that clods will not break readily.

PART 2 - PRODUCTS

2.1 TOPSOIL

A. Topsoil for lawn, meadow, and hydroseed areas shall be a mixture of weed-free compost and Loamy Sand screened through a 3/8" screen unless noted otherwise.
1. Type I Topsoil for Lawn & Meadow (Owner-seeded): 30% compost / 70% Loamy sand.
a. Topsoil for lawn and meadow areas shall be coordinated with the Owner, who will provide and install seed by drill seeding. The Contractor shall be responsible for rough and finish grading, rototilling, and coordination with the Owner to avoid compaction or disturbance of seeded areas.
2. Type I Modified Topsoil for Hydroseed Areas (Contractor-seeded): 20% compost / 80% loamy sand
a. Topsoil in hydroseeded areas shall be lower in organic content to support appropriate native species establishment and minimize weed competition.
b. Native topsoil may be reused in hydroseeded areas with approval by Owner's Representative, provided it meets friability and drainage requirements and includes minor compost incorporation as needed.
c. Native subsoils excavated from depths exceeding three feet (3') shall not be used as surface topsoil in hydroseeded areas unless approved by the Owner's Representative following on-site testing. All planting areas shall receive a minimum of six inches (6") of imported or amended topsoil.
3. Type II Topsoil for Planting: 50% compost, 50% Loamy sand.
4. Topsoil mix for hydroseeded native areas may be reduced in compost content at the discretion of the Owner's Representative to support appropriate native species establishment and minimize weed competition.

B. Compost: Well-composted, stable, and weed-free organic matter, pH range of 5.5 soluble salt content of 5 to 10 decisiemens/m; not exceeding 0.5 percent inert contaminants and fee of substances toxic to plantings; and as follows:
1. Organic Matter Content: 50% to 60% of dry weight.
2. Feedstock: Agricultural, food, or industrial residuals; biosolids; yard trimmings; or source-separated or compostable mixed solid waste.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Subgrade:
1. Verification: Verify that the subgrades have been graded to within one tenth of a foot (0.10') of the grades shown on the Grading Drawings.
2. Aesthetic Acceptance: Verify that Owner's Representative has given the subgrade aesthetic acceptance. Do not place compost material or rototill material into subgrade until Owner's Representative has accepted subgrade for aesthetic correctness.

3. Notification of Discrepancies: Notify the Owner's Representative in writing of any discrepancies.

B. Planting:
1. Pre-Planting Inspection: Compost material shall not be installed until a pre-planting inspection has been completed per Section 32 93 00 – Planting.

3.2 SURVEY REQUIREMENTS

A. Lines and Levels: Establish lines and levels, locate and lay out by instrumentation and similar appropriate means for all planting area finish grades.

B. General Staking: Provide a sufficient quantity of grade stakes as required to provide the depths of compost material shown on the drawings.

3.3 PREPARATION

A. Protection of Existing Conditions:
1. General: Use every possible precaution to prevent damage to existing conditions to remain such as structures, utilities, irrigation systems, plant materials and paving on or adjacent to the site of the Work.

B. Surface Preparation:
1. Inspection: Inspect subgrade soil for stones over one inch in diameter, sticks, oils, chemicals, plaster, concrete, and other deleterious materials.
2. Removal: Do all Work when necessary to remove the deleterious materials before and after subgrade preparation.

3.4 PREPARING SUBGRADE

A. Plow with a rototiller or other approved equipment to the depth shown on the drawings. Note: This Work shall occur prior to irrigation Work.

3.5 TOPSOIL PLACEMENT

A. Place Topsoil as detailed on plans.

B. Spillage:
1. Take precautions to prevent spillage when hauling on or adjacent to any public street or highway.
2. In the event that spillage occurs, remove all spillage and sweep, wash, or otherwise clean such streets or highways as required by local City, County, or State authorities.

C. Dust Control: Use water trucks or temporary irrigation and take all precautions needed to prevent a dust nuisance to adjacent public or private properties.

D. Erosion:
1. Correct erosion and siltation damage at no cost to the Owner.

E. Settlement Repair: Correct settlement within the Warranty period at no cost to the Owner.

3.6 FINISH GRADING OPERATIONS

A. General: Grade with uniform slope between points where elevations are given or between such points and existing grades, unless indicated otherwise.

B. Soil Surface Tolerances:
   1. Planting Areas: Bring finished soil surface to within one-tenth of a foot (0.10') of finish grades indicated on Grading Drawings. Grade flatter areas at tighter tolerance if required to provide positive drainage.
   2. Allowances: Make proper allowances for settlement, spoils from plant pits, etc

C. Survey Requirements:
   1. Lines and Levels: Establish lines and levels, locate and lay out by instrumentation and similar appropriate means all planting area finish grades.
   2. Staking: Provide grade stakes and string lines at a maximum twenty-five foot (25') spacing or closer as required to bring the soil surface to the grades shown on the Grading Drawings with a smooth surface and positive surface drainage.

D. Surface Drainage:
   1. Slope finish grades to drain surface water away from buildings, walks, paving, and other structures unless otherwise indicated.
   2. Slope finish grades to drain surface water to catch basins, area drains or trench drains as shown on the Grading Drawings.

E. Rounded Sculptural Landforms: Blade soil surface parallel with contours to achieve smooth, rounded landforms as shown on the Grading Drawings.

F. Depressions and Loose Material: Fill and compact depressions, and remove all loose material to finish surface true to line and grade, presenting a smooth, compacted, and unyielding surface.

G. Excessive Compaction: Rip areas which become compacted more than eighty-five percent (85%) compaction to a twelve-inch (12") depth, rototill and blade smooth, prior to planting. Hydroseed areas in stormwater basins or slopes must remain permeable. Final grading should avoid excessive smoothing / rolling which could reduce permeability.

3.7 PROTECTION

A. Erosion: Correct erosion and siltation damage at no cost to the Owner.

B. Settlement Repair: Correct settlement within the Warranty period at no cost to the Owner.

C. Drainage: Keep surface of compost and topsoil material in such condition that it will drain readily and effectively.

D. Materials, Tools, and Equipment: In handling materials and operating tools and equipment, protect the compost material from damage by laying down planks, plywood, or other accepted protective materials where required.

E. Vehicular Traffic: Do not allow vehicles to travel in a single track. If ruts are formed, blade smooth.

F. Storage of Materials: Do not store or stockpile materials on owner provided compost material. Compost material to be covered with plastic tarpaulins for protection from leaching.

3.8 CLEANUP

A. Daily: Keep all areas of Work clean, neat, and orderly at all times.

B. Final: Clean up and remove all deleterious materials and debris from the entire Work area prior to Final Completion.

END OF SECTION 32 91 13

32 92 23 – LAWN AND HYDROSEED

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Lawn (by owner)
   2. Meadow (by owner)
   3. Hydroseed (by contractor)
   4. Sod at irrigation turf rotors (by contractor)

B. Related Requirements:
   1. Section 32 80 00 – Irrigation System (by contractor)

1.3 DEFINITIONS

A. Finish Grade: Elevation of finished surface at soil.

1.4 QUALITY ASSURANCE

A. Installer Qualifications: A qualified landscape installer whose work has resulting in successful lawn and hydroseed establishment.
   1. Installer's Field Supervision: Require Installer to maintain an experienced full-time supervisor on project site when planting is in progress.

B. Preinstallation Conference: Conduct a conference at project site to comply with requirements in Division 1 Specifications, and to coordinate with Owner. The Owner plans to drill seed for the lawn and meadow areas. Contractor shall coordinate on grading, soil preparation, protection of work, establishment, and fertilizer for these areas to clearly delineate areas of responsibility between the Contractor and the Owner.

1.5 SUBMITTALS

A. Seed Analysis: A complete analysis of the seed shall be submitted by the Contractor prior to planting. The analysis shall include: varieties, percentage of pure seed, germination rate, other crop seed (including inert and weed seed), and the germination test date. All crop seed in excess of one percent (1%) must be itemized.

B. Sod sample and hydroseed analysis.

C. Fertilizer Certification: Submit duplicate copies of all invoices for all fertilizer showing the grade furnished.

D. Maintenance and Establishment Plan: Summarize the installation, fertilization, and establishment process delineating both Contractor and Owner responsibilities.

PART 2 - PRODUCTS

2.1 SEED

A. Turf Grass Seed Mix (By Owner)

B. Meadow Seed Mix (By Owner)

C. Hydroseed Mix:
1. Seed Mix Composition
30% - Tufted Hairgrass, Deschampsia cespitosa
25% - Creeping Red Fescue, Festuca rubra
20% - Blue Wildrye, Elymus glaucus
15% - Idaho Fescue, Festuca idahoensis
10% - California Oatgrass, Danthonia californica
2. Seed must be Pure Live Seed (PLS), and certified noxious weed free.

D. Other Seed Requirements:
1. Seed Law: All seeds shall conform to the requirements of the Washington State Seed Laws, and where applicable, the Federal Seed Act.
2. Noxious Weed Seed: All seed shall be free of seeds of weeds listed as primary noxious by the Washington State Seed Law. Seeds shall not contain seeds of weeds listed as secondary noxious by the Washington State Seed Law, singly or collectively in excess of the labeling tolerance specified by the Washington State Seed Law.
3. Rejection: When seeds furnished under this specification fail to meet the requirements within tolerance, as provided by the Washington State Seed Law, the lot shall be rejected or subjected to fiscal adjustment.
4. Recleaning: Seeds shall be thoroughly recleaned and of uniformly good quality and appearance throughout each lot.
5. Preparation for Delivery: Seeds shall be packed in clean, sound containers of uniform weight. Seed shall be labeled as required by law.
6. Reference Specifications: Chapter 15.49, Washington State Seed Law

2.2 SOD AT IRRIGATION HEADS

A. Provide twelve-inch (12”) diameter of sod at irrigation turf rotor heads. Grass species to match owner installed turf grass seed. Coordinate with owner on installation and protection of irrigation heads during turf and meadow installation and establishment.

2.3 MULCH FOR HYDROSEEDING

A. Bonded Fiber Matrix (BFM) or equivalent erosion control hydro-mulch.
1. Apply 2,000-3,500 lbs per acre

B. Hydroseed mulch shall be one hundred percent (100%) wood fiber mulch manufactured by the defibrating process from fir, hemlock, or alder. The mulch shall have a minimum of sixty percent (60%) of fibers 8.5 mm or longer and seventy-seven percent (77%) of the total fiber exceeding 3.5 mm in length.

C. Wood fiber mulch shall be in uniform weight displayed clearly on each package. Fiber shall be dyed green in color to provide visual metering of application. Tackifier shall be incorporated into the wood fiber in the drying process.

2.4 TACKIFIER

A. Tackifier to be primarily composed of guar gum.

B. Tackifier must be pre-mixed into the mulch.

C. Percentage of tackifier shall not be less than two percent (2%) or greater than ten percent (10%), with the percentage used clearly labeled on the outside of package.

D. Tackifier rates shall be adjusted by adding wood fiber mulch with tackifier and regular wood fiber mulch to provide tackifier rates equivalent to or greater than specified.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas to receive seeding for compliance with requirements and other conditions affecting performance. Verify finish subgrade is correct before beginning work. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Protect structures, utilities, sidewalks, pavements, and other facilities, trees, shrubs, and plantings from damage caused by seeding operations.
   1. Protect adjacent and adjoining areas from hydroseeding overspray.

B. Provide erosion-control measures to prevent erosion or displacement of soils and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways.

3.3 INSTALLATION SCHEDULE

A. Seeding is best performed in spring (mid-March to June) or fall (late September to October). If seed is applied in the spring or summer, irrigation must be provided to ensure grass survival. Avoid seeding after October 15 unless approved by Owner's Representative.

3.4 LAWN / MEADOW SEEDING (BY OWNER)

A. Coordinate preparation of lawn and meadow area with Owner.

B. Coordinate protection of irrigation system (by contractor) and all work within lawn and meadow areas during seed installation with Owner.

3.5 HYDROSEEDING

A. Hydroseeding:
   1. Seed, mulch, tackifier, and water shall be thoroughly mixed into a uniform hydroseeding slurry and applied simultaneously in a single operation. The slurry shall be continuously agitated to maintain a homogenous mix until discharge.
   2. Apply slurry using a hydraulic hydroseeder equipped with a continuous mechanical agitator and discharge nozzles capable of delivering a uniform spray pattern. Distribution lines shall be sized to prevent clogging.
   3. Do not begin hydroseeding until final grading is complete and approved. Soil shall be free of loose rocks, debris, and excessive compaction immediately prior to application.
   4. Hydroseed all designated areas uniformly, using light multiple passes if necessary to achieve full, even coverage without bare soil visible. Mulch shall form a continuous protective mat over the seeded surface.

5. Ensure that the hydroseed slurry is applied directly to the soil surface to maximize seed-to-soil contact. Avoid excessive slurry buildup ("pooling") in low areas or thin "stripping" on slopes.
6. On 3:1 slopes or steeper, apply slurry in light, overlapping passes to promote slurry adhesion and minimize runoff or slippage.
7. Do not hydroseed during active rainfall, immediately prior to heavy rainfall, or during periods of high winds.

B. Watering
1. Fall Seeding: No irrigation needed except in prolonged dry spell (greater than two (2) weeks).
2. Spring Seeding: Light watering two to three (2-3) times/week for the first six to eight (6-8) weeks if natural rainfall is insufficient.
3. Water enough to keep soil moist but not saturated.

C. Application Rates:
1. Pure Live Seed (PLS) Seed: 45-50 lbs/acre
2. Bulk rate (carrier + mulch): 90-120 lbs/acre

3.6 SOD IRRIGATION TURF ROTORS (BY CONTRACTOR)

A. Match top of sod with finish grade.

3.7 HYDROSEED MAINTENANCE

A. Establishment Procedures:
1. Provide light irrigation if conditions are dry to encourage germination and deeper root development. Water as needed, avoiding runoff.
2. Monitor seeded areas regularly for weed invasion, with particular attention to noxious weeds.
3. Mow if weeds overtop native seedlings. Mow to eight (8”) to ten inches (10”) high; never mow below six inches (6”) to protect native seedling crowns.
4. Inspect all areas for bare patches, especially on steep slopes and in runoff zones. Spot-reseed any bare areas immediately to prevent erosion. Apply mulch over reseeded areas to stabilize soil.
5. At the end of the first full growing season (12 months post-seeding), seeded areas shall achieve:
   a. A minimum of 60–70% live vegetative cover.
   b. No bare patches larger than fifty (50) square feet.
   c. No active soil erosion or slope failures.
6. If the cover standard is not met, Overseed bare areas and/or complete additional corrective work (e.g., soil amendment, drainage fixes) prior to final acceptance.
7. Upon final acceptance, mowing shall cease to allow native grasses to mature, develop clumps, and self-sow naturally.

B. Herbicide:
1. No broadcast herbicide spraying shall occur.
2. Spot-application of herbicide is allowed only for targeted control of noxious weeds and must be performed with care to avoid impacting native seedlings.

C. Fertilizer:
1. No turf fertilizer applications are permitted unless approved by the Owner’s Representative.
2. If fertilizer is required, use a low or no phosphorus formulation appropriate for native grass establishment.

D. Reseeding Requirements:
   1. Any seeded areas that fail to achieve at least eighty percent (80%) live cover within one (1) month of germination shall be reseeded.
   2. If reseeding fails to achieve establishment, alternate stabilization methods such as erosion control blankets, coir nets, or hydro-mulch applications shall be implemented.
   3. If winter weather prevents adequate grass growth, time limits for reseeding may be adjusted at the discretion of the Owner's Representative.

E. Erosion Repairs:
   1. Any areas that experience erosion shall be immediately repaired by:
      a. Fixing underlying drainage or runoff problems
      b. Regrading if necessary
      c. Reseeding and reapplying mulch over the repaired area.

3.8 LAWN & MEADOW MAINTENANCE

A. Coordinate closely with the Owner regarding lawn and meadow establishment. The Owner will be responsible for seeding the lawn and meadow areas, while the Contractor shall provide overall site preparation, final grading, and irrigation installation. Coordination between the Contractor and Owner is critical to ensure protection of installed work and successful establishment of the lawn and meadow areas.

3.9 INSPECTION AND SUBSTANTIAL COMPLETION

At the time of Substantial Completion, all hydroseeded areas shall exhibit a uniformly applied slurry with no visible bare soil, overspray, or mulch accumulation. The site shall be free of erosion, rills, or sediment movement on hydroseeded slopes. Initial germination of seeded species shall be visible across the full extent of the seeded area. The site must also be free of invasive and noxious weed species. Any areas failing to meet these conditions shall be corrected prior to acceptance of Substantial Completion.

3.10 WARRANTY AND MAINTENANCE PERIOD

A. The Contractor shall provide a one (1) year warranty and maintenance period beginning at the date of Substantial Completion. During this period, the Contractor shall be responsible for ensuring successful establishment of hydroseeded areas, including maintaining erosion-free conditions, achieving required vegetative cover thresholds, and controlling invasive and noxious weeds. The Contractor shall reseed, repair, or otherwise remediate any areas that fail to establish adequately or experience erosion, weed infestation, or die-off during the warranty period. All repairs, reseeding, or corrective measures required during the warranty period shall be performed at no additional cost to the Owner.

3.11 CLEANUP AND PROTECTION

A. Promptly remove soil and debris created by work from paved areas. Clean wheels of vehicles before leaving site to avoid tracking soil onto roads, walks, or other paved areas.

B. Remove erosion-control measures after establishment period.

END OF SECTION 32 92 23

32 93 00 – PLANTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Installing plant material as shown on the Drawings.
   2. Installing fertilizer, and mulch.

B. Related Requirements:
   1. Section 32 80 00 – Irrigation System
   2. Section 32 91 13 – Soil Preparation

1.3 REFERENCES

A. Refer to the following standards:
   1. WSDA Washington State Department of Agriculture - Rules Relating to Standards for Nursery Stock.
   2. American Standard for Nursery Stock, ANSI Z60.1-1990.
   3. Hortus Third, Cornell University.

1.4 DEFINITIONS

A. Balled and Burlapped Stock: Exterior plants dug with firm, natural balls of earth in which they are grown, with ball size not less than sizes indicated or diameter and depth recommended by ANSI Z60.1 for type and size of tree or shrub required; wrapped, tied, rigidly supported, and drum-laced as recommended by ANSI Z60.1.

B. Container Grown Plant: Exterior plants grown and marketed in a container which generally prevents the growth of roots beyond its side walls or bottom, with a fully developed root system which holds the rootball together when the container is removed. Container and plant sizes shall not be less than sizes indicated or diameter and depth recommended by ANSI Z60.1 for type and size of shrub required.

C. Finish Grade: Elevation of finished surface of planting soil.

D. Manufactured Topsoil: See Section 32 91 13 – Soil Preparation.

E. Recycled Topsoil: Screened, on-site soil meeting the requirements of Section 32 91 13 – Soil Preparation.

F. Planting Soil: Topsoil used in tree, shrub and perennial pits shall be a mixture of ten percent (10%) compost by volume and ninety percent (90%) existing, on-site topsoil, screened through a three-eighths inch (3/8”) screen or approved equal.

G. Subgrade: Surface or elevation of subsoil remaining after completing excavation, or top surface of a fill or backfill, before placing planting soil.

1.5 SYSTEM DESCRIPTION

A. Materials, equipment, and labor for planting; reestablishing finish grading of planting areas following planting; protection and immediate maintenance; guarantee and replacement; and related items necessary to complete the work indicated.

B. Quantities: Determine exact amounts from Contract Drawings.

1.6 SUBMITTALS

A. Submit the following:
   1. Notification: Within thirty (30) days after the award of Contract, submit documentation that plant materials have been ordered, purchase order number, and photographic sample of each plant species.
   2. Product Data:
      a. Mulch
      b. Staking Materials
      c. Root Barrier
      d. Compost

B. Submit Maintenance Data. Include special directions essential for Owner's maintenance program during guarantee/warranty period. Include duplicate copies for landscaping maintenance personnel use during maintenance period.

C. Warrantees:
   1. Plant Material Warranty: Written Warranty on Contractor's letterhead.

D. Samples:
   1. Mulch: One (1) cubic foot.

E. Maintenance Data:
   1. Submit Maintenance Data as specified in Section 01 77 00. Include special directions essential for Owner’s maintenance program during guarantee/warranty period. Include duplicate copies for landscaping maintenance personnel use during maintenance period.

1.7 QUALITY ASSURANCE

A. Supplier, installer qualifications: Contractor to have at least five (5) years’ experience performing comparable work.

B. Pre-Installation Meeting:
   1. All plants shall be reviewed by the Owner’s Representative on site prior to planting.
   2. Stake all tree locations for approval prior to excavating pits.
   3. Plant five (5) shrubs and two (2) trees and stake in the presence of the Owner’s Representative prior to planting all other shrubs and trees.

1.8 DELIVERY, STORAGE, AND HANDLING ON NEW PLANT MATERIAL

A. Products Excluding Plant Materials:
   1. Labeling: Furnish standard products in unopened manufacturer's standard containers bearing original labels showing quantity, analysis and name of manufacturer.
   2. Storage: Store materials and products with protection from weather or other conditions which would damage or impair their effectiveness.

B. Acceptance of Contractor-Procured Plant Materials:
   1. Owner acceptance of Plant Materials at Delivery: Owner's Representative to review plant materials upon delivery to verify that plants are undamaged, healthy and satisfactory for which to provide the Warranty requirements described in these Specifications.
   2. Unsatisfactory Conditions: Contractor to notify Owner's Representative immediately if unsatisfactory conditions are found that will not allow the plants to be warranted as described in these Specifications.
   3. Acceptance of Warranty Responsibility: The Contractor, by accepting delivery of plant material, without providing written notification of unsatisfactory conditions, assumes Warranty responsibilities for the plant material as described in these specifications.
   4. Unloading: The Contractor has responsibility for removing plant material from delivery vehicle.
   5. Protection Prior to Installation: Protect plant materials from sun and drying winds from delivery until planted in final location on site. Heel-in all rootballs if not planted the same day as delivered.
   6. Proper Plant Handling: Handle and protect plants, roots, rootballs, and new buds to prevent plant injuries. Pick up all plants from the rootball or container, not the trunk.
   7. Unsatisfactory Materials: Immediately remove unsatisfactory materials from site.
   8. Verification of Species: All plant material shall be delivered with tags or labels identifying species and variety (as applicable). Incorrect species shall be removed from the site immediately.
   9. Plant Tags: Do not remove yellow, plastic lock-seal tags with serial numbers until end of Warranty period.

1.9 PROJECT SITE CONDITIONS

A. Environmental Requirements: Plant during periods normal for optimum growth, as determined by season, weather conditions, and accepted practice. Contractor may conduct planting operations under unseasonable conditions, without additional compensation, by accepting full responsibility for subsequent resulting losses.

B. Underground Conditions:
   1. Locate utility lines and underground obstructions to avoid damage during excavation.
   2. Contractor shall repair and replace damaged buildings, equipment, underground utilities, irrigation equipment, paving, surfacing, stairs, and other work damaged as a result of Contractor's operations.
   3. Locate and clearly mark irrigation pipe, wire, valves, and other underground equipment.

1.10 SEQUENCING AND SCHEDULING

A. Coordinate ordering of materials with Owner immediately following General Contract award. Ensure that specified sizes and quantities are furnished.

B. Planting Schedule: Contractor is responsible for using good horticultural practices and judgment regarding timing of planting.

1.11 WARRANTY

A. Warranty Period for this work is as stated in General Conditions and begins at Owner acceptance. Warranty period for all plant material shall be one (1) year from date of Owner acceptance.
   1. Guarantee replacement: Acceptance of sample plants does not constitute acceptance of all plants. Final acceptance of plants shall occur at Owner acceptance of the completed project.
      a. Plant materials: Warrant to be healthy and thriving.

b. Remove and replace immediately during the Guarantee Period: Dead, diseased, dying, broken, or missing plant materials (except as noted below). Use specified plant and plant as specified; guarantee until acceptable, active, healthy growth is evident.
c. Contractor's responsibility: During Guarantee Period, you are not held responsible for replacing plants destroyed or damaged by vandalism, accidents caused by vehicle (other than yours), or Acts of God, provided that you have exercised due care to protect the work.
d. When required replacement time falls during non-planting season, you may request Owner's permission to defer planting until proper season. If granted, immediately remove dead plants, including roots, from site.
e. Backfill pits properly with topsoil. Finish grade and leave in acceptable condition until proper planting season occurs. Replace with plants of same kind and size as those originally planted. Plant as originally specified.

1.12 MAINTENANCE

A. The maintenance period shall continue until substantial completion. At a minimum, maintenance shall include: watering, weed and pest control, and temporary barriers as required to insure healthy, thriving plant growth.

PART 2 - PRODUCTS

2.1 MATERIAL – GENERAL

A. Comply with Quality Assurance provisions, references, specifications, and manufacturer's data.

2.2 PLANT MATERIALS

A. Meet or exceed following reference standards for quality, size, and condition:
1. WSDA Rules Related to Standards for Nursery Stock.
2. ANSI Z60.1-2004: Nursery Stock.
3. American Joint Committee of Horticultural Nomenclature: Standardized Plant Names.

B. Plant abbreviations (see Contract Drawings for complete plant list):

B&B	Balled and burlapped	S	Small
BR	Bare root	M	Medium
br	Branches	L	Large
cal	Caliper	EXL	Extra large
cont	Container	NCN	No common name
dia	Diameter	oc	On center
gal	Gallon	tri-spaced	Triangular spaced

2.3 PLANTING SOIL

A. Tree and Shrub Pits: Backfill for tree and shrub pits shall be a mixture of ten percent (10%) compost by volume and ninety percent (90%) existing, on-site topsoil, screened through a three-eighths inch (3/8”) screen or approved equal.

B. Perennial and Groundcover Beds: Perennial and groundccover beds shall be amended with a mixture of ten percent (10%) compost by volume and ninety percent (90%) existing, on-site topsoil, screened through a three-eighths inch (3/8") screen or approved equal.

C. Compost: Shall be made from ground yard waste that has first been screened through a five-eighths inch (5/8") trammel screen. The composting process shall include five (5) three (3) day periods during which the compost temperature is between 131 to 165 degrees Fahrenheit. The total composting time period shall be a minimum of six (6) months. Compost shall be pure compost with no additives and certified organic by the Washington Department of Agriculture with the following minimum nutrient analysis:

Guaranteed Minimum Analysis: Compost	1.10-0.40-1.10%
Total Nitrogen (N)	1.10%
Water Insoluble Organic Nitrogen	1.10%
Available Phosphate (P_2O_5)	0.40%
Soluble Potash (K_20)	1.10%
Calcium (Ca)	0.58%

D. Equal to Cedar Grove Compost, 17825 Cedar Grove Road S.E. Maple Valley, WA 98038, 425-432-2395, 425-432-7043 (fax).

2.4 FERTILIZER

A. Conform to referenced FS O-F-24D, Commercial Fertilizers and WSDA Laws.

B. Fertilizer for All Tree and Shrub Plantings:
1. "Best Paks – 20-10-5 in biodegradable packet available from Simplot Turf and Horticulture, 1-800-992-6066.

2.5 MULCH

A. Reground Fir Mulch

B. Acceptable Products Available From:
1. Whidbey Topsoil (360) 331-7645
2. Or approved equal.

PART 3 - EXECUTION

3.1 PRE-PLANTING INSPECTION

A. General: Verify installation conditions as satisfactory to receive work of this section. Do not install until unsatisfactory conditions are corrected. Beginning work constitutes Contractor's acceptance of conditions as satisfactory.

B. Contaminants:
1. Verify existing soil conditions for contaminants that may have been discarded by other trades, such as thinner or plaster.
2. Report findings in writing immediately to Owner's Representative before placing topsoil.

C. Adverse Drainage Conditions: Notify Owner's Representative in writing of adverse drainage conditions affecting plant growth.

3.2 PREPARATION

A. Field Measurements:
   1. Verify actual plant layout in relation to Contract Drawings: Make adjustments as required by Owner's Representative.
   2. In shrub planting areas, follow specified distances on center rather than estimated number of plants, be it a larger or smaller quantity.

B. Plant Locations:
   1. Stake all tree locations with three-foot (3') wood stakes for acceptance by Owner's Representative.
   2. Make required field adjustments as directed by Owner's Representative.
   3. Shrubs may be staked out by boundary rather than individual plants.
   4. Avoid obstructions such as irrigation equipment.

C. Protect the public, adjacent properties, surfaces, and surrounding areas to prevent harm during Work of this Section.

3.3 INSTALLATION

A. Install the Work in accordance with References and specifications.

3.4 FINISH GRADING

A. Finish subgrade and obtain approval of Owner's Representative before you start planting or place any soil. Finish subgrade shall be smooth and conform to the final finish grade after soil placement. Allow for added soil in individual plantings as specified.

3.5 PLANTING

A. Preparation:
   1. Before planting, soak dry rootballs.
   2. Prune broken roots one-half inch (½") or greater in diameter. Make clean cuts.
   3. Plant when plant materials are available and weather conditions are consistent with good horticultural practice.

B. Plant Pits:
   1. Dig plant pits and plant according to details. Waste excess pit spoils evenly over subgrade.
   2. If you encounter clay soil or unusual conditions likely to be detrimental to new plantings, notify Owner's Representative immediately.
   3. Remove unsuitable material excavated from plant holes and dispose of it legally off project site.
   4. Install plants with POSITIVE drainage away from rootball, unless otherwise noted.

C. Fertilizer – Trees and Shrubs Only:
   1. Prior to completing backfilling of rootball, place Best Paks on sides evenly around rootball, six inches (6") minimum and eight inches (8") maximum below the finish grade and approximately two inches (2") from root tips. Owner's Representative shall be present when Best Paks are installed.
   2. Place quantities by plant size as indicated and in accordance with manufacturer's instructions:
      a. 1 pak - 1 gal.
      b. 3 paks - 5 gal.
      c. 9 paks - 15 gal. (trees)

D. Planting:
   1. Hold plant in center of hole, approximately two inches (2”) above normal growing position and backfill with soil approximately halfway.
   2. Backfill to within five inches (5”) of finish grade; fill hole with water and allow to settle.
   3. Backfill to finish grade with specified planting soil.
   4. Raise plants settling below finish grade to correct elevation.

E. Plant Tags:
   1. Remove and dispose of nursery labels, tags and stakes.
   2. Do not remove yellow, plastic lock-seals with serial numbers until end of Warranty period.

F. Soil:
   1. Place soil to a uniform depth as shown on the Contract Drawings.

3.6 MULCHING

A. Before installing mulch, obtain acceptance of the Owner’s Representative of planting areas, grades, soil depths, and plant locations.

B. Install mulch layer under all trees, shrubs, ferns and groundcover to the limits and depths as shown on the Contract Drawings.

C. Install uniform mulch layer material to the depths shown on the Contract Drawings over cleaned and graded subsurface.

D. At plant trunks and stems, taper mulch back from root ball crown so mulch does not touch bark.

3.7 FINAL INSPECTION

A. Remove defective materials; in their place, install new materials, as specified. Furnish in same variety and current size of existing healthy plant materials, subject to a one (1) year guarantee beginning at the date of new installation. Remove any weeds.

3.8 CLEANING

A. Sweep paving clean. Leave installations properly planted, clean, and orderly; premises free from scatterings and other residue of work. Leave site neat and clean at end of each working day.
   1. Remove and dispose on site such items as excess earth, clippings, trimmings, leaves, litter, and debris.
   2. Rake planting areas to an even, fine grade. Wash hard surfaces clean.
   3. Remove flag labels from plantings.

3.9 PROTECTION OF COMPLETED WORK

A. Install barriers as necessary and required to protect the work during Guarantee Period, or for shorter period as directed.

3.10 PLANT ESTABLISHMENT

A. Contractor to provide water to maintain plants in non-irrigated areas during plant establishment period.

END OF SECTION 32 93 00

SECTION 33 00 00 –PIPE & PIPE FITTINGS: GENERAL STATEMENT (WATER SUPPLY)

PART 1 - GENERAL

1.1 DESCRIPTION

A. The work in this Section includes utility piping systems, plumbing piping systems, pipe pressure testing, and pipe cleaning.

B. This work does not include water main and service work within the Aquatic Center site. Water piping work within the Aquatic Center site shall be in accordance with Section 33 10 00 – Water Service.

1.2 RELATED SECTIONS

A. Water Utility Distribution Piping (Water Supply) - Section 33 11 00
B. Water Utility Distribution Valves (Water Supply)– Section 33 12 16
C. Earthwork – Section 31 00 00

1. ICS6, Enclosures for Industrial Controls and Systems

F. National Fire Protection Association (NFPA)

1. 54, National Fuel Gas Code

1.4 SUBMITTALS

A. Catalog data consistent with Section 01 33 00 – Submittal Procedure – Shop Drawings, Product Data, and Samples including:

1. Schedule showing pipe type, size, schedule of pipe, appurtenances, type of linings and coatings, cathodic protection.
2. Copies of any manufacturer’s written directions regarding material handling, delivery, storage and installation.
3. Technical product data on piping appurtenances.

B. Certifications and Testing consistent with Section 01 45 00 – Quality Control including:

1. Certification that products used meet standards referenced.
2. Notification of time and date of piping pressure tests.
3. Copies of pressure test results on all piping systems.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Protect pipe coating during handling using methods recommended by manufacturer. Use of bare cables, chains, hooks, metal bars or narrow skids in contact with coated pipe is not permitted.

B. Prevent damage to pipe during transit. Repair abrasions, scars, and blemishes. If repair of satisfactory quality cannot be achieved, replace damaged material immediately.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Furnish piping, fittings and appurtenances in accordance with the Contract Documents.

B. Pipe sizes indicated are nominal inside diameter, except for HDPE pipe which is based on iron pipe sizing.

C. Use straight, round pipe.

D. For temporary piping not specifically addressed in Piping Schedule, utilize materials, joints and fittings equal to those specified for similar applications of permanent construction.

2.2 COMPONENTS AND ACCESSORIES

A. Couplings Restraint

1. Provide mechanical restraint for all couplings.
2. Assure couplings and restraint match test pressure rating of piping system.

2.3 MECHANICALLY RESTRAINED JOINTS

A. The restraining of water pipes, fittings, and valves shall be accomplished by the use of either a bolted or boltless system. Any device utilizing round point set screws shall not be permitted.

B. All couplings installed underground to connect to ductile iron or PVC pipe shall be manufactured of ductile iron.

C. All mechanical restraints shall conform to the State of Washington Department of Transportation, “Standard Specifications for Road, Bridge, and Municipal Construction”, latest edition. (WSDOT Standard Specifications).

2.4 BRONZE NIPPLES, COUPLERS, AND FITTINGS

A. Bronze threaded nipples, couplers, and fittings shall meet the requirements of ANSI B-16.15, ASA 125-pound class.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Prior to installation, inspect and verify condition of piping and appurtenances. Installation constitutes installer’s acceptance of product condition for satisfactory installation.

3.2 PREPARATION

A. Correct defects or conditions which may interfere with or prevent a satisfactory installation.

3.3 EXTERIOR PIPING ERECTION/INSTALLATION/APPLICATION

A. Unless otherwise shown on the Drawings, provide a minimum of thirty (30) inches earth cover over exterior buried piping systems and appurtenances conveying water, fluids, or solutions subject to freezing.

B. Laying Pipe in Trench

1. Excavate and backfill trench in accordance with Section 31 00 00 – Earthwork.
2. Clean each pipe length thoroughly and inspect for compliance to Specifications.
3. Grade trench bottom and excavate for pipe bell and lay pipe on trench bottom or bedding material.
4. Provide gasket or joint material according to manufacturer's directions after joints have been thoroughly cleaned and examined.
5. Except for first two (2) joints, before making final connections of joints, two (2) full sections of pipe shall have been previously installed with earth tamped alongside of pipe of final bedding material placed.
6. Lay pipe in only suitable weather with good trench conditions. Never lay pipe in water except where approved by the Engineer.

C. Lining-up Push-on Joint Piping

1. Lay piping on route lines shown on Drawings.
2. Deflect from straight alignments or grades by vertical or horizontal curves.
3. Maximum offset between extended centerlines of any two (2) adjacent pipe lengths is in strict accordance with the pipe manufacturers published literature on deflections and offsets.
4. Provide special bends when specified or where required alignment exceeds allowable deflections stipulated.
5. Provide shorter lengths of pipe in such length and number that angular deflection of any joint, as represented by specified maximum deflection, is not exceeded.

D. Anchorage and Blocking

1. Provide reaction blocking, anchors, joint harnesses, or other acceptable means for preventing movement of piping caused by forces at buried or exposed piping tees, wye branches, plugs, or bends.
2. Size thrust block as detailed on the Drawings.
3. Place concrete blocking so that it extends from fitting into solid undisturbed earth wall. Concrete blocks shall not cover pipe joints.
4. Provide bearing area of concrete in accordance with details on Drawings.
5. Provide insulating components where dissimilar metals are joined together.

3.4 CONNECTIONS WITH EXISTING PIPING

A. Where connection between new work and existing work is made, use suitable and proper fittings to suit conditions encountered.

B. Perform connections with existing piping at time and under conditions which will least interfere with service to those affected by such operation.

C. Undertake connections in fashion which will disturb existing system as little as possible.

D. Utilize suitable equipment and facilities to dewater, drain, and dispose of liquid removed without damage to adjacent property.

E. Where connections to existing systems necessitate employment of past installation methods not currently part of trade practice, utilize necessary special piping components.

3.5 FIELD QUALITY CONTROL

A. General

1. Utilize pressures, media, and pressure test durations as specified on Piping Schedules and provided under project specifications for applicable pipe material.
2. Isolate equipment which may be damaged by the specified pressure test conditions.
3. Perform pressure test using calibrated pressure gauges and calibrated volumetric measuring equipment to determine leakage rates. Select each gauge so that the specified test pressure falls within the upper half of the gauge's range. Notify Engineer twenty-four (24) hours prior to each test.
4. Completely assemble and test new piping systems prior to connection to existing pipe systems.
5. Acknowledge satisfactory performance of test and inspections in writing to Engineer prior to final acceptance.
6. Provide all necessary equipment and perform all work required in connection with the test and inspections.
7. Bear the cost of all testing and inspecting, locating and remedying of leaks and any necessary retesting and reexamination.

3.6 CLEANING AND DISINFECTION

A. Cleaning

1. Clean interior of piping systems thoroughly before installing.
2. Maintain pipe in clean condition during installation.
3. Before joining piping, thoroughly clean and wipe joint contact surfaces and then properly dress and make joint.
4. Immediately prior to pressure testing, clean and remove grease, metal cuttings, dirt, or other foreign materials which may have entered the system.
5. At completion of work and prior to final acceptance, thoroughly clean work installed under these specifications. Clean equipment, fixtures, pipe, valves, and fittings of grease, metal cuttings, and sludge which may have accumulated by operation of system, from testing, or from other causes. Repair any stoppage of discoloration or other damage to parts of building, its finish, or furnishings, due to failure to properly clean piping system, without cost to the Owner.

END OF SECTION

SECTION 33 05 26 – UTILITY LINE IDENTIFICATION MARKING (WATER SUPPLY)

PART 1 – GENERAL

1.1 DESCRIPTION

A. The work of this Section includes furnishing and installing utility line marking tape and tracer wire in the water utility trench.

B. This work does not include water main and service work within the Aquatic Center site. Water piping work within the Aquatic Center site shall be in accordance with Section 33 10 00 – Water Service.

1.2 SUBMITTALS

A. As specified in Section 01 33 00 – Submittal Procedure – Shop Drawings, Product Data, and Samples.

B. Certification that the materials used in the tape fabrication meet the requirements of this Section.

PART 2 - PRODUCTS

2.1 MARKING TAPE

A. Capable of being inductively detected electronically.

B. Construction: Two (2) layers of impervious plastic film not less than four inches (4”) wide. Total thickness of tape shall not be less than 0.005 inch (five (5) millimeters) plus or minus ten percent (10%) manufacturing tolerances.

1. Film: Inert plastic. Each film layer shall be not less than 0.0005 inch thick (one half (0.5) millimeters).
2. Adhesive: Compatible with foil and film.

C. Imprint: One inch (1”) or larger bold black letters.

D. Legend: Identify buried utility line tape with imprint such as “CAUTION: WATER LINE BELOW.” Repeat identification at approximately twenty-four inch (24”) intervals.

E. Background Color: APWA color code and as specified below:

Color	Utility
Safety Red	Electric
High Visibility Safety Yellow	Gas, Oil, Steam, Dangerous Materials
Safety Alert Orange	Telephone, Communications, Cable Television
Safety Precaution Blue	Water System, Irrigation
Safety Green	Sanitary Sewer, Storm Sewer
Safety Brown	Force Mains, Reclaimed Water, and Effluent Lines

F. Manufacturer: Lineguard, Inc., Wheaton, Illinois; Reef Industries, Inc., Houston, Texas; Thor Enterprises, Inc., Sun Prairie, Wisconsin; or approved equal.

2.2 TRACER WIRE

A. Tracer wire shall be blue coated No. 12 AWG, continuous to above ground access points (meters and valves). Splices in wire, if needed, shall be made with waterproof splice kits.

PART 3- EXECUTION

3.1 MARKING TAPE

A. Install tape in backfill directly over each buried utility line as shown. Place tape during final backfilling. Bury tape approximately twelve (12) inches above the crown of the pipe.

3.2 TRACER WIRE

A. Install tracer wire in backfill over each buried utility line as shown in the construction plans.

B. A minimum of 2 ft. of excess/slack wire is required in all trace wire access boxes after meeting final elevation.

C. Trace wire must be properly grounded at all dead ends/stubs.

D. Trace wire systems must be installed as a single continuous wire, except where using approved connectors. No looping or coiling of wire is allowed.

END OF SECTION

33 09 10 – INSTRUMENTATION AND CONTROL FOR WATER UTILITIES (WATER SUPPLY)

PART 1 - GENERAL

1.1 SUMMARY

A. Design of the instrumentation and control system and associated electrical components shall be the responsibility of the Contractor. The design shall meet the requirements of the Specifications and Plans. The contractor shall provide a complete and functional system that meets the intent of the Specifications and Plans.

B. Section includes performance requirements for water system controls including the following:

1. Potable Reservoir Controls
2. Irrigation Reservoir Controls
3. Well pump variable frequency drive (VFD) controls
4. Chemical metering pump controls
5. ATEC filtration system controls

C. Section also includes product specifications for the following:

1. Submersible level transmitter
2. Pressure transmitter
3. Well pump VFD
4. Source meter

D. Related Requirements:

1. Section 22 05 23.2 “General Duty Valves for Plumbing Piping (Water Supply)” for flow control solenoid valve.
2. Division 26 "Electrical."
3. Section 33 11 13 “Potable Water Supply Wells.”
4. Section 33 12 16 "Water Utility Distribution Valves (Water Supply)" for pressure sustaining solenoid valve.
5. Section 33 16 13 “Above Ground Concrete Water Reservoir (Water Supply).”
6. Section 46 30 00 “Water and Wastewater Chemical Feed Equipment (Water Supply)” for chemical metering pumps and flow switches.
7. Section 46 61 00 “Filtration Equipment (Water Supply)” for ATEC filtration system.

1.2 REFERENCES

A. National Electrical Manufacturers Association (NEMA):

1. NEMA 250 – Enclosures for Electrical Equipment (1000 Volts Maximum)

B. Underwriters' Laboratories:

1. UL 508 – Industrial Control Equipment

C. National Sanitation Foundation (NSF International):

1. NSF 61 – Drinking Water System Components – Health Effects
2. NSF 372 – Technical Requirements

1.3 SUBMITTALS

A. See Section 01 33 00 “Submittal Procedures” for submittal requirements.

B. Section 01 77 00 “Closeout Procedures.”

C. Submit shop drawings and one line diagrams for the control system.

1.4 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing Products specified in this section with minimum five years of experience.

B. Installer: Company specializing in performing work of this section with minimum three years of experience.

1.5 PERFORMANCE REQUIREMENTS

A. Potable Reservoir Controls

1. A submersible level transmitter will be installed in the potable reservoir and shall perform the following functions:
   a. Open flow control solenoid valve: the submersible level transmitter sends a signal to the flow control solenoid valve in the treatment building to open, which will start potable reservoir filling. Opening the valve will cause pressure to drop in the raw water line from the well as measured by the pressure transmitter in the pressure sustaining solenoid valve vault. When the pressure drops below the well pump VFD pressure setpoint, the VFD will turn the well pump on.
   b. Close flow control solenoid valve: the submersible level transmitter sends a signal to the flow control solenoid valve in the treatment building to close, which will stop potable reservoir filling. Closing the valve will cause pressure to increase in the raw water line from the well as measured by the pressure transmitter in the pressure sustaining solenoid valve vault. When the pressure reaches the well pump VFD pressure setpoint, the VFD will turn the well pump off.
   c. Potable reservoir high water level alarm: the submersible level transmitter sends a signal to the well pump control panel to activate the potable reservoir high-level alarm.
   d. Potable reservoir low water level alarm: the submersible level transmitter sends a signal to the well pump control panel to activate the potable reservoir low-level alarm.

B. Irrigation Reservoir Controls

1. A submersible level transmitter will be installed in the irrigation reservoir and shall perform the following functions:
   a. Open pressure sustaining solenoid valve: the submersible level transmitter sends a signal to the pressure sustaining solenoid valve on the irrigation reservoir fill line to open, which will start irrigation reservoir filling. Opening the valve will cause pressure

to drop in the raw water line from the well as measured by the pressure transmitter in the pressure sustaining solenoid valve vault. When the pressure drops below the well pump VFD pressure setpoint, the VFD will turn the well pump on.

b. Close pressure sustaining solenoid valve: the submersible level transmitter sends a signal to the pressure sustaining solenoid valve on the irrigation reservoir fill line to close, which will stop irrigation reservoir filling. Closing the valve will cause pressure to increase in the raw water line from the well as measured by the pressure transmitter in the pressure sustaining solenoid valve vault. When the pressure reaches the well pump VFD pressure setpoint, the VFD will turn the well pump off.
c. Irrigation reservoir high water level alarm: the submersible level transmitter sends a signal to the well pump control panel to activate the irrigation reservoir high-level alarm.
d. Irrigation reservoir low water level alarm: the submersible level transmitter sends a signal to the well pump control panel to activate the irrigation reservoir low-level alarm.
e. Re-establish any irrigation pump shut-offs, if present, to de-energize irrigation pumps due to an extreme irritation reservoir low water level.

2. Pressure Sustaining Solenoid Valve
   a. Valve shall be normally closed. When the irrigation reservoir calls for water, the valve shall open in pressure sustaining mode.
   b. When the valve is open in pressure sustaining mode, the valve shall maintain a minimum pressure on the upstream side of the valve to ensure that potable reservoir filling is prioritized above irrigation reservoir filling.
   c. Pressure sustaining solenoid valve pressure setting is indicated in the Plans.
   d. When both reservoirs are calling for water, the pressure sustaining solenoid valve will modulate (close) to limit flow to the fire reservoir.

3. Flow Control Solenoid Valve
   a. Valve shall be normally closed. When the potable reservoir calls for water, the valve shall open in flow control mode.
   b. When the valve is open in flow control mode, the valve shall limit the flow rate of water through the valve to a maximum rate.
   c. Flow control solenoid valve flow rate setting is indicated in the Plans.

C. Reservoir Set Point Control Panel

1. Install panel in reservoir site pumphouse as indicated in the Plans.
2. Signal from the reservoir level transmitters shall pass through the reservoir set point control panel before going to the flow control and pressure sustaining solenoid valves.
3. The water level that triggers the following control functions for both the potable and irrigation reservoirs shall be adjustable with this panel.
   a. Potable reservoir:
      1) Open flow control solenoid valve
      2) Close flow control solenoid valve
      3) High water-level alarm
      4) Low water-level alarm

   b. Irrigation reservoir
      1) Open pressure sustaining solenoid valve
      2) Close pressure sustaining solenoid valve
      3) High water-level alarm
      4) Low water-level alarm

D. Well Pump VFD Controls

1. VFD control panel shall be capable of controlling the well pump in the following scenario:
   a. Control well pump on/off based on pressure in treatment building as measured by treatment building pressure transmitter. Flowrate to match treatment system capacity of 35 gpm.
   b. VFD shall adjust well pump motor speed to maintain a constant pressure in treatment building as measured by treatment building pressure transmitter. VFD pressure setting is indicated in the Plans.
   c. VFD shall utilize flow rate limiting to limit well pumping rate to a maximum of 120 gpm as measured by the source meter.

E. Chemical Metering Pump Controls

1. Dedicated switched receptacles:
   a. Provide dedicated 120V receptacles for chemical metering pumps as indicated on the Plans.
   b. Receptacles shall be switched, meaning they are wired such that they are energized only when the flow control solenoid valve in the treatment building is open (potable water reservoir filling) and de-energized when the valve is closed.

2. Flow Switch:
   a. Flow switch shall monitor if no-flow conditions or flow conditions exist in the pipe on which it is installed.
   b. Provide wiring such that when no-flow conditions exist, power to dedicated receptacles for chemical metering pumps is interrupted.

F. ATEC Filtration System

1. Filter system control panel shall be energized only when the flow control solenoid valve in the treatment building is open. Panel includes a timer to monitor filter run-time for system backwashing.
2. Filter solenoid backwash valves shall be hydraulically actuated with pressure from the filter inlet piping.

PART 2 - PRODUCTS

2.1 SUBMERSIBLE LEVEL TRANSMITTER

A. Meet the following requirements

1. NSF 61 and/or 372 certified.
2. UL-listed.
3. Output signal: 4-20mA analog.
4. Measuring range: 0 to 60 feet of water min.
5. Material: standard 316L stainless steel

B. Manufacturers and Products

1. Keller Levelgage
2. Endress & Hauser Waterpilot FMX11
3. Engineer approved equal

2.2 PRESSURE TRANSMITTER

A. Meet the following requirements

1. NSF 61 and/or 372 certified
2. Piezoresistive sensing element
3. ¼" NPT connection
4. Wetted materials: 316 stainless steel
5. Pressure range: 0 to 100 psi (min.)
6. Output signal: 4-20 mA
7. ±0.5% accuracy

B. Manufacturers

1. Keller Valueline
2. USA Bluebook
3. Engineer approved equal

2.3 WELL PUMP VFD

A. Well pump motor shall be controlled by a variable frequency drive (VFD) control panel with the following integrated features/capabilities:

1. HAND/OFF/AUTO modes for well pump control.
2. Compatible with site power
3. Accepts pulse and 4-20mA analog signal input from source meter and pressure transmitter.
4. Flow Rate Limiter: VFD limits well pump flow rate to a maximum user input flow rate value.

B. Manufacturer and Products:

1. Yaskawa iQpump 1000
2. Engineer approved equal

2.4 SOURCE METER

A. Source meter shall be a magnetic flow meter with the following features:

1. 4-20mA analog signal output.
2. NSF 61 and/or 372 certified
3. Remote digital display with flow rate and total volume display

B. Manufacturer and Products:

1. Seametrics iMAG 4700r (2-inch)
2. Engineer approved equal

PART 3 - EXECUTION

3.1 EXAMINATION

A. Requirements: Verification of existing conditions before starting work.

B. Verify correct power supply is available.

3.2 INSTALLATION

A. Install control systems at locations indicated on Drawings.

B. Install control system components in accordance with manufacturer's instructions.

C. Install control wire in conduit from reservoir level transmitters to reservoir set point control panel in pumphouse at reservoir site and pressure sustaining solenoid valve and flow control solenoid valve. Signal path for 4-20mA analog signal from level transmitters to solenoid valves shall be as follows: level transmitters > reservoir set point control panel > pressure sustaining and flow control solenoid valves.

D. Install control wire in conduit from source meter to remote digital display and well pump VFD control panel. Signal path for 4-20mA analog signal from source meter to well pump VFD control panel shall be as follows: source meter > remote digital display > VFD control panel. Install source meter remote display and VFD control panel in pumphouse near well site per plans.

3.3 FIELD QUALITY CONTROL

A. Start-up control systems by energizing system equipment and testing operation of hardware in presence of Engineer. Verify operation in conformance with the Plans and these Specifications.

B. Equipment Acceptance:

1. Adjust, repair, modify or replace system components that fail to perform as specified and rerun tests. Make final adjustments to equipment per manufacturer's requirements.
2. Document adjustments, repairs and replacements in manufacturer's field services certification.

3.4 DEMONSTRATION

A. Demonstrate equipment startup, shutdown, system operation, routine maintenance, alarm condition responses, and emergency repair procedures to Owner personnel.

END OF SECTION 33 09 10

SECTION 33 10 00 - WATER SERVICE

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes, but is not limited to the following:

1. Water main within Building project area, water services, fire hydrants and fire department connections.
2. Coordination and installation with Fire Protection Designer and Fire Marshal.
3. Coordination of building plumbing connection point.
4. Coordination of water main connection point.
5. Construction records.

1.2 REFERENCES

A. Reference the following standards:

AHJ	Public Authority Having Jurisdiction AHJ is an abbreviation for public Authorities Having Jurisdiction. For this project the AHJ denotes Island County.
UPC	The Uniform Plumbing Code
AWWA	American Water Works Association Standards
ASTM	American Society for Testing and Materials
WSDOT	Washington Department of Transportation 2025 Standard Specifications and Standard Plans for Road, Bridge, and Municipal Construction

1.3 SUBMITTALS

A. Submit the following information in conformance with submittal procedures noted in Division 01.

1. Product data sheets or shop drawings for all materials listed in Part 2 Products and/or noted on Plans.
2. Record drawings.

PART 2 - PRODUCTS

2.1 PIPE AND FITTINGS

A. Pipe four inches in diameter and larger shall be ductile iron pipe Class 52 per WSDOT Section 9-30.1(1).

B. Fittings shall be per applicable portions of WSDOT Section 9-30.2.

C. Pipe shall be marked with the National Sanitation Foundation (NSF) seal and in accordance with ASTM and AWWA marking requirements, which include, but are not limited to, the manufacturer's name and class of pipe. Pipe shall bear no evidence of interior or exterior extrusion marks. Pipe walls shall be uniform, smooth, and glossy.

D. Conductive warning tape shall be as defined per Section 31 00 00 - Earthwork.

2.2 VALVES

A. Gate valves (3 to 16 inches) shall conform to WSDOT Section 9-30.3.

B. Valve boxes for buried valves shall be in accordance with WSDOT Section 9-30.3(4).

2.3 FIRE DEPARTMENT CONNECTION (FDC)

A. FDC shall be approved by the Fire Marshall and shall conform to AHJ requirements.

2.4 HYDRANTS

A. Hydrants shall conform to AHJ requirements per WSDOT 9-30.5 and AHJ requirements.

2.5 CONCRETE THRUST BLOCKING

A. Concrete thrust blocking shall conform to WSDOT Section 7-09.3 and AHJ requirements.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify trenches are ready to receive work, and are excavated to the dimensions and elevations indicated on the Contract Documents.

3.2 INSTALLATION

A. Conform trench excavation, bedding, and backfill for water mains to requirements of Section 31 00 00 - Earthwork, unless otherwise specified.

1. Provide a minimum of 30-inches of cover for all water and fire service lines in accordance with AHJ Standards.

B. Install water main pipe, fittings and appurtenances in accordance with WSDOT Section 7-09, and in accordance with manufacturer's instructions.

1. Pipe deflection at joints shall be no more than one half the manufacturer's allowable amount.

C. Install valves for water mains in accordance with WSDOT Section 7-12.

D. Install conductive warning tape in accordance with Section 31 00 00 - Earthwork.

E. Connect to building water system.

F. Install fire hydrants in accordance with AHJ requirements.

G. Install concrete thrust blocking in accordance with WSDOT 7-09.3.

3.3 TESTING AND DISINFECTION

A. Coordinate testing with AHJ requirements.

B. Pressure test water main pipe in accordance with WSDOT Section 7-09.3, AWWA C600 and AHJ requirements.

C. Flush and disinfect water services (greater than 2-inch) in accordance with WSDOT Section 7-09.3 and AHJ requirements. Provide and pay costs for disinfection, sampling, and testing for water service.

1. Prevent flooding and downstream property damage when flushing water lines.

D. Flush and disinfect water service connections (2 inch and smaller) in accordance with WSDOT Section 7-15.3 and AHJ's requirements. Provide and pay costs for disinfection, sampling, and testing for water service.

1. Prevent flooding and downstream property damage when flushing water lines.

3.4 CLEANING

A. Leave premises clean and free of residue of work of this Section in accordance with the requirements of Division 01 of this Project Manual.

END OF SECTION 33 10 00

SECTION 33 11 00 - WATER UTILITY DISTRIBUTION PIPING (WATER SUPPLY)

PART 1 - GENERAL

1.1 DESCRIPTION

A. The work covered in this Section includes furnishing, installing, and cleaning piping systems and fittings for project water lines, to include water service lines, valves, miscellaneous products, accessories, and appurtenant items.

B. This work does not include water main and service work within the Aquatic Center site. Water piping work within the Aquatic Center site shall be in accordance with Section 33 10 00 – Water Service.

1.2 RELATED SECTIONS

A. Section 33 05 26 – Utility Line Identification Marking

1.3 REFERENCES

A. See “Pipe & Pipe Fittings: General Statement” – Section 33 00 00.

B. State of Washington Department of Transportation, “Standard Specifications for Road, Bridge, and Municipal Construction”, latest edition. (WSDOT Standard Specifications).

C. NSF 61 – Drinking Water System Components – Health Effects

1.4 SUBMITTALS

A. See Section 01 33 00 – Submittal Procedure – Shop Drawings, Product Data, and Samples.

B. Product Data: Provide data on pipe materials, pipe fittings, expansion joint fittings, flex fittings, valves, accessories, and miscellaneous products. Provide manufacturer’s catalog information and manufacturer’s certification. Indicate valve and data ratings.

C. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

D. Contractor Qualifications: A minimum of five project references, including current contact name, address, and telephone number where the Contractor or their subcontractor has successfully performed similar work within the past five years. Material References: A minimum of five project references, including current contact name, address, and telephone number where the submitted materials have been successfully applied, in similar exposures, within the past five years.

E. Pressure test results on all piping systems, include the following information:
   i. Time and date of piping pressure tests
   ii. Pressure test witnesses
   iii. Pressures recorded during test, including expansion phase and test phase pressures
   iv. Duration of expansion phase and test phase

F. Project Record Documents: Record actual locations of pipelines, valves, connections, thrust restraints, and invert elevations. Identify and describe unexpected variations to subsoil conditions or discovery of uncharted utilities. Contractor records and drawings shall be

submitted with as-built submittals. Contractor to maintain as-builts throughout the project duration during construction on-site.

G. Operation and Maintenance Manuals consistent with Section 01 78 50 – Operation and Maintenance Data.

1.5 DELIVERY, STORAGE, PROTECTION AND HANDLING

A. Deliver and store valves in shipping containers with labeling in place. Inspect for damage.

B. Provide temporary protective coating on cast iron and steel valves.

C. Provide temporary end caps and closures on piping and fittings. Maintain in place until installation.

D. Deliver and store fire hydrants in shipping containers with labeling in place.

E. Deliver and store piping covered to protect piping from ultraviolet UV exposure.

F. Protect piping systems from entry of foreign materials by temporary covers, completing sections of the work, and isolating parts of the completed system.

PART 2 - PRODUCTS

2.1 WATER PIPE

A. Polyethylene (PE) Pressure Pipe (4 inches and over): PE pressure pipe shall meet the requirements of ANSI/AWWA C906. Pipe materials shall be high-density polyethylene PE 4710 conforming to the requirements of ASTM D3350 cell classification of PE445574C/E, type II, grade PE47. Pipe diameter shall be iron pipe size per Table 3 of ANSI/AWWA C906. Pipe pressure class shall be as listed in Table 5 of ANSI/AWWA C906 for DR 11 PE4710 material.

B. Polyethylene Tubing: Polyethylene tubing shall meet the requirements of AWWA C901. Tubing shall be high molecular mass with a 300 psi rating. Tubing used for ¾ and 1 inch shall be SDR 7 (copper pipe size). Tubing used for 1-1/2 and 2 inches shall be SDR 7 (copper tube size).

C. Ductile Iron Pipe: Class 52 meeting the requirements of AWWA C151. Ductile iron pipe shall have a cement mortar lining and a 1-mil thick seal coat meeting the requirements of AWWA C104.

D. PVC Pipe (Under 4-inches): ASTM D 1785 Schedule 80.

E. Galvanized Steel pipes under 4-inches: Steel pipe less than 4 inches in diameter must conform to ASTM A 53, schedule 40 and must be hot dip galvanized inside and out, including the couplings. The pipe sections must be coupled by malleable iron screw coupling per ANSI Specification B16.3.

2.2 FITTINGS

A. General: Bolts, nuts and washers used for securing fittings shall be of similar materials. Steel bolts shall meet the requirements of ASTM A 307 or ASTM 568 for carbon steel or ASTM F 593 or ASTM F 738 for stainless steel. Nuts shall meet the requirements of ASTM A 563 for

carbon steel or ASTM F 594 or ASTM F 836 for stainless steel. Iron bolts and nuts shall meet the requirements of ASTM A 536, grade 65-45-12.

B. Polyethylene (PE) Pipe (4 inches and Over): Fittings for PE pipe shall meet the requirements of ANSI/AWWA C906.

C. Ductile Iron Pipe: Fittings for ductile iron pipe shall meet the requirements of AWWA C110 or AWWA C153. Joints shall meet the requirements of AWWA C111. Fittings shall be cement mortar lined, meeting the requirements of AWWA C104. Gaskets for flat faced or raised faced flanges shall be 1/8 inch thick neoprene having a durometer of 60 plus or minus 5 of 1/16-cloth inserted. The type, material, and identification mark for bolts and nuts shall be provided.

D. Polyvinyl Chloride (PVC) Pipe (Under 4-inches): Fittings for PVC pipe under 4 inches shall meet the requirements of ASTM D2466.

2.4 BEDDING AND COVER MATERIALS

A. Bedding and Backfill: As specified in Section 31 00 00 - Earthwork.

2.5 ACCESSORIES

A. Concrete for Thrust Restraints:

1. When specified, concrete thrust blocks and anchors shall be installed as shown on the Drawings.
2. The thrust block cavity shall be hand dug into undisturbed soil or previously placed compacted backfill. The cavity shall be formed with soil or wood to hold the freshly placed concrete without displacement until an initial set has occurred.
3. Concrete thrust blocking, as detailed on the Plans, shall be placed at bends, tees, dead ends, and crosses. Blocking shall be commercial concrete meeting the requirement of WSDOT Standard Specifications Section 6-02.3(2)B poured in place. Concrete blocking shall bear against solid undisturbed earth at the sides and bottom of the trench excavation and shall be shaped so as not to obstruct access to the joints of the pipe or fittings.

B. Joint Restraint

1. Restraint Devices for PVC Pipe shall incorporate a series of serrations on the inside diameter to provide positive restraint, exact fit, 360-degree contact and support of the pipe wall.
2. Restraint Devices shall be manufactured of high strength ductile iron, ASTM A536, Grade 65-45-12 or ASTM A36 structural steel.
3. Bolts and connecting hardware shall be of high strength low alloy material in accordance with ANSI/AWWA C111/A21.11
4. Restraint Devices for PVC Pipe shall have a water working pressure rating equivalent to the full rated pressure of the PVC Pipe on which they are installed, with a minimum two to one (2:1) safety factor in any nominal pipe size.
5. Notarized certification from the manufacturer of the restraint device shall be provided with submittals.
6. Restraint Devices for mechanical Joint or Push-On fittings shall be Uni-Flange 1300 (series) or approved equal.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that water main and main line tee size, location, and invert are as indicated.

B. The Contractor shall inspect each pipe and fitting prior to installation to ensure that there are no damaged portions of the pipe. Pipe damage prior to completion of the project shall be repaired or replaced by the Contractor.

C. Handling: Pipe, fittings and accessories shall be carefully inspected before and after installation and those found defective shall be rejected. Pipe and fittings shall be free from fins and burrs. Before being placed in position, pipe, fittings, and accessories shall be cleaned, and shall be maintained in a clean condition. Proper facilities shall be provided for lowering sections of pipe into trenches. Under no circumstances shall pipe, fittings or any other material be dropped or dumped into trenches.

D. Storage: Pipe should be stored, if possible, at the job site in unit packages provided by the manufacturer. Caution should be exercised to avoid compression damage or deformation to bell ends of the pipe. Pipe should be stored in such a way as to prevent sagging or bending and protected from exposure to direct sunlight by covering with an opaque material while permitting adequate air circulation above and around the pipe. Gaskets should be stored in a cool, dark place out of the direct rays of the sun, preferably in original cartons.

E. Assure exposed piping is sufficiently supported to bear weight of valve when it is installed.

3.2 PREPARATION

A. Cut pipe ends square, ream pipe ends to full pipe diameter, remove burrs.

B. Remove scale and dirt on inside and outside before assembly.

C. Prepare pipe connections to equipment with flanges or mechanical joints.

3.3 TRENCHING

A. See Section 31 00 00 – Earthwork for additional requirements.

B. Hand trim excavation for accurate placement of pipe to elevations indicated.

C. Form and place concrete for pipe thrust restraints at each change of pipe direction. Place concrete to permit full access to pipe and pipe accessories. Provide required square foot of thrust restraint bearing on subsoil as indicated on the drawings.

D. Backfill around sides and to top of pipe with backfill material, tamp in place and compact, then complete backfilling.

3.4 INSTALLATION – GENERAL PIPE

A. Maintain separation of non-potable water main from potable water sources in accordance with State code.

B. Establish elevations of buried piping to ensure not less than three (3) feet of cover over pipe; or as indicated on the drawings and as directed by the engineer.

C. Install pipe to indicated elevation to within tolerance of one (1) inch.

D. Install HDPE pipe and fittings in accordance with manufacturer's recommendations and to AWWA C906, ASTM F2206 and PPI Handbook of PE Pipe 2nd edition, including Technical Reports and Notes, standards.

E. Install ductile iron piping and fittings to AWWA C600.

F. Install PVC pressure piping and fittings to ASTM D2774.

G. Install pipelines to line and grade indicated.

H. Install pipe to allow for expansion and contraction without stressing pipe or joints.

I. Install locator tape 12 inches above installed pipe.

J. Install trace wire as indicated in project Drawings.

K. All ductile iron sleeves, fittings, and valves with mechanical joints shall be restrained with an approved Restraining Device (Joint Restraint).

L. Prepare exposed, unfinished pipe, fittings, supports, and accessories ready for finish painting. Refer to Section 09 90 00 – Paints & Coatings.

M. Install bell and spigot pipe with bell end upstream.

N. Install valves with stems upright or horizontal, not inverted.

O. Install above ground water piping to the most current version of ASME B31.9, ASME B31.3, and ASME 31.4.

P. Inserts:

1. Provide inserts for placement in concrete formwork.
2. Provide inserts for suspending hangers or supporting posts from reinforced concrete slabs and sides of reinforced concrete structures.
3. Provide hooked rod to concrete reinforcement section for inserts carrying pipe over four (4) inches.

Q. Pipe Hangers and Supports:

1. Install in accordance with ASME B31.996.
2. Support horizontal piping as scheduled.
3. Wall and Footing Support for Pipe Sizes four (4) inches and over: Welded steel bracket and wrought steel clamp and/or sleeve.

3.5 INSTALLATION - VALVES

A. Set valves on concrete block or other acceptable solid bearing.

B. Center and plumb valve box over valve operating nut. Set box cover flush with finished grade.

3.6 CONNECTIONS TO EXISTING WATER LINES

A. Connection to existing water lines shall be made where and as indicated on the drawings and as directed by the Engineer. The sizes of pipe, fittings, valves and appurtenant items required to make connection shall correspond to the sizes of existing pipe and of project pipe. Connections shall be done in accordance with WSDOT Standard Specification 7-09.3(19).

3.7 APPLICATION

A. Install gate valves for shut-off and to isolate tanks, or parts of system.

3.8 HYDROSTATIC PRESSURE TESTING

A. Pressure test shall be witnessed by Engineer. Notify Engineer at least 48 hours prior to conducting pressure test.

B. Hydrostatic Tests:

1. Water main appurtenances and service connections to the meter setter shall be tested in sections of convenient length under a hydrostatic pressure equal to the pressure specified for the expansion phase and test phase. Pumps, gauges, plugs, saddles, corporation stops, miscellaneous hose and piping, and measuring equipment necessary for performing the test shall be furnished and operated by the Contractor.

2. Sections to be tested shall normally be limited to 1,500 feet. The pipeline shall be backfilled sufficiently to prevent movement of the pipe under pressure.

3. Expansion Phase: During the expansion phase, the test section is pressurized 10 psi above the test pressure (235 psi) and make-up water is added, as required, to maintain the required expansion phase pressure for four (4) hours. Upon completion of the expansion phase the pressure is reduced by 10 psi to the test pressure (225 psi).

4. Test Phase: During the test phase, the test section of pipe is brought to the test pressure and is monitored for at least 15 minutes, provided no leakage is detected (i.e., no loss of pressure). Should leakage occur, the test duration shall be 2-hours. If the 2-hour duration is necessary, the hydrostatic pressure shall not vary by more than 5 psi.

   a. Under no circumstances shall the total time under both phases exceed eight (8) hours. If the test is not completed due to leakage, equipment failure or any other reason, depressurize the test section, and permit the system to "relax" for eight (8) hours prior to the next testing sequence.

   b. Each valve, along the test section, shall be tested by closing each in turn and relieving the pressure beyond. This test of the valve will be acceptable if there is no immediate loss of pressure on the gauge when the pressure comes against the valve being checked. The Contractor shall verify that the pressure differential across the valve does not exceed the rated working pressure of the valve.

   c. Prior to calling out the Engineer to witness the pressure test, the Contractor shall have all equipment set up completely ready for operation and shall have successfully performed the test to ensure that the pipe is in satisfactory condition.

5. Any visible leakage detected shall be corrected by the Contractor regardless of the allowable pressure change specified above. Should the tested section fail to meet the

pressure test successfully as specified, the Contractor shall, at no additional expense to the Parks, locate and repair the defects and then retest the pipeline.

6. Test shall be made with the hydrant auxiliary gate valves open and pressure against the hydrant valve. Each valve shall be tested by closing each in turn and relieving the pressure beyond. This test of the valve will be acceptable if there is no immediate loss of pressure on the gauge when the pressure comes against the valve being checked. The Contractor shall verify the pressure differential across the valve does not exceed the rated working pressure of the valve.

7. Defective materials or workmanship, discovered as a result of hydrostatic field test, shall be replaced by the Contractor at no additional expense to the Parks. Whenever it is necessary to replace defective material or correct the workmanship, the hydrostatic test shall be re-run at the Contractor's expense until a satisfactory test is obtained.

3.9 CLEANING

A. Clean interior of piping systems thoroughly before installing.

B. Maintain pipe in clean condition during installation.

C. Before joining piping, thoroughly clean and wipe joint contact surfaces and then properly dress and make joint.

D. Immediately prior to pressure testing, clean and remove grease, metal cuttings, dirt, or other foreign materials which may have entered the system.

E. At completion of work and prior to final acceptance, thoroughly clean work installed under these specifications. Clean fixtures, pipe, valves, and fittings of grease, metal cuttings, and sludge which may have accumulated by operation of system, from testing, or from other causes.

3.10 FIELD QUALITY CONTROL

A. Perform field inspection and testing in accordance with this Section.

B. If tests indicate Work does not meet specified requirements, remove Work, replace, and retest at no cost to the Owner.

3.11 DISINFECTION OF WATER PIPING SYSTEM

A. Refer to Section 33 13 00.

END OF SECTION

SECTION 33 11 13 – POTABLE WATER SUPPLY WELLS (WATER SUPPLY)

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes work for rehabilitation of the well and for replacing the well pump and appurtenances, including:

1. Well pump
2. Well pump motor
3. Riser pipe
4. Check valves
5. Torque arrestors
6. Sounding tubes

B. Related Requirements:

1. Section 33 00 00 "Pipe & Pipe Fittings: General Statement (Water Supply)."

1.2 REFERENCES

A. American Water Works Association (AWWA):

1. AWWA A100 – Water Wells
2. AWWA C654 – Disinfection of Wells

B. National Sanitation Foundation (NSF International):

1. NSF 61 - Drinking Water System Components – Health Effects

C. Water System Design Manual, Washington State Department of Health, Current Edition.

1.3 QUALIFICATIONS

A. The work of this section shall be performed by a licensed well driller in the state of Washington.

1.4 SUBMITTALS

A. Section 01 33 00 “Submittal Procedures” Shop Drawings, Product Data, and Samples.

B. Product Data: Submit pump curve defining full range of pump performance, efficiency, and horsepower.

C. Manufacturer’s Installation Instructions: Submit installation instructions for pumps and accessories.

D. Manufacturer's Certificate: Certify Products meet or exceed specified requirements.

1.5 CLOSEOUT SUBMITTALS

A. Section 01 33 00 “Submittal Procedures” Shop Drawings, Product Data, and Samples.

B. Section 01 78 23 “Operation and Maintenance Data.”

C. Section 01 78 39 “Project Record Documents.”

D. Operation and Maintenance Data: Submit spare parts list, exploded assembly views, and recommended maintenance intervals.

1.6 QUALITY ASSURANCE

A. Perform Work in accordance with AWWA A100.

B. Perform Work in accordance with Drawings, Washington State Department of Ecology, Washington State Department of Health, State, and County standards.

C. All components that come in contact with potable water must be approved for use with potable water by the National Sanitation Foundation (NSF), now called NSF International.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Accept equipment on site in shipping containers with labeling in place. Inspect for damage.

B. Protect equipment from entry of foreign materials and other damage by temporary covers.

PART 2 - PRODUCTS

2.1 GENERAL

A. All materials coming into contact with potable water shall be NSF 61 certified.

2.2 WELL PUMP

A. Well pump shall meet the following requirements:

1. Submersible style pump
2. 375 ft of head at 120 gpm
3. 4-inch motor or 6-inch motor that fits in existing well casing

B. Manufacturer:

1. Grundfos SP160S150-9
2. Engineer approved equal

2.3 WELL PUMP MOTOR

A. Motor shall be compatible with well pump
B. 3-phase power and voltage compatible with site power and VFD Controller

2.4 RISER PIPE

A. Riser Pipe: Riser pipe shall be 3” galvanized steel.

2.5 CHECK VALVES

A. Material: stainless steel
Diameter: Match riser pipe

B. Manufacturer:

1. Flowmatic 80SS
2. Engineer approved equal

2.6 TORQUE ARRESTORS

A. Material: Styrene-butadiene rubber (SBR)
Diameter: Match riser pipe

B. Manufacturer:

1. Boshart Industries spyder type torque arrestor.
2. Engineer approved equal

2.7 SOUNDING TUBE

A. Shall be constructed of 1” inner diameter (ID) polyethylene (PE) for well depth probe. Tube shall extend from top of pump to top of casing. Provide a second sounding tube if space is available in the casing.

PART 3 - EXECUTION

3.1 GENERAL

A. Install new well pump and appurtenances after performing well rehabilitation.

3.2 INSTALLATION

A. Pump/Motor

1. Install pump and motor in accordance with the manufacturer’s recommendations. Pump depth should match current installation depth, with pump intake no lower than the top of the screen.

3.3 CLEANING

A. The Contractor shall leave all affected areas in existing or better conditions.

B. The Contractor shall remove all remnants of construction following well pump replacement.

3.4 WELL REHABILITATION

A. Well rehabilitation work shall include the following:

1. Pre-rehabilitation pump test

a. Measure and record static water level in well before conducting pump test.

b. Conduct 30-minute constant rate pump test (with existing well pump). Measure and record drawdown, pumping water level, and well production rate at the following intervals. Drawdown and pumping water level measurements shall be made to the nearest 0.01 feet.

1) 0 to 10 minutes from start of pumping: every 30 seconds
2) 10 to 15 minutes from start of pumping: every 1 minute
3) 15 to 30 minutes from start of pumping: every 2 minutes

c. Measure and record water level recovery in well. Record water level in well to the nearest 0.01 foot at the following intervals:

1) 0 to 10 minutes from start of pumping: every 30 seconds
2) 10 to 15 minutes from start of pumping: every 1 minute
3) 15 minutes from start of pumping to recovery within 95% of static water level: every 2 minutes

2. Document make, model, and horsepower of existing submersible well pump when removed. Document riser pipe length and diameter. Provide information to Owner and Engineer.

3. Well inspection and well rehabilitation plan

a. Inspect well to identify potential factors that may be impacting well performance.

b. Develop plan for well rehabilitation to address factors identified during inspections. Possible rehabilitation approaches include brushing of casing interior and well screen, acid cleaning, jetting/surging for well redevelopment, and chlorine disinfection.

c. Discuss plan with Owner and Engineer to confirm scope of well rehabilitation.

4. Perform well rehabilitation

a. Perform the scope of work confirmed with Owner and Engineer.

5. Post-rehabilitation pump test

a. Follow same procedure as pre-rehabilitation pump test, except that test will be performed with new well pump. Submit pump test information to Engineer to confirm capacity of well.

3.5 DISINFECTION OF WELL

A. Well shall be disinfected according to the requirements of AWWA C654 – Disinfection of Wells.

3.6 FIELD QUALITY CONTROL

A. Operation Test

1. Verify pump operation after installation by operating pump in presence of engineer. Check pump’s maximum rate of flow, shut off pressure, and vibration.

B. All materials used in the well shall be new and free of defects.

END OF SECTION 33 11 13

SECTION 33 12 16 – WATER UTILITY DISTRIBUTION VALVES (WATER SUPPLY)

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Valves
2. Valve Boxes
3. Pressure Sustaining Solenoid Valve
4. Fire Hydrants
5. Meters and Accessories

B. Related Sections:

1. Section 31 00 00 – Earthwork
2. Section 33 11 00 – Water Utility Distribution Piping (Water Supply)
3. Section 33 13 00 – Disinfecting Water Utility Distribution (Water Supply)

C. This work does not include water main and service work within the Aquatic Center site. Water piping work within the Aquatic Center site shall be in accordance with Section 33 10 00 – Water Service.

1.2 REFERENCES

A. American Water Works Association:

1. AWWA C500 - Metal-Seated Gate Valves for Water Supply Service.
2. AWWA C509 - Resilient-Seated Gate Valves for Water-Supply Service.
3. AWWA C550 - Protecting Epoxy Interior Coating for Valves and Hydrants.

B. National Sanitation Foundation (NSF International):

1. NSF 61 - Drinking Water System Components - Health Effects

C. Washington State Department of Transportation Standard Specifications for Road, Bridge, and Municipal Construction (WSDOT Standard Specifications), latest edition.

1.3 SUBMITTALS

A. Section 01 33 00 - Submittal Procedure – Shop Drawings, Product Data, and Samples.

B. Product Data: Submit data on pipe materials, pipe fittings, valves and accessories.

C. Manufacturer's Certificate: Certify Products meet or exceed specified requirements.

1.4 CLOSEOUT SUBMITTALS

A. Section 01 33 00 - Submittal Procedures – Shop Drawings, Product Data, and Sample.

B. Section 01 78 50 – Operation and Maintenance Data.

C. Section 01 78 90 – Project Record Documents.

D. Project Record Documents: Record actual locations of valves.

E. Provide Operation and Maintenance Data for valves; include illustrations, installation instructions, maintenance instructions and parts lists.

F. Manufacturer's Certificates: Submit Statement of Compliance, supporting data, from material suppliers attesting that valves and accessories provided meet or exceed AWWA Standards and specification requirements.

1.5 QUALITY ASSURANCE

A. Perform work in accordance with the project plans, AWWA, State, and County standards.

1.6 QUALIFICATIONS

A. Manufacturer: company specializing in manufacturing Products specified in this section with minimum three years of experience.

B. Installer: Company specializing in performing work of this section with minimum three years of experience.

1.7 DELIVERY, STORAGE AND HANDLING

A. Prepare valves and accessories for shipment according to AWWA Standards and seal valve and ends to prevent entry of foreign matter into product body.

B. Store products in areas protected from weather, moisture, or possible damage; do not store products directly on ground; handle products to prevent damage to interior or exterior surfaces.

1.8 ENVIRONMENTAL REQUIREMENTS

A. Conduct operations not to interfere with, interrupt, damage, destroy, or endanger integrity of surface or subsurface structures or utilities, and landscape in adjacent areas.

1.9 MAINTENANCE MATERIALS

A. Section 01 78 50 – Operation and Maintenance Data.

B. Furnish two (2) tee wrenches (valve keys) to Owner; required length.

PART 2 - PRODUCTS

2.1 RESILIENT WEDGE GATE VALVES

A. Manufacturers:

1. Mueller Company
2. Kennedy Valve Co.
3. M&H Valve Co.
4. Clow Eddy - Iowa
5. American Flow Control
6. Substitutions: Section 016700 – Product Requirements.

B. Furnish materials.

C. Resilient Wedge Gate Valves: AWWA C509; iron body, bronze or ductile iron.

1. Resilient seats.
2. Stem: Non-rising bronze stem.
3. Operating Nut: Square; open counterclockwise unless otherwise indicated.
4. Ends: Flanged, mechanical joint or bell end connections.
5. Coating: AWWA C550; interior/exterior.
6. Sizes 12-inch diameter and smaller: 200 psig.

2.2 VALVE BOXES

A. 12-inch diameter valves and smaller: Domestic cast iron, two-piece, screw type, as manufactured by Tyler Union or approved equivalent.

B. Cast iron lid, marked "Water".

C. Valve boxes and lids shall be traffic (H-20) rated.

2.3 VALVE ACCESSORIES

A. Concrete for Thrust Restraints/Thrust Blocks: Concrete type specified on project plans.

B. Concrete for grouting of vault lids: Concrete be in conformance with WSDOT Specification Section 6-02.

2.4 PRESSURE SUSTAINING SOLENOID VALVE

A. See Section 33 09 10 Instrumentation and Control for Water Utilities (Water Supply)" for description of pressure sustaining solenoid valve operation.

B. Operation: valve shall go into pressure sustaining mode when solenoid is energized. While in pressure sustaining mode, valve shall modulate open/close to maintain a pre-set pressure on the upstream side of the valve. See plans for pressure setting. Valve shall be closed when solenoid is not energized.

C. Valve requirements:

1. Valve body material: Epoxy coated ductile iron
2. Normally closed solenoid (when solenoid is not energized)
3. Opening and closing speed control
4. Integral pressure gauge on upstream side of valve.
5. Size: 3-inch
6. Maximum headloss through valve: 4 psi at 120 gpm

D. Manufacturers:

1. Bermad 730-55 EN Series
2. Engineer approved equal

2.5 FIRE HYDRANTS

A. Fire hydrants shall be a Clow Model Medallion with 5.25 in. hydrant valve, a 4.5 in. NST port with 5 in Storz adapter, and (2) 2.5 in. NST ports. Installed as specified in the Drawings.

2.6 AIR RELEASE VALVES

A. Valves must comply with ANSI/AWWA C512.

B. Valves shall be cast iron or ductile iron and have a 1-inch NPT inlet.

2.7 BLOW OFF ASSEMBLIES

A. Blowoff assemblies shall be constructed at the locations shown on the Drawings and in accordance with the pertinent detailing included in the Drawings.

2.8 POLYETHYLENE TUBING

A. Fittings used for service connections shall be made of bronze or brass alloy.

B. Fittings used for polyethylene tubing shall be either compression or stab type. Stab type fittings shall utilize an internal grip ring and O ring seal. Stainless steel liners shall be used when utilizing compression fittings on polyethylene tubing.

2.9 SERVICE FITTINGS

C. Polyethylene tubing shall meet the requirements of AWWA C901. Tubing shall be high molecular mass with a 300 psi rating. Tubing shall be SDR 7 (copper pipe size).

2.10 BRONZE NIPPLES AND FITTINGS

A. Bronze threaded nipples and fittings shall meet the requirements of ANSI B16.15, ASA 125 pound class.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verification of existing conditions before starting work.

B. Determine exact location and size of valves from Drawings; obtain clarification and directions from Engineer prior to execution of work.

C. Verify invert elevations of existing work prior to excavation and installation of valves.

3.2 PREPARATION

A. Identify required lines, levels, contours and datum locations.

B. Locate, identify, and protect utilities to remain from damage.

C. Do not interrupt existing utilities without permission and without making arrangements to provide temporary utility services.

1. Notify Owner not less than 3 days in advance of proposed utility interruption.
2. Do not proceed without written permission from the Owner.

D. Perform trench excavation, backfilling and compaction in accordance with Section 31 00 00 – Earthwork.

3.3 INSTALLATION

A. Install valves in conjunction with pipe laying; set valves plumb.

B. Provide buried valves with valve boxes installed flush with finished grade.

C. Install insulation to outside of valve boxes.

D. Install Work in accordance with the project plans, AWWA, State, and County standards.

3.4 DISINFECTION OF DOMESTIC WATER PIPING SYSTEM

A. Flush and disinfect system in accordance with Section 33 13 00.

3.5 FIELD QUALITY CONTROL

A. Section 01 45 00 - Quality Control and Section 01 82 00 – Demonstration and Testing.

B. Perform pressure test on site water distribution system in accordance with Section 33 11 00, Site Water Utility Distribution Piping.

END OF SECTION

SECTION 33 13 00 – DISINFECTING WATER UTILITY DISTRIBUTION (WATER SUPPLY)

PART 1 – GENERAL

1.1 SUMMARY

A. Section includes disinfection of potable water distribution and transmission system; and testing and reporting results.

B. Related Sections:
   1. Section 33 11 00 – Water Utility Distribution Piping (Water Supply)

1.2 REFERENCES

A. Washington State Department of Health.

B. American Water Works Association:
   1. AWWA B300 - Hypochlorites
   2. AWWA B301 - Liquid Chlorine
   3. AWWA B302 - Ammonium Sulfate
   4. AWWA B303 - Sodium Chlorite
   5. AWWA C600 - Installation of Ductile-Iron Water Mains and Their Appurtenances
   6. AWWA C651 - Disinfecting Water Mains

1.3 CLOSEOUT SUBMITTALS

A. Section 01 33 00 – Submittal Procedure – Shop Drawings, Product Data, and Samples.

B. Disinfection Report:
   1. Type and form of disinfectant used.
   2. Date and time of disinfectant injection start and time of completion.
   3. Test locations.
   4. Name of person collecting samples.
   5. Initial and 24-hour disinfectant residuals in treated water in parts per million for each outlet tested.
   6. Date and time of flushing start and completion.
   7. Disinfectant residual after flushing in parts per million for each outlet tested.

C. Bacteriological Report:
   1. Date issued, project name, and testing laboratory name, address, and telephone number.
   2. Time and date of water sample collection.
   3. Name of person collecting samples.
   4. Test locations.
   5. Coliform bacteria test results for each outlet tested.
   6. Certify water conforms, or fails to conform, to bacterial standards of the Washington State Department of Health.

1.4 QUALITY ASSURANCE

A. Perform Work in accordance with AWWA C651.

B. Perform Work in accordance with the Drawings, State, and County standards.

1.5 QUALIFICATIONS

A. Water Treatment: Company must have documented experience in disinfecting potable water systems specified in this section with minimum three years of experience.

B. Testing Laboratory: Company specializing in testing potable water systems, specifically bacteriological testing, certified by the State of Washington.

PART 2 – PRODUCTS

2.1 DISINFECTION CHEMICALS

A. Chemicals: AWWA B300, Hypochlorite, AWWA B301, Liquid Chlorine, AWWA B302, Ammonium Sulfate, or AWWA B303, Sodium Chlorite.

PART 3 – EXECUTION

3.1 EXAMINATION

A. Verification of existing conditions before starting work.

B. Verify piping system has been cleaned, inspected, and pressure tested.

C. Perform scheduling and disinfecting activity with start-up, water pressure testing, adjusting and balancing, demonstration procedures, including coordination with related systems.

3.2 INSTALLATION

A. Provide and attach required equipment to perform the Work of this section.

B. Perform disinfection of water distribution system and installation of system and pressure testing. Refer to Section 33 11 00.

C. Introduce treatment into piping system.

D. Maintain disinfectant in system for 24 hours.

E. Flush, circulate, and clean until required cleanliness is achieved.

F. Replace permanent system devices removed for disinfection.

3.3 FIELD QUALITY CONTROL

A. Section 01 45 00 - Quality Control and Section 01 82 00 – Demonstration and Training.

B. Disinfection, Flushing, and Sampling:

1. Disinfect pipeline installation in accordance with AWWA C651.
2. Upon completion of retention period required for disinfection, flush pipeline until chlorine concentration in water leaving pipeline is no higher than that generally acceptable for domestic use.
3. Legally dispose of chlorinated water. When chlorinated discharge may cause damage to environment, apply neutralizing chemical to chlorinated water to neutralize chlorine residual remaining in water.

C. After final flushing and before pipeline is connected to existing system, or placed in service, employ an approved independent testing laboratory to sample, test and certify water quality suitable for human consumption.

END OF SECTION

33 13 13 – WATER RESERVOIR DISINFECTION (WATER SUPPLY)

PART 1 - GENERAL

1.1 DESCRIPTION

A. Section includes:

1. Water tank disinfection.
2. Bacteriological testing.

1.2 REFERENCES

A. American Water Works Association:

1. AWWA C652 - Disinfection of Water Storage Facilities.

1.3 SUBMITTALS

A. Section 01 33 00 – Submittal Procedure – Shop Drawings, Product Data, and Samples.

B. Disinfection Procedure: Submit procedure description including type of disinfectant to be used and calculations indicating quantities of disinfectants required to produce specified chlorine concentration in accordance with Section 3 and 4 of AWWA C652.

C. Test Reports: Indicate results of bacteriological and residual chlorine laboratory test reports.

D. Manufacturer’s Certificate:

1. Certify disinfectants meet or exceed AWWA Standards requirements.

1.4 CLOSEOUT SUBMITTALS

A. Section 01 33 00 - Submittal Procedures – Shop Drawings, Product Data, and Sample.

B. Section 01 78 50 – Operation and Maintenance Data.

C. Section 01 78 90 – Project Record Documents

D. Project Record Documents: Record actual location.

1.5 QUALITY ASSURANCE

A. Perform Work in accordance with the Drawings, State, and County standards.

B. Perform Work in accordance with AWWA C652.

1.6 DELIVERY, STORAGE, AND HANDLING

B. Store disinfectants in cool, dry place away from combustibles such as wood, rags, oils and grease.

C. Handle disinfectants with caution; protect skin and eyes from contact; avoid breathing vapors; wear gloves, aprons, goggles, and vapor masks.

1.7 ENVIRONMENTAL REQUIREMENTS

A. Furnish personnel working inside tank during disinfection with equipment to comply with Federal and State regulations for work conducted in hazardous atmosphere.

B. Neutralize disinfectant solution before disposal.

C. Legally dispose of disinfection solution.

D. Repair damage caused by disinfectant solution and disinfection procedures.

PART 2 - PRODUCTS

2.1 DISINFECTANTS

A. Chlorine Forms: In accordance with AWWA C652, Section 3.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verification of existing conditions before starting work.

B. Conduct inspection of tank interior before beginning disinfection.

1. Verify tank is clean and free of polluting materials.
2. Verify tank pipe and vent connections are properly made and clear of obstructions.
3. Verify paint is thoroughly cured in accordance with paint manufacturer's instructions.

3.2 PREPARATION

A. Protect aquatic life and vegetation from damage from disinfectant solution purged from tank.

3.3 APPLICATION

A. Use any one or a combination of the three methods for disinfecting tank specified in Section 4 of AWWA C652:

1. Chlorination Method 1.
2. Chlorination Method 2.
3. Chlorination Method 3.

3.4 FIELD QUALITY CONTROL

A. Section 01 45 00 - Quality Control, 01 82 00 – Demonstration and Training.

B. Collect samples of water from filled tank for bacteriological analysis in accordance with Section 4.4 of AWWA C652; take inlet and outlet water samples.

C. Test water samples per State of Washington Department of Health including but not limited to bacterial contamination and residual chlorine.

D. When water samples fail to meet State of Washington Department of Health standards for potable water perform the following corrective measures until water quality conforms to State Health Standards:

1. Inlet and Outlet Water Sample Failure: Eliminate source of contamination in water supply, repeat disinfection, and retest water quality.
2. Outlet Water Sample Failure: Repeat disinfection, and retest water quality.

END OF SECTION

SECTION 33 14 17 - WATER UTILITY SERVICE LATERALS (WATER SUPPLY)

PART 1 – GENERAL

1.1 DESCRIPTION

A. The work of this Section includes installing 2-inch and smaller service connections from the main to maintenance facilities, including associated meter setter, meter, meter box, and fittings.

B. This work does not include water main and service work within the Aquatic Center site. Water piping work within the Aquatic Center site shall be in accordance with Section 33 10 00 – Water Service.

1.2 SUBMITTALS

A. As specified Section 01 33 00 “Submittal Procedures.”

B. Product Data: Submit data on service connection accessories including piping, fittings, meter setters, meters, meter boxes and associated appurtenances. Include relevant illustrations, installation instructions, maintenance instructions, and parts lists.

C. Manufacturer's Certificate: Certify Products meet or exceed specified requirements.

PART 2 – PRODUCTS

2.1 SADDLES

A. Saddles shall be ductile iron, bronze, brass, or stainless steel.

B. Saddles used for ¾- and 1-inch services shall be single strap and may be either AWWA tapered thread or female iron pipe thread outlet. Saddles used for 1½- and 2-inch services shall be double strap and shall be female iron pipe thread outlet. Saddles used on PVC pipe shall be formed for PVC pipe and have flat, stainless steel straps.

C. Saddles shall be designed for use with the pipe material being used (i.e., PVC, HDPE, Ductile Iron, etc.).

2.2 CORPORATION STOPS

A. Corporation stops shall be made of bronze or brass alloy. Corporation stops shall have either AWWA tapered thread or male iron pipe thread inlets and outlet connections compatible with either copper or polyethylene tubing. Thread patterns for the saddle outlet and corporation stop inlet shall be the same.

2.3 POLYETHYLENE TUBING

A. Polyethylene tubing shall meet the requirements of AWWA C901. Tubing shall be high molecular mass with a 200 psi rating. Tubing shall be SDR 7 (copper pipe size).

2.4 SERVICE FITTINGS

A. Fittings used for service connections shall be made of bronze or brass alloy.

B. Fittings used for polyethylene tubing shall be either compression or stab type. Stab type fittings shall utilize an internal grip ring and O ring seal. Stainless steel liners shall be used when utilizing compression fittings on polyethylene tubing.

2.5 METER SETTERS

A. Meter setters shall be manufactured and tested in accordance with all applicable parts of AWWA C800.

B. Meter setters shall have an inlet angle ball valve, outlet angle dual check valve, measure 12 inches in height, and shall have inlet and outlet threads compatible with fittings connecting to service pipes.

C. Meter setters shall have meter saddle nuts for installation and removal of the meter.

2.6 BRONZE NIPPLES AND FITTINGS

A. Bronze threaded nipples and fittings shall meet the requirements of ANSI B16.15, ASA 125-pound class.

2.7 METER BOXES

A. Meter boxes and covers located in the non-traffic areas shall be constructed of either reinforced concrete or high-density polyethylene. High-density polyethylene meter boxes and covers shall have a tensile strength conforming to ASTM D638. Meter box covers shall include a reading lid.

B. Meter boxes located in traffic areas shall be constructed of reinforced concrete, cast iron, or ductile iron. Traffic covers shall be constructed of aluminum, steel, cast iron, or ductile iron. Meter boxes and covers shall be designed for H-20 loading.

2.8 METERS

A. Meters shall be new and complete, front proof units conforming in all details to AWWA C700 for cold water displacement type meters or AWWA C708 for cold water multi-jet type meters.

B. Meters shall be guaranteed to operate normally and accurately, without leakage or damage to any part at a constant working pressure of 150 psi.

C. Meters shall not be digital display type.

D. Meter model shall be submitted to and approved by the Engineer.

PART 3 – EXECUTION

3.1 EXAMINATION

A. Verification of existing conditions before starting work.

B. Determine exact location and size of service laterals from Drawings; obtain clarification and directions from Project Representative prior to execution of work.

C. Verify invert elevations of existing work prior to excavation and installation of new work.

3.2 PREPARATION

A. Locate, identify, and protect utilities to remain from damage.

B. Do not interrupt existing utilities without permission and without making arrangements to provide temporary utility services.

1. Notify the Owner not less than 3 days in advance of proposed utility interruption.
2. Do not proceed without written permission from the COR.

C. Perform trench excavation, backfilling, and compaction in accordance with Section 31 00 00 - Earthwork.

3.3 INSTALLATION

A. Install service laterals in conjunction with laying new pipe as necessary.

B. Install Work in accordance with the project plans, AWWA, State, and County standards.

3.4 DISINFECTION OF WATER PIPING SYSTEM

A. Flush and disinfect system in accordance with Section 33 13 00 “Disinfecting Water Utility Distribution Piping.”

3.5 FIELD QUALITY CONTROL

A. Section 01 40 00 “Quality Requirements” and Section 01 77 00 “Closeout Procedures.”

B. Perform pressure test on site water distribution system in accordance with Section 33 11 00 “Water Utility Distribution Piping.”

END OF SECTION 33 14 17

33 16 13 – ABOVE GROUND CONCRETE WATER RESERVOIR (WATER SUPPLY)

PART 1 - GENERAL

1.1 DESCRIPTION

A. Section includes:

1. Contractor designed, reinforced concrete, cast-in-place water storage tank
2. Tank appurtenances
3. Piping connections

B. Contractor shall furnish all labor, materials, equipment, and incidentals required to design, fabricate, deliver, erect, and test each tank. Each tank structure shall include a foundation and other accessory components as shown on the Contract Drawings and described herein.

1.3 DESIGN REQUIREMENTS

A. The reservoir contractor shall be responsible for the reservoir design and the design shall meet all State, Federal, and local requirements for domestic water storage. The reservoir contractor shall be responsible for obtaining the required building permit from the Island County Building Department.

B. Design Criteria:

1. Soil Bearing: Refer to the Geotechnical Investigation Report. This information should be made available to the engineer performing the site/soils analysis for his use in making a determination regarding site suitability and reservoir design.
2. Engineer: The reservoir design shall be fully developed and provided by the contractor and all drawings and design data shall be stamped and certified by a registered engineer currently licensed in the State of Washington.
3. Structural Design: The design of the reservoir shall be in accordance with the most current edition of the following codes: IBC-2015, ASCE 7, ACI 318, ACI 350, ACI 350.3, AWWA D-110 and AWWA D-115.
4. Design Loads:

    a. Seismic – The reservoir, including the foundation slab, shall be designed to resist seismic forces per IBC & ASCE 7, with seismic criteria per Zip Code, I=1.5, and W=weight of concrete plus full contents. The reservoir base shall be sized to not exceed the soil bearing capacities determined for the site.
    b. Wind – The reservoir shall be designed for a basic wind speed of 115 mph (exposure D) per IBC & ASCE 7 current edition. Empty, the reservoir shall have a minimum factor of safety of 4 against overturning and 3 against sliding (coefficient of friction assumed at 0.35 or as provided by the soil analysis).
    c. Snow Load – The roof shall be designed for a minimum snow load of 45 psf, or per IBC, or local code; whichever is higher.
    d. Hydraulic Load – Hoop steel stresses shall not exceed an average of 12,000 psi at full volume, and all bars shall be at the smallest practical diameter in order to maintain maximum bonding areas.
    e. Soil Bearing Pressure – Reservoir static loading shall be uniformly distributed by the base. Seismic soil loading may be distributed as a triangular wedge under a circular base or an octagonal base of equal section modules.

5. Hand Railings: Withstand 200 pounds applied in any direction on top rail with no permanent set, cracking or failure of welds.

1.4 SUBMITTALS

A. See Section 01 33 00 – Submittal Procedure – Shop Drawings, Product Data, and Samples.

B. Shop Drawings and Product Data: Signed and sealed by professional engineer.

1. Include details of all tank components (see Product Data).
2. Include details of reinforcing steel, joint design, concrete mix design.
3. Include details of all penetrations and waterstop measures of the penetrations.

C. Product Data: Submit manufacturer's product literature including catalog information, dimensions, materials, instructions for installation and use, and application rates for:

1. Waterstops.
2. Joint Filler.
3. Bond Breaker.
4. Curing Compound.
5. Vibration Equipment.
6. Bearing Pads.
7. Joint Sealant.
8. Roof Hatch.
9. Roof Ventilator.
10. Ladders and Railings.
11. Piping.
12. Couplings.
13. Inlets, outlets, drains, and overflows.

D. Design Data: Submit structural calculations for tank and tank foundation, signed and sealed by professional engineer.

E. Building Permit: Submit a copy of the approved Building Permit obtained from Island County.

F. Test Reports:

1. Submit reports of slump tests, air content tests, strength tests and any special inspections as required by structural engineer or Island County.

G. Manufacturer’s Certificate: Certify products meet or exceed State, Federal, and local requirements for the following:

1. Non-prestressed reinforcing steel.
2. Non-prestressed welded steel wire fabric.
3. Concrete mix design.
4. Concrete mix ingredients, including admixtures.
5. Concrete batch tickets in accordance with ASTM C94/C94M with the following additional information:

a. Type, name, and quantity of admixtures.
b. Type, brand, and quantity of cement.
c. Total water content by producer.
d. Maximum size of aggregate.
e. Weights of fine and coarse aggregate.
f. Indicate ingredients are as previously certified.

6. Pipe, pipe fittings, joints, joint gaskets, lubricants, and coatings.

1.5 CLOSEOUT SUBMITTALS

A. Section 01 78 50 – Operation and Maintenance Data.

B. Section 01 78 90 – Project Record Documents.

C. Building Permit Final Inspection/Approval: Provide approved final inspection report for the reservoir installation.

D. Project Record Documents: Record actual location layout and final configuration of water storage tank.

1.6 QUALITY ASSURANCE

A. Design and construct concrete tank in accordance with AWWA D110 and AWWA D115.

B. Perform Work in accordance with the Island County Building Department, International Building Code, Washington State Department of Health, Island County Public Health Department, structural engineer, and Owner standards.

1.7 QUALIFICATIONS

A. Manufacturer/Installer: Company specializing in performing work of this section shall be required to prove experience in having installed a minimum of ten similar water reservoirs within the previous five years.

B. Design concrete water storage tank under direct supervision of Professional Engineer experienced in design of this work and licensed in State of Washington.

C. Installation shall be executed by a qualified and experienced erection crew, trained and certified by the tank manufacturer.

1.8 PRE-INSTALLATION MEETINGS

A. Convene minimum one week prior to commencing work of this section.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Reinforcing Steel:
   1. For reinforcing steel fabricated on-site, ship from mill in bundles, limited to one size and length, tagged with waterproof tag showing name of mill, heat number, grade and size of bars, and identifying number.
   2. For reinforcing steel fabricated off-site, deliver in bundles identified as to structure and shop drawing number; identify each individual bar with waterproof tag showing grade, size and bar mark from shop drawings.
   3. Protect reinforcing steel and wire fabric from damage and from dirt, oil, grease, other foreign matter, and rust-causing conditions.
   4. Do not store reinforcement in direct contact with ground.

B. Concrete Ingredients:

   1. Handle, control and store concrete materials in accordance with ACI 304.

1.10 FIELD MEASUREMENTS

A. Verify field measurements prior to fabrication.

1.11 COORDINATION

A. Coordinate work, including piping for water system, with Project Representative.

1.12 MAINTENANCE MATERIALS

A. Section 01 78 50 – Operation and Maintenance Data.

PART 2 – PRODUCTS

2.1 GENERAL

A. All materials inside the tank that can come in contact with potable water shall be NSF-61 certified.

B. All required tank materials and principal appurtenances shall be supplied by the tank manufacturer.

2.2 CONCRETE WATER STORAGE TANK

A. Manufacturers:
1. Baker Silo, LLC. or approved equivalent.

2.3 CONCRETE

A. Materials:

1. Portland Cement: Cement used shall be standard Portland Cement, Type 1. It shall contain a minimum of 6 sacks cement per cubic yard and shall have a 28-day minimum compressive strength of 4,500 psi.
2. Aggregate:

a. Maximum aggregate size shall be 1 ½” for the base unless otherwise noted.
b. Maximum aggregate size on all formed surfaces 6” or less in thickness shall be ¾”. In the event that ¾” rock is not available, the closest available size approximating ¾” shall be used.

3. Slump: Maximum slump shall generally be 6 to 6 ½”. If additives, such as air entrainment, water reducing agents, or super plasticizers are used, the allowable slump may be correspondingly higher. Not to exceed 9”.
4. Air Entrainment: 4 ½ - 7 ½ %
5. Water: Potable.
6. Admixtures:

a. Air entraining Admixture: ASTM C260
b. Other Admixtures: ASTM C94/C94M
c. Admixtures containing calcium chloride or soluble chlorides are not permitted.
d. Maximum Free Chloride Ions: 0.06 percent of weight of cement in concrete mix.

7. Curing: After placement, the concrete shall be sprayed with an approved curing compound.

8. Testing: A minimum of 6 test cylinders shall be cast for each pour. The cylinders shall be tested by a certified testing lab and each set of cylinders shall be tested per the following:

   a. One Cylinder at 7 days.
   b. Three Cylinders at 28 days.
   c. Two Cylinders on hold if needed.

2.4 REINFORCEMENT

A. General:

1. All reinforcing steel shall conform with ASTM specification A615, Grade 60, having a minimum yield stress of 60,000 psi.
2. Bars shall be free from loose scale, dirt, grease, or any other substance which will impair the bond between the concrete and reinforcing bars.
3. Tie Wire – Tie wire shall be steel, black annealed, 16 gauge minimum.

2.5 WATER STOP

A. General:

1. Waterstop shall be installed in all construction joints below water level.
2. Waterstop shall be spliced per manufacturer's recommendations or lapped a minimum of 12".
3. Waterstop shall be 3/16" x 4" for reservoirs under 30' in height and shall be 3/16" x 6" for reservoirs 30' and over in height.
4. Waterstop shall be "Greenstreak" #703, or approved equal, for base to wall connection.
5. Waterstop RX 101 (Bentonite Swellstop) shall be used in wall cold joints.

2.6 ACCESSORIES

A. All accessories shall comply with "Recommended Standards for Water Works," latest edition, by Great Lakes Upper Mississippi Board of State Public Health and Environmental Managers.

B. Access Hatch: All hatches shall be installed in the roof, shall be constructed from a minimum of 14-gauge, galvanized metal, shall include provisions for a padlock and shall have weather stripping where the hatch cover meets the hatch. Roof hatch size shall be 2'-6" x 3'.

C. Air Vent: All vents shall be a minimum of 8", screened with non-corrosive screen (24 mesh) and installed in the center of the roof. The vent shall be designed to prevent the entrance of surface and rainwater, birds, animals, insects and dust as much as is feasible and still vent properly.

D. Overflow: All overflows shall be 4" unless otherwise noted, screened with non-corrodible screen and installed in the sidewall immediately under the roof. Overflows shall be provided with a pipe thread at the exterior wall surface and piped to ground level with PVC pipe and fittings. An air gap shall be provided on the overflow to prevent back siphoning into the reservoir. The end of the pipe at the air gap shall be covered with 24 mesh screen to prevent the entrance of birds, animals, and insects as much as feasible. Galvanized steel brackets fabricated from ¼" x 1 1/2" flat bar mounted to the reservoir wall with 3/8" x 3 ¾" anchor bolts shall be provided at such intervals as will adequately stabilize the overflow pipe, approximately every 7'.

E. Ladders: The ladders shall be hot dip galvanized after fabrication. A minor amount of welding may be necessary after galvanizing. Welds shall then be painted with a cold galvanizing compound. Interior ladders shall extend the full height of the reservoir. Any ladder over 20' in length shall be equipped with a "Lad-Saf" Flexible Cable Safety System (Galvanized) or equal per State of Washington General and Health Standards, WAC 296-24-81009, Special Requirements. (5).

F. Handrail on Roof: Aluminum or galvanized three feet high or as indicated on Drawings; conform to OSHA Standards.

G. Water Level Indicator: Half travel indicators shall consist of a nominal 1" x 6" white PVC indicator board with black numerals and gradation markings, stainless steel float, weatherproof pulleys and 1/16" stainless steel cable.

H. Control Wire Blockouts: Unless otherwise shown on the plans, (2) 2" galvanized pipes shall be cast into the roof adjacent to the access hatch for mounting the water system controls onto the reservoir.

2.7 CURE SPRAY, FORM RELEASE AGENTS, AND COATINGS

A. General:

1. All cure sprays, form release agents and coatings used on surfaces that will come into contact with the water to be stored in the reservoir must have NSF approval for use with potable water.

2.8 FLEXIBLE PIPE COUPLINGS

A. Factory pre-assembled couplings for plain-end pipe; double-ring, wedge-gasketed, flared-sleeve type mechanical joint, AWWA C111.

2.9 SOURCE QUALITY CONTROL

A. Section 01 45 00 – Quality Control.

B. Concrete Testing:

1. Perform compressive strength, slump, and air content tests for each day of pouring concrete; cast 6 cylindrical strength test specimens for each test set.
2. Test one cylinder at 7 days; test three cylinders at 28 days; hold remaining cylinders for testing when other cylinders are damaged prior to testing.
3. Determine concrete strength from standard test specimens made and cured according to ASTM C31/C31M and ASTM C172, and tested in accordance with ASTM C39/C39M.
4. Determine air content in accordance with ASTM C231 or C173/C173M, as applicable.
5. Determine slump in accordance with ASTM C143/C143M.

PART 3 – EXECUTION

3.1 EXAMINATION

A. Verification of existing conditions before starting work.

B. Verify elevations and grading for water storage tank and location of water storage tank.

C. Verify compacted subgrade is dry and is ready to support imposed loads.

D. Verify drainage structure frames, manhole frames, and any other utility access frame/lids are installed in correct position and elevation.

3.2 PIPING

A. General:

1. All pipes extending into the reservoir shall be installed prior to the start of reservoir construction and shall be stubbed up out of the ground so that the reservoir base slab can be poured around the pipes. Pipes 4” and larger shall be ductile iron pipe with mechanical joint fittings. Pipes smaller than 4” shall be galvanized with threaded fittings. Retainer glands, such as “Megalugs” shall be used for joint restraints in lieu of thrust blocks wherever applicable. Pipes must pass pressure test requirements prior to reservoir installation.

3.3 CONCRETE

A. Unless otherwise specified, conform to ACI 304, ACI 305, and ACI 306R for concrete installation requirements such as preparation, mixing, conveying, depositing, curing, and cold and hot weather requirements.

B. Concrete shall generally be placed within 90 minutes of batching. However, in extreme cases where this is not physically possible because of the distance between the job site and the ready mix plant, an approved retarding agent may be used.

C. Unless otherwise shown on the Drawings, the base shall slope to a specific drain pipe at a minimum of ¼” per foot of radius, assuming the drain pipe is near the center of the tank. Otherwise, the base should be flat. The roof shall slope form the center to the outside edge at a minimum of ¼” per foot of radius.

3.4 REINFORCEMENT

A. Non-Prestressed:

1. Cleaning and Bending: Clean metal reinforcement free of loose rust, mill scale, or other coatings capable of reducing bond.
2. Cutting and Bending:

   a. Perform cutting and bending in the shop.
   b. Bend and cut steel cold; do not bend or straighten bars in manner capable of injuring material.

3. Placement:

   a. Arrange and place reinforcement in accordance with shop drawings.
   b. Secure in position with chairs, spacers, and ties. Concrete brick may be used to support reinforcement for slabs on grade when approved by Engineer.
   c. Bending and placing shall be in accordance with “Specifications for Structural Concrete for Buildings” (ACI 318-latest edition). Laps and splices shall be staggered, and all reinforcing steel shall be accurately placed as shown on the plans. All reinforcing steel shall be firmly secured to prevent movement during the

placing of the concrete. The only exception to this shall be where dowel bars are used at the connection of the base and wall. These dowels may be installed after the concrete is placed ("wet set") as long as the depth of embedment and the location are accurately controlled, and installation is done prior to the initial setting of the concrete.

4. Splicing:

   a. Furnish reinforcing bars in full lengths as indicated on Drawings and shop drawings.
   b. Do not splice bars unless indicated on Drawings.
   c. Make splices in accordance with ACI 318; perform welding in accordance with AWS D1.4.
   d. Lap mesh reinforcement a minimum of one mesh space plus 3", and tie.

5. Concrete Cover:
   a. Provide clearance and spacing indicated on Drawings.
   b. Where no clearances are indicated, provide minimum concrete cover over reinforcement as required by IBC.

3.5 FORMWORK

A. Responsibility: Design and construction of formwork is sole responsibility of Contractor.

B. Design Criteria:

1. Design formwork system with adequate bracing, strength, and stability to ensure finished concrete within tolerances specified in ACI 347.
2. Provide formwork sufficiently tight to prevent leakage of mortar.
3. Chamfer external corners ¾".

C. Coating Forms:

1. Coat forms with bond breaker before placing reinforcing steel.
2. Do not allow excess form coating material to stand in puddles in forms or to come in contact with concrete against which fresh concrete is to be placed.
3. Clean reinforcing steel contaminated with bond breaker before placing concrete.

D. Embedded Items:

1. Clean items to be embedded in concrete free from oil or foreign matter capable of reducing bond of concrete to these items.
2. Install inserts, anchors, sleeves, and other items specified under other sections of these specifications.
3. Close ends of conduits, piping, and sleeves embedded in concrete with caps or plugs.

E. Waterstops:

1. Install waterstops in accordance with manufacturer's instructions.
2. Support and protect portion of waterstop extending beyond bulkhead during placing of concrete and subsequent removal of forms.
3. Make watertight field splices by heat-sealing. Maintain continuity of ribs and bulbs. Allow splice to cool before stressing reinforcement.
4. Repair damaged waterstops before placing concrete.

3.6 MIXING

A. Mix and deliver ready-mixed concrete in accordance with ASTM C94/C94M.

B. Do not over-mix or use concrete which is retained in mixers so long as to require additional water in excess of design mix water to permit satisfactory placing.

C. Use preparation methods capable of producing concrete with temperature not more than 90 degrees F, and not less than 50 degrees F, when placed.

D. Do not heat concrete ingredients to temperature higher than necessary to keep temperature of mixed concrete, as placed, within specified temperatures.

E. Do not heat water in excess of 90 degrees F.

3.7 CONVEYING

A. Convey concrete from mixer to final deposit by methods preventing segregation or loss of materials.

3.8 CONCRETE PLACEMENT

A. Before each wall pour, the existing concrete shall be thoroughly cleaned by pressurized water or whatever means may be necessary to remove all loose scale, oil and any foreign material that may prevent a good bond with the existing concrete.

B. In the pouring process, concrete shall not be allowed to free-fall more than 5 feet. The concrete shall be deposited in horizontal layers not to exceed 18” in depth and shall be placed as closely as possible to its final position to avoid segregation.

C. Deposit concrete as nearly as practical in its final position to avoid segregation due to rehandling or flowing; do not use vibrators to move concrete horizontally with forms.

D. Do not use retempered concrete or concrete contaminated by foreign material.

E. Plan and conduct concrete placement to ensure concrete is kept plastic and free of cold joints.

F. When continuous installation is delayed more than 45 minutes between adjacent concrete placements, install bulkhead construction joint, complete with waterstops where required.

G. Remove temporary spreaders in forms when concrete has reached elevation making spreaders unnecessary.

H. Do not commence placing when sun, heat, wind, or limitations of facilities provided prevent proper finishing or curing.

I. Discontinue concreting when descending ambient air temperature falls lower than 50 degrees F unless preparations are made and in place to heat or insulate concrete in accordance with cold weather concreting requirements.

3.9 CONSOLIDATION

A. Consolidate concrete thoroughly as concrete is placed to secure dense mass; work concrete well around reinforcement and embedded items and into corners of forms.

B. Use internal vibrators inserted vertically over entire area.

C. Vibrate all concrete with high frequency internal vibrators as it is placed. Penetrate the concrete with a sufficient number of vibrations to thoroughly work the concrete around reinforcement and embedded fixtures without separation of aggregate.

D. Vibrate until voids are eliminated, coarse aggregate is suspended in mortar, and entrapped air bubbles begin to rise to surface; concrete should move back into space vacated by vibrator.

E. Space vibrator insertions so area visibly affected by vibrator overlaps adjacent just-vibrated area by several inches.

F. Penetrate at least 6 inches into previously placed layers to bond between layers and avoid cold joints.

G. Do not use form vibrators.

H. Take care not to over-vibrate air entrained concrete; place vibrator to eliminate honeycombing but avoid excess vibrating that bleeds entrapped air from mix.

I. Do not use vibrators to transport concrete.

3.10 CONCRETE FINISHES

A. Base and Roof:

1. All slab finishes shall be a “wood float” finish only, to prevent slippery surfaces. The concrete shall be worked no more than is necessary to produce a “wood float” finish that is uniform in texture and relatively free from screed/float marks. The underside of the roof shall be a rough form finish as results for the use plywood forms.

B. Walls:

1. Steel forms shall be used on all wall pours. Forms may be built with a minimum of refinement but as a minimum must not leak excessive amounts of mortar or yield beyond specific tolerances when the concrete is vibrated. Rock pockets, honeycombed areas, form tie holes and any holes over ½” deep will be repaired. However, no grinding/repairing will be done on “fins”, projections and minor form misalignments (especially at construction joints) as long as they do not exceed the specified tolerances. No sacking or hand-rubbing will be performed on any concrete finishes.

3.11 CONCRETE PROTECTION

A. Immediately after placement, protect concrete from premature drying, excessively hot or cold temperature and mechanical injury.

B. Maintain concrete with minimum moisture loss and relatively constant temperature for period necessary for hydration of cement and hardening of concrete.

C. After concrete has hardened, loosen forms as soon as possible without damage to concrete, and run curing water continuously down inside form.

3.12 REMOVAL OF FORMS

A. Do not remove forms until members have acquired sufficient strength to support their own weight and imposed loads safely.

B. Normal elapsed time on wall form removal shall be approximately 16 hours unless low temperatures or poor weather conditions dictate otherwise. The normal elapsed time for roof form removal shall be 7 to 10 days.

C. Notify Engineer before forms are removed so examination of newly stripped surfaces may be made prior to patching.

3.13 REPAIR OF TIE HOLES AND MINOR DEFECTS

A. Allowable tolerances for concrete surfaces shall be classified as “abrupt” and “gradual”. Offsets caused by displaced or misplaced forms and form alignment shall be considered as abrupt irregularities. All other are classed as gradual irregularities. Allowable tolerances are the same for both slabs and walls and are as follows:

1. Abrupt – ½”
2. Gradual – 1”

B. Repair concrete immediately after form removal.

C. Honeycombs and small defective areas:

1. Remove to sound concrete.
2. Wet affected area.
3. Brush on bonding grout consisting of 1 part cement, 1 part fine sand and water to produce consistency of thick cream.
4. Apply patching mortar consisting of 1 part cement, 2-1/2 parts sand and enough water to produce stiff consistency.
5. Consolidate patching mortar and strike off to leave patch slightly higher than surrounding surface.
6. Finish repaired area flush with surrounding area after mortar has been in place for 1 hour.

D. Tie Holes:

1. Thoroughly clean and dampen.
2. Fill solid with patching mortar.

E. Perform patching before curing compound is applied.

F. Cure patched areas the same as adjacent concrete.

G. Make repairs uniform in color and finish with surrounding concrete.

3.14 CURING

A. Keep concrete moist for at least 7 curing days after placement.

B. Water curing is preferred method of protection.

1. Cover exposed surfaces with saturated burlap or cotton mats and keep wet continuously with soil soaker hose for 7 days.
2. Leave covering in place, without wetting, for additional 3 days.

C. Use of curing compound is permissible provided it meets NSF approval.

1. Do not use curing compounds on surfaces to which mortar, concrete or paint is applied.
2. Keep surfaces moist after forms are removed, and form tie holes repaired.
3. After surfaces are finished, apply curing compound according to manufacturer's instructions.

D. Slabs: Immediately following slab finishing, apply liquid membrane forming curing compound or begin water curing before surface becomes dry.

3.15 FLOOR AND WALL FOOTINGS

A. Construct floor and wall footings to dimensions indicated on Drawings.

B. Place vapor retarder over subbase; overlap joints minimum of 12 inches or the minimum specified in the IBC; whichever is larger.

C. Install inlet, outlet, drain and overflow pipes, and other penetrations through floor and encased in concrete.

D. Install and support vertical waterstop so bottom of center bulb is at elevation of top of footing.

1. Support waterstop without puncturing water stop.
2. Splice waterstop using thermostatically controlled sealing iron.
3. Spark test each splice before encasement in concrete.

E. Install floor and wall footings monolithically. Construction joints in floor or between floor and footings are not permitted.

F. Cure floor by flooding with water and maintaining saturated for 7 days.

G. Finish floor slab with mechanical steel float.

3.16 HOT WEATHER REQUIREMENTS

A. Conform to ACI 305 when concreting during hot weather.

3.17 COLD WEATHER REQUIREMENTS

A. Conform to ACI 306.1 when concreting during cold weather.

3.18 TANK ACCESSORIES

A. Coordinate placement of tank accessories. Set items level, plumb, and in alignment with adjoining work.

B. Provide anchors and inserts in sufficient number for proper fastening of items. Embed anchors in concrete to accurately align metal work at proper level.

C. Drill holes as required for bolts and screws in supports and in metal work. Conceal fasteners where possible.

D. Provide join sealant as required to set, seal, and secure metal items.

3.19 MANUFACTURER'S FIELD SERVICES

A. Section 01 45 00 – Quality Control.

B. Furnish field representative experienced in installation of tank to supervise installation.

1. Furnish Installation Certificate attesting foundation and tank are properly installed.

3.20 CLEANING, DISINFECTION, AND TESTING

A. Cleaning: Tank installer shall clean and pressure wash the interior of the reservoir after it is constructed.

B. Leak Testing:

1. Testing of the reservoir consists of filling the reservoir to check for water tightness no sooner than 28 days after all concrete pouring is completed and no later than 60 days after completed. The testing of the water can be done from this initial filling and if there are no obvious problems with the reservoir, it can be put on line without emptying and refilling.
2. To test the reservoir, fill to full, close all valves and let set for 24 hours. Note the height of the water. Check the water height after three consecutive 24 hour periods. Allowing for evaporation, the water level shouldn't drop more than 1 tenth of one percent in any 24-hour period.

C. Disinfecting: Disinfect tank in accordance with Section 33 13 13 Water Reservoir Disinfection.

D. Purities Testing: This testing typically consists of taking samples of the water to a certified lab for bacteria testing prior to placing the reservoir in service. Special attention must be given to ensure that the water source has been tested and is clear of bacteria and contaminants that could affect the samples taken from the reservoir.

END OF SECTION

33 31 13 – SANITARY SEWER PIPE

PART 1 - GENERAL

1.1 DESCRIPTION

A. The WORK under this Section includes providing all labor, materials, tools and equipment necessary for furnishing and installing PVC sanitary sewer pipe, in accordance with these Specifications and in reasonably close conformity with the lines and grades shown on the Drawings or established by the ENGINEER.

B. This WORK includes furnishings and installing connecting bands, branch connections, elbows or other fittings, and all appurtenances required to complete the sanitary sewer installation.

1.2 SUBMITTALS

A. Sanitary Sewer Pipe: Material certifications stating conformance with the requirements of this Section.

B. Project Record Documents: Accurately record actual locations and inverts of buried pipe.

PART 2 - PRODUCTS

2.1 PVC PRESSURE PIPE (FORCE MAIN)

A. Polyvinyl chloride (PVC) under 4 inches shall meet the requirements of ASTM D2241. Pipe material shall be PVC 1120, PVC 1220, or PVC 2120, and shall have minimum wall thickness equal or greater than a standard dimension ratio (SDR) of 21. Pipe shall bear the National Sanitation Foundation Seal for use to transport potable water. Pipe shall be considered flexible conduit. Joints shall meet the requirements of ASTM D3139 using a restrained rubber gasket meeting the requirements of ASTM F477.

2.2 PVC GRAVITY PIPE AND FITTINGS

A. Solid wall PVC sanitary sewer pipe and fittings shall be solid wall construction and shall conform to the following requirements: For pipe sizes up to 15 inches: ASTM D3034 SDR 35. Joints for solid wall PVC pipe shall conform to ASTM D3212 using elastomeric gaskets conforming to ASTM F477. Fittings for solid wall PVC pipe shall be injection molded, factory welded, or factory solvent cemented.

PART 3 - EXECUTION

3.1 CONSTRUCTION

A. Bedding and backfill shall conform to the requirements of Utility Trenching and Backfill.

B. Sheeting and bracing required for trenches shall meet OSHA requirements.

C. Before lowering into the trench; the pipe shall be inspected for defects. All cracked, chipped, or broken pipe shall be discarded. The ends and interior of the pipe shall be clean. Belled ends shall be laid upgrade. Handling of the pipe shall be accomplished in a manner that will not damage the pipe. The joint shall be made in the manner recommended by the manufacturer. Care shall be taken not to buckle or disturb previously laid pipe.

D. Pipe shall be laid accurately to the line and grade.

E. Pipe shall be cleaned of all foreign matter, and water shall be kept out of trenches until joints have been completed. When WORK is not in progress, open ends of pipe and fittings shall be securely closed to keep foreign matter and animals from entering.

F. Each joint shall be inspected to ensure that it is properly made before backfilling is done. Care shall be taken to prevent any dirt or foreign matter from entering the open end of the pipe. Where it is necessary to cut pipe, such cuts shall be neatly made in an approved manner. The laid pipe shall be true to line and grade and, when completed, the sewer shall have a smooth and uniform invert. No section of gravity sewer, including service connections shall have an adverse grade which would pond water in the invert of the sewer.

G. Pressure test gravity pipe using a low-pressure air test in accordance with ASTM F1417.

H. Pressure test pressure rated pipe to 200 psi. Repair leaks and re-test

1. Coordinate all pipe installation and testing with ODEQ to ensure all inspection and testing requirements are met.
2. After completion of pipeline installation, including backfill, but prior to final connection to existing system, conduct hydrostatic pressure and leakage test in accordance with AWWA C600.
3. Provide equipment required to perform leakage and hydrostatic pressure tests.
4. No pipeline will be approved when pressure test varies by more than 5 psi at completion of hydrostatic pressure test.
5. Before applying test pressure, completely expel air from section of piping under test. Provide corporation cocks so air can be expelled as pipeline is filled with water. After air has been expelled, close corporation cocks and apply test pressure. At conclusion of tests, remove corporation cocks and plug resulting piping openings.
6. No pipeline installation will be approved when leakage is greater than that determined by the following formula:

$L = (SD\sqrt{P})/133{,}200$ where:
L = Allowable leakage in gallons per hour
S = Length of pipe tested in inches
D = Nominal diameter of pipe in inches
P = Average test pressure in pounds per square inch (gauge)

I. Connections to existing sewer mains shall be made so that no projections or rough surfaces occur within the pipe.

J. All sewer mains shall be installed to the criteria for the separation of water mains and sanitary sewers set forth in WAC 246-272B. Any deviations from such requirements must be approved by the Owner.

END OF SECTION 33 31 13

33 34 00 – ONSITE WASTEWATER DISPOSAL

PART 1 - GENERAL

1.1 DESCRIPTION

A. The WORK under this Section includes providing all labor, materials, tools and equipment necessary for furnishing and installing the proposed wastewater drainfield systems in accordance with the plans. This includes all associated system components, wastewater treatment systems, interconnecting piping and valving, and the complete pressurized distribution drainfield system in accordance with these Specifications and in reasonably close conformity with the lines and grades shown on the Drawings or established by the ENGINEER.

1.2 SUBMITTALS

A. Product Data: Submit data on wastewater treatment system, piping and valving, drainfield components including piping and alternative media (gravelless chambers).

B. Project Record Documents: Accurately record actual locations and inverts of buried pipe.

1.3 REFERENCES

A. Washington State Department of Health Large On-site Sewage System Regulations (Chapter 246-272B WAC)

B. ASTM D 1784: Rigid Vinyl Compounds

C. ASTM D 2564: Solvent Cement for PVC Pipe and Fittings

D. ASTM F 1668: Procedures for Buried Plastic Pipe

1.4 SUBMITTALS

A. Product Data: Submit data on wastewater treatment system, piping and valving, pumps and controls and drainfield components including piping and alternative media (gravelless chambers).

B. Manufacturer’s Installation Instructions: Submit special procedures for alternative media (gravelless chamber) and wastewater treatment system installation.

C. Project Record Documents: Accurately record actual locations and inverts of all installed infrastructure including buried pipe and drainfield components.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Protect treatement equipment, interconnecting piping and valves and drainfield components during handling using methods recommended by manufacturer.

B. Prevent damage to pipe, treatment equipment and gravelless chambers during transit. Repair abrasions, scars, and blemishes. If repair of satisfactory quality cannot be achieved, replace damaged material immediately.

PART 2 - PRODUCTS

2.1 PVC PIPE AND FITTINGS

A. Pipe and fittings shall meet the requirement of 33 31 13 Sanitary Sewer Pipe.

2.2 ALTERNATE MEDIA – GRAVELLESS DRAINFIELD CHAMBERS

A. Gravelless drainfield chamber units shall be Quick4 Plus Standard Low Profile chambers as manufactured by Infiltrator Water Technologies or approved equivalent.

2.3 WASTEWATER TREATMENT SYSTEM

A. BioMicrobics, Inc. MicroFAST 3.0.

PART 3 - EXECUTION

3.1 CONSTRUCTION

A. Bedding and backfill shall conform to the requirements of Utility Trenching and Backfill.

B. Sheeting and bracing required for trenches shall meet OSHA requirements.

C. Before lowering into the trench; the pipe shall be inspected for defects. All cracked, chipped, or broken pipe shall be discarded. The ends and interior of the pipe shall be clean. Belled ends shall be laid upgrade. Handling of the pipe shall be accomplished in a manner that will not damage the pipe. The joint shall be made in the manner recommended by the manufacturer. Care shall be taken not to buckle or disturb previously laid pipe.

D. Pipe shall be laid accurately to the line and grade.

E. Pipe shall be cleaned of all foreign matter, and water shall be kept out of trenches until joints have been completed. When WORK is not in progress, open ends of pipe and fittings shall be securely closed to keep foreign matter and animals from entering.

F. Each joint shall be inspected to ensure that it is properly made before backfilling is done. Care shall be taken to prevent any dirt or foreign matter from entering the open end of the pipe. Where it is necessary to cut pipe, such cuts shall be neatly made in an approved manner. The laid pipe shall be true to line and grade and, when completed, the sewer shall have a smooth and uniform invert. No section of gravity sewer, including service connections shall have an adverse grade which would pond water in the invert of the sewer.

G. Gravelless Drainfield Chambers

1. Stake out location of drainfield trenches. Set the elevation of the trench bottoms.
2. Install sedimentation and erosion control measures as necessary.
3. Excavate and level the designated area.
4. Remove any debris from the bed walls. Rake the bottom and sides if smearing has occurred while excavating. Verify the bottom of the trenches are level using a transit, laser or level.
5. Install and backfill the chambers and lateral piping in accordance with the manufacturer's recommendations.
6. Perform "squirt" testing as required for Department of Health acceptance.

END OF SECTION 33 34 00

33 34 13 – SEPTIC TANKS

PART 1 - GENERAL

1.1 DESCRIPTION

A. The WORK under this Section includes providing all labor, materials, tools and equipment necessary for furnishing and installing the proposed septic tank, pump tanks and treatment tank systems as depicted in the project plans and in reasonably close conformity with the lines and grades shown or established by the ENGINEER.

B. The CONTRACTOR shall provide fiberglass reinforced plastic (FRP) and concrete wastewater storage tanks as shown on the drawings. The onsite wastewater tanks shall be manufactured according to applicable American National Standards Institute (ANSI) and American Water Works Association (AWWA) standards. The tank sizes, fittings and accessories shall be as shown on the drawings.

C. The FRP and concrete tanks shall be designed for underground installation and shall be constructed in compliance with WAC 246-272B-06450.

1.2 REFERENCES

A. Washington State Department of Health Large On-site Sewage System Regulations (Chapter 246-272B WAC)

B. ANSI/AWWA D120-09; Thermosetting fiberglass-reinforced plastic tanks.

1.3 SUBMITTALS

A. Product Data: Submit data on tank(s), including scaled drawings, piping, effluent filter and tank accessories.

B. Manufacturer’s Installation Instructions: Submit special procedures for septic tank installation.

C. Project Record Documents: Accurately record actual locations and inverts of all tanks and associated components.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Prevent damage to septic tanks during transit to the site. Handle and store the tanks in accordance with manufacturers recommendations. Repair abrasions, scars, and blemishes. If repair of satisfactory quality cannot be achieved, replace damaged material immediately.

PART 2 - PRODUCTS

2.1 SINGLE-WALL AND DOUBLE-WALL FIBERGLASS REINFORCED PLASTIC (FRP) UNDERGROUND ONSITE WASTEWATER TANKS

A. Loading Condition: Tank(s) shall meet the following design criteria:

1. Internal Load – Tank(s) shall be designed to withstand a 5-PSIG air-pressure test with a 5:1 safety factor.
2. Surface Loads – Tank shall be designed to withstand surface H-20 and HS-20 axle loads when properly installed according to manufacturer's current installation manual and operation guidelines.
3. External Hydrostatic Pressure For Underground Tanks – Tank shall be designed for 7 feet of overburden over the top of the tank, the hole fully flooded, and a safety factor of 5:1 against general buckling.

B. Materials:

1. Tank(s) shall be manufactured with a laminate consisting of resin and glass fiber reinforcement. No sand/silica fillers or resin extenders shall be used.
2. All internal mounting hardware shall be manufactured of rustproof materials.

C. Design:

1. The tank(s) shall be designed as a single-wall or double-wall vessel as specified and shown in the drawings.
2. Tank(s) shall be manufactured with structural ribs which are fabricated as an integral part of the tank wall.
3. Capacity and Dimensions:
   a. Tank shall have a nominal capacity of 22,000 gallons.
   b. Tanks shall have a nominal outside diameter of 10 feet.

2.2 PRECAST CONCRETE SEPTIC TANKS

A. Tanks shall be as specified on the plans or approved alternates from the Washington State Department of Health's Qualified Products list.

2.3 ACCESSORIES

A. Access Openings:

1. All access openings shall have a diameter of 24 inches or 30 inches, as specified on the plans, complete with riser, lid and necessary hardware.
2. Size and location(s) as shown on tank drawings.

B. Pipe and Fittings:

1. Tank(s) shall be equipped with factory-installed threaded fittings, or pipe stubs.
2. PVC pipe shall at a minimum meet the requirements of ANSI Schedule 40.
3. All flanged nozzles shall be flanged and flat-faced, and conform to Class 150 bolting patterns as specified in ANSI/ASME/B16.5-2009.

4. Steel NPT fittings shall withstand a minimum of 150 foot-pounds of torque and 1,000 foot-pounds of bending, both with a 2:1 safety factor.
5. Location of fittings and piping shall be as shown on tank drawings.

C. Attached Access Risers:

1. Attached access risers shall be PVC or FRP as supplied by tank manufacturer.
2. Attached access risers shall be 30 inch diameter.
3. Access risers shall be attached to access openings during installation utilizing adhesive or FRP bonding kits supplied by the tank manufacturer.

D. Anchoring:

1. Anchor straps shall be FRP anchor straps supplied by tank manufacturer.
2. Number and location of straps shall be as shown on drawings or as recommended by manufacturer.
3. Prefabricated concrete deadmen, which are designed to ACI standard 318-11, shall be supplied by tank manufacturer.

2.4 BEDDING AND BACKFILL MATERIAL

A. Aggregate Bedding and backfill Material shall be as specifically recommended by the tank manufacturer.

B. Geotextile Fabric: The geotextile fabric specified for backfill separation shall be Mirafi 180N Filter Fabric or approved equal.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Section 01 01 00 – General Requirements: Verification of existing conditions before starting work.

B. Verify upstream and downstream sanitary sewer connections, size, location and depth.

3.2 PREPARATION

A. Ream pipe ends and remove burrs.

B. Remove scale and dirt from components before assembly.

C. Establish invert elevations for each component in the system.

D. Hand trim excavation to suit septic tank and pipe connections.

3.3 TANK AND TANK BEDDING

A. Excavate in accordance with plans and actual field conditions.

B. Place bedding material level in on continuous layer not exceeding 6 inches compacted depth. Compact to 95%.

C. Install septic tank and backfill in accordance with manufacturer's recommendations.

D. Test tank in accordance with manufacturer's recommendations and in accordance with WAC 246-272b-06450 to verify water tightness. Coordinate all testing/inspection activity with ENGINEER prior to commencement.

END OF SECTION 33 34 13

33 36 16 – UTILITY SEPTIC TANK EFFLUENT PUMPS

PART 1 - GENERAL

1.1 DESCRIPTION

A. The WORK under this Section includes providing all labor, materials, tools and equipment necessary for furnishing and installing complete submersible effluent pump systems, including all accessories and control units, in accordance with the drawings or as established in the field by the OWNER or their representative.

1.2 REFERENCES

A. Washington State Department of Health Large On-site Sewage System Regulations (Chapter 246-272B WAC)

1.3 SUBMITTALS

A. Shop Drawings: The Contractor shall furnish shop drawings and technical data sheets for the pumping systems. Show size, materials, and components of system. The submittals shall clearly specify the materials of construction, equipment compatibility, along with drawings for each unique system and related equipment being supplied.

B. Product Data: Submit for each type of pumping system required. Include data for all pump system appurtenances including, but not limited to, slide rail assembly, discharge piping, valves, junction boxes, level controls and control panels. Include pump catalog data and performance curves, as well as, control data and panel wiring schematic

C. Manufacturer’s Certificate: Certify products meet or exceed specified requirements.

D. Manufacturer’s Installation Instructions: Submit special procedures for system installation.

E. Project Record Documents: Accurately record actual locations and inverts of all system components.

1.4 OR-EQUAL EVALUATION

A. The term “approved equal” shall mean equal in the judgment of the ENGINEER. Should the Contractor seek approval of a product other than the brand or brands named in the specifications, it shall furnish written evidence that such product conforms in all respects to the specified requirements, and that it has been used successfully elsewhere under similar conditions. It will not be the responsibility of the manufacturer specified within these specifications to provide research, documentation, or data supporting the difference between the “or equal” and the specified product. This will be the sole responsibility of the Contractor seeking the approval.

B. Where the specified requirements involve conformance to recognized codes or standards, the Contractor shall furnish evidence of such conformance in the form of test or inspection reports, prepared by a recognized agency, and bearing an authorized signature. Manufacturer’s standard data and catalog cut sheets will not be considered sufficient in themselves, and the ENGINEER will not be responsible for seeking further data from the manufacturer, or for otherwise

researching the product. Failure to provide complete data will be cause for rejection of the product.

1.5 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing wastewater effluent pumping systems with a minimum of three years documented experience.

B. Installer: Company specializing in performing work of this section with a minimum of three years documented experience.

1.6 WARRANTY

A. The effluent pump manufacturer shall provide a five (5) year warranty for the effluent pump system. Warranty term shall ensue after acceptance and system startup procedures are complete. The manufacturer shall submit detailed exclusions from the warranty or additional cost items required to maintain the equipment in warrantable condition. The warranty shall be documented in product literature.

1.7 DELIVERY, STORAGE AND HANDLING

A. Protect all components from entry of foreign materials and water during delivery and storage.

B. Accept system components on site in manufacturer’s original containers or configuration. Inspect for damage.

C. Store sensitive materials for field assembly in dry area in original shipping containers.

D. Repair any damage according to manufacturer’s instructions.

PART 2 - PRODUCTS

2.1 PUMPS

A. Pumps must be approved for the use described in these specifications. Pump shall be 0.33 to 3.0 hp, 60 Hz, two-wire motor, with 30 foot long extra heavy duty (SOOW) electrical cord with ground. The pumps must be submersible High-Head Effluent pumps. Pumps shall be UL and CSA listed for use with effluent in Class I Division 1 locations. The pumps must have a minimum 24-hour run dry capability without water lubrication. The pumps shall have a 1/8-inch bypass orifice to ensure flow circulation for motor cooling and to prevent air bind. The pump shall have a floating impeller design to protect against up thrust and increase pump life. The pumps liquid ends must be repairable (by replacing impellers and/or diffusers) for better long-term cost of ownership. The motor must be rated for continuous use and frequent cycling, at least 100 cycles per day. The motor cable must be suitable for Class 1, Division 1 and 2 applications. The pumps shall be lightweight for easy removal and maintenance. The pump intake screen must be 1/8-inch mesh polypropylene. The pump shall have internal thermal overload protection and internal lightning protection. All pumps shall undergo 3-point (Dead head, Design Flow, and Design Flow + 30%) wet testing at the factory to confirm performance.

2.2 SPLICE BOX CONDUIT SEALS AND SEALANTS

A. The use of a UL-approved conduit seal kit accessible above ground shall be required to prevent the passage of gases, vapors, or flames through the conduit to the control panel. An additional UL classified sealant shall be added to the splice box coupling to prevent condensation accumulation in the splice box. The following UL approved sealants shall be used:

1. UL classified moisture-cure polyurethane quick drying foam or approved equal with an R-5 rating for each inch of foam.
2. UL classified silicone sealant or approved equal consisting of a neutral cure silicone, non-acetic, non-corrosive silicone able to withstand temperatures to 450° F.

2.3 CONTROLS

A. Controls and alarms shall be listed per UL 508. Panels shall be repairable in the field without the use of soldering irons or substantial disassembly.

B. Panels shall be Orenco Systems®, Inc. or approved equal. Control Panels shall be configured as recommended by manufacturer for the pumping system being operated.

2.4 INSTALLATION

A. All pumping system, and electrical components shall be installed in accordance with the Manufacturer's recommendations, the project plans, and all state and local regulations.

2.1 LOCATION

A. The location of the pump control panel shall be as indicated on the drawings. Consult with the ENGINEER for any variations to the locations shown. The panel, when possible, should be mounted in the shade and protected from the weather. The panel should be located at a convenient height (usually about five feet above the ground) and where it will be accessible for maintenance.

PART 3 - EXECUTION

3.1 PRECONSTRUCTION CONFERENCE

A. Before any work at the site is started, a conference attended by the Owners Representatives, Contractor, and others as appropriate will be held to establish a working understanding among the parties as to the work involved for installing each component of the effluent pump systems.

3.2 PUMP INSTALLATION

A. Install pump including fittings, brackets, discharge piping, valves, rail and lifting system, float systems and wire pump to junction box.

3.3 CONTROL PANEL INSTALLATION

A. Mount and wire control panel for pumping station operation.

B. Wire control panel in accordance with electrical drawings, National Electrical Code and manufacturer's recommendations.

3.4 STARTUP, INITIAL TESTING AND OPERATION

A. Notify Owner's Respresentative three days prior to effluent pump system testing.

B. Provide startup and initial testing of system. Hydraulically test pump system to performance requirements by receiving, pumping and discharging water.

C. Correct failures during test by repairing or replacing malfunctioning parts or equipment or faulty workmanship, regardless of cause, within 48 hours after discovery.

D. After correcting failures caused by defective equipment, material, or faulty workmanship, retest until failures are eliminated.

E. Confirm general sequencing of pump and float operation and control panel are in accordance with performance requirements.

F. Document and certify startup results in startup report.

END OF SECTION 33 36 16

SECTION 33 40 00 - STORM DRAINAGE SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes, but is not limited to:

1. Catch basins, culverts, area drains, cleanouts, storm drain pipes, fittings, and other appurtenances as shown on the Plans.
2. Stormwater facility including but not limited to pre-settling cell, sand filter and infiltration pond.
3. Coordination of building plumbing connection points.
4. Construction records.

1.2 REFERENCES

A. Reference the following standards:

AHJ	Public Authority Having Jurisdiction. For this project the AHJ denotes Island County.
WSDOT	Washington Department of Transportation 2025 Standard Specifications and Standard Plans for Road, Bridge, and Municipal Construction
Ecology	State of Washington Department of Ecology Stormwater Management Manual for Western Washington, 2019. (www.ecy.wa.gov/programs/wq/stormwater/manual.html)
ASTM	American Society for Testing and Materials

1.3 SUBMITTALS

A. Submit the following in accordance with submittal procedures noted in Division 01.

1. Product data sheets and shop drawings for materials listed in Part 2 Products and/or noted on Plans.

PART 2 - PRODUCTS

2.1 POLYVINYL CHLORIDE (PVC) DRAIN PIPE

A. Polyvinyl Chloride (PVC) Drain Pipe: conform to WSDOT Section 9-05.12(1) with rubber gasket joints.

1. Fittings shall be same material as pipe.
2. Provide connections to catch basins and inlets with AC or GPK manhole adapter or an approved equivalent product. Portland cement joints on pipe are prohibited.

2.2 DUCTILE IRON PIPE (DI)

A. Ductile Iron Pipe shall be Class per Plan and shall conform to WSDOT 9-05.13.

B. Fittings for ductile iron pipe shall be in accordance with WSDOT Section 9-05.13. Saddles fastened to pipe with external bands shall not be acceptable on any new ductile iron pipe.

C. Culvert pipe's inlet and outlet ends shall be beveled per Plans.

2.3 FITTINGS, COUPLINGS AND JOINTS

A. Fittings shall be the same material as the pipe.

B. Connections to maintenance holes shall be connected by core drilling and flexible connections.

C. Jointing of dissimilar pipe shall be in accordance with WSDOT Section 7-08.3(2)G.

2.4 CONDUCTIVE WARNING TAPE

A. Conductive warning tape shall conform to Section 31 00 00 - Earthwork.

2.5 BEDDING AND BACKFILL MATERIAL

A. Bedding and backfill material shall be in accordance with Section 31 00 00 - Earthwork and as noted on the Plans.

2.6 CATCH BASINS

A. WSDOT Type 1 and Type 2 catch basins shall be per WSDOT Standard Plans B-5.20-03 and B-10.20-02 respectively unless otherwise specified.

1. Grates within parcel area shall be Herringbone metal frame and grate conforming to WSDOT Standard Plans B-30.10-03 and B-30.50-03.
2. Accessible grates for rectangular frames in pedestrian areas shall meet Accessible requirements and shall conform to WSDOT Standard Plan B-30.15-00.
3. Where solid cover is noted on plans, Rectangular Solid Metal Cover shall conform WSDOT Standard Plan B-30.2-04.

2.7 AREA DRAIN

A. Area Drain shall be per plans.

1. Rim to invert distance shall be 18 inches minimum.
2. Area drain to include minimum 18 inch depth sump.

2.8 SAND FILTER

A. Sand Medium shall be per plan.

2.9 GRAVEL BACKFILL FOR DRAINS

A. Gravel Backfill for Drains shall conform to wsdot section 9-33.2(1) Table 3 and per Plans.

2.10 COBBLES:

A. Cobbles per Section 31 00 00 – Earthwork.

2.11 GEOTEXTILES

A. Geotextiles per Section 31 00 00 – Earthwork.

PART 3 - EXECUTION

3.1 EXAMINATION AND COORDINATION WITH OTHER WORK

A. Verify trenches are ready to receive work, and are excavated to the dimensions and elevations indicated on the Contract Documents.

3.2 TRENCHING AND PIPE INSTALLATION

A. Excavate trench and install pipe to alignments, elevations, grades and slopes indicated on the drawings.

B. Excavate and prepare trench in accordance with Section 31 00 00 - Earthwork.

C. Place bedding and backfill in conformance with Section 31 00 00 - Earthwork.

D. Install service drain pipe in conformance with WSDOT Section 7-18.

E. Install conductive warning tape in accordance with Section 31 00 00 - Earthwork.

3.3 CATCH BASIN INSTALLATION

A. Install catch basins and storm drain structures in accordance with WSDOT Section 7-05 and the Plans.

3.4 AREA DRAIN INSTALLATION

A. Install area drains in accordance with the manufacturer’s installation requirements, WSDOT Section 7-05 and the Plans.

3.5 STORMWATER FACILITY INSTALLATION

A. Excavate and form stormwater facility cell and pond in accordance with Section 31 00 00 – Earthwork, the Plans, and Owner's Geotechnical Engineer's requirements on site.

3.6 CLEANING AND TESTING

A. Clean and test pipe in conformance with WSDOT Section 7-04.3

1. Replace sections that do not pass testing as directed by Owner's Representative or AHJ at no additional cost to Owner.

B. Leave premises clean and free of residue of work of this Section in accordance with the requirements of this Project Manual.

END OF SECTION 33 40 00

40 75 21 – CHLORINE ANALYZERS (WATER SUPPLY)

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes the following items inside the treatment building:

1. Free and monochloramine analyzer sensor
2. Free and monochloramine analyzer display panel

B. Related Requirements:

1. Division 26 "Electrical."
2. Section 46 30 00 “Water and Wastewater Chemical Feed Equipment (Water Supply).”
3. Section 46 61 00 “Filtration Equipment (Water Supply).”

1.2 REFERENCES

A. National Electrical Manufacturers Association (NEMA):

1. NEMA 250 – Enclosures for Electrical Equipment (1000 Volts Maximum)

B. National Sanitation Foundation (NSF International):

1. NSF 61 – Drinking Water System Components – Health Effects

1.3 SUBMITTALS

A. See Section 01 33 00 “Submittal Procedures” for submittal requirements.

B. Section 01 77 00 “Closeout Procedures.”

1.4 CLOSEOUT SUBMITTALS

A. Section 01 33 00 “Submittal Procedures” Shop Drawings, Product Data, and Samples.

B. Section 01 78 23 “Operation and Maintenance Data.”

C. Section 01 78 39 “Project Record Documents.”

D. Operation and Maintenance Data: Submit spare parts list, exploded assembly views, and recommended maintenance intervals.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Accept equipment on site in shipping containers with labeling in place. Inspect for damage.

B. Protect equipment from entry of foreign materials and other damage by temporary covers.

PART 2 - PRODUCTS

2.1 GENERAL

A. All materials coming into contact with potable water shall be NSF 61 certified.

2.2 FREE AND MONOCHLORAMINE ANALYZER SENSOR

A. Sensor shall be an amperometric chlorine analyzer sensor that meets the following requirements

1. Measured parameters:
   a. Free chlorine
   b. Monochloramine
   c. pH
   d. Conductivity
   e. Temperature
2. Free chlorine measurement shall be without monochloramine interference (i.e., free chlorine value shall be the true value, including in the presence of monochloramine)
3. Measurements not be dependent on flow rate of water
4. Self-cleaning sensor
5. No reagents or waste stream
6. NSF 61 certified.

B. Manufacturers and Products

1. Halogen Systems MP-Mono Monochloramine & Free Chlorine Sensor
2. Engineer approved equal

2.3 FREE AND MONOCHLORAMINE ANALYZER DISPLAY PANEL

A. Display panel shall be by the same manufacturer as the sensor and shall meet the following requirements

1. Display all parameters measured by sensor on one screen
2. Data log capacity: 1 million lines of logged data on included SD card
3. Communication board with cellular/ethernet connection and Bluetooth® mobile app, allowing for real-time remote access to sensor data and alarms
4. (4) 4-20 mA analog outputs
5. (1) alarm-dry contact
6. NEMA 250 type 4X enclosure
7. UL certified

B. Manufacturers

1. Halogen Systems D20 Display/Controller
2. Engineer approved equal

PART 3 - EXECUTION

3.1 EXAMINATION

A. Requirements: Verification of existing conditions before starting work.

B. Verify correct power supply is available.

3.2 INSTALLATION

A. Install control systems at locations indicated on Drawings.

B. Install control system components in accordance with manufacturer's instructions.

C. Install necessary equipment (i.e., cellular antenna, wiring, etc.) for display panel communications module. Provide a complete and functional system that provides water system operator with real-time remote access to sensor data and alarms.

D. Mount display panel on treatment building wall at location shown in Plans.

3.3 FREE CHLORINE RESIDUAL LOW-LEVEL ALARM

A. Set display panel to trigger alarm via communications module to notify water system operator if free chlorine residual drops below 0.5 mg/L.

3.4 SUBSCRIPTIONS

A. Provide Owner with one-year subscription to remote access communications module subscription.

3.5 FIELD QUALITY CONTROL

A. Follow manufacturer instructions for sensor and display panel start-up, commissioning, and calibration procedures.

B. Equipment Acceptance:

1. Adjust, repair, modify or replace system components that fail to perform as specified and rerun tests. Make final adjustments to equipment per manufacturer's requirements.
2. Document adjustments, repairs and replacements in manufacturer's field services certification.

3.6 DEMONSTRATION

A. Demonstrate equipment startup, shutdown, system operation, routine maintenance, alarm condition responses, and emergency repair procedures to Owner personnel.

END OF SECTION 40 75 21

46 30 00 – WATER AND WASTEWATER CHEMICAL FEED EQUIPMENT (WATER SUPPLY)

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes the sodium hypochlorite chemical metering system in the treatment building, including:

1. Chemical metering pump
2. Chemical storage tanks
3. Chemical injection points
4. Chemical injection tubing
5. Static mixers
6. Flow switches
7. Treatment chemicals

1.2 REFERENCES

A. National Sanitation Foundation (NSF International):

1. NSF 60 - Drinking Water Treatment Chemicals – Health Effects
2. NSF 61 - Drinking Water System Components – Health Effects

1.3 SUBMITTALS

A. As specified in Section 01 33 00 “Submittal Procedures.”

B. Product Data:

1. Submit manufacturer product information concerning materials of construction and fabrication.
2. Chemical metering pump: Submit pump information showing performance characteristics with pump and system operating point indicated. Include electrical characteristics and connection requirements. Submit manufacturer model number, dimensions, service sizes, and finishes.

C. Manufacturer's Installation Instructions:

1. Submit detailed instructions on installation requirements including storage and handling procedures, anchoring, and layout.
2. Submit application, selection, and hookup configuration with pipe and accessory elevations. Submit hanging and support requirements and recommendations.

D. Manufacturer's Certificate: Certify products meet or exceed specified requirements.

E. Manufacturer's Field Reports: Submit certification after installation certifying equipment has been installed in accordance with manufacturer’s instructions.

1.4 QUALITY ASSURANCE

A. Perform Work in accordance with the project plans, State, and County standards.

B. Ensure materials of construction on pump liquid end, tubing, and fittings are compatible with chemicals listed in Part 2 of this Section.

1.5 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years documented experience.

B. Installer: Company specializing in performing work of this section with minimum three years documented experience.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Inspect for damage.

B. Store products in areas protected from weather, moisture, or possible damage; do not store products directly on ground; handle products to prevent damage to interior or exterior surfaces.

1.7 CLOSEOUT SUBMITTALS

A. See Section 01 77 00 “Closeout Procedures” and Section 01 33 00 “Submittals Procedures” for closeout submittal requirements.

B. Project Record Documents: Record actual locations and final orientation of equipment and accessories. Provide solution dilution ratio and final equipment settings that were used to obtain the required chlorine residual.

C. Operation and Maintenance Data: Submit maintenance instructions for equipment and accessories consistent with Section 01 78 23 “Operation and Maintenance Data.”

1.8 SCHEDULING

A. See Section 01 32 16 “Construction Progress Documentation.”

B. Schedule work after piping changes/installation.

1.9 COORDINATION

A. Coordinate installation and start-up with Engineer.

1.10 WARRANTY

A. See Section 01 77 00 “Closeout Procedures” for warranty requirements.

B. Furnish manufacturer’s warranty for products in this section.

1.11 EXTRA MATERIALS

A. See Section 01 77 00 “Closeout Procedures” for requirements for spare parts and maintenance products.

B. Furnish one complete set of manufacturer's recommended spare parts for each type of metering pump, including but not limited to:

1. One complete rebuild kit for each type of chemical metering pump provided, to include replacement diaphragm, ball check valves, O-rings, and gaskets.

C. Furnish special tools required for equipment maintenance. Furnish list of equipment and tools needed to maintain and calibrate equipment.

PART 2 - PRODUCTS

2.1 GENERAL

A. All treatment chemicals shall be NSF 60 certified.

B. All materials coming into contact with potable water shall be NSF 61 certified, unless otherwise allowed by engineer.

2.2 CHEMICAL METERING PUMPS

A. Metering pump shall meet the following requirements:

1. Diaphragm type pump with auto prime valve.
2. Materials of Construction: Acrylic head, PVC fittings, ceramic balls, PTFE/Polyprel® seat/O-rings.
3. Output Capacity (with auto prime valve): 1.75 gallon per hour minimum.
4. Rated Pressure at Rated Output Capacity: 50 psi minimum.
5. Manual speed control.

B. Manufacturers

1. LMI PD061-A40HI
2. Engineer approved equal.

C. Metering pump accessories

1. Provide one repair and maintenance (RPM) kit: LMI RMP-A40A.

2.3 CHEMICAL STORAGE TANKS

A. 50-gallon polyethylene tank and cover.

B. Tank shall be suitable for the intended use. Metering pump shall be mounted on the tank cover.

2.4 CHEMICAL INJECTION POINTS

A. PVC construction.

B. Ball valve, check valve, and injection quill.

C. Manufacturers

1. LMI
2. Griffco
3. Engineer approved equal

2.5 CHEMICAL INJECTION TUBING

A. Clear tubing for chemical injection supplied by metering pump manufacturer, to ensure capability with chemicals used. Tubing material and size shall be per the manufacturer's recommendation.

B. Mounting brackets, miscellaneous fittings, and connections.

2.6 STATIC MIXERS

A. Static mixer shall meet the following requirements:

1. Blade style mixer
2. Schedule 80 PVC
3. 6 mixing elements
4. Male NPT pipe threads, same size as connecting pipe

B. Manufacturers

1. Koflo 2-80-4-6-2
2. Engineer approved equal

2.7 FLOW SWITCHES

A. Flow switch shall meet the following requirements:

1. Paddle type flow switch with 316 stainless steel paddle.
2. NPT connection.
3. On switch point of 16 gallons per minute (gpm) and off switch point of 11 gpm when installed in 2-inch pipe.
4. 200 psi working pressure.

B. Manufacturers:

1. Harwil Q-10N/6/NO
2. Engineer approved equal

2.8 TREATMENT CHEMICALS

A. Sodium hypochlorite:

1. 12.5% strength
2. NSF 60 certified

B. Contractor is responsible for providing sufficient quantities of chemical solution to conduct all testing requirements of this section. In addition to the quantities required for testing, contractor shall provide (1) 15-gallon container of each chemical listed in this section.

2.9 PRODUCT LIST

A. A summary of the required products is provided in the following table.

Quantity	Description	Manufacturer	Model/Capacity	Options/Accessories
1	Chemical metering pump	LMI	PD061-A40HI (1.75 gph, or approved equal)	RPM-832 spare parts kit
1	Chemical storage tank	Submit for approval	50-gallon, or approved equal	
1	Chemical injection points	Submit for approval	Submit for approval	
As needed	Chemical injection tubing	Submit for approval		Mounting brackets, miscellaneous fittings, connections
1	Static mixer	Submit for approval	Submit for approval	
1	Flow Switch	Submit for approval	Submit for approval	
As needed	Sodium hypochlorite	Submit for approval	12.5%	

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify layout and orientation of pumps, accessories, and piping connections.

3.2 INSTALLATION

A. Mount pump to chemical storage tank

B. Install piping accessories in pump suction and discharge.

C. Connect piping to pump suction and discharge.

D. Flush piping with clean water.

E. Install flow switch per manufacturer recommendations, including with recommended upstream and downstream unobstructed straight pipe requirements. Perform testing to confirm that flow switch interrupts power to chemical metering pump when now flow conditions exist. Report results of testing to Engineer per Section 01 77 00 “Closeout Procedures.”

F. Install Work in accordance manufacturer's recommendations and State of Washington requirements.

3.3 FIELD QUALITY CONTROL

A. Section 01 40 00 “Quality Requirements” and Section 01 77 00 “Closeout Procedures”: Field inspecting, testing, adjusting, and balancing.

B. Pre-operational Check: Before operating system or components, make the following checks:

1. Vent air from system to assure water in pump.

C. Start-up and Performance Testing:

1. Conduct pump calibration upon startup. Follow manufacturer's instructions. Equipment used for calibration (including calibration column) is to become property of the Owner.
2. Operate chemical metering system on clear water for continuous period of four hours, under supervision of manufacturer's representative.
3. Hydrostatically test system piping for leaks at 150 psig.

D. Equipment Acceptance:

1. Adjust, repair, modify and replace components of system failing to perform and repeat tests.
2. Make final adjustments to equipment under direction of manufacturer's representative.

3.4 MANUFACTURER’S FIELD SERVICES

A. Section 01 40 00 “Quality Requirements”: Requirements for manufacturer’s field services.

B. Furnish services of manufacturer's representative experienced in installation of products supplied under this specification for not less than one man-day on-site for installation inspection and field testing and instructing Owner's personnel in maintenance of equipment.

C. Furnish installation certificate from equipment manufacturer's representative attesting equipment has been properly installed and is ready for start-up and testing.

END OF SECTION 46 30 00

46 61 00 – FILTRATION EQUIPMENT (WATER SUPPLY)

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Iron and manganese filtration system in the treatment building, including the required appurtenances to create a functional treatment system that meets project objectives.

B. Related Requirements:

1. Section 46 30 00 “Water and Wastewater Chemical Feed Equipment (Water Supply).”

1.2 REFERENCES

A. National Sanitation Foundation (NSF International):

1. NSF 61 - Drinking Water System Components – Health Effects

B. American Water Works Association (AWWA):

1. AWWA C653 “Disinfection of Water Treatment Plants.”

1.3 SUBMITTALS

A. As specified in Section 01 33 00 “Submittal Procedures.”

B. Submit installation and arrangement drawings showing the design of the fabricated skid, including dimensions and locations of equipment. Show locations of tanks, piping, electrical equipment, pipe and valve supports, and skid anchor hold-downs.

C. Submit operations and maintenance manuals.

D. Submit shop drawings and product data for the individual pieces of equipment, components, and accessories per those equipment specifications.

E. Submit data as a single complete package for tanks, piping, structural skid or base design, valves and actuators, control panels, instrument components, power and instrumentation conduits and wiring, and other items.

F. Submit structural and or seismic anchorage drawings showing the design of the fabricated skid.

G. Certification from manufacturer(s) that products used meet standards referenced.

1.4 DELIVERY, STORAGE. AND HANDLING

A. Protect filtration equipment during handling using methods recommended by manufacturer.

B. Prevent damage to equipment during transit. Repair abrasions, scars, and blemishes. If repair of satisfactory quality cannot be achieved, replace damaged material immediately.

1.5 GUARANTEES

A. The manufacturer shall guarantee all equipment, coatings, valves, and controls for three (3) years against defects in workmanship or materials. Any part proving defective shall be replaced or repaired as per the manufacturer's recommendation within this period in accordance with this guarantee.

B. The manufacturer shall guarantee that, under actual operating conditions: (1) the media shall not be washed out of the system during the service run or backwashing period, and (2) the underdrain system, gravel and media shall not become fouled, either with turbidity or by other particles, while operating as specified by the manufacturer.

1.6 CLOSEOUT SUBMITTALS

A. As specified in Section 01 33 00 "Submittal Procedures" and Section 01 77 00 "Closeout Procedures.

B. Provide the following closeout submittals:

1. Satisfactory bacteriological test results from a certified laboratory.
2. Satisfactory full-scale pilot test results: Completed copy of the Full-Scale Pilot Test Worksheet provided at the end of this section. Including water quality test results from a certified laboratory.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. ATEC Water Systems, or engineer approved equal.

2.2 FABRICATED SYSTEM COMPONENTS

A. Filter vessels

1. The vessels shall be of electric welded pressure vessel quality carbon steel construction rated for 150 psig working pressure and hydrostatically tested at 225 psig. Heads shall be built of Grade SA-455 steel. Sidewalls shall be built of Grade SA-572 steel and tank heads and handholds shall comply with ASME Code requirements. Sidewalls and heads shall each have a thickness of at least 1/4-inch.
2. Vessels shall have stainless steel grooved coupling connections on the service inlet and outlet. Manifolds shall have a flanged connection on the system inlet and outlet.
3. Access opening for tanks shall include one 11" x 15" manhole in the top head and one 8" circular access port in lower sidewall of tank adjacent to lower head to allow for underdrain servicing and/or media removal. Support for tanks shall be structural steel angle iron legs welded to lower section of the sidewall.
4. The vessels shall be mounted to a common 4 inch by 6 inch by ¼ inch tubular steel frame (skid) with forklift brackets and four crane lifting hooks. The vessels shall be mounted so

that they can be removed individually with the use of standard hand tools and a forklift or similar lifting device.

5. Hold-down tabs with oversized ¾ " bolt holes shall be positioned at key places on the length of the skids to allow the system's attachment to the floor by anchor bolts which shall be provided by the Contractor.

B. Coatings

1. Both immersed and non-immersed steel surfaces on tanks of all diameters shall be sand blasted to a near white metal surface finish per SSPC-SP-10 finish.
2. All filter vessel and manifold immersion service surfaces shall be coated with 3M Company ScotchKote 134, an epoxy fusion coating which conforms to the requirements of NSF Standard 61 for contact with potable water. The coating shall be applied in accordance with the manufacturer's recommendations to a minimum coating thickness of 10 mils DFT (dry film thickness).
3. The exterior finish shall be applied in at least two coats and may be achieved in more than two coats. Exterior surfaces will be coated by a primer coat and application by applying a 2-3 mil DFT coat of a rust resistant primer and 1.5-2.5 mils DFT of Cardinal 6400 Series Polyurethane.
4. Touch-up paint shall be supplied for all coating systems and colors used. Paint shall be in sealed containers from the manufacturer labelled with color as well as system location applicability.

C. Internal Distribution

1. The filter system shall be a "down-flow" type with raw water entering the top of the filter, flowing through the filter tank, and coming out the bottom of the tank.
2. The upper distribution system shall be of the baffle type to evenly distribute the water over the entire tank area.
3. The lower distribution system shall be of a proven design to provide a uniform backwash flow across all the filter media. The underdrain will be constructed with the appropriate number of individual stainless steel wedge wire radial outlets with openings of not more than 0.010 inches to optimize distribution functionality. The radial arms are secured to a stainless-steel hub-base by nipples threaded into stainless steel pipe couplings welded to the hub. Each radial arm shall have adequate outlet orifices for the stated flow located beneath the wedge wire. The underdrain shall be designed to handle two times the design backwash flow rate with less than two (2) psi of head loss. The distribution system shall be embedded in a single layer sub-fill of ½" washed gravel to support the filter bed.

D. Main Operating Valve

1. The main operating valve on each tank shall be an industrial automatic multi-port diaphragm type, slow opening and closing, free of water hammer. The diaphragm assembly shall be fully guided on its perimeter when pressure activated from one position to another to assure a smooth reliable shut-off without sticking. There shall be no contact of dissimilar metals within the valve and no special tools shall be required to service the valve. The valve shall be hydraulically actuated. Valve shall be certified to ANSI/NSF 61 standard.
2. Main operating valve shall be Bermad IR-350-P or engineer approved equal.

E. Pipe and Fittings

1. Raw and treated water manifold and piping shall be Schedule 40 steel with a nominal wall thickness of 0.25" or greater. Backwash piping shall be Schedule 40 steel. Immersed

portions of manifolds shall be coated with a fusion epoxy coating, certified to NSF/ANSI Standard 61 in the same manner specified for filter vessels in Section 2.A.

2. A 2" threaded connection shall be provided on the inlet manifold near the inlet connection point.

F. Controls

1. A factory-mounted and wired cycle controller shall incorporate multi-ported pilot control valves to govern all steps of automatic backwash. Provision for manually initiated backwash shall be included as will provisions to accommodate remote initiation of backwash. The controller shall be an Alex-Tronix controller requiring a 120 or 220 VAC connection to power the local panel which controls and monitors backwash status.
2. The pilot control valves shall be pre-connected to automatically pressure activate the operating control valve through the steps of backwash and return to service. In case of power failure, a complete backwash cycle shall be started through manual operation of the pilot control valve. The control panel shall always indicate the cycle of operation.
3. The system shall be equipped with electrical lockouts to prevent more than one unit from backwashing at the same time, except when the system is manually overridden.

G. Filter Media

1. The filter media shall be NSF/ANSI Standard 61 listed manganese dioxide coated media meeting the following requirements:
   a. Mesh size: 45 to 16 U.S. Mesh (0.36 mm to 1.9 mm)
   b. Media substrate: silica sand
   c. Coating: manganese dioxide
   d. 12.5% manganese dioxide content
   e. Recommended service flow rate: 2 – 10 gpm/ft^2
   f. Recommended backwash rate: 12 – 18 gpm/ft^2
   g. Manufacturer: Vibrantz Technologies Pyrolox Advantage
2. The media shall not require regeneration to operate if sodium hypochlorite is used as the oxidant and a free chlorine residual of at least 0.5 mg/L is maintained in the filter effluent.
3. Media shall be provided by filter manufacturer.

H. Oxidation System

1. Chlorine, in the form of sodium hypochlorite solution injected in the raw water, shall be the oxidant used in this system and a free chlorine residual equal to or greater than 0.5 gm/L shall be maintained in the product water leaving the treatment system.
2. See Section 46 30 00 “Water and Wastewater Chemical Feed Equipment (Water Supply)” for additional requirements.

I. Backwash Assembly

1. A backwash assembly shall be provided by the filter manufacturer consisting of the following components:
   a. Backwash throttling gate valve
   b. Site glass
   c. Flow meter with display panel. Flow meter shall measure totalizing and instantaneous flow of water through the backwash assembly.
2. Pipe material shall be as described in Part 2 Section 1.2.E “Pipe and Fittings.”

J. Accessories

1. Liquid filled pressure gauges of ½% full scale accuracy in corrosion resistant frames shall be provided (0-160 psig) for inlet and outlet manifold of the system. Gauges shall be 4½" in diameter with surge suppression snubbers and will be mounted above the control panel.
2. Sampling ports shall be supplied for treated product water from each filter vessel as well as composite sampling ports for raw and finished water and for backwash effluent.
3. Two ¾" threaded half couplings shall be provided, one on the inlet and one on the outlet manifold for such use as the customer may consider appropriate. These shall be plugged at time of delivery.

PART 3 - PRODUCTS

3.1 EXAMINATION

A. Prior to installation, inspect and verify condition of vessels, internal distribution manifolds, valves, assemblies, piping and appurtenances. Installation constitutes installer's acceptance of product condition for satisfactory installation.

3.2 PREPARATION

A. Correct defects or conditions which may interfere with or prevent a satisfactory installation.

3.3 INSTALLATION

A. Install filtration equipment in accordance with the manufacturer's instructions.

B. Ensure filter skid is level and true to floor and existing utilities.

C. Complete pipe, electrical and pneumatic/pressurized water connections.

D. Place gravel and media in accordance with the manufacturer's instructions.

E. Properly disinfect gravel and pre-treat media in accordance with the manufacturer's instructions.

F. Install control panel and necessary electrical wiring for operation of the system.

G. Route treated water and backwash water to waste during system startup. Engineer must provide approval before treated water is routed to the potable reservoir.

H. Ensure system setup is in accordance with the manufacturer's instructions.

I. Provide assistance, including manpower to system operator and Engineer during treatment startup and full-scale pilot test.

3.4 FIELD SERVICE

A. The Contractor, water system operator, Engineer, and a factor authorized service representative shall be present for treatment system startup.

B. The services of a factory authorized service representative shall be made available to supervise, inspect and supply operator training and initial start-up as needed for initial system operation. The manufacturer's representative (factory trained) for the filter system specified herein shall be present at the jobsite for one (1) eight-hour day, travel time excluded.

C. The Contractor will verify that the system is ready for startup per manufacturer's start up requirements and provide notification at least two weeks in advance of the manufacturer's representative's scheduled visits on site.

3.5 CLEANING AND DISINFECTION

A. Cleaning

1. Clean treatment facility in accordance with AWWA C653 "Disinfection of Water Treatment Plants" before disinfecting, conducting bacteriological sampling, and treatment system startup.
2. Maintain equipment in clean condition during installation.
3. Before joining piping or other connections, thoroughly clean and wipe joint contact surfaces and then properly dress and make joint.
4. Prior to equipment testing, clean and remove grease, metal cuttings, dirt, or other foreign materials which may have entered the system.
5. At completion of work and prior to final acceptance, thoroughly clean work installed under these specifications. Clean equipment, fixtures, pipe, valves, and fittings of grease, metal cuttings, and sludge which may have accumulated by operation of system, from testing, or from other causes. Repair any damage to equipment, piping, or parts of building, its finish, or furnishings, due to failure to properly clean, without cost to the Owner.

B. Disinfection

1. Disinfect treatment facility in accordance with AWWA C653 "Disinfection of Water Treatment Plants" before conducting bacteriological sampling and treatment system startup.
2. Disinfect all piping in the treatment building.
3. Dechlorinate chlorinated discharge water in accordance with AWWA C653 "Disinfection of Water Treatment Plants" and state, county, and other applicable requirements.

C. Bacteriological Sampling

1. Contractor shall conduct bacteriological sampling in accordance with AWWA C653 "Disinfection of Water Treatment Plants" until satisfactory results have been obtained.
2. Bacteriological testing shall be performed by a certified lab at the expense of the Contractor.
3. Provide lab test results to Engineer.
4. Satisfactory bacteriological test results must be provided to the Engineer and the Engineer must give approval before treatment system startup.

3.6 FULL-SCALE PILOT TESTING

A. Full-scale pilot testing shall be conducted after satisfactory bacteriological test results are provided to the Engineer and the Engineer gives approval to commence full-scale pilot testing.

B. The Contractor, water system operator, and Engineer shall meet on site to review full-scale pilot test requirements, and for the start of pilot testing. Water system operator shall conduct the

remainder of the pilot test under the direction of the Engineer. The Contractor shall provide manpower and equipment as necessary to correct treatment system installation deficiencies (if any) identified during full-scale pilot testing.

C. Water system operator shall complete the Full-Scale Pilot Test Worksheet provided at the end of this section, including water quality test results from a certified laboratory.

D. Engineer will full-scale pilot test results. If test results are adequate as determined by Engineer, Engineer will coordinate with Contractor and water system operator to implement final treatment system settings. If test results are inadequate as determined by Engineer, Contractor shall coordinate with water system operator and Engineer to repeat Validation Testing until adequate results are obtained.

E. Contractor shall bear the cost of all testing and inspecting (including water quality lab testing), locating and remedying of leaks, and any necessary retesting and reexamination.

RE: Geotechnical Report
Parcel No. R32910-091-3750
Maxwelton Road • Langley, WA 98260
PGC Project 23014

Dear Ms. Cox:

Palmer Geotechnical Consultants, Inc. (PGC) is pleased to present this geotechnical report regarding proposed improvements at the subject property. This report was prepared in accordance with our proposal dated April 5, 2023.

We appreciate the opportunity to be of service to you. If you have questions regarding this report, please do not hesitate to call.

Sincerely,

Palmer Geotechnical Consultants, Inc.

Scott Palmer, P.E.
President

1.0 Introduction

A geotechnical report has been prepared for the design and construction of a proposed new community aquatic center at west side of the subject property, located on Maxwelton Road in Langley, Washington. The property is identified as parcel number R32910-091-3750 by the Island County Assessor and is approximately 148.51-acres, owned by the South Whidbey Parks and Recreation District. Seven hollow stem auger borings were advanced to depths ranging from 9.3 to 15.4 feet below current site grades on Thursday, July 20, 2023. Logs of the borings are provided in Appendix A.

2.0 Project Description

The project consists of constructing a new community aquatic center with associated utilities, asphaltic paving, and stormwater facilities. A report providing preliminary infiltration recommendations was provided to the design team on July 12, 2023. The new aquatic center is proposed to consist of one building, 192 feet wide and approximately 24,000 square feet (s.f.) with an asphaltic parking lot to the north. The proposed location of the facility is currently undeveloped.

Preliminary locations for the facility have been reviewed in support of this report, though no formal site plan has been developed. Additionally, no construction documents were available at the time of this report. PGC assumes construction for the buildings will be steel-framed with slab-on-grade floors and supported on shallow footings.

3.0 Scope of Services

The goal of our scope was to characterize existing subsurface conditions in the vicinity of the proposed improvements. Our services included visiting the site, observing the advancement of seven borings, and preparing this report.

4.0 Site Description and Subsurface Conditions

4.1 Surface Conditions

The proposed construction involves a single parcel identified by the Island County Assessor as parcel number R32910-091-3750. The parcel is approximately 148.51-acres and is currently partially developed to the east of the project site. The location of the proposed aquatic center was previously developed as a homestead. Indicators of the previous development include a concrete pad, septic tanks, power pole, and debris from electric fencing. The parcel has an existing administration building, sports complex, and multiple public trails. The remainder of the parcel is

covered with native deciduous and coniferous trees over a healthy understory of native bushes and shrubs. Wetlands have been delineated to the north. The parcel is approximately square in shape and undulates throughout the property.

Access to the property is along the west property boundary from Maxwelton Road and to the east from Langley Road. The parcel is bordered by developed commercial, industrial, and residential properties.

4.2 Subsurface Conditions

For this project, we observed the excavation of seven hollow stem augers utilizing a rubber track mini drill rig, operated by a third party. During advancement soils were classified and logged in accordance with the United Soil Classification System (USCS), bagged and discretely labeled to be transported to the laboratory for supplemental testing.

From the existing ground surface to depths between 0.6 and 1.2 feet below present ground (BPG) was a dark brown topsoil in all borings except B-4. This unit consisted of silty sand with gravel and organics that was loose to medium dense, moist, and dark brown in color. Beneath the topsoil, and from the existing ground surface in B-4, were 2.8 to 5.0-foot-thick units of silty sand with gravel. These units were yellow brown in color, medium dense becoming dense to very dense, and moist. Orange mottling was observed throughout. To the maximum depth explored were 4.3 to 10.0-foot-thick units of gravelly sand with varying amounts of silt to silty sand with varying amounts of gravel. these units had orange mottling in the upper reaches of the units and were very dense, moist, and gray in color. Groundwater was not observed in the test pits. Groundwater levels are expected to vary with seasonal conditions. See the exploration logs in Appendix A for additional information.

The Geologic Map of the Langley and Western part of the Tulalip 7.5-minute Quadrangle, Island County, Washington, published by the Washington State Division of Geology and Earth Resources (Schasse, et. al., 2009), maps the site surface geology of the parcel as Pleistocene Vashon Stade Till (Qgt_v). Qgt_v is generally described as overconsolidated and unsorted varying amounts of clay, sand, silt, boulders, and gravel. Layers of advance outwash sand and ablation till are located throughout this deposit. This unit is massive to thick and forms vertical slopes.

United States Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) online Web Soil Survey maps the soils of the project area as Utsalady-Uselessbay complex, 0 to 5 percent slopes.

The Utsalady complex is composed glacial outwash with more than 80 inches to a restrictive feature with a high to very high permeability. The Hydrologic Soil Group is A with a land capability classification of 4s. The Uselessbay complex is composed of glacial outwash with 20 to 39 inches to a restrictive feature with very low to moderately low permeability. The Hydrologic Soil Group is A/D with a land capability classification of 4s.

Soil conditions encountered in the field consist of gravelly sand to sand with varying amounts of sand, gravel, and silt. These conditions are typical of native and fill deposits in the region and are consistent with area geology sources.

4.3 Groundwater Conditions

During our exploration, a distinct groundwater surface representative of saturated flow in the phreatic zone was not encountered in any of the exploration locations. Mottled soils were observed during our exploration as described in Section 4.2. Mottled soils and low chroma colors generally indicate wetting and drying cycles that occur in the upper soil column from surface water and fluctuating interflow are transmitted through stratigraphic variations of permeability.

The project scope did not include any long-term measurement of groundwater level conditions. If ongoing groundwater level conditions are desired a direct monitoring program conducted during the wet months, from October to May should be undertaken. It should be understood that water level conditions within the soil column may fluctuate in conjunction with stratigraphic permeability variations.

A Department of Ecology search within the immediate vicinity of the subject property indicates observed static water levels at depths from 22.0 to 210.0 feet BPG on properties with similar elevations to the project site. Existing wells located within the property have Department of Ecology (DOE) Well Tag Number (WTN) of AGA-524 with an observed static water level of 192.0 feet BPG, WTN BPA-499 has an observed static water level of 34.2 feet BPG.

5.0 Conclusions

Based on our review of available data, soil conditions encountered during exploration, laboratory testing, and our analysis, we believe the site is suitable for the proposed improvements.

The proposed construction should be appropriately designed utilizing the recommendations set forth below.

6.0 Site Development Recommendations

6.1 Site Preparation

Initial grading shall include the removal of all vegetation within proposed construction areas. The actual depth of stripping should be reviewed by the Project Geotechnical Engineer of Record at the time of construction, with expected minimum stripping depths between approximately 0.6 to 1.5 feet to remove topsoil and organics. Subgrade preparation depths within the vicinity of foundation elements should be a minimum of 4.0 BPG, depending on location. Depths could vary from the recommended depths to approximately 1.0 feet if a significant amount of time lapses from the writing of this report.

All vegetation, trees and roots larger than ¼-inch diameter or any accumulation of organic matter that will result in an organic content of more than 3 percent should be removed and not used as engineered fill. Roots larger than ¼-inch diameter should not be disced into the soils. These materials should be raked and hand-picked, as necessary, to ensure proper removal of organic materials.

Any areas proposed for structural fill should be relatively level with appropriately prepared subgrade soils.

6.2 Construction Considerations

The near-surface fine-grained soil at the project site is easily disturbed during wet weather and may become difficult to work with. Haul roads and staging area improvements will be necessary for support of construction traffic during the rainy season or when the moisture content of the subgrade soil begins to elevate, generally within a few percentage points above optimum. If not carefully executed, site preparation and excavation activities can create extensive soft areas. Earthwork should be planned and executed to minimize subgrade disturbance if site improvements are performed during wet weather months. The thickness of the haul roads and staging areas should be selected by the contractor. Haul roads subjected to repeated construction traffic may require a minimum of 18 inches of imported granular material. For light staging areas, 12 inches of imported granular material may be required. We recommend that imported granular material for haul roads and staging areas consist of durable crushed rock that is well graded with less than 8 percent by dry weight passing the U.S. Standard No. 200 sieve.

6.3 Erosion Control

The on-site soil is susceptible to erosion. Thus, we recommend that all efforts are made to limit construction during periods of wet weather. However, if construction occurs during wet weather,

erosion control measures should be implemented prior to construction and all steep slopes should be covered with straw matting or loose straw and that all slope surfaces be planted as soon as practical to minimize erosion. Surface water runoff should be collected and directed away from slopes to prevent water from running down the slope face. Erosion control measures such as truck tire washers and temporary detention and settling basins should be used in accordance with local and state ordinances.

6.4 Drainage

Footing drains should be installed outside the footing at the lowest portion of the foundation elements. Footing drains should be installed in such a manner to prevent backflow from other drainage sources. Drainage from footing drains and roof tightlines should be collected in separate systems. Each could discharge to a Low Impact Development Feature (LID) discharging at least 10 feet from any foundation element.

PGC recommends ensuring that the connections are watertight and sealed and routine maintenance is conducted along the length of pipe. PGC also recommends that an annual inspection program is initiated to ensure no damage or disconnect of the pipe, or its accessories occurs.

If rain gardens are selected, PGC recommends either PGC designs the rain gardens, or a licensed civil engineer or landscape architect is contacted.

6.5 Structural Fill

Structural fill includes fill proposed for use beneath foundations, slabs, pavements, any other areas intended to support structures, or within the influence zones of structures. Structural fill shall be free of organic matter and other deleterious material and, in general, should consist of a maximum particle size no larger than 3 inches in diameter. Recommendations for suitable fill material are provided in the following sections.

6.5.1 On-Site Native Soil

The on-site native soil may not be suitable for use as structural fill. Due to the variability of fines content, our experience, and laboratory testing, the on-site soil will be sensitive to small changes in moisture content and may be difficult, if not impossible, to compact adequately during wet weather or when its moisture content is more than a few percentage points off optimum. However, this soil may require extensive wetting if it is used as structural fill.

We recommend using imported granular material for structural fill if the appropriate moisture content of the on-site soil cannot be achieved.

6.5.2 Imported Granular Material

Imported material can be used as structural fill. Imported structural fill material should conform to Section 9-03.14(2), Select Borrow, Section 9-03.9(3) Crushed Surfacing Base Course or Crushed Surfacing Top Course as outlined in the most recent edition of the State of Washington Department of Transportation *Standard Specifications for Road, Bridge, and Municipal Construction (WSDOT Standard Specifications),* or approved equal verified by the geotechnical engineer of record.

Trenches and other areas proposed for the waterline should be backfilled utilizing material that conforms to Section 9-03.12(3) Gravel Backfill for Pipe Zone Bedding as outlined in the most recent edition of *WSDOT Standard Specifications*.

All granular material must be durable such that there is no degradation of the material during and after installation as structural fill. The percentage of fines can be increased to 12 percent if the fill is placed during dry weather and provided the fill material is moisture conditioned, as necessary, for proper compaction. The material should be placed in lifts with a maximum uncompacted thickness of 8 inches and compacted to not less than 95 percent of the maximum dry density, as determined by ASTM D 1557. During the wet season or when wet subgrade conditions exist, the initial lift should have a maximum thickness of 15 inches and should be compacted by rolling with a smooth-drum, non-vibratory roller.

6.6 Slab and Pool Underlayment

Structural slabs and pool areas should have select fill placed and compacted prior to concrete placement,

6.6.1 Slab underlayment (internal building areas)

If internal areas (such as offices and common areas) are to have floor coverings, PGC recommends the installation of slab underlayment consisting of a capillary break. We recommend the installation of 6 inches of crushed rock containing less than 5 percent by weight passing the No. 200 U.S. Sieve under a sheet of 12 mil (visqueen) plastic sheeting under 4 inches of ASTM-33 sand or approved equal.

6.6.2 Slab underlayment (pool areas)

To provide better long-term performance we recommend that the areas of the pool are over-excavated 12 inches and 12 inches of structural fill conforming to Section 6.5.2 is placed and compacted.

7.0 Foundation Design Recommendations

The site is expected to be underlain by medium dense becoming very dense gravelly sand with silt to silty sand with gravel. Subsurface conditions within the vicinity of TP-4 provided the most favorable conditions for infiltrations. Locations with a higher fines content will be difficult to work with in extreme dry or wet conditions. Any areas receiving fill or with recompacted soils should extend a minimum of 1.0 feet outside the foundation element.

We conclude that the proposed construction improvements for the new buildings can be supported on shallow footings.

7.1 Spread Footings

We recommend that footings be designed with a minimum depth of 24 inches and a minimum width of 18 inches. An allowable bearing capacity of 3,500 psf may be used for design assuming a total settlement of 1-inch and differential settlement of ½-inch in 50 feet. A one-third increase in allowable bearing pressure is also typical for such systems when resisting short-term loads such as wind and seismic forces.

Lateral loads can be resisted by passive pressure against buried portions of the footings, retaining earth walls for the daylight basement, and sliding resistance between the bottoms of the footings. Table 1 below provides our recommended allowable soil parameters for shallow foundation design.

Table 1. Soil Parameters

Parameter	Value	Factor of Safety
Allowable Bearing Capacity	3,500 psf	3.0
Active – Free to Rotate*	37 pcf	1.0
Active – At Rest*	56 pcf	1.0
Passive	195 pcf	2.0
Soil Frictional Coefficient	0.35	1.5

*Permanent, below-grade walls should be designed for an additional uniform lateral pressure of 9H psf for seismic loading, where H is the depth embedded.

These values assume footings are backfilled with native soils or structural fill. The upper 18 inches of soil should be ignored unless the area is paved or covered with concrete due to soil disturbance associated with freeze/thaw action.

Sliding resistance between subgrade soils and foundations value assumes concrete placed directly on the subgrade.

7.2 Pavement Section Recommendations

To perform pavement section design calculations, PGC estimated traffic counts based upon the proposed size of the facility proposed parking lot. PGC anticipates approximately 150 parking spaces with lanes of travel in between, as well as moderate to heavy use depending upon the season. PGC assigned traffic loading values of approximately 116,733 (18-kip ESALs) for automobiles, delivery trucks, service trucks and aid vehicle access. We recommend assumed design ESALs are utilized as a minimum and that they be verified by the design team to ensure the most appropriate criteria is applied.

Calculations were performed per AASHTO Flexible Pavement Design methods, with the following standard input parameters:

Table 2. Parameters used for pavement design

Pavement Design Life	20 Years
Terminal Serviceability Index	2.0
Reliability	95
Expected Growth Rate	2.0%
Subgrade CBR Value	10

Based upon the above data and input parameters, PGC provides the following minimum roadway section design:

- Subgrade shall be proof-rolled to confirm that it contains no soft or deflection areas.
- A minimum of 4 inches of crushed surfacing base course (CSBC) in accordance with WSDOT Standard Specification 9-03.9(3) shall be placed in two lifts and compacted to 95 percent of its dry density.
- A minimum of 4 inches of Hot Mix Asphalt (HMA) in accordance with WSDOT Standard Specifications

7.3 Preliminary Infiltration Recommendations

In compliance with the 2014 SWMMWW, updated 2018, PGC performed a grain-size analysis on select samples obtained during our field investigation. The results of laboratory analysis performed on selected soil samples are presented below in Table 3.

PGC understands infiltration facility design is in the preliminary stages and is proposed to be underground within the vicinity of the test pits. Typical conditions below a layer of topsoil, consist of gravelly silty sand, silty gravelly sand, and silty sand with varying amounts of gravel that is very dense with low to moderate permeability. The exception are the soils within the vicinity of TP-4 where soils were of medium density with no orange mottling below 2.0 feet BPG. No seepage or groundwater was observed in any location. A distinct restrictive layer was observed during exploration in all test pits except TP-4 beginning at approximately 2.0 to 4.0 feet BPG depending on location. The fines content within the restrictive layer was between 22.8 to 42.5 percent, and soil density was dense becoming very dense with depth and orange mottling was observed throughout. Therefore, rates applied for design of systems should use a value corresponding to the restricting conditions.

For design purposes, PGC recommends a preliminary K_{sat} infiltration rate of *1.5 in/hr* in all locations. Final design should also take into account the effect of seasonal high groundwater. Based on observations of mottling and soil coloration patterns, typical winter season perched interflow may be affected by the complex hydrostratigraphy of the near-surface soils and prevalence of overconsolidated soils that temporarily perch interflow, at least for an undeveloped and uncontrolled site condition. Therefore, due to the proposed improvements at the site, perched water conditions should be anticipated.

Table 3. Summary of Grain Size Analysis Method and Long-Term Infiltration Rate (LTIR)

Sample ID	Depth (BPG) (feet)	USCS Class	Fines %	D_{10} (mm)	D_{60} (mm)	D_{90} (mm)	CF	K_{sat} (in/hr.)	Moisture Content %
TP-1 @ 4.7'-4.9	4.7'-4.9'	**SM**	42.5	0.018	0.997	3.0	0.324	**1.7**	6.8
TP-2 @ 3.8'-4.0'	3.8'-4.0'	SM	17.2	0.044	1.820	18.0	0.324	**4.1**	12.3
TP-3 @ 4.8'-5.0'	4.8'-5.0'	**SM**	29	0.026	1.401	7.0	0.324	**2.9**	15.6
TP-4 @ 2.4'-2.6'	2.4'-2.6'	SM	12.4	0.060	1.747	22.0	0.324	**4.9**	3.1
TP-4 @ 4.2'-4.4'	4.2'-4.4'	**SM**	12.9	0.028	1.556	20.0	0.324	**4.4**	4.1
TP-4 @ 6.3'-6.5'	6.3'-6.5'	SM	16.3	0.046	1.268	3.6	0.324	**6.5**	15.2
TP-5 @ 3.8'-4.0'	3.8'-4.0'	**SM**	24.2	0.031	1.388	13.0	0.324	**3.2**	3.8
TP-5 @ 4.8'-5.0'	4.8'-5.0'	SM	22.8	0.033	1.248	11.0	0.324	**3.6**	4.5

While potentially variable horizons that are low to moderate in fines content and the interpreted presence of shallow seasonal interflow should be incorporated into the site-appropriate design of the infiltration facilities, PGC observed the soil conditions were generally uniform in the test pit locations below the topsoil.

The preliminary K_{sat} rate is based upon the most restrictive conditions observed during excavation. If actual infiltration rates are desired for design, a Small-Scale Pit Test (PIT) will likely need to be performed in the vicinity of the proposed facilities. Additionally, PGC recommends we be contacted to review design plans and specifications, to ensure design of the proposed stormwater facilities are consistent with the content and intent of recommendations presented herein. PGC may be contacted for additional consultation toward facility design at the request of the client and design engineer.

7.4 Wet weather conditions

If unstable conditions are encountered due to wet weather, windrowing, or mixing with dry materials may be required. In some cases, a sacrificial lift of unsuitable material may need to be used to cap the fill and removed later to continue fill process during more suitable weather conditions.

8.0 Seismic Design Criteria

The *Liquefaction Susceptibility Map of Island County* (Palmer et al., 2004) indicates that there is a very low (Site Class C) for liquefaction on the parcel in the vicinity of the proposed construction. All structures should be designed according to criteria outlined by the latest edition, at the time of construction, of the International Code Council® for Site Class C.

9.0 Construction Observation

We recommend that PGC is retained to review final design plans and to ensure conformance with our recommendations. Satisfactory earthwork and foundation performance depends to a large degree on the quality of construction. Subsurface conditions observed during construction should be compared with those encountered during the subsurface explorations. Recognition of changed conditions often requires experience; therefore, qualified personnel should visit the site with sufficient frequency to detect whether subsurface conditions conform or have changed significantly from those anticipated.

10.0 General Comments

The analysis and recommendations presented in this report are based upon the data obtained from our exploration locations, available public records, and from other information and sources discussed in this report. This report does not reflect variations that may occur between known data points, across the site, or due to the modifying effects of construction or weather. The nature and extent of such variations may not become evident until construction begins or is completed. Should variations appear that differ from the data and recommendations contained within this report, PGC should be immediately notified so that further evaluation and supplemental recommendations can be provided. PGC is not responsible for ensuring that other members of the project team implement our recommendations.

The scope of our services does not include services related to construction safety precautions or dewatering operations. Our recommendations are not intended to direct the contractor's methods, techniques, sequences or procedures, except as specifically described in our report for consideration in design.

Within the limitations of scope, schedule, and budget, our services have been executed in accordance with the generally accepted practices. This report has been prepared for the exclusive use of our client and their representatives for specific application to the project discussed and has been prepared in accordance with generally accepted geotechnical engineering practices in this area at the time this report was prepared. This report may not be relied upon by third parties or for

other sites.

No warranties, either expressed or implied, are intended or made. Site safety and dewatering requirements are the responsibility of others. In the event that changes in the nature, design, or location of the project as outlined in this report are planned, the conclusions and recommendations contained in this report shall not be considered valid unless PGC reviews the changes and either verifies or modifies the conclusions of this report in writing.

If you have questions concerning this letter, please feel free to contact me at 360.929.5676.

Sincerely,

Palmer Geotechnical Consultants, Inc.

1. Introduction

1.1 Water System Overview

The South Whidbey Parks & Rec District water system (the System) is a group A Transient Non-Community (TNC) water system owned by the South Whidbey Parks and Recreation District (the District) and operated by licensed satellite management agency (SMA) NW Natural (formally King Water Company). The System is located in South Whidbey Community Park (the Park) on the south end of Whidbey Island in Island County, Washington, approximately three miles northwest of the town of Clinton.

The System is currently approved by the Washington State Department of Health (DOH) to serve up to four non-residential service connections. According to its Water Facilities Inventory (WFI) form, the System is currently serving four non-residential service connections and approximately 37,000 users per year. A summary of the System's contact information, source information, connections, and service population is provided in the WFI form included in **Appendix A**.

1.2 Project Overview

The District is planning the development of an aquatic center which will house a public pool and other recreation facilities. This report describes water system improvements needed to support the planned development. The identified improvements to fully support the proposed aquatic center include:

- 99,000-gallon dedicated reservoir to support domestic and fire flow needs
- Reservoir fill line
- Distribution piping from the reservoir to the aquatic center
- Water quality treatment

The location and elevation of the reservoir will allow the aquatic center to be gravity fed, so no new pumping facilities will be required. Construction of the actual aquatic center is not covered under the scope of this report. A brief overview of the project scope is provided in **Sections 1.2.1** through **1.2.4.**

Figure 1 shows the site and vicinity, along with select elements of the existing water system and proposed improvements.

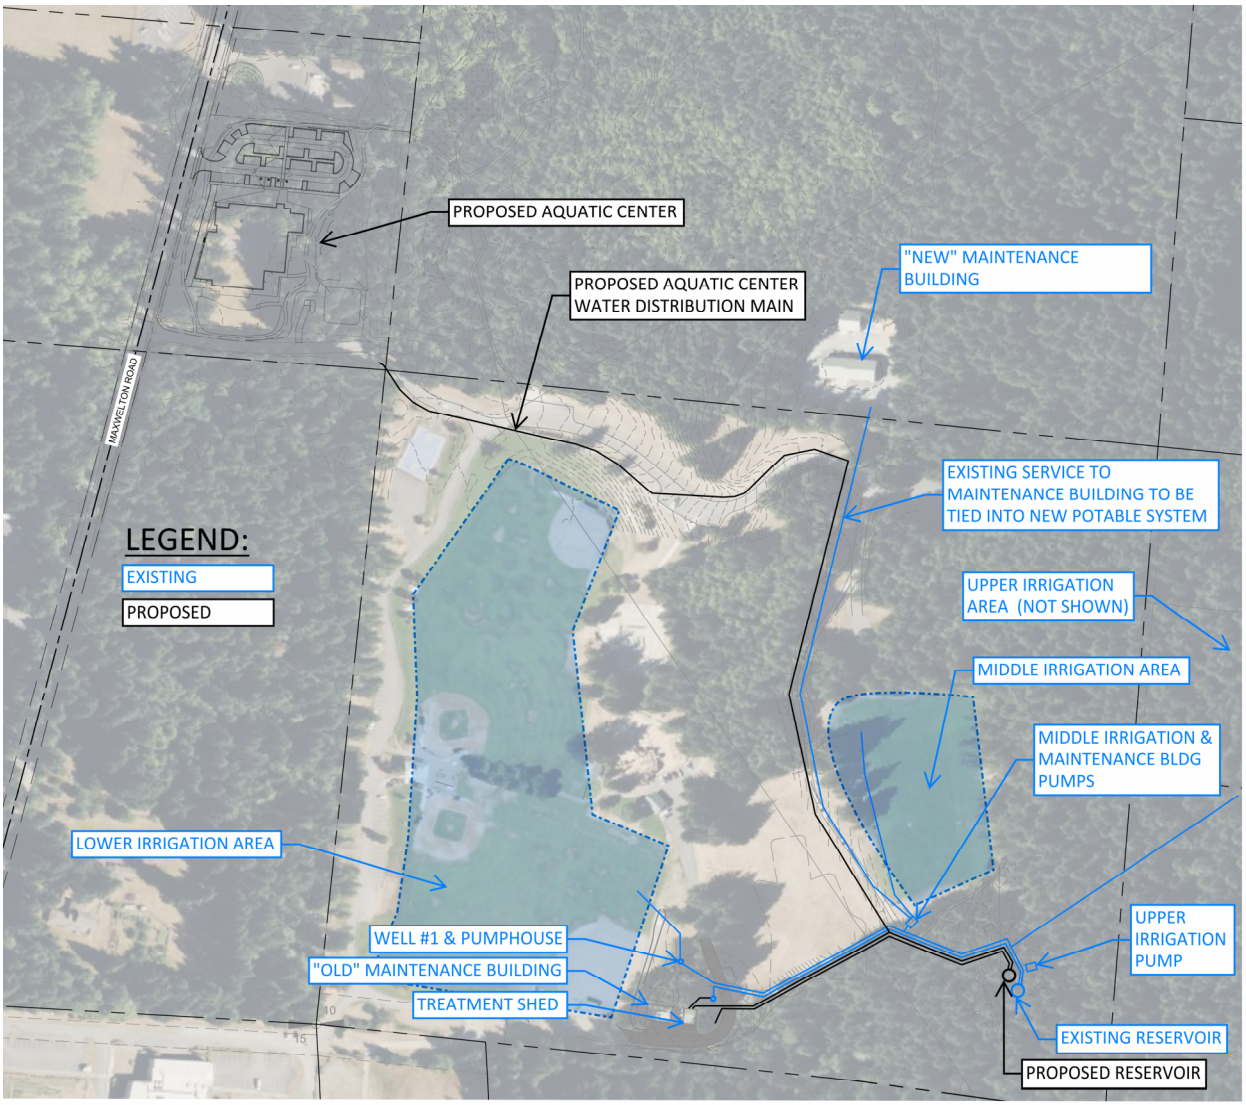

Figure 1. Vicinity Map and System Overview

1.2.1 System Capacity

The aquatic center will increase the System's water demand. A capacity analysis was prepared to demonstrate the System has adequate capacity to meet the increased water demand associated with the aquatic center. That capacity analysis is included in **Section 5**.

1.2.2 System Improvements: Storage Reservoir

The System has an existing reservoir which provides storage for both domestic and irrigation needs at the Park. A new reservoir is proposed to provide a dedicated storage tank for domestic and fire flow demands of the aquatic center. The existing storage reservoir (hereafter referred to as the irrigation reservoir) will mainly serve the park's irrigation system. The proposed reservoir (hereafter referred to as the storage reservoir) will provide storage for only the park's domestic and fire flow demands.

1.2.3 System Improvements: Watermains

A 12-inch HDPE watermain is proposed to provide water to the Aquatic Center site. This watermain is sized for domestic service, hydrant fire flow, and a fire sprinkler system in the aquatic center.

An 8-inch HDPE watermain is proposed to provide water near the older maintenance buildings. This watermain is sized for hydrant fire flow and could be extended for future use to serve a proposed campground.

1.2.4 Well Pump Replacement and VFD Controls

The submersible well pump in the System's active well was installed approximately 35 years ago. To ensure proper performance for future use, the well will be refurbished and the pump will be replaced with a new, 3-phase submersible pump and motor controlled by a variable frequency drive (VFD).

1.2.5 System Improvements: Treatment

1.2.5.1 Description of the Problem

The System's active source is a groundwater well which produces water with iron and manganese concentrations above the secondary Maximum Contaminant Levels (MCL). The District desires to provide treatment to reduce the levels of iron and manganese in the water delivered to the proposed aquatic center.

Iron and manganese are naturally occurring metals in groundwater and are currently classified as secondary drinking water contaminants by the Environmental Protection Agency (EPA), meaning they are regulated for aesthetic reasons such as taste, odor, and discolored water which can stain plumbing fixtures like bathtubs and sinks.

There are also emerging concerns regarding possible negative health effects from elevated levels of manganese in drinking water. Manganese is currently being considered for possible inclusion as a primary drinking water contaminant, which are regulated for their potential adverse effects on human health.

The secondary maximum contaminant levels (SMCLs) for iron and manganese are 0.3 mg/L and 0.05 mg/L, respectively. These SMCLs were established by the EPA and are enforced by the DOH in Washington. Laboratory test results for raw water samples from the System's active well are summarized in **Table 1**. Raw water concentrations exceed the SMCL for both iron and manganese.

Table 1. : Raw Water Iron and Manganese Concentrations

Analyte	Concentration (mg/L)	SMCL (mg/L)
Iron	1.21	0.3
Manganese	0.201	0.05

1.2.5.2 Proposed Solution

To reduce the concentrations of iron and manganese in the water produced by the System's well, it is proposed to install a manganese dioxide adsorption treatment system. A sodium hypochlorite chemical feed system will be provided to oxidize the iron and manganese and maintain the oxidative state of the catalytic media. The treatment system will be installed in an existing maintenance building (hereafter referred to as the treatment building) located near the System's active well. Finished water quality targets for iron and manganese are 50% of the SMCLs or 0.15 mg/L for iron and 0.025 mg/L for manganese.

2. Existing System Configuration

The water system currently consists of two wells, a concrete reservoir, pressurized and gravity fed potable water distribution systems, and three different irrigation zones. The potable water system appears to be properly isolated from the irrigation systems by backflow prevention devices.

2.1 Existing System Schematic

A schematic diagram of the existing System is provided in **Figure 2**.

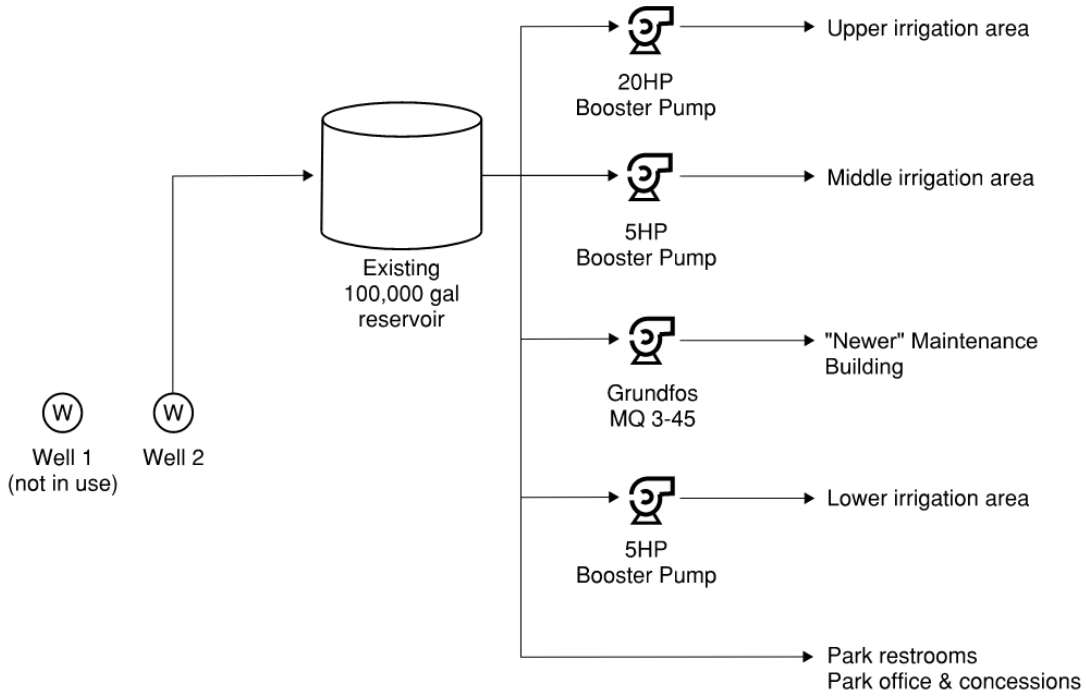

Figure 2. Existing Water System Schematic

2.2 Sources

The system's primary well is Well #2, installed in 1990 and capable of providing 120 gallons per minute (gpm) with a 15-horsepower (hp) Goulds 100H15 submersible pump. This well is currently listed as S01 on the Water Facilities Inventory (WFI). A copy of the well log and the WFI is provided in **Appendix A**. The WFI lists two more wells, a secondary emergency water source Well #1 (S02) and an inactive Well #3 (S03). The WFI lists the production of Well #1 as 50 gpm. Well #1 is currently not in use and is disconnected from the gravity distribution system. Another well previously installed near the proposed aquatic center (previously listed as Well #3) has been decommissioned.

Source information is summarized in **Table 2**. Copies of the well logs are provided in **Appendix A**.

Table 2. Well Parameters

Parameter	Well #2 (Primary)	Well #1 (Emergency)
Source (WFI)	S01	S02
Drill Date	4/2/1990	No data
Well Tag ID #	AGA 524	AGA 525
Current Well Production (gpm)	120	50
Water Right Qi (gpm)	60	60
WFI Listed Capacity (gpm)	120	50
Depth (feet)	308	200
Casing Diameter	6"	6"
Well Head Elevation	200'	200'
Screened Interval	299-308'	no data
Static Water Level	192'	no data
Pump Test (gpm)	50	no data
Drawdown (feet)	9.5	no data
Yield (gpm/foot of drawdown)	5.3	no data

2.3 Storage

The well pump for Well #2 is connected to a 3-inch polyvinyl chloride (PVC) dedicated reservoir fill line that top-fills the system's reservoir. The reservoir volume is 100,000 gallons and is located at an elevation of approximately 275 feet. The concrete reservoir is 30 feet in diameter and 20 feet tall. The reservoir was installed in 1993 and was lined in 2003 to address a leak. Float level switches at the reservoir control the operation of the well pump.

2.4 Distribution System

An 8-inch C900 PVC line leaves the bottom of the reservoir, then tees to feed a pump house adjacent to the reservoir and heads downhill paralleling the reservoir fill line.

The pump house adjacent to the reservoir houses a 20-HP pump that is used to irrigate the upper soccer fields. The pump discharge line contains a backflow prevention device which isolates the upper irrigation system from the potable water system. The irrigation pump and irrigation zones are manually controlled.

The 8-inch C900 PVC line also feeds a small pump enclosure that contains a 5-HP irrigation booster pump and a Grundfos MQ 3-45 variable speed drive booster pump (Grundfos pump). The 5-HP irrigation booster pump supplies water to the mid soccer fields. The pump's discharge line contains a backflow prevention device which isolates the mid irrigation system from the potable water system. The irrigation pump and irrigation zones are manually controlled. The Grundfos pump supplies water to the newer maintenance office building via a 2-inch PVC pipe. The Grundfos pump is set to maintain a discharge pressure of 40 psi.

The 8-inch C900 PVC line terminates at a valve cluster that feeds the lower pump house. This pump house contains Well #1 and a 5-HP booster pump that is used to provide irrigation water on the lower baseball fields. When irrigation is needed in this zone the pump is activated to provide additional pressure for proper sprinkler head operation. The irrigation laterals are protected by a backflow prevention device installed shortly after the line tap of the potable distribution piping.

A 6-inch PVC pipe leaves the lower pumphouse to feed the concession stand and restrooms via gravity. A 1-inch and 2-inch PVC pipe services the restrooms and concession stand from the 6-inch PVC line, respectively.

3. Water System Planning

The existing water system is registered with the Washington State Department of Health (DOH). The system is known as the South Whidbey Parks and Rec District Water System and was assigned a Public Water System Identification Number of 02660 E. The system currently has a Green Operating Permit, which indicates that the system is adequate for the existing connections.

This report includes a capacity analysis of the existing park water system and documents water system improvements needed to support the development of a new aquatic recreation center with community pools, wellness/physical therapy/rehabilitation center, and gym near the park's entrance from Maxwelton Road. Construction drawings for water system improvements to support the aquatic center are included in **Appendix D**.

The treatment system will be sized to support the System's domestic demand only; water used for irrigation will not be treated. A nominal design capacity of 35 gpm was selected for the treatment system. This capacity is sufficient to meet domestic demand as demonstrated in **Section 5.7**.

4. System Improvements Summary

Proposed improvements to the water system include new treatment improvements, a new potable water storage reservoir, and distribution improvements to existing and proposed potable water points of use.

4.1 Storage Reservoir

This project proposes preservation of the existing 100,000-gallon concrete reservoir and construction of a new 99,000-gallon concrete reservoir in the same vicinity. The existing reservoir will maintain its existing configuration of storing untreated (raw) water from Well #2 prior to use by the park's existing irrigation system. The proposed reservoir will be used for storage of treated, potable water from Well #2, for use at the proposed aquatic center. More information on storage capacity is included in **Section 5.8** and **Appendix B**.

4.2 Site Piping

System piping improvements are proposed to convey raw water from Well #2 to the new treatment equipment, treated water from the treatment facility to the proposed potable water reservoir, and distribution piping from the proposed reservoir to the aquatic center. More information on proposed site piping improvements is included in **Section 5.8**.

4.3 Well Pump Replacement and VFD Controls

The existing submersible well pump in Well 2 will be replaced with a new, three-phase submersible well pump and motor. The motor will be controlled with a VFD pump controller. The VFD will enable the well to pump at 120 gpm into the irrigation reservoir or 35 gpm through the proposed treatment system and into the proposed storage reservoir. When pumping at 35 gpm through treatment, the VFD will reduce the motor speed to only provide adequate pressure to maintain this lower flowrate. VFD controllers are a more energy efficient method of providing flow control than a throttling valve. Information on the proposed well pump is provided in **Table 3** and product information, including a pump curve, is included in **Appendix E.**

Table 3. Proposed Well Pump and VFD Information

Parameter	Value
Nominal Head	360 feet
Nominal Pumping Rate	160 gpm
Operating Point	120 gpm @ 350 ft head, 96% VFD motor speed
Phase	3
Voltage	230 or 430
Motor Horsepower	15
Motor Diameter	6"

4.4 Treatment

A 35-gpm manganese dioxide-adsorption treatment system is proposed to remove iron and manganese from Well #2 raw water.

4.5 Proposed System Schematic

A schematic diagram of the proposed water system is provided in Figure 3.

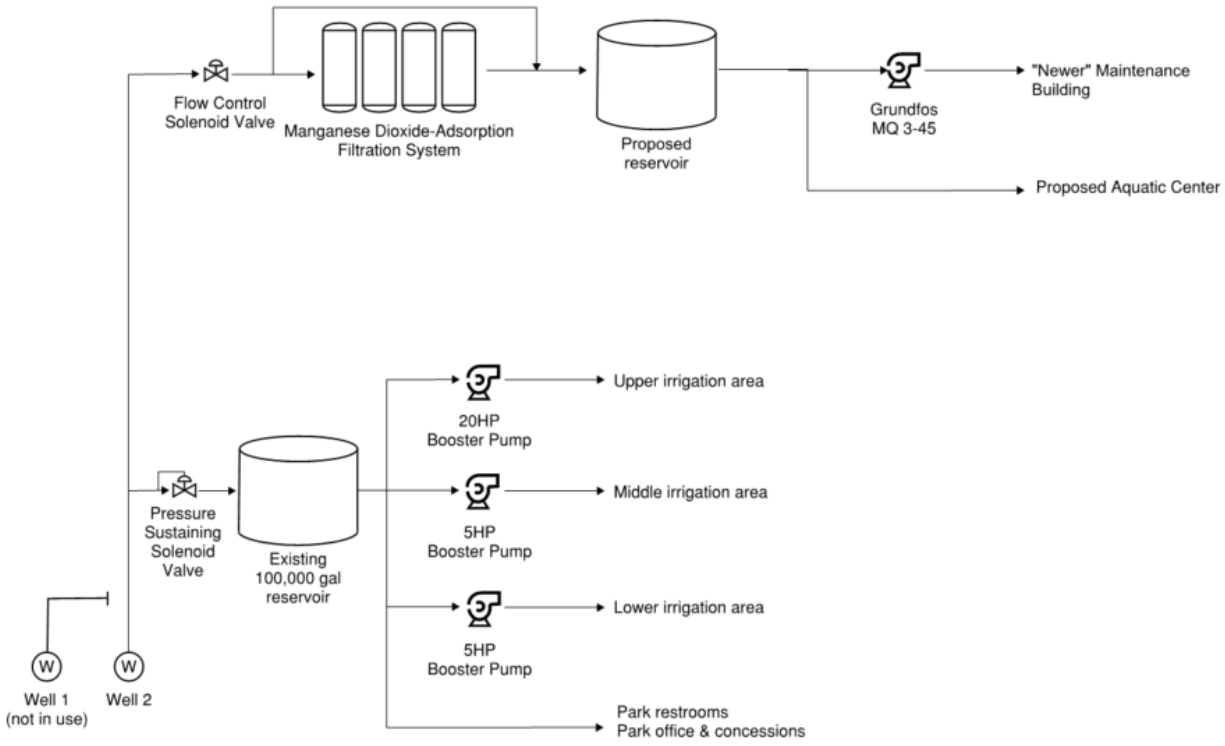

Figure 3. Proposed Water System Schematic

4.6 Construction Plans

Construction plans for the proposed improvements are included in **Appendix** D**.**

5. Capacity Analysis

5.1 Overview

This capacity analysis demonstrates the System has the legal and physical capacity to serve the proposed aquatic center, in addition to existing demands. Capacity analysis calculations are summarized in this section and provided in full in **Appendix B**.

To determine the overall capacity of the System, the capacity of each system component was determined individually. The following legal and physical capacities were determined.

Legal Capacities: *Water Rights*

Physical Capacities: Source, Storage, Treatment, and Distribution

This capacity analysis considers the demands of all water uses in the system (existing and proposed) with respect to water rights and source capacity. The capacities of the proposed storage reservoir, treatment system, and potable water distribution system are considered with respect to existing and proposed domestic and identified fire flow needs only.

This project proposes to create a separate reservoir and distribution system for the aquatic center. Storage capacity of the existing reservoir is therefore not addressed in this report.

5.2 Connections

To support the proposed aquatic center improvements, the system needs to demonstrate adequate capacity for the following connections:

Table 4. Water System Connections

Existing	Proposed
Old maintenance building Park restrooms Park office/concessions building New maintenance building Irrigation zones (upper, middle, lower)	Aquatic center

5.3 Water System Demand

Monthly water usage data from 2011 through 2015 was provided by the system. System water usage from 2015 through present is not available. The water usage data is provided in **Appendix B**. The water system usage is seasonal, with most of the usage occurring during summer irrigation. system typically has little water usage from November through February when three maintenance staff are the primary users. The development of the aquatic center will change the seasonal usage trends.

The capacity analysis for the existing facility is based on a summer usage scenario using data from 2011 through 2015. **Figure 4** shows the monthly water usage for the system from 2011 to 2015.

The annual average day demand (ADD) for the existing system is 31,000 gallons per day (gpd). The summer ADD is approximately 90,000 gpd. The ADD during non-summer months is approximately 7,000 gpd.

The maximum month average daily demand (MMADD) is 110,000 gpd. Since the majority of the sites water usage is due to irrigation demands an alternative method of determining the MDD was used. The standard method of multiplying the MMADD by a factor of 1.65, resulting in the MDD exceeding the physical capacity of the well pump, so this method was not valid. The anticipated maximum daily demand (MDD) was determined by multiplying the non-irrigation MMADD demands by a factor of 1.65. The irrigation demands were multiplied by 7/5 to represent irrigation for 5 days of a 7day week since irrigation is manual operation by park staff. Using this method the MDD for the existing facility is approximately 156,000 gpd.

Peak Hour Demand (PHD) determination is discussed in **Section 5.4.3**, including determination of PHD for existing uses.

Water System Demands for the developed site, inclusive of existing demands plus proposed aquatic center is discussed in **Section 5.4**.

Table 5. Existing System Demand Summary

Parameter	Value
ADD (annual)	31,000 gpd
ADD (summer)	90,000 gpd
ADD (domestic/non-irrigation)	7,000 gpd
MDD (estimated)	156,000 gpd
PHD (irrigation)	225 gpm
PHD (domestic/non-irrigation)	50 gpm

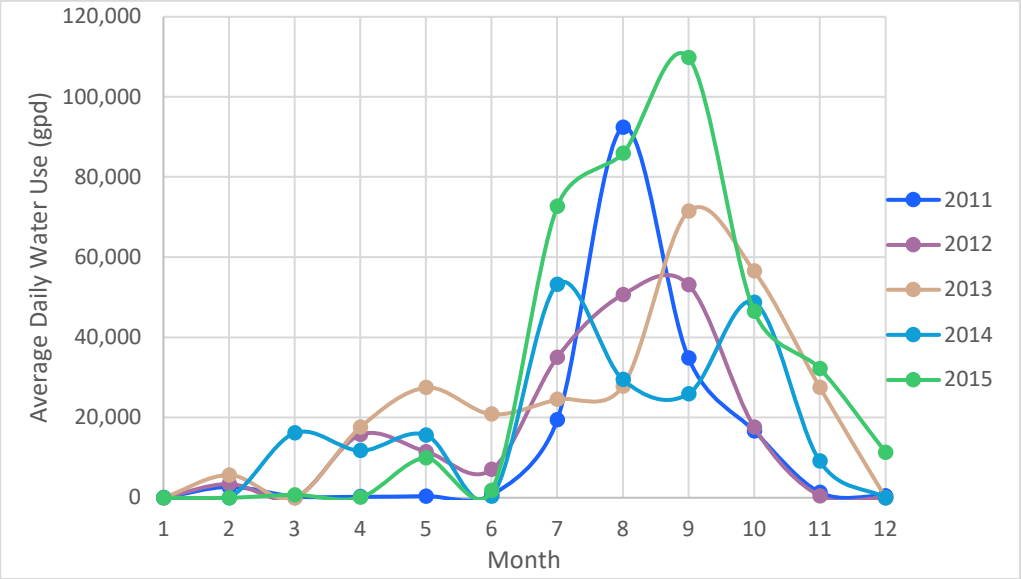

Figure 4. 2011-2015 Average Daily Water Use Per Month

5.4 Proposed Water System Demand

5.4.1 Maximum Day Demand (MDD)

The aquatic center will likely have fairly consistent usage throughout the year, since this system will not have irrigation system demands. The aquatic center MDD was estimated based on the anticipated number of aquatic center users, staff, and pool maintenance water requirements. The maximum number of users of the aquatic center is approximately 1,000 people including staff. The Design Manual was referenced to estimate the amount of water used per person. A daily demand of 10 gpd/person was selected for facility users and 15 gpd/person for facility staff. To determine pool maintenance water requirements, Table 3-2 was referenced. Table 3-2 suggests 10 gpd of water is needed for every 100 square feet of pool area. The aquatic center MDD is estimated at 11,000 gpd.

The proposed additional facilities are a minor portion of the site's overall current and anticipated future MDD. Irrigation demands in the summer months are estimated at 83,000 gallons per day on average. The design MDD limited by the well production is 141,700 gpd.

The MDD calculations are included in **Appendix B** and summarized in **Table 6.**

Table 6. Maximum Day Demand (Proposed)

Parameter	Value
MDD (total system, estimated)	162,500 gpd
MDD of irrigation	141,700 gpd
MDD of Aquatic Center	11,000 gpd
MDD (other existing domestic needs)	9,800 gpd

5.4.2 Average Day Demand (ADD)

The ADD for the aquatic center was calculated by multiplying the MDD by 40% (the assumed yearly occupancy percentage). The demand for pool maintenance remained the same as MDD demand. The aquatic center ADD is 5,000 gpd.

As discussed in **Section 5.3**, the existing water system summer ADD is 90,000 gpd. The system's anticipated summer ADD (worst case scenario) which would include the existing buildings, irrigation demand, and the proposed aquatic center is 95,000 gpd. The system's anticipated domestic ADD (inclusive of existing non-irrigation demand plus aquatic center) is 16,400 gpd.

ADD calculations for the water system under proposed build-out conditions are included in **Appendix B** and summarized in **Table 7**.

Table 7. Average Day Demand (Proposed)

Parameter	Value
ADD (annual)	36,000 gpd
ADD (summer)	95,000 gpd
ADD (domestic)	12,000 gpd

5.4.3 Peak Hour Demand (PHD)

PHDs were determined for the domestic uses in the proposed build-out condition (inclusive of demands from both maintenance buildings) which will rely on the proposed potable reservoir. Irrigation PHD was not included in this analysis because the irrigation system will be supplied by the existing reservoir.

PHD of the system was determined using a fixture count analysis. The analysis estimates PHD based on the number of plumbing fixtures in each building, including: older maintenance building, newer maintenance building, and the proposed aquatic center.

The PHD of the combined existing plus proposed facilities is 90 gpm. See **Appendix B** for the system analysis calculations.

5.4.4 Fire Flow Demand

South Whidbey Fire Department determined fire flow requirements for the aquatic center. These requirements are summarized below.

Table 8. Fire Flow Requirements

Parameter	Requirement
Fire Flow	1,200 gpm
Duration	60 min
Volume	72,000 gal

5.4.5 Demand Design Value Summary

The design values used for analyzing the system are summarized in Table 9 below.

Table 9. Proposed System Demand Summary

Parameter	Existing	Proposed
ADD (annual)	31,000 gpd	36,000 gpd
ADD (summer)	90,000 gpd	95,000 gpd
ADD (domestic/non-irrigation)	7,000 gpd	12,000 gpd
MDD (estimated)	151,500 gpd	162,000 gpd
PHD (irrigation)	225 gpm	225 gpm
PHD (domestic/non-irrigation)	47	90 gpm

5.5 Water Right Capacity

The system owns two water rights; G1-25547P from November 15, 1989, which allows 60 gpm and 25.5 acre-ft/year, and G1-28084P from August 4, 2000, which allows 60 gpm and 40.2 acre-ft/year. Permit G1-28084P states that the combined quantity of the two permits shall not exceed 120 gpm, or 65.7 acre-ft/year (21,400,000 gal/year). The water rights are adequate for the full pump capacity of Well #2 since the withdrawal rate is 120 gpm. The system has used up to 34 acre-feet (ac-ft) in the past and it is

anticipated that the system would use 41 ac-ft with aquatic center in full operation. The current usage type specified on the water rights are municipal, continuous. This is consistent with proposed usage. See **Appendix A** for a copy of the system's water rights and water rights self-assessment form.

5.5.1 Annual Withdrawal Water Right

The maximum annual withdrawal rate of 65.7 acre-ft/yr in the System's water right results in a maximum average daily withdrawal of 5,356 gpd as shown below:

$$Max.\,Annual\,Withdrawal = 65.7\,acre \cdot ft/yr \times \frac{43{,}560\,ft^2}{acre} \times \frac{7.48\,gal}{ft^2}$$

$$= 21{,}400{,}000\ \ gal/year$$

The System's ADD after the proposed improvements is 36,000 gpd, or 13,140,000 gal/year. Therefore, the System's annual withdrawal water right is sufficient to support the ADD associated with the improvements proposed in this report.

5.5.2 Instantaneous Withdrawal Water Right

The maximum instantaneous withdrawal rate of 120 gpm in the System's water right results in a maximum daily withdrawal of 172,800 gpd as shown below:

$$Max.\,Daily\,Withdrawal = 120\,gal/min \times 1{,}440\,min/day = 172{,}800\ \ gal/day$$

The System's estimated MDD after the proposed improvements is 162,000 gpd. This demand, which is predominantly based on existing park irrigation usage, is adjustable based on watering frequency and duration.

The maximum allowable daily irrigation volume allowed by the water right can be determined by subtracting the MDDs of the aquatic center and existing park domestic connections from the maximum daily withdrawal allowed by the water right. As determined in **Section 5.4.1**Error! Reference source not found., the total system domestic MDD is 20,800 gpd (including aquatic center MDD of 11,000 gpd and existing park domestic MDD of 9,800 gpd).

$$Max.\,Daily\,Irrigation\,Withdrawal = 172{,}800\ gal/day - 20{,}800\ gal/day = 152{,}000\ \ gal/day$$

For future irrigation scheduling, the maximum daily irrigation withdrawal limit, as allowed by the instantaneous withdrawal water right, is 152,000 gal/day.

5.6 Source Capacity

The System's source capacity was calculated assuming a pump run time of 24 hours per day.

$$Max.\,Daily\,Withdrawal = 120\,gal/min \times 1{,}440\,\text{min}\,pumping\ /day = 172{,}000\ \ gal/day$$

This is longer than the recommended 20 hours per day of pumping noted in the WSDM due to how the well is used to support park services. Park staff manually operate the irrigation system and typically only irrigate no more than 5 days per week. Therefore, the well will have 48-hour rest period each week. This equates to 17 hour per day run time. This calculation is shown below:

$$Average\ Daily\ pumping = \ 5days\frac{x\,\frac{24hours}{day}}{7\ days} = 17.1\ hours\ per\ day$$

The System's estimated MDD after the proposed improvements is 162,000 gpd. The source is adequate to support the proposed additional demand. Regardless of the water system's choice of how long to run their well pump, we recommend that irrigation water usage be measured and recorded to determine an accurate MDD.

5.7 Treatment Capacity

The proposed water treatment system can treat water from Well #2 at a maximum rate of 35 gpm. 2.5% of this water is expected to be used for backwashing the filters and lost from the system. With a pump run of 20 hours per day, the treatments system will yield 40,650 gal/day.

$$Daily\ Treatment\ Capacity = (35\ gal/\,\text{min} \times\ 97.5\%) \times 1{,}200\,\text{min}\,pumping\ /day = 40{,}950\ \ gal/day$$

The proposed treatment system provides adequate capacity to meet the domestic MDD of 20,800 gal/day.

5.8 Storage Capacity

The System's existing 100,000-gallon reservoir contains insufficient storage volume for the improvements proposed in this report but it is proposed to remain in place to support the existing irrigation system. Existing domestic connections will be disconnected from the existing reservoir, and a new 120,000-gal reservoir is proposed for storage of treated water prior to distribution to existing domestic connections within the park, as well as the new aquatic center. The new reservoir will also be sized to accommodate fire flows to the aquatic center as required by the fire department. The rest of this section refers to sizing and capacity of the **proposed reservoir** only.

Reservoir sizing was completed according to the *WSDM* to provide the system with adequate storage capacity to meet the anticipated system demands. The five following storage components were considered in the design process:

1. Operational Storage (OS)
2. Equalizing Storage (ES)
3. Dead Storage (DS)
4. Standby Storage (SB)
5. Fire Suppression Storage (FSS)

The proposed reservoir consists of reinforced circular concrete with a 26-foot diameter and 25-foot height. This equates to approximately 99,200 gallons of proposed reservoir storage (V_{PR}) and 3,971 gallons of storage per foot of proposed reservoir height (V_{Pf}).

Operational storage (OS) is the height difference between the water levels in the reservoir where the well pump is turned on and off. Adequate operational storage will prevent excess cycling of the well pump by minimizing the number of times it needs to start. For efficient treatment operations it is recommended to run the treatment system for a minimum of one hour.

$$Treatment\ Run\ Time\ one\ hour = 35\ gal \times 60 = 2{,}100\ gallons$$

$$Minimum\ OS = 2{,}100\ gallons\ or\ 0.55\ feet\ of\ storage$$

A full one foot of elevation will be provided between the well pump on and off signal to provide for an extended run time for the treatment system. Therefore, the operation storage is calculated as follows:

$$OS = 1.0\ ft \times 3{,}971\ gal/ft \cong 3{,}971\ gal$$

Equalizing storage (ES) is the volume of water that is needed to meet the peak demand period for the water system. Equalizing storage was calculated using equation 7-1 from the *WSDM* as follows:

$$ES = (PHD - Q_s)(150\ minutes)$$

Where:
PHD = Peak Hour Demand
Q_s = Well Pump Capacity (as limited by the proposed treatment system)

$$ES = (90\ gpm - 35\ gpm)(150\ minutes) = 8{,}250\ gal\ (or\ 2.1\ ft\ of\ storage)$$

The HGL of the gravity system will be set on the bottom of equalizing storage in the reservoir. The elevation of the base of the reservoir is 265 feet and the bottom of ES equates to 20.9 feet. The HGL will be is listed as 285 feet.

Dead storage (DS) is the unusable volume at the top (TDS) and bottom (BDS) of the reservoir. One foot of freeboard will be provided at the top of the reservoir over the well pump off water level. The reservoir outlet will be raised six inches above the bottom of the reservoir to prevent silt and other

material that may collect in the reservoir from entering the distribution system. Therefore, dead storage can be calculated as follows:

$$TDS = 1.0\ ft \times 3{,}971\ gal/ft \cong 3{,}971\ gal\ (or\ 1.0\ ft\ of\ storage)$$

$$BDS = 0.5\ ft \times 3{,}971\ gal/ft \cong 1{,}986\ gal\ (or\ 0.5\ ft\ of\ storage)$$

$$DS = TDS + BDS \cong 5{,}960\ gal\ (or\ 1.5\ ft\ of\ storage)$$

Standby storage (SB) is the volume of water available to supply the System in case of abnormal operating conditions that prevent the source from properly functioning. The standby storage provided by the proposed reservoir can be calculated as the remaining volume after operational storage, equalizing storage, and dead storage are accounted for. The provided standby storage is calculated as follows:

$$SB = V_R - OS - ES - DS = 99{,}200\ gal - 3{,}790\ gal - 8{,}250\ gal - 5{,}960\ gal$$

$$SB \cong 81{,}105\ gal\ (or\ 20.4\ ft\ of\ storage)$$

Fire suppression storage is calculated using equation 7-3 from the DOH *Water System Design Manual*.

Water System Design Manual Equation 7-3:

$$FSS = (FF)(t_m)$$

Where:

FF = Fire flow rate (1,200 gpm, see **Table 8**)
t_m = duration of fire flow rate in minutes (60 minutes, see **Table 8**)

FSS is therefore calculated as follows.

$$FSS = (1{,}200\ gpm)(60\ min) = 72{,}000\ gal$$

Fire suppression storage may be nested within standby storage. Because the standby storage provided by the reservoir is greater than the required fire suppression storage, all fire suppression storage is considered nested in standby storage.

The provided storage volumes are summarized in **Table 10.**

Table 10. Proposed Reservoir: Storage Component Summary

Storage Component	Volume (gal)	Depth (ft)
Top Dead	3,971	1.0
Operational	3,971	1.0
Equalizing	8,250	2.1
Fire Suppression/Standby	81,105	20.4
Bottom Dead	1,986	0.5
Total	99,200	25.0

5.8.1 Reservoir Water Age

Water age may sometimes be a problem when large fire suppression storage requirements must be met. The reservoir water age was calculated using the aquatic center ADD. The winter water age was calculated as 20 days.

$$Winter\ Water\ Age = \frac{Storage\ Volume}{ADD} = \frac{99{,}200\ gal}{5{,}000\ gpd} = 19.8\ days$$

5.9 Distribution System Capacity

Distribution systems must be adequately sized to meet minimum residual pressure requirements at service connections. It is further recommended that maximum pressures and velocities are limited. These requirements and recommendations are as follows (DOH 2020):

1. Minimum design pressure of 30 psi at service connections under PHD conditions
2. Minimum design pressure of 20 psi in distribution system under fire flow plus MDD conditions, if applicable
3. Maximum recommended design velocity in watermains of 8 feet per second (fps)
4. System pressure should typically be no less than 40 psi and no higher than 80 psi.
5. Water pressure should drop no more than 25 percent between static and peak flow conditions.

A hydraulic model for the System was prepared and modeling results are included in **Appendix C**.

5.9.1 Static Hydraulic Model

The static model simulates a zero-demand scenario and therefore represents the highest pressures the System will experience under normal operating conditions. To simulate high pressures, the static model assumes reservoirs are filled to the top of operational storage, no demands are placed on the system, and all booster pumps are turned off.

The model indicates that in this scenario, Service pressures in the distribution system will range between 40 to 50 psi in the gravity-fed pressure zones. Pressures below 30 psi occur in the higher elevation areas near the reservoir, but all connections in the higher elevation areas are served by existing booster pumps.

5.9.2 Peak Hour Demand Hydraulic Model

The peak hour demand model simulates a peak demand scenario and therefore represents the lowest pressures the System will experience under normal operating conditions. Water systems should be able to provide peak hour demand at no less than 30 psi at all service connections throughout the distribution system when all equalizing storage is depleted (DOH 2020). For this reason, the peak hour demand model assumes reservoir depths at the bottom of the equalizing storage components for each reservoir as described in **Table 10**.

The model indicates that in this scenario, System pressures will range between 35 to 40 psi in the gravity-fed zones. Once again, pressures below 30 psi occur in the higher elevation areas near the reservoir, but all connections in the higher elevation areas are served by existing booster pumps. Pressures at all other service connections exceed 30 psi. The highest pressures occur upstream of the treatment system at 49 psi.

5.9.3 Fire Flow Plus MDD Model

The fire flow plus MDD model simulates a fire flow plus maximum day demand scenario. Water systems supplied through gravity storage must provide fire suppression storage with a bottom level in the reservoir that produces no less than 20 psi at all points throughout the distribution system under the maximum day demand plus fire flow conditions (DOH 2020). Fire suppression storage is nested with standby storage and the bottom of fire suppression storage is assumed to be at the bottom of standby storage. Accordingly, the water levels in all three reservoirs were placed at the bottom of the standby storage water levels in **Table 10**. Fire flow demand was placed at the aquatic center, to represent the hydrant proposed at that site.

The model indicates that in this scenario, System pressures will range between 25 to 40 psi in the gravity-fed zones, including 25 psi at the aquatic center, where the demand is set to 1208 gpm.

5.9.4 Pipe Sizing

The EPANet modeling prepared for this project determined that a 12-inch HDPE distribution main was sufficient for delivery of the required fire flow to the aquatic center, by gravity alone, at 20 psi minimum. 4" HDPE was determined to be sufficient for the new reservoir fill line.

Other Considerations

The capacity analysis revealed that if irrigation is monitored, the water right, source, and storage are adequate for serving Phase 1 and Phase 2 build out with pumping and distribution system upgrades.

5.10 System Capacity Summary

The capacity of each system component is summarized in **Table 11**.

Table 11. Capacity Summary

System Component	Capacity	Demand	Result
Water Rights (Annual)	21,400,000 gal/yr	13,140,000 gal/yr	Sufficient capacity
Water Rights (Instantaneous)	173,000 gpd	162,000 gpd	Sufficient capacity
Source Production	173,000 gpd	162,000 gpd	Sufficient capacity
Treatment	41,580 gpd	20,800 gpd	Sufficient capacity
Storage	99,200 gal	various	Sufficient capacity for required components
Distribution System	n/a	n/a	Adequate Pressure

Based on the source meter readings made available for this analysis, it is possible that system demands will exceed capacity. The system should take daily source meter readings for two summers to determine an accurate MDD.

6. Water Quality

6.1 Raw Water Quality

Raw water quality samples were taken by Facet staff and sent to a lab for testing. Water quality lab test results are summarized in **Table 12**. Full test lab results are included in **Appendix F**.

Table 12. Raw Water Quality Summary

Analyte	Sample Date	Concentration (mg/L)	MCL (mg/L)
Arsenic	11/15/24	0.0010	0.010
Iron	11/15/24	1.21	0.3
Manganese	11/15/24	0.201	0.05
Hardness (as $CaCO_3$)	11/15/24	98.3	N/A
Ammonia (as N)	11/15/24	0.60	N/A
Nitrite (NO_2^- as N)	12/17/24	ND	1.0
Nitrate (NO_3^- as N)	12/17/24	ND	10.0
Sulfide (as S)	11/15/24	ND	N/A
Total Organic Carbon (TOC)	11/15/24	1.80	N/A
Dissolved Organic Carbon (DOC)	12/17/24	1.32	N/A

7. Analysis of Treatment Alternatives

7.1 Iron and Manganese Treatment

Three alternative treatment methods for iron, and manganese were considered: sequestration, ion-exchange, and manganese dioxide-adsorption. These alternatives are discussed in the following three sections.

7.1.1 Alternative #1: Sequestration

Polyphosphates are used in drinking water treatment as sequestration agents to prevent iron and manganese from precipitating out of solution, including in the presence of an oxidant. This can minimize the undesirable aesthetic effects of iron and manganese by preventing the formation of the iron and manganese particulate matter that may cause taste, odor, color, and water staining issues. Polyphosphates are typically introduced to drinking water by injection of a diluted polyphosphate solution with a chemical metering system.

Disposal of filter backwash wastewater, which is associated with other treatment methods, is not required with sequestration. Consequently, provisions for backwash disposal such as an infiltration area or piping to a roadside ditch are not required.

Sequestration is a relatively inexpensive treatment method compared to other alternatives. It requires little initial capital investment, typically only minor alterations to the existing system, and long-term operation and maintenance costs are comparatively low.

According to the DOH, sequestration should not be used when the combined iron and manganese concentration exceeds 0.5 mg/L (DOH 2020). Furthermore, DOH will not approve sequestration if the combined iron and manganese concentration exceeds 1.0 mg/L or if the manganese concentration exceeds 0.1 mg/L (DOH 2020).

The polyphosphates used as sequestering agents are a nutrient source for bacteria. As a result, a chlorine disinfectant residual must be maintained throughout the distribution system to control bacterial growth. Chlorine is an oxidant and will precipitate iron and manganese from the water. Polyphosphates will not dissolve iron and manganese precipitate back into solution, they will only prevent precipitation from occurring in the first place. Therefore, chlorine injection must be downstream of polyphosphate injection to prevent iron and manganese precipitation before polyphosphate is added to the water.

The effectiveness of sequestration agents decreases with time. Therefore, systems with a high average water age due to large storage reservoirs, large distribution systems, or low water usage, may require larger polyphosphate doses or find sequestration impractical altogether. Pool water at the aquatic center may be recycled at low frequencies; as a result, sequestered iron and manganese could precipitate out in the pool water and cause staining.

Sequestration also becomes less effective in higher temperature water. While this is not typically a problem in distribution piping, it can lead to iron and manganese precipitation in hot water domestic piping. Consequently, sequestration may not be effective at preventing iron and manganese precipitation and staining for aquatic center facilities such as hot tubs.

Sequestration does not remove iron and manganese from the water. As a result, the potential for negative health consequences due to manganese in drinking water are not addressed.

A summary of the pros and cons associated with sequestration of iron and manganese is provided in **Table 13**.

Table 13. Sequestration Pros and Cons

Pros	Cons
1. Lower initial capital investment. 2. Low O&M costs. 3. Minor alterations to existing system. 4. Does not require backwash waste disposal.	1. Requires chlorination. 2. Effectiveness decreases with time and higher temperatures; this could lead to iron and manganese precipitation in pool water and staining of pools/hot tubs. 3. Does not actually remove iron and manganese from the water, potential adverse health effects due to manganese remain. 4. Combined iron and manganese concentration is above 1.0 mg/L, DOH will not approve sequestration. 5. The manganese concentration exceeds 0.1 mg/L, DOH will not approve sequestration.

7.1.2 Ion Exchange

Ion exchange treatment systems are commonly referred to as water softeners and are mostly used as point of use treatment systems at individual households to reduce water hardness. Ion exchange can also be used to reduce iron and manganese concentrations in drinking water.

Ion exchange treatment systems consist of a brine tank and vessels containing an ion exchange resin. For iron and manganese removal, a resin with positively charged sodium ions attached to its surface is used. When water containing iron and manganese comes into contact with the resin, the positively charged iron and manganese ions preferentially "exchange" places with the sodium ions on the surface of the resin. Following this exchange, the iron and manganese are bound to the resin, and the sodium is present in aqueous form in the water. In some cases, potassium is used instead of sodium where there may be concerns regarding dietary sodium intake from drinking water.

Periodically, the resin must undergo a backwash regeneration cycle to remove the iron and manganese built up on the resin. In this process, a brine solution consisting of sodium chloride (also known as table salt) or potassium chloride is pumped into the ion exchange vessel and sodium or potassium ions replace the iron and manganese ions on the resin. The brine solution used in the backwash regeneration, which now contains the iron and manganese removed from the resin, is typically diverted to a swale, roadside ditch, or a municipal sewer.

For large systems, the quantity of salt needed to make the brine solution can make operating ion exchange treatment systems cost prohibitive. Furthermore, larger ion exchange treatment systems may require a Washington State Department of Ecology (DOE) waste discharge permit.

Ion exchange treatment can reduce the pH and alkalinity of water, potentially making it more corrosive. In some instances, corrosion control treatment may be required in conjunction with ion exchange treatment.

Ion exchange is only suitable for low concentrations of iron and manganese; high concentrations can foul the resin and cause decreased treatment performance over time. Ion exchange should not be used when the combined iron and manganese concentration exceeds 0.3 mg/L (GLUMRB 2018).

A summary of the pros and cons associated with ion exchange treatment for iron and manganese removal is provided in **Table 14**.

Table 14. Ion Exchange Pros and Cons

Pros	Cons
1. Reduces water hardness. 2. Reduces iron and manganese concentrations.	1. High operational cost due to salt requirements. 2. Disposal of backwash regeneration waste brine solution. 3. May require DOE waste discharge permit. 4. Combined iron and manganese concentration exceeds maximum recommended level of 0.3 mg/L.

7.1.3 Alternative #3: Manganese Dioxide-Adsorption

Manganese dioxide-adsorption is one of the most common treatment methods for iron and manganese removal. In this method, an oxidant is continuously applied to a manganese dioxide-based filter media to maintain the media's oxidative state. As water containing iron and manganese in solution passes through the filter vessels, the iron and manganese are adsorbed onto the surface of the oxidized filter media, oxidized in place by the media, precipitated, and removed from the water.

Commonly used filter media for manganese dioxide-adsorption treatment systems include manganese greensand, manganese dioxide ore (also known as pyrolusite), and manganese dioxide coated substrate media. Chlorine is the most commonly used oxidant, but permanganate is also used.

Manganese dioxide-adsorption is typically more effective than other treatment alternatives at removing iron and manganese when concentrations are high. These treatment systems also have a history of successfully removing iron, manganese, and other contaminants from ground water sources on Whidbey Island. Furthermore, the System's operator, NW Natural Water, has extensive experience operating manganese dioxide-adsorption treatment systems in other water systems.

Periodically, the filter media must undergo a backwash cycle to remove the iron and manganese precipitate and other contaminants that have adsorbed onto the surface of the filter media. Well water

or pressurized distribution water is pumped through the filters in reverse direction to accomplish this. The backwash waste is typically diverted to an infiltration swale/pond.

A summary of the pros and cons associated with manganese dioxide-adsorption treatment for iron and manganese removal is provided in **Table 15**.

Table 15. Manganese Dioxide-Adsorption Pros and Cons

Pros	Cons
1. Effective at removing iron and manganese at high concentrations in source water. 2. History of success on Whidbey Island. 3. System operator has experience with these types of treatment systems.	1. Disposal of backwash waste. 2. Oxidant chemical costs contribute to operational costs.

7.1.4 Selected Alternative

The selected alternative is Alternative #3: manganese dioxide-adsorption. This alternative is preferred primarily because iron and manganese concentrations are too high for sequestration and ion exchange, manganese dioxide-adsorption's history of success on Whidbey Island, and the operator's familiarity with manganese dioxide-adsorption treatment systems.

7.2 Oxidant Selection

Two oxidant alternatives were considered for the proposed manganese dioxide-adsorption treatment system: chlorine (in the form of sodium hypochlorite) and permanganate (in the form of potassium permanganate). These alternatives are discussed in the following two sections.

7.2.1 Alternative #1: Sodium Hypochlorite

Sodium hypochlorite is the most commonly used oxidant for manganese dioxide-adsorption treatment processes for small water systems on Whidbey Island, and the System's operator has extensive experience with this oxidant. A chemical metering system injects a diluted sodium hypochlorite solution into the process piping upstream of the filters. This continuous oxidant application continuously regenerates the filter media and maintains its oxidative state.

Using sodium hypochlorite as the oxidant has the added benefit of providing a free chlorine or chloramine disinfectant residual, which can help control bacterial growth in the system. However, it may also result in taste and odor issues associated with chloramine formation in the presence of ammonia and disinfection byproduct formation in the presence of dissolved organic carbon (DOC). The System has moderately high raw water ammonia concentrations, so chloramine taste and odor issues could be a concern if the proper chlorine dose is not maintained; this is discussed further in **Section**

7.3.1. Furthermore, the System's DOC levels are above the threshold at which disinfection byproducts are a concern; this is discussed further in **Section 7.3.2**.

Maintaining an adequate chlorine residual on the filter outlet is essential for optimal treatment performance and ensuring continuous regeneration of the filter media's oxidative state. A post-filter free chlorine residual of 1.0 mg/L is recommended.

A summary of the pros and cons associated with sodium hypochlorite oxidation is provided in **Table 16**.

Table 16. Sodium Hypochlorite Oxidation Pros and Cons

Pros	Cons
1. Provides a disinfectant residual. 2. System operator has extensive experience with this oxidant.	1. Moderately high ammonia levels could lead to taste and odor issues associated with chloramine formation if chlorine dosage is not correct. 2. High DOC levels could lead to disinfection byproduct formation.

7.2.2 Alternative #2: Potassium Permanganate

Potassium permanganate is also regularly used as the oxidant for manganese dioxide-adsorption treatment processes and the System's operator has experience with it. Potassium permanganate powder is dissolved in water to form a solution which is injected into the process piping upstream of the filters via a chemical metering system. Potassium permanganate, when properly dosed, is effective at maintaining the oxidative state of the filter media.

Potassium permanganate is a strong oxidant; however, it is not used to provide a disinfectant residual. For this reason, potassium permanganate generally has lower potential for disinfection byproduct formation. If a disinfectant residual is required, a sodium hypochlorite solution is typically injected downstream of manganese dioxide-adsorption treatment.

Potassium permanganate dosing must be carefully monitored. If the dose is too high, the treated water will turn a pink or purple color. When this happens, manganese concentrations in the treated water may exceed the raw water concentration because additional manganese is being added to the water in the form of permanganate. If the dose is too low, the oxidative state of the media will not be maintained, and treatment performance may decrease. Getting the correct potassium permanganate dose can be challenging and typically requires more regular monitoring by the operator.

A summary of the pros and cons associated with potassium permanganate oxidation is provided in **Table 17**.

Table 17. Potassium Permanganate Oxidation Pros and Cons

Pros	Cons
1. Lower potential for disinfection byproduct formation.	1. No disinfectant residual. 2. Can turn water pink or purple if dose is too high. 3. Can increase manganese concentration if dose is too high. 4. Requires more regular operator monitoring.

7.2.3 Selected Oxidant

Sodium hypochlorite is the selected oxidant; primarily because it is easier to maintain optimal dosing levels and it provides a disinfectant residual in the system.

There is however some concern regarding the potential for taste and odor issues associated with chloramine formation given the ammonia levels in the raw water. However, with proper dosing to reach break point chlorination, this should not occur.

There is also concern regarding the potential for formation of disinfection byproducts given the DOC levels in the raw water. However, the EPA's disinfection byproduct rule does not apply to TNC water systems such as the System.

Space will be provided in the treatment building for future potassium permanganate oxidation if chloramine taste and odor issues become a problem. In that scenario, sodium hypochlorite could be moved downstream of the filters to maintain a disinfectant residual or chlorination could be removed from the System entirely. In the former case, there would still be potential for chloramine taste and odor issues.

7.3 Secondary Water Quality Effects

This section discusses possible secondary water quality effects of the selected treatment method and selected oxidant.

7.3.1 Ammonia

Ammonia is not a regulated drinking water contaminant; nevertheless, it can be responsible for taste and odor problems for systems employing chlorination, including in the form of sodium hypochlorite. When chlorine reacts with ammonia, ammonia is converted to chloramines. There are three types of chloramines: monochloramine, dichloramine, and trichloramine. Dichloramine and trichloramine carry a "swimming pool chlorine" taste and odor that many water system customers find objectionable, while monochloramine typically does not carry such taste and odor.

When chlorine reacts with ammonia, monochloramine is the first chloramine to form. As more chlorine is added, monochloramine is converted to dichloramine, which is in turn converted to trichloramine.

Finally, when more chlorine is added still, trichloramine is broken down into nitrogen gas, which escapes from the water and leaves the system. The point at which sufficient chlorine has been added to convert most trichloramine to nitrogen gas is called the chlorination breakpoint. Once the chlorination breakpoint is achieved, additional chlorine added to the system will form a free chlorine disinfectant residual.

Chloramines are collectively referred to as combined chlorine, because they consist of compounds of chlorine combined with ammonia. Total chlorine is the sum of free and combined chlorine. Breakpoint chlorination is typically defined as the point at which the free chlorine residual is 85% or higher of the total chlorine residual.

Chloramines are disinfectants, albeit weaker disinfectants than free chlorine, and some water systems will intentionally form monochloramine to provide a disinfectant residual in the system. This, however, is not recommended with manganese dioxide-adsorption treatment systems unless another oxidant is provided upstream of the filters because a continuous oxidant application is required to maintain the oxidative state of the filter media.

To ensure a free chlorine disinfectant residual is established, and to prevent the accumulation of taste and odor causing dichloramine and trichloramine, sufficient chlorine must be added to fully convert ammonia to chloramines and on to nitrogen gas. This process typically requires about ten parts chlorine to one part ammonia. As a result, the presence of ammonia can dramatically increase chlorine demand.

The System's raw water ammonia concentration was measured at 0.60 mg/L. Therefore, ammonia is expected to contribute approximately 6.0 mg/L of chlorine demand. This ammonia concentration and associated chlorine demand is considered moderately high. Achieving breakpoint chlorination with this ammonia concentration is feasible; however, it will require that the operator closely monitoring chlorine dosing, the free chlorine residual, and the total chlorine residual, particularly in the first few months of treatment operation.

7.3.2 Disinfection Byproduct Formation Potential Assessment

Disinfection byproducts form when disinfectants added to drinking water react with naturally occurring organic matter found in the water. Common disinfection byproducts associated with chlorine disinfection include total trihalomethanes (TTHMs) and five haloacetic acids (HAA5s). Both TTHMs and HAA5s are classified as primary drinking water contaminants, meaning they are regulated for their potential adverse effects on human health. The EPA has set primary maximum contaminant levels (MCLs) for both TTHMs and HAA5s.

Dissolved organic carbon (DOC) water quality testing is often used to quantify the amount of naturally occurring organic matter in water that could react with chlorine to form TTHMs and HAA5s. Waters with DOC less than 1.0 mg/L are unlikely to exceed the TTHM MCL, and waters with DOC less than 2.0 mg/L are unlikely to exceed the HAA5 MCL (DOH 2020). The System's raw water DOC concentration is 1.32 mg/L, suggesting that TTHM formation could be a concern.

The EPA's disinfection byproduct rule does not apply to TNC systems. As discussed in **Section 7.2.3**, potassium permanganate has a lower potential for disinfection byproduct formation and using it as the pre-filter oxidant may reduce disinfection byproduct levels in the system if desired in the future.

7.3.3 Corrosion Potential Assessment

Adding chlorination to a system can change the oxidation-reduction potential of the water and increase its corrosivity (DOH 2020). This can affect a system's ability to maintain compliance with the EPA's Lead and Copper Rule (LCR), depending on what materials were used in construction of the water system and premise plumbing (i.e., lead service lines, lead-based solder, copper plumbing, bronze and brass fittings, etc.). The LCR does not apply to TNC systems.

8. Full-Scale Treatment System Design

8.1 Full-Scale Treatment Pilot Test

The proposed treatment is not required by DOH and is being installed to address secondary contaminants. In addition, the same treatment process has been installed in a number of systems in Island County and functions well. Due to these considerations, a full-scale treatment system design has been provided using conservative loading rates. Once the system is installed, treatment removal efficiencies will be monitored and operating parameters will be adjusted to provide optimal performance. The "Full-scale pilot testing" will be performed after installation following the procedures discussed in **Section 10.7**.

8.2 Treatment System Overview

The proposed treatment system consists of a sodium hypochlorite chemical metering system that chlorinates the raw well water upstream of pressurized filter vessels. The filter vessels contain manganese dioxide-based media. The well pump will deliver water through the treatment system prior to filling the storage reservoir. Backwash water will also be supplied by the well pump and backwash waters will be directed to an infiltration area near the treatment building.

The proposed system will contain bypass piping to allow for the following modes of operation:

1. Normal operation (no treatment bypass)
2. Treatment bypass

A summary of major treatment system components is provided in **Table 18**.

Table 18. Major Treatment System Components Summary

Treatment System Components	Component Description
Filter Vessels	(4) 18" diameter x 60" sidewall height
Filter Media	Pyrolox advantage (manganese dioxide coated silica sand)
Filter Media Volume	42" depth (6.2 cf/filter)
Oxidant	Chlorine via sodium hypochlorite
Chlorine Dose (Initial Target)	8.2 mg/L
Free Chlorine Residual (Post Filter Target)	1.0 mg/L
Free Chlorine Residual (Post Filter Minimum)	0.5 mg/L
Backwash Supply Source	Treated Well Water

8.3 Design Criteria

Recommended design criteria are summarized in **Table 19**. These criteria were used to size the proposed treatment system. A conservative design target hydraulic loading rate of 5.0 gpm/sf was selected based on Facet's experience with similar treatment systems and similar water quality on Whidbey Island. Typically, hydraulic loading rates of as high as 9 gpm/sf see effective treatment. The backwash rate, duration, and frequency are based on information provided by the filter media and filter manufacturers and may need to be adjusted by the operator in the field during or after the full-scale treatment pilot test. Treatment design calculations are summarized in the following sections and provided in full in **Appendix G**.

Table 19. Treatment System Design Criteria

Design Criteria	Recommendation
Manufacturer	ATEC
Nominal Treatment Capacity	35 gpm
Hydraulic Loading Rate (all filters in service)	5.0 gpm/sf
Backwash Flow Rate	30 gpm/filter
Unit Backwash Flow Rate	17 gpm/sf
Backwash Duration	5 min/filter
Backwash Frequency	Once per 12 hours of filter run time
Filter Back Pressure During Backwash	40 psi

8.4 Flow Rate Available for Backwash

The proposed well pump will be used to backwash the filters. This pump has a design pumping rate of 120 gpm as described in **Section 4.3**. As discussed in **Section 9.1**, a flow control solenoid valve will limit the treatment influent flowrate to 35 gpm, so only 35 gpm is available for filter backwash.

8.5 Filter Size

If possible, it is preferred to limit filter cross-sectional surface area to ensure a sufficient flow rate for backwash can be provided by the well. Due to the flow control valve described in **Section 8.4**, 35 gpm is available for backwash. A filter diameter of 18 inches was selected because this results in a total backwash flow rate requirement of 30 gpm as shown in the following calculation.

$$Q_{BW} = n_{bw} A_F q_{bw}$$

Where:
Q_{BW} = total backwash flow rate required
n_{bw} = number of filters backwashed at a time
A_F = cross-sectional surface area of filter
q_{bw} = backwash flow rate per unit cross-sectional surface area of filter

$$Q_{BW} = (1\ filter)\left[\pi\left(\frac{9}{12}\ ft\right)^2 /filter\right](17\ gpm/sf) = 30\ gpm$$

8.6 Filter Quantity

The design target hydraulic loading rate is 5.0 gpm/sf with all filters in service. The minimum number of filters that can satisfy this requirement is four as shown in the following calculation.

$$q_f = \frac{Q_C}{nA_F}$$

Where:
q_f = filter loading rate
Q_C = nominal treatment capacity
n = number of filters in operation
A_F = cross-sectional surface area of filter

$$q_f = \frac{35\ gpm}{(4\ filters)\left[(\pi)\left(\frac{9}{12}\ ft\right)^2/filter\right]} \cong 5.0\ gpm/sf$$

With one filter out of service during backwash, the hydraulic loading rate will be 6.6 gpm/sf as shown in the following calculation. This is still well within the range of hydraulic loading rates seen for similar treatment systems and water qualities on Whidbey Island. It is estimated that only 100 gallons of water will be delivered to the reservoir during backwash operation. This is less than 1% of the treated water and will have a negligible impact of finished water quality.

$$q_f = \frac{40\ gpm}{(3\ filters)\left[(\pi)\left(\frac{9}{12}\ ft\right)^2/filter\right]} \cong 6.6\ gpm/sf$$

8.7 Backwash Operations

Water for backwash operations will be provided from the well via the filter inlet manifold. Each filter will be sequentially backwashed with treated water from the three other filters. Typically, 30 psi of back pressure in the filters is recommended to ensure treated water from the three filters is forced up through the filter being backwashed and out the backwash line.

Water flows from high to low head. If the head required to fill the storage reservoir is lower than the head required to flow up through the filter being backwashed, water will preferentially fill the storage reservoir and not backwash the filter. The elevation difference between the storage reservoir and treatment building results in a pressure of approximately 40 psi in the filters. This is more than the 30 psi recommended, so a pressure sustaining valve on the treatment outlet is not required to create more back pressure.

8.8 Backwash Frequency

The filters should be backwashed before filter breakthrough occurs; this is the point at which contaminant concentrations exceed their MCLs or SMCLs. To determine the theoretical volume of treated water before filter breakthrough, a filter media capacity based on a potassium permanganate demand of 10,000 mg/cf was selected. Additionally, the potassium permanganate demand equivalents and raw water quality listed in **Table 20** were used to establish the effective iron and manganese concentrations listed.

Table 20. Potassium Permanganate Demand Equivalents

Contaminant	Equivalence	Measured Concentration (mg/L)	Effective Concentration (mg/L)
Iron	1:1	1.21	1.21
Manganese	2:1	0.201	0.402
Total	N/A	N/A	1.61

The total binding capacity of the filter media was calculated as follows.

$$M_B = nV_F m_b = ndA_F m_b$$

Where:
M_B = total binding capacity of filter media expressed as mass of contaminant
n = number of filters
V_F = volume of filter media per filter
A_F = cross-sectional surface area of filter
d = depth of filter media in filter vessels
m_b = binding capacity of filter media per unit volume expressed as mass of contaminant

$$M_B = (4\ filters)\left(\frac{42}{12}\ ft\right)\left[(\pi)\left(\frac{9}{12}\ ft\right)^2/filter\right](10{,}000\ mg/ft^3) \cong 247{,}000\ mg\ of\ binding\ capacity$$

The theoretical volume of water treated before backwash is required, the theoretical filter run time before backwash is required, and the corresponding number of days between backwash cycles can be calculated from the total binding capacity, well production rate, and average system water usage as follows.

$$V_W = \frac{M_B}{C_E}$$

$$t = \frac{V_W}{Q_W}$$

$$Days = \frac{V_W}{ADD}$$

Where:

V_W = volume of treated water between backwash cycles
M_B = total binding capacity of filter media expressed as mass of contaminants
C_E = total effective concentration of iron and manganese
t = filter run time between backwash cycles
Q_W = well production rate
ADD = average day demand (gpd)

$$V_W = \frac{(247{,}000\ mg)}{(1.61\ mg/L)\left(\frac{3.79\ L}{gal}\right)} \cong 40{,}500\ gal$$

$$t = \frac{40{,}500\ gal}{(35\ gal/min)(60\ min/hour)} \cong 19\ hours$$

$$Days = \frac{40{,}500\ gal}{5{,}000\ gpd} \cong 8\ days$$

The above calculations suggest that the filters can run for approximately 19 hours before filter breakthrough occurs. This equates to approximately 8 days between backwash cycles for periods with average water usage. It is anticipated that a filter run time of 12 hours is very conservative estimate. The 12 hour of run time was assumed for design purposes.

During the full-scale treatment pilot test, filter run time will be extended to the filter breakthrough point or 63,000 gallons at a minimum. Based on the results of the validation test, the treatment system will be configured to backwash before breakthrough occurs.

The system operator should confirm that backwash occurs at minimum on a weekly basis to prevent channelization of the filter media, which can decrease treatment performance. If backwash has not occurred due to low water usage, the operator should manually initiate backwash.

8.9 Backwash Volume

Each filter will be backwashed at rate of 17 gpm/sf, equating to 30 gpm for the 18-inch diameter filters, for five minutes. This equates to a total backwash volume of 600 gallons for the four filters as shown below.

$$17\ \frac{gpm}{ft^2} \times (\pi)\left(\frac{9}{12}\ ft\right)^2 \cong 30\ gpm$$

$$30\ \frac{gal}{min} \times 5\ \frac{min}{filter} \times 4\ filters \cong 600\ gallons$$

Assuming backwash every 12 hours of production, the percentage of produced water used for backwashing is calculated as follows.

$$\frac{600\ gal}{25{,}200\ gal + 600\ gal} \cong 2.3\%\ of\ water\ used\ for\ backwash$$

This percentage may change based on the backwash frequency selected after the full-scale treatment pilot test.

8.10 Backwash Disposal

Backwash waste will be routed from the filters to an air gap and on to an infiltration area via gravity flow. The backwash infiltration area consists of a natural depression near the treatment building where backwash waste will be infiltrated into native soil. An outfall dispersal pad consisting of drainage rock will be provided at the daylight point of the drainpipe to minimize erosion of native soil.

8.11 Oxidative Demand

Chlorine, in the form of a liquid sodium hypochlorite solution, is the selected oxidant. Raw water quality data was used to estimate the oxidative demand of the water. The results of that estimate summarized in **Table 21**. Full oxidative demand calculations based on raw water quality data are included in **Appendix G**.

Approximately 80% of the chlorine demand is due to ammonia. The treatment system will target breakpoint chlorination.

Table 21. Estimated Oxidative Demand

Source of Oxidative Demand Estimate	Chlorine Demand (mg/L)
Raw Water Quality Data	7.2

8.12 Chemical Metering System

Characteristics of the proposed chemical metering system are summarized in **Table 22**. The design dosing rate was calculated based on the undiluted chlorine solution strength, dilution ratio, estimated oxidative demand of the raw water, and post-filter chlorine residual target. Calculations are provided in **Appendix G**. Metering pump product information is provided **Appendix E**.

Table 22. Proposed Chemical Metering System

Chemical Metering Pump Model	LMI PD061-A40HI
Chemical Metering Pump Capacity	1.75 gph
Chemical Storage Tank	50 gal, polyethylene
Solution Type	Sodium Hypochlorite
Undiluted Solution Strength	12.5%
Undiluted Solution Volume	1 gal
Dilution Water Volume	4 gal
Total Diluted Solution Volume	5 gal
Diluted Solution Concentration	25,000 ppm
Design Dose Rate (Initial Target)	8.2 ppm
Free Chlorine Residual (Target)	1.0 ppm
Free Chlorine Residual (Minimum)	0.5 ppm
Design Flow Rate	0.69 gph
Design Flow Rate Percent of Pump Capacity (Manual Speed Setting)	39%

As indicated in **Table 22**, the design dose rate listed is an initial target. It is based on the estimated oxidative demand of the source water. The actual oxidative demand in the field may vary from this estimate, possibly resulting in a required dosing rate different from the initial target listed in order to achieve the target chlorine residual. To account for this, the design flow rate was selected to be in the midrange of the chemical metering pump's capacity. This will give the operator room to adjust the dosing rate as needed in the field. Dilution factors may also be adjusted to support different chlorine demands.

The operator should maintain the target post-filter free chlorine residual of 1.0 mg/L in order to continuously regenerate the media and maintain its oxidative state. Post-filter free chlorine residuals should not drop below the minimum of 0.5 mg/L. The post-filter free chlorine residual should also be at least 85% of the post-filter total chlorine residual to ensure that breakpoint chlorination is obtained.

8.13 Future Chemical Metering Systems

Space in the treatment building is provided for a future potassium permanganate metering system. However, switching to potassium permanganate is not anticipated because the disinfection byproduct rule does not apply to TNC systems.

8.14 Pre-Filter Contact Time

No dedicated contact tank is provided for oxidation before the filters because contact time is not needed for the iron and manganese adsorption process.

8.15 Process Control and Monitoring

Process control and regular monitoring are essential for reliable treatment performance. The following methods of controlling and monitoring the treatment process are recommended for the proposed treatment system.

8.15.1 Chemical Dosing

The chemical metering pump dose rate is controlled via a manual speed setting. This speed setting may need to be adjusted by the operator to provide sufficient chlorine dosing to maintain the oxidative state of the filter media. The estimated manual speed setting required is listed in **Table 22**.

The metering pump will be powered by a dedicated electrical outlet that is only energized when the storage reservoir calls for the well pump to turn on. A flow switch will be installed in the treatment building on the raw water line from the well to cut power to this outlet when there is no flow in the pipe. This will minimize the chance of a chlorine overfeed event if the reservoir calls for water, but no water is flowing due to a closed valve, the well pump fails to start, or some other mechanical or electrical issue.

8.15.2 Water Quality Monitoring

The following water quality sampling locations will be provided to monitor treatment performance.

1. Raw water
2. Post chlorine injection point
3. Treated water
4. Distribution system entry point

The first three sampling locations will be in the treatment building and will be utilized to monitor treatment system performance. The distribution system entry point sampling location will be on the storage reservoir outlet adjacent to the tank and will be the point of compliance for DOH water quality monitoring.

The post-chlorine injection point sample tap will be used to monitor chlorine dosing. Regular monitoring of this sample tap will inform the operator if the expected amount of chlorine is being dosed. Additionally, comparison of the chlorine residual at this sample tap location with the treated water sample tap location will provide data on the oxidative demand of the water.

The treated water sample tap will be installed in the treatment building downstream of the filters. Regular monitoring of iron and manganese concentrations at this location will inform the operator if water quality targets are being met. Regular monitoring of the free and total chlorine residuals at this

location will inform the operator if breakpoint chlorination is being achieved as desired. The free chlorine residual should be at least 85% of the total chlorine residual for breakpoint chlorination.

In addition to the water quality monitoring requirements of the DOH, the System's operator should conduct the following water quality monitoring on a weekly basis at minimum. The well and treatment system should be running during sample collection and be allowed to run continuously for a minimum of fifteen minutes before sample collection. The free and total chlorine residual monitoring listed below should be performed with a DPD chlorine test kit.

1. Raw Water: iron and manganese
2. Post chlorine injection point: free and total chlorine
3. Treated water: iron, manganese, free chlorine, and total chlorine

If the target water quality targets or chlorine residuals are not being met, the operator may need to consider adjusting one of or a combination of the following:

1. Chlorine dosing
2. Backwash frequency
3. Backwash flow rate

8.15.3 Backwash Monitoring

The backwash flow rate is controlled by throttling a gate valve on the backwash line and will be set by an ATEC employee during treatment system startup. The target backwash rate is the highest flow rate that will not force filter media out of the filters during backwash. This is approximately 17 gpm/sf for the selected filter media, equating to 30 gpm for the 18-inch diameter filters. The actual backwash rate will be determined in the field by the ATEC employee.

The backwash air gap and the sight glass on the backwash line can be visually inspected for the presence of filter media to determine if the backwash rate is too high. A water meter on the backwash line will be used to monitor the backwash rate. If the backwash rate changes, or if filter media is being expelled from the filters during backwash, the operator may need to adjust the backwash gate valve.

Backwash operations are automatically initiated by the filter control panel after an adjustable, preset filter runtime. This filter runtime will be determined during the full-scale treatment pilot test. If regular water quality monitoring indicates filter breakthrough is occurring before backwash is initiated, the backwash flow rate and frequency may need to be revaluated by the System's engineer.

9. System Controls

9.1 Control Valves

Well pump on/off for potable water reservoir filling operations will be controlled by a pressure transducer on the reservoir fill line. When the potable reservoir level transmitter calls for water, a normally closed flow control solenoid valve on the potable reservoir fill line will open. This will allow

water to flow through the treatment system and up to the potable water reservoir. The flow control valve will limit the flow of water though the treatment system to 35 gpm to match the treatment system capacity. The VFD will maintain pressure upstream of the flow control valve to 50 psi, so when the valve opens, pressure in the reservoir fill line will drop and the VFD will turn on the well pump. Once the reservoir is full, the solenoid valve will shut, pressure in the reservoir fill line will rise, and the VFD will turn off the well pump.

When the irrigation reservoir level transmitter calls for water, a normally closed pressure sustaining solenoid valve on the irrigation reservoir fill line will open, causing pressure in that line to drop and the VFD to energize the well pump. The pressure sustaining valve will only open enough to maintain upstream pressure at 50 psi. This will ensure that the potable water reservoir will have priority on filling and only excess water will be delivered to the irrigation reservoir if both reservoirs are calling for water at the same time. If the potable water reservoir is full, the pressure sustaining valve will open more allowing the full capacity of the well pump to be delivered to the irrigation reservoir. Once the reservoir is full the pressure sustaining solenoid valve will shut and the VFD will turn off the well pump.

10. System Startup and Testing

10.1 Storage Reservoir Disinfection

The proposed reservoir will be disinfected before being brought into service in accordance with *AWWA C652 – Disinfection of Water Storage Facilities*. The contractor performing the work will be required to submit a detailed disinfection procedure description, including type of disinfectant to be used and calculations indicating the quantities of disinfectants required to produce the chlorine concentrations required in *AWWA C652*. The contractor shall furnish satisfactory bacteriological laboratory test results and chlorine residual test results showing the required chlorine concentration was achieved.

10.2 Storage Reservoir Leak Testing

Leak testing of the proposed reservoir shall follow the procedures outlined in this section.

Testing of the reservoir consists of filling the reservoir to check for water tightness no sooner than 28 days after all concrete pouring is completed and no later than 60 days after completed. The testing of the water can be done from this initial filling and if there are no obvious problems with the reservoir, it can be put online without emptying and refilling.

To test the reservoir, fill to full, close all valves and let sit for 24 hours. Note the height of the water. Check the water height after three consecutive 24-hour periods. Allowing for evaporation, the water level should not drop more than one tenth of one percent in any 24-hour period.

10.3 Watermain Disinfection

Watermains installed as a part of this project will be disinfected before being brought into service in accordance with the WSDOT Standard Specifications for Road, Bridge, and Municipal Construction M 41-10, Section 7-09.3(24). The contractor performing the work will be required to submit a satisfactory bacteriological test result.

10.4 Watermain Pressure Testing

Watermains installed as a part of this project will be pressure testing before being brought into service in accordance with the WSDOT Standard Specifications for Road, Bridge, and Municipal Construction M 41-10, Section 7-09.3(23).

10.5 Treatment Plant Disinfection

The proposed treatment system must be disinfected before being brought into service in accordance with *AWWA C653 – Disinfection of Water Treatment Plants*, including disinfection of plant piping downstream of the chlorine injection point. According to *AWWA C653*, the storage reservoir must also be disinfected before being brought back into service in accordance with *AWWA C652 – Disinfection of Water Storage Facilities*. Disinfection of the treatment plan, watermains, and storage reservoir should coincide.

The contractor performing the work will be required to submit a detailed disinfection procedure description, including type of disinfectant to be used and calculations indicating the quantities of disinfectants required to produce the chlorine concentrations required in AWWA C653. The contractor shall furnish satisfactory bacteriological laboratory test results and chlorine residual test results showing the required chlorine concentration was achieved.

10.6 Treatment Plant Startup

An ATEC representative, the contractor, system operator, and engineer should all be present for the treatment system startup. The following items should be evaluated during startup:

1. All ATEC system components are functioning properly and as intended
2. Backwash rate is properly set
3. Chemical metering system equipment is functioning properly and as intended
4. All system piping is functioning without leakage
5. The treatment system as a whole is functioning properly and as intended

10.7 Full-Scale Treatment Pilot Testing Procedures

After startup, a full-scale treatment pilot test will be performed. This test should be performed by the system operator under the supervision of the engineer. A pilot test worksheet and instructions are provided in **Appendix H**.

Typically, during pilot testing for manganese dioxide-adsorption treatment pilot testing, the potential for silica to bind to and foul the filter media is assessed. This is done by testing pre-filter and post-filter water samples for silica. If the pre-filter silica concentration is greater than the post-filter concentration, silica could be binding to the filter media. Over time this may foul the media and result in decreased treatment performance.

In cases where silica fouling of the filter media is a concern, the filter manufacturer recommends dosing a small amount of potassium permanganate upstream of the filters to minimize media fouling. Pre- and post-filter water quality testing will be performed for silica during the full-scale treatment pilot test to determine if pre-filter potassium permanganate addition is required to prevent silica fouling of the media.

The goals of the full-scale pilot test are as follows. Pilot testing may need to be repeated multiple times to achieve these goals.

1. Confirm finished water quality targets for iron and manganese are being met.
2. Confirm target post-filter free chlorine residual target is being met.
3. Confirm breakpoint chlorination is achieved.
4. Determine the chemical metering system equipment settings that will reliably achieve goals 1 through 3.
5. Determine the number of hours of filter run time at which filter breakthrough occurs.
6. Determine a backwash frequency that minimizes the percentage of system water used for backwashing yet occurs frequently enough to prevent filter breakthrough from occurring during normal operations.
7. Determine if a pre-filter potassium permanganate chemical metering system is required to prevent silica fouling of the filter media.

Filter to waste piping is provided in the treatment system design and should be used when establishing the initial chemical feed settings to prevent under or over chlorinated water from entering the System. Filter to waste water will be directed to the backwash infiltration area.

11. Operation and Maintenance Considerations

11.1 Operation and Maintenance Requirements

Operation and maintenance of the proposed treatment system will be the responsibility of the System's operator. A treatment system operation and maintenance manual will be provided by ATEC.

Operation of ATEC manganese dioxide-adsorption treatment systems generally do not place a heavy burden on the operator; however, there will be additional operation and maintenance requirements beyond what is already required for the System. A summary of these requirements is provided in **Table 23**.

Table 23. Treatment System Operation and Maintenance Requirements

Every time operator visits pumphouse
Check chlorine solution tank level, fill as needed.
Verify chlorine pump turns on/off with opening/closing of flow control solenoid valve.
Check pressure loss across filters while filters are running, inspect filter media if pressure loss exceeds 5 psi.
Weekly
Raw water quality field testing: iron and manganese.
Post chlorine injection point water quality field testing: free and total chlorine
Treated water quality field testing: iron, manganese, free chlorine, and total chlorine.
Monthly
Manually initiate backwash cycle, allow backwash cycle to complete. Observe backwash for each filter, confirm that target backwash rate and duration is achieved for each filter.
Inspect all piping and valve connections for tightness and leaks, correct deficiencies.
Inspect all hydraulic tubing for leaks and restrictions, replace if damaged.
Biannually
Check and record media level in all filters, add additional media as required to maintain recommended level. Record when additional media is added.
Annually
Fully open and close backwash throttling valve, reset valve to obtain required backwash flow rate.
Clean sight glass (annually or as needed).
Inspect filter vessels for rust and remove, touch up paint (annually or as needed)
Every Five Years
Rebuild or exchange backwash control valves (every 5 years or as needed).
Every 30 years
Replace filter media (every 30 years or as needed).

11.2 Operator Training and Certification Requirements

A Purification Plant Criteria Worksheet was completed for the proposed treatment system to determine the level of operator certification required. The treatment system was identified as a Class 1 water treatment plant, requiring a Water Treatment Plant Operator Level 1 (WTPO 1) certified operator in responsible charge. The completed Purification Plant Criteria Worksheet is included in **Appendix I**.

PROVISIONS

PROVISIONS

Well Construction: All water wells constructed within the State shall meet the minimum standards for well construction and maintenance as provided under chapter 18.104 RCW, Washington Water Well Construction Act of 1971, and Chapter 173-160 WAC, Minimum Standards for Construction and Maintenance of Wells.

Water Level Monitoring: In order to protect the ground water resource, static water level in the well shall be measured at least once each month. Ecology shall be notified if water levels drop below normal seasonal declines. The water level data shall be maintained and made available to Ecology upon request.

Water Use: An approved measuring device shall be installed and maintained for each diversion/withdrawal of the sources identified by this water right in accordance with the rule "Requirements for Measuring and Reporting Water Use," Chapter 173-173 WAC.

Water use data shall be recorded weekly. Data shall be maintained by the property owner and promptly submitted to Ecology upon request. Recording and retention of data by the water right holder are required to inform the water users about how much water is used, when the water is used and to assist users in efficient water management.

Chapter 173-173 WAC describes the requirements for data accuracy, device installation and operation, and information reporting. It also allows a water user to petition Ecology for modifications to some of the requirements. Installation, operation and maintenance requirements are contained in the document entitled "Water Measurement Device Installation and Operation Requirements."

Department of Ecology personnel, upon presentation of proper credentials, shall have access at reasonable times, to the records of water use that are kept to meet the above conditions, and to inspect at reasonable times any measuring device used to meet the above conditions.

Sea Water Intrusion: Permittee or certificate holder and its successor(s) shall provide data on chloride concentrations for the well authorized by this permit or certificate with analysis performed by a state accredited laboratory. Accreditation information may be obtained from Ecology's Quality Assurance Program at (360) 895-4649. Sampling shall occur in April and August of each year, with a copy of the laboratory results for both sampling events submitted by October 15 of the same year, to the Department of Ecology, Northwest Regional Office, Bellevue, Washington.

If pumping from any well authorized by this water right causes chloride concentrations to show an increasing trend, immediate action shall be required to prevent pumping concentrations from increasing, as is consistent with the water quality anti-degradation policy WAC 173-200-030. These actions include, but are not limited to reducing the instantaneous withdrawal rate (gpm) of the well, lowering the annual quantity removed from the well, drilling additional wells, installing more storage capacity, or revising the pumping schedule. If chloride concentrations continue to increase, even after corrective measures are taken, the permit holder shall relinquish the option to perfect additional allocated quantities regardless of the stage of development.

Conservation and Water Use Efficiency: Issuance of this water right may be subject to implementation of the minimum requirements established in the Conservation Planning Requirements, Guidelines and Requirements for Public Water Systems Regarding Water Use Reporting, Demand Forecasting Methodology, and Conservation Programs, March 1994, and as revised.

Under RCW 90.03.005 and 90.54.020(6), conservation and improved water use efficiency must be emphasized in the management of the State's water resources, and must be considered as a potential new source of water. Accordingly, as part of the terms of this water right, the applicant may be required to prepare and implement a water conservation plan approved by Department of Health. The standards for such a plan may be obtained from either the Department of Health or the Department of Ecology.

Water System Plan: Department of Health approval of a water system plan is required prior to the issuance of a certificate.

Decommissioning of Well #1: Well #1 shall either be properly decommissioned or maintained in accordance with chapter 18.104 RCW, Washington Water Well Construction Act of 1971, and Chapter 173-160 WAC, Minimum Standards for Construction and Maintenance of Wells.

Water Allocation: The applicant is advised that the certificate will issue for only that quantity of water that has been withdrawn and applied to actual beneficial use. Such quantity applied to actual beneficial use shall not exceed the quantity specified in this report of exam and will be calculated on the basis of the best information available to Ecology, including metering data and/or water duty analysis. The applicant is advised that the quantity of water allocated by this permit may be reduced at the time of final certification to reflect system capacity and actual usage.

A water right certificate shall not be issued until a final investigation has been made.

This permit shall be subject to cancellation should the permittee fail to comply with the above development schedule and/or fail to give notice to the Department of Ecology on forms provided by that Department documenting such compliance.

Given under my hand and the seal of this office at Bellevue, Washington, this 27th *day of* January, *2004.*

DESCRIPTION OF PROPOSED WORKS

Well and delivery system to irrigate 20 acres and supply water to concession stand and restrooms. 100,000 gallon holding tank.

DEVELOPMENT SCHEDULE

BEGIN PROJECT BY THIS DATE:	COMPLETE PROJECT BY THIS DATE:	WATER PUT TO FULL USE BY THIS DATE:
Started	February 26, 1994	February 26, 1995

PROVISIONS

Installation and maintenance of an access port as described in Ground Water Bulletin No. 1 is required. An air line and gauge may be installed in addition to the access port.

In order to monitor the resource, static water level (SWL) shall be measured **at least** twice each year, in April and August. Measurements shall be taken after the pump has been shut off a reasonable time to allow water level to return to normal. Ecology's Water Resources Section (Northwest Regional Office) shall be notified if a below normal seasonal drop is measured in SWL, otherwise this data shall be maintained and be made available to Ecology upon request. The Department has made available to the public a measuring device (E-Tape) through Island County Health Department.

An approved measuring device shall be installed and maintained in accordance with RCW 90.03.360, WAC 508-64-020 through WAC 508-64-040. Meter readings shall be recorded monthly and this data shall be maintained and be made available to the Department of Ecology upon request.

A certificate of water right will not be issued until a final investigation is made.

This permit shall be subject to cancellation should the permittee fail to comply with the above development schedule and/or fail to give notice to the Department of Ecology on forms provided by that Department documenting such compliance.

Given under my hand and the seal of this office at Bellevue, Washington,

this 26th day of February, 1993.

MMADD Other	1,498	5,489	21,462	9,756	8,631
MDD=($MMADD^{O}$*1.65+$MMADD^{irr}$*7/5)	129,698	75,730	105,407	76,943	155,931
Annual Total Usage	5,700,000	6,000,000	8,400,000	6,600,000	11,200,000
ADD	15,616	16,438	23,014	18,082	30,685

MDD was based on 1.65 peaking factor for the non-irrigation portion of water usage and a 7/5 peaking factor for the irrigation demand. This would correspond to only irrigating 5 days of week. The standard peaking factor calculation estimates water usage above the physical capacity of the well, which is impossible.

Well Capacity	173,000	gpd
Max Annual Use	34	ac-ft

WATER RIGHTS SUMMARY

System: South Whidbey Parks and Rec District
PWS ID: 02660 E
Location: Langley, WA

Certificate #	Name	Priority Date	Source Name	Primary or Supplemental	Q_i (gpm)	Q_a (acre-ft)
G1-25547 C	South Whidbey Parks and Recreation District	11/15/89	Well	Primary	60.0	25.5
G1-28084 P	South Whidbey Parks and Recreation District	08/04/00	Well	Supplemental	60.0	40.2
				Total	**120**	**65.7**
				max flow per day (gal)	172,800	2,860,000
						21,400,000
						58,600

Total
annual water rights (CF/yr)
annual water rights (gal/yr)
avg available daily water rig

Q_i = Maximum Instantaneous Flow Rate
Q_a = Maximum Annual Withdrawal

Conversion Factors	
square feet per acre	43,560
gallons per CF	7.48
days per year	365
hours per day	24

Pump	
pump cycles per hour	6
pump run per hour (min)	60
pump run per day (min)	1440

EXISTING AND PROPOSED: DEMAND CALCULATIONS

System: South Whidbey Parks and Rec District
PWS ID: 02660 E
Location: Langley, WA

Function	Size (Sq. Feet)	Users	Daily Demand (gpd)	Total MDD (gpd)	Total ADD (gpd)[1]
Existing Facility Demand Requirements					
Irrigation Demand				*141,691*	*83,000*
Non-Irrigation Demand (Domestic)				9,800	7,000
Yearly Demand				*151,491*	*31,000*
Aquatic Center Demand Requirements					
Total Facility Users[3]	N/A	1,000	10	10,000	4,000
Staff	N/A	10	15	150	150
Swimming Pool[4]	3,501	N/A	10	350	350
Activity Pool	2,269	N/A	10	227	227
Hydrotherapy Spa	100	N/A	10	10	10
Subtotal	*5,870*	*1,010*		*11,000*	*5,000*
Existing + Proposed Aquatic Center				*162,491*	*95,000*
Summer Total After Build Out (Worst Case)				162,000	95,000

[1]-Used daily average users value of 40%

[2]-Inclusive of both existing and proposed demands.

[3]- Values from Water System Design Manual 06/2020, WSDOH, Table 3-2; Pool (swimmer); gpd/person

[4]- Values from Water System Design Manual 06/2020, WSDOH, Table 3-2; Pool Maintenance; gpd/100 sq. ft

		DESIGN	
ADD	System (Summer)	95,000	gpd
	System (Annual)	36,000	gpd
	Domestic	12,000	gpd
MDD	System[2]	162,000	gpd
	Design (limited by Water Right)	156,000	gpd
	Domestic	20,800	
	Anticipated Annual Usage	41	ac-ft

SOURCE-BASED PHYSICAL CAPACITY

System: South Whidbey Parks and Rec District
PWS ID: 02660 E
Location: Langley, WA

WATER RIGHT CALCULATIONS

Based on Annual Volume & Average Day Demand (Eqn 6-3):

$Q_a > (365 * ADD)$

Where:

Q_a *= Annual Volume of Water Available from All Sources, as limited by Water Right (gallons/year)*
ADD = Average Daily Demand (gpd)

	Q_a (gal/year)	ADD (gpd)	365*ADD (gal/year)	Governs:
Potential Connections	21,400,000	36,000	13,140,000	Demand

Based on Instantaneous Flow & Maximum Day Demand (Eqn 6-4):

$V_d = (Q_i * t_d)$
$V_d > MDD$

Where:

V_d *= Total Volume of Water Available for Maximum Day's Demand (gpd)*
MDD = Maximum Daily Demand (gpd)
Q_i *= Instantaneous Maximum Water Right Flow Rate (gpm)*
t_d *= Time that source operates per day (minutes/day)*

	Q_i (gpm)	Minutes Pumped/Hr	t_d (min/day)	V_d (gpd)	MDD (gpd)	Governs
Potential Connections	120	60	1440	172,800	162,000	Demand

SOURCE-BASED PHYSICAL CAPACITY

System: South Whidbey Parks and Rec District
PWS ID: 02660 E
Location: Langley, WA

SOURCE CALCULATIONS

Total Source Capacity (Eqn 4-2):

$V_T=sum(Q_j*T_j)$

Where:

V_T = Total volume of water available to the system over a specified period of time (gal/specified time period)
Q_j = Delivery rate of source (gal/unit time)
t_j = Time that flow (Q_j) was delivered from source "j"

Source ID	1	2	0	0	0
Q_j Delivery Rate (gpm)	0	120			
Max Pump Time (min/day)		1200			
Max Days Pumped (days/yr)		365			
V_j Source Capacity (gal/yr)	0	52,560,000	0	0	0

Q_s = 120 gpm

V_T = 52,560,000 gal/yr

Based on Source Production & Maximum Day Demand (Eqn 4-3):

$N=V_{t/MDD}$
V_d>MDD

Where:

V_t = Total Volume of Water Available for all non-emergency souces in 24 hour period
MDD = Max Daily Demand (gpd)
Q_s = Total Well Production Flow rate (gpm)
t_d = Time that source operates per day (minutes/day)

	Q_s (gpm)	Minutes Pumped/Hr	t_d (min/day)	V_t (gpd)	MDD (gpd)	Governs
Potential Connections	120	60	1,440	172,800	162,000	Demand

SOURCE-BASED PHYSICAL CAPACITY

System: South Whidbey Parks and Rec District
PWS ID: 02660 E
Location: Langley, WA

TREATMENT CALCULATIONS

Based on Treatment Max Design Flow & Maximum Day Demand (Eqn 6-4):

$N = V_d/MDD = (Q_t * t_d)/MDD)$

Where:

N = Number of Service Connections, ERUs
V_d = Total Volume of Water Available for Maximum Day's Demand (gallons/day)
MDD = Maximum Daily Demand (gpd)
Q_t = Treatment System Maximum Design Flow Rate (gpm)

	Q_t (gpm)	Percent Backwash Waste	V_d, Avg. Daily Treatment Capacity (gal)	Domestic MDD (gpd)	Governs
Potential Connections	35	2.5%	40,950	20,800	Demand

SUMMARY

Condition	Capacity (gpd)	Limiting Factors	Governed by
Water Right	13,140,000	Q_a & ADD	Demand
Water Right	162,000	Q_i & MDD	Demand
Source	162,000	Q_s & MDD	Demand
Treatment Capacity	20,800	Q_t & Domestic MDD	Demand

(only applies to Domestic water demand)

System is limited by: Source Capacity and Water Right

System's most-limiting Capacity: Source Capacity

System will need to limit daily irrigation on summer days to meet source capacity and water right limitations

PEAK HOUR DEMAND (PHD) CALCULATION

System: South Whidbey Parks and Rec District
PWS ID: 02660 E
Location: Langley, WA

Description: The demand calculations are based on the AWWA M22 2004 edition Chapter 4 "Estimating Demands Using Fixture Values" per the sample calculation on Page 37.

		Buildings/Units						
		Existing					Proposed	
Fixture or Appliance	Suggested Fixture Value (gpm)	Concession Stand	Old Maintenance Bldg	Maintenance Bldg	Castle Park Restroom	Total Existing Fixtures	Aquatic Center	Total Future Fixtures
Toilet (tank)	4	3	1	1	4	9		9
Toilet (flush valve)	35					0	9	9
Urinal (wall or stall)	16	1			2	3	2	5
Urinal (flush valve)	35					0		0
Bidet	2					0		0
Shower (single head)	2.5		1			1	20	21
Faucet (lavatory)	1.5	2	1	1	4	8	8	16
Faucet (sink)	2.2	1		1		2	2	4
Faucet (utility sink)	4					0	1	1
Dishwasher	2					0		0
Bathtub	8					0		0
Clothes washer	6					0	1	1
Hose connection - 1/2 in.	5		1	1		2		2
Hose connection - 5/8 in.	9					0	6	6
Hose connection - 3/4	12					0		0
Misc. - Bedpan washer	10					0		0
Misc. - Drinking fountains	2	1			1	2	2	4
Misc. - Dental units	2					0		0
Total Fixture Value:		35.2	13	12.7	56	**117**	**481**	**598**
% of overall future system flow		5.9%	2.2%	2.1%	9.4%	**19.5%**	**80.5%**	**100.0%**

Total Domestic Peak Hour Demand (from Fig 4-2) **90** **gpm**

STORAGE CAPACITY CALCULATIONS

System: South Whidbey Parks and Rec District

PD Series

DATA SHEET

Chemical Metering Pump

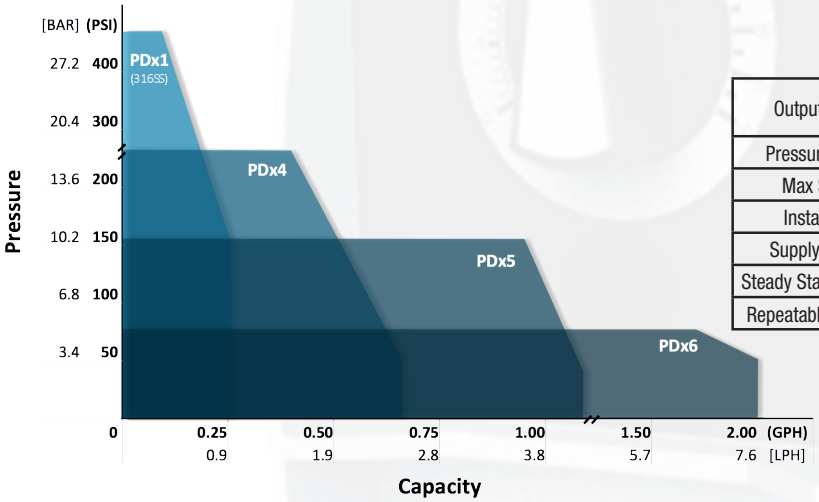
Designed to Last

Introducing the PD Series chemical metering pump, the new standard in water treatment. This upgrade to LMI's most popular pump series includes an improved drive design, all new electronics, and proven FASTPRIME™ liquid ends. Available in Manual or Enhanced control models, the PD Series pump fits seamlessly into your process control application. The Manual model offers straightforward control without the need for tedious calculations. Its split-scale dial ensures precision, even at lower flow rates. The Enhanced model offers external control and a large graphical display to provide intuitive access to advanced features such as calibration assist, system and user totalizers, the new STAYPRIME™ degassing technology, and more.

Trusted by water treatment professionals for more than a generation, the PD Series chemical metering pump will continue to earn your trust for years to come.

Manual Model Enhanced Model

Performance Specifications



Output Range	.002 – 2.0 GPH (.008 – 7.6 LPH)
Pressure Range	50-450 PSI (3.4-30.6 BAR)
Max Stroke	160 SPM
Installation	Indoor/Outdoor
Supply Voltage	115-230V / 50-60Hz
Steady State Accuracy	+/- 3%
Repeatable Accuracy	+/- 3%

*Standard on PD0 and PD7 models

Features and Benefits

- Shared drive platform with universal 115-230V, 50/60 Hz power supply
- Flows from 2 GPH (7.57 LPH) up to 450 PSI (30.6 BAR)
- Simplified capacity control with constant stroke length to maintain calibration across the adjustable range
- Advanced electronics with dynamic compensation for temperature and voltage conditions
- FastPrime™ liquid ends (standard) that allow fast and easy priming with integrated bleed valve
- AutoPrime™ liquid ends (optional), designed specifically for off-gassing liquids (See page 4 for performance specifications)
- Rugged construction with NEMA 4X/IP 65 housing for the harshest environments and outdoor use
- Compact footprint for efficient use of space in process applications or OEM configuration
- Agency certifications - NSF 61 and 50 (pending), ETL, CE
- Built on decades of experience and fully backed by LMI's two-year warranty

Enhanced Functionality (PD7)

- **2.4" Color LCD** - Intuitive navigation allows you to configure and operate with ease – view status and alerts from a distance to confirm safe operation
- **External Control Inputs** - Automate your process with pulse pacing, remote start/stop, and tank level indication – ideal for proportional dosing
- **Calibration Assist** - Simply draw from a column and adjust the estimated value on-screen to the measured actual – calibration is that easy
- **System & User Totalizers** - An odometer for your pump that logs pump strokes, estimated volume, and power cycles – confirm pump operation between visits
- **StayPrime™ Degassing Technology** - Automates the priming cycle after a period of idle pump time to ensure prime

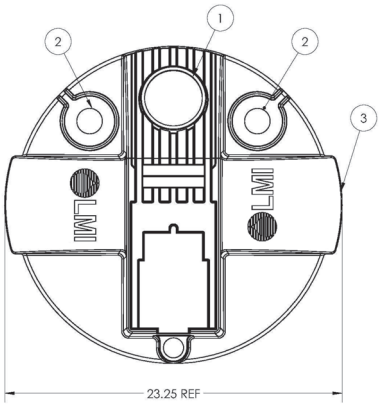
Information Sheet

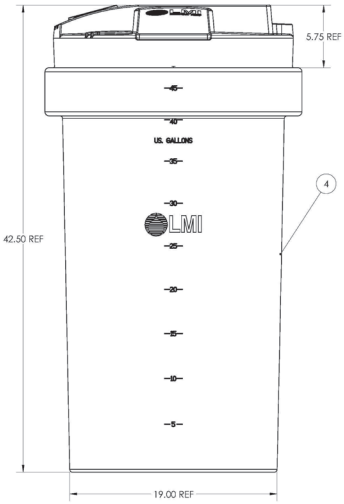
Polyethylene Tank and Cover Assembly and Accessories

MODEL NO. 26350
50 GALLON TANK ASSEMBLY

- Ultraviolet resistant, molded yellow polyethylene tank.
- High rigidity black polyethylene cover with molded recess for mounting of pump, agitator* and liquid level switch.
- 5 gallon (20 liter) graduations
- Self supporting, tapered sides.
- Suitable for most corrosive and noncorrosive solutions.
- Can be nested up to four (4) per carton for shipping economy.
- Certified to NSF/ANSI Standard 61 and 372.

Model No. 26350





COMPONENT PARTS

Ref No.	Part No.	Description	Qty
1	25985	Caplug Assembly Black Polyethylene	1
2	10346	Caplug Assembly Black Polyethylene	2
3*	26637	Cover, Black Polyethylene	1
4	25688	Tank, 50 Gallon Yellow Polyethylene	1

Shipping wt. 25 lbs (11.4 kg)

NOTES:

1. Full, flat bottom support required.
2. Maximum solution/ambient temperature 110° F (43° C)
3. Minimum solution/ambient temperature 0° F (-18°C)
4. Maximum weight limit for cover 50 lbs (23 kg)
5. Not suitable for use with concentrated organic solvents, oils and related materials.

NSF
Certified to NSF/ANSI 61 & 372

Cover must be drilled at factory for agitator mounting. Please indicate your desire for this option when ordering.

CORPORATION STOPS

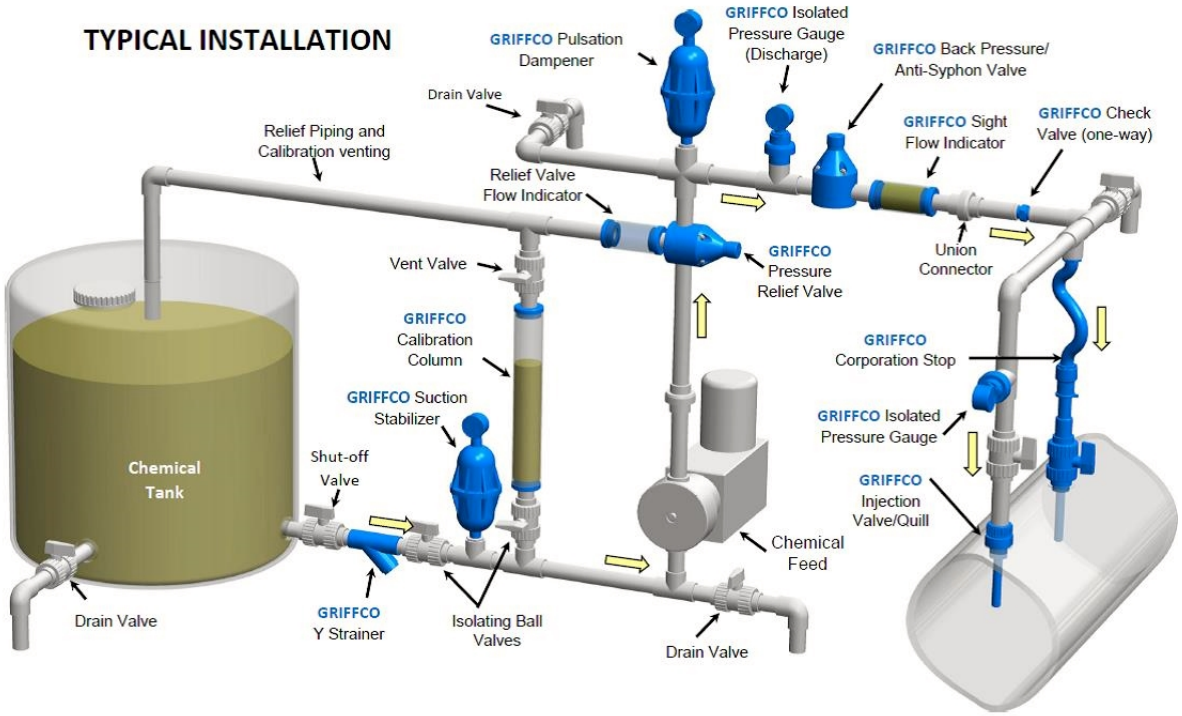
Features:

- **High Reliability / Low Cost**
- **Lead Free Brass Corp stops**
- **Union connections (Threads optional)**
- **Integral ball check valve w/spring**
- **Poppet tip option**
- **Dual lock capability**
- **316SS locking chain**
- **Variable & custom injector lengths**
- **Ball Valves with PTFE seals**
- **Wide range of materials for quills and ball valves**

Griffco corporation stops are designed to ensure chemical feed systems inject into the center of a process stream for better mixing and to prevent corrosion along the process pipe. In addition, they allow for quill servicing without having to turn off or shut down the process or main line. The check valve prevents the process fluid from going back up the chemical line. Robust construction ensures reliability in the rigorous service of municipal and industrial applications. Materials of construction include PVC, CPVC, PVDF, 316 SS, Alloy 20 and Hastelloy C. They are available in sizes 1/2", 3/4", and 1".

Operation:

Griffco corporation stops are threaded into a process pipe or tank to deliver chemical to a desired application point. The ball valve allows for separation of the process fluid and chemical being injected for servicing or isolations purposes. The integrated quill keeps the chemical off the wall of the tank or pipe and will ensure better mixing of the chemical with the process fluid. The ball check in the valve functions as a positive shut-off to ensure the process fluid does not go back up the chemical line. The union facilitates an easy connection between the valve and the chemical line. An optional flexible line is available to allow for removing or retracting the quill from the process or main.



Technical Data:

Sizes: Model CS	**1/2", 3/4", and 1"**
Quill Connections:	**Plastic: Union Threaded Connection** **Metal: Male Threads**
Ball Connections	**Threaded: 3/4", 1", 1.25" (NPT, AWWA [Brass only])**
Maximum Temperature: (°F)	**Plastic: 140° ; Metal: 300°**
Maximum Operating Pressure:	**150 psi**
Materials of Construction:	
Ball Valve:	**316SS, Brass(Lead-Free), PVC, PVDF, CPVC, Brass (AWWA threads)**
Optional Check Valve Ball / Spring: **Check Valve Body Matches Quill Material**	**Plastic: PTFE Ball / Hastelloy C Spring** **Metals: 316SS Ball and 316SS Spring (matches body) ,** **A20 – A20 Ball - No Spring**
O Ring:	**Standard: Viton Optional: EPDM**
Union Nut:	**Standard: Plastic: Matches Quill Material** **Metal valve: N/A for threads only. Optional: Others on Request**
Injection Quill:	**PVC, CPVC, PVDF, 316 SS, A 20, Hast. C, Others on Request**
Locking Chain:	**316SS**

FLOW SWITCH

MODEL Q-10N Q-10VCR

FLEXIBLE DESIGN:

Model Q-10 is provided with three factory adjustable parameters which provide performance flexibility to meet a multitude of applications:

- Paddle Area
- Paddle Length
- Paddle Stiffness

Responds to fluid flow only, independent of line pressure and temperature.

Maximum flow rate should be no more than five times the close point.

Positive stop eliminates fatigue effects of turbulence, vibration and flow surge on flow detecting element.

Small size and low profile provides easy mounting in crowded installations.

Very low pressure drop - typically less than 1.0 psig at normal flow rate.

Quick response.

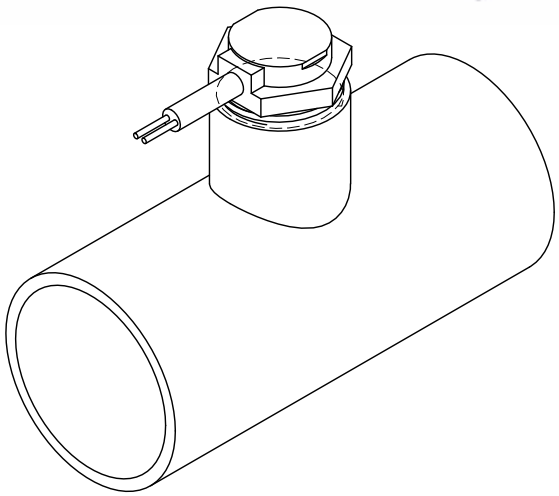
Available with NO, NC or SPDT Reed Switch

Switches 5VDC to 240VAC.

Switches resistive and light inductive loads.

Switch employs magnetic coupling.

Send us your special requirements. We will quote a special unit to meet those requirements.



KEY FEATURES

Flow Range	**0.7–1,025 GPM (2.6–3,880 L/m)**
Working Temp	**200°F (93°C) Maximum**
Working Pressure	**250 psig (1724 kPa)**
Process Connection	**1" NPT**
Electrical (Reed) Switch	**SPNO 0.5A**
Enclosure	**NEMA 4X / IP 66**

TYPICAL USES

Monitoring flow of coolant supplied to:

Brakes and Clutches	Emergency Wash-Down Showers
Computer Systems	Marine and Stationary Engines
Diodes, SCRs, Triacs, etc.	RF and Radar Transmitters
Electromagnets	Spot welders
Fire Sprinkler Flow Alarms	Transformers
Lasers	Vacuum Systems

In Chemical Processing:

Fluid Blending Systems	Liquid Transfer
Heat Transfer Fluids	Monitor Filter Clogging
Liquid Scrubbers	Starting back-up pumps

Monitoring pump output, valve position, systems flow status

In Water Treatment:

Irrigation Systems	Municipal Water Supply Systems

≋ TYPICAL WORKING FLUIDS

For use in concentrated acids, bases, ketones, esters, alcohols, phenols, etc.

Mild Acids	Hydrocarbons
Mild Bases	Ketones
Plating Solutions	Lubricating Oils
Gasoline	Cooling Tower Water
Glycol Solutions	Water (saltwater, pure, tap, etc.)
JP-4

Contact Ratings:
- AC Voltage (max. switching) 300VAC
- DC Voltage (max. switching) 350VDC
- Current (max. switching) 0.5A
- Current (max. carrying) 2.5A
- Power (max) (VA, W) 50 watts
- Contact resistance (max. initial) 0.15 ohms
- Insulation resistance 1010 ohms
- Operating temperature -40°F–240°F (-40°C–115°C)

OPTIONAL: SPNC or SPDT, 3 watt, 100VAC/VDC.

Q-10N (NORYL®)

WORKING PRESSURE: 200 psig max. @ 70°F
WORKING TEMPERATURE: 180°F @ ambient pressure
WETTED MATERIALS: Body: Noryl® (PPO) (10% glass fibers); Paddle: 316 stainless steel

Q-10VCR (FORTRON®)

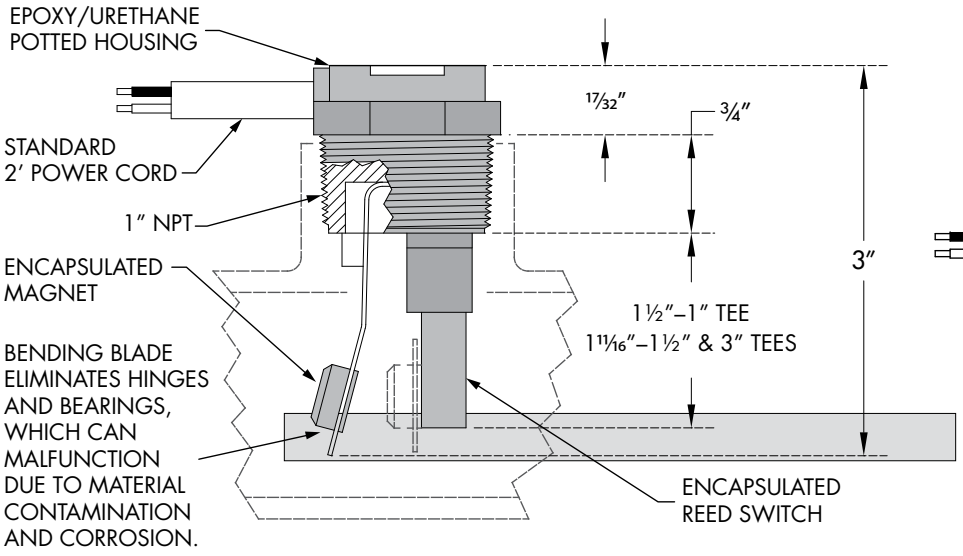
WORKING PRESSURE: 250 psig max. @ 70°F
WORKING TEMPERATURE: 200°F @ ambient pressure
WETTED MATERIALS: Body: Fortron® (PPS) (40% glass fibers); Paddle: HASTELLOY® C

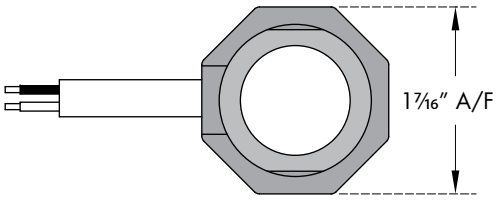
INDUCTIVE LOADS

Switch contacts have been tested with small relays and 30A J-C relay inductive driving coils at 120/240VAC to 500,000 operations without failure.

NOTE: Model Q-10N employs magnetic coupling between bending blade and switch body. Magnetic particles can accumulate on and around magnetic housing which may affect proper operation. Please conduct appropriate fluid magnetic particle evaluation and operational tests prior to and during installation and use.

INSTALLATION DIMENSIONS





- Installation drawing and a numbered parts list is supplied with each unit.
- Special one-day delivery is available.

Pressure Relief/Sustaining Valve

Model 730

- Prioritizing pressure zones
- Ensuring controlled pipeline fill-up
- Preventing pipeline emptying
- Pump overload & cavitation protection
- Safeguarding pump minimum flow
- Excessive line pressure protection

The Model 730 Pressure Relief/Sustaining Valve is a hydraulically operated, diaphragm actuated control valve that can fulfill either of two separate functions. When installed in-line, it sustains minimum pre-set, upstream (back) pressure regardless of fluctuating flow or varying downstream pressure.
When installed as a circulation valve, it relieves excessive line pressure when above maximum pre-set.

Features and Benefits

- **Line pressure driven –** Independent operation
- **Balanced seal disk –** High relief flow capacity
- **In-line serviceable –** Easy maintenance
- **Double chamber design**
  - Moderated valve reaction
  - Protected diaphragm
- **Flexible design –** Easy addition of features
- **Variety of accessories –** Perfect mission matching
- **"Y" or angle, wide body –** Minimized pressure loss
- **Semi-straight flow –** Non-turbulent flow
- **Stainless Steel raised seat –** Cavitation damage resistant
- **Obstacle free, full bore –** Uncompromising reliability
- **V-Port Throttling Plug –** Low flow stability

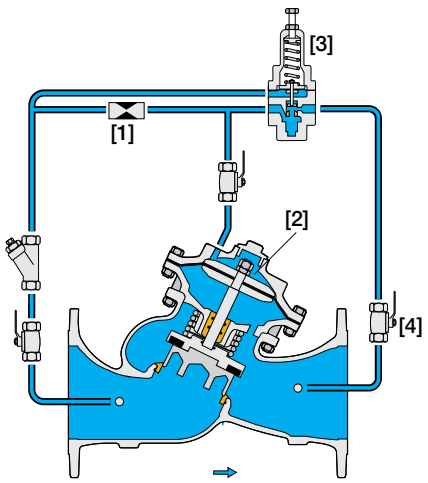
Major Additional Features

- UL Listed and FM Approved for fire protection – **FP-730-UL/FM**
- Solenoid control – **730-55**
- Quick pressure relief valve – **73Q**
- Pressure sustaining & reducing valve – **723**
- Check feature – **730-20**
- High sensitivity pilot – **730-12**
- Level control & pressure sustaining valve – **753**
- Pump control & pressure sustaining valve – **743**
- Pump circulation & pressure sustaining valve – **748**
- Electrically selected multi-level settings – **730-45**
- High sensitivity hydraulic positioning – **730-85**
- Electronic pressure sustaining valve – **738-03**

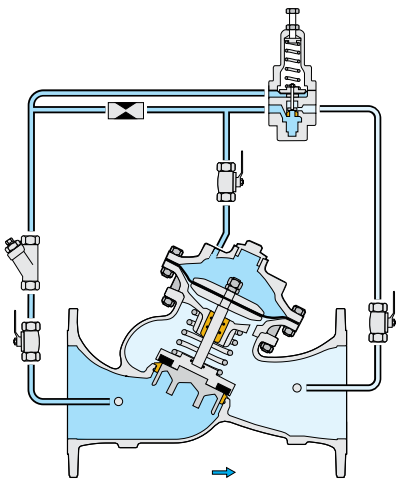
See relevant BERMAD publications.

Operation - Pressure Sustaining (In-Line)

The Model 730 is a pilot controlled valve equipped with an adjustable, 2-Way pressure sustaining pilot.
The restriction **[1]** continuously allows flow from the main valve inlet into the upper control chamber **[2]**. The pilot **[3]** senses upstream pressure and should be set to minimum system pressure allowed.
Should upstream pressure tend to fall below pilot setting, the pilot throttles, enabling pressure to accumulate in the upper control chamber, causing the main valve to throttle, sustaining upstream (back) pressure at pilot setting.
Should upstream pressure be below pilot setting, the pilot closes, causing the main valve to close drip tight. Should upstream pressure tend to rise above pilot setting, the pilot releases accumulated pressure causing the main valve to modulate open.
The downstream cock valve **[4]** enables manual closing.



Valve Regulates

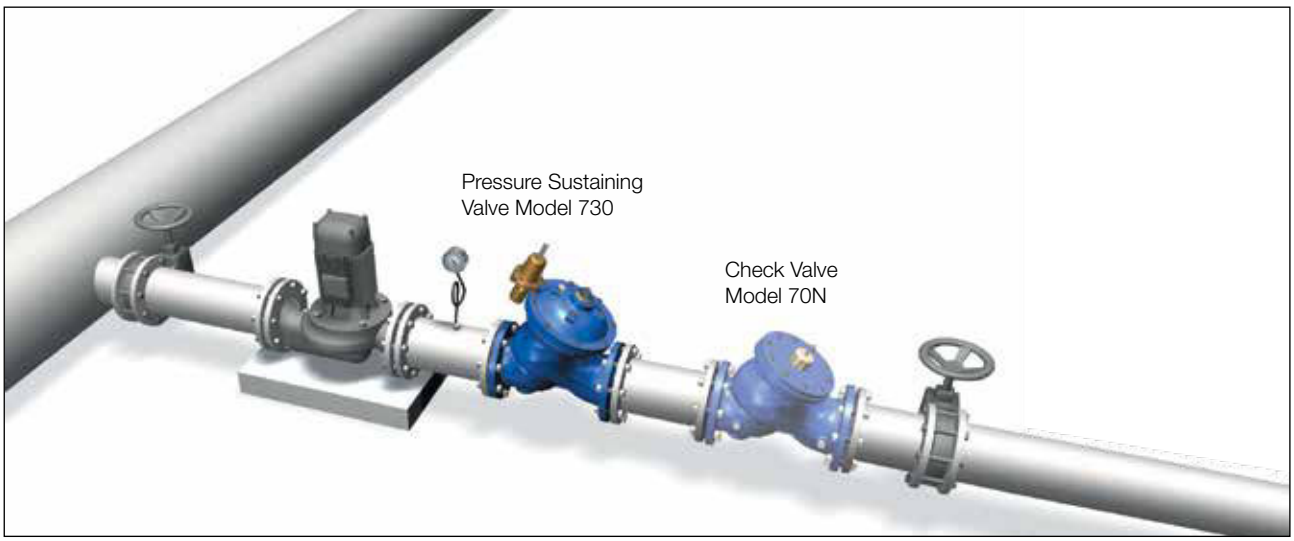


Valve Closed
(Upstream pressure below pilot setting)

Typical Applications

Pump Overload and Cavitation Protection

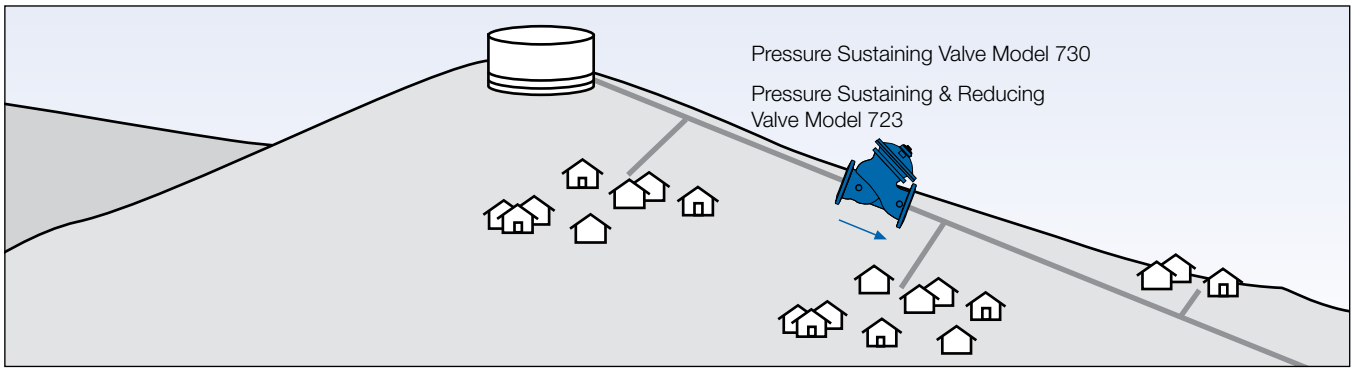
The Model 730 sustains pump discharge pressure, preventing pump overload and cavitation damage caused by excessive demand.
By connecting the pilot sensing line to pump suction, the Model 730 becomes Model 730R which sustains pump suction pressure.
Where suction pressure regimes vary, the Model 736 is needed to limit pump flow by sustaining pump differential pressure.



Prioritizing One Zone over Another

This application is usually found in gravity fed systems. The **Model 730** enables prioritizing the higher elevation zone over downhill consumers when they create excessive total demand.

By adding a pressure reducing feature to the primary pressure sustaining function, the Model 730 becomes a **Model 723** that also protects downhill consumers from over pressure during low demand.



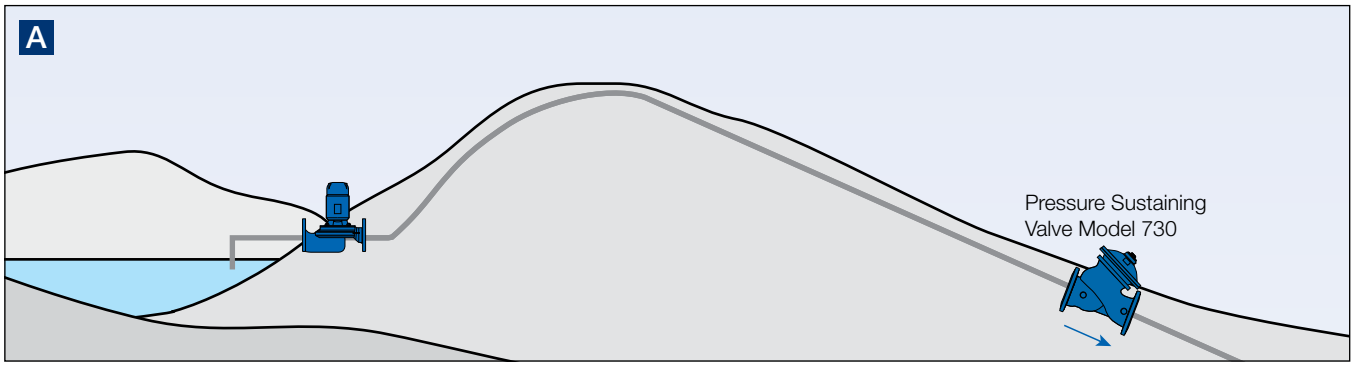
Preventing Line Emptying

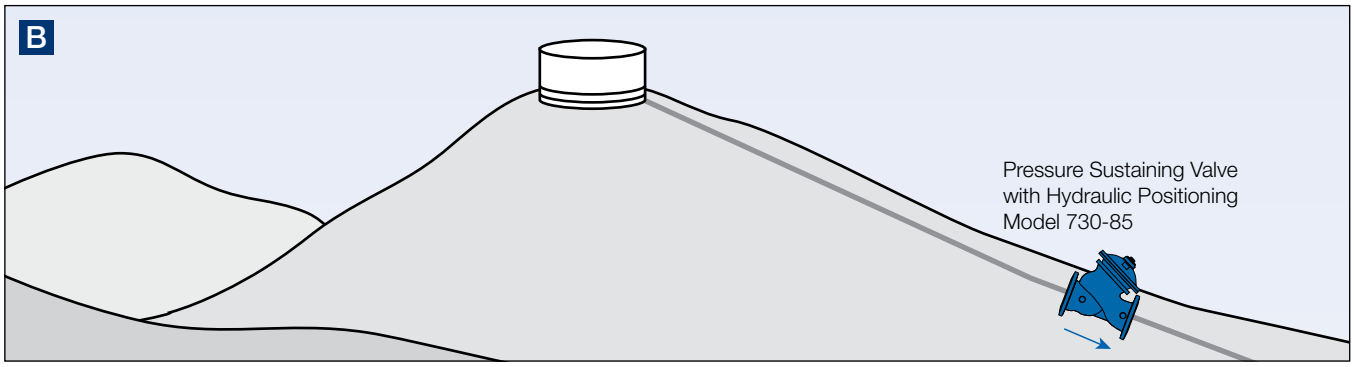
Line emptying presents a serious problem in water distribution networks. Preventing it in downhill networks requires setting the pilot slightly above the elevation differential between the highest point of the line and the valve.

Where a **pump** provides pressure A , the relatively high pressure causes the **Model 730** to open wide. When the pump stops, pressure drops below pilot setting and the valve closes drip-tight preventing line emptying.

Where a **reservoir** provides pressure B , there is only a small potential for variation in pressure (the difference in high and low reservoir levels). The problem is made worse by having a significant part of that potential pressure lost on line friction. The standard Model 730 might not be enough. The solution is to install a valve with very low head loss, super sensitivity, accuracy and repeatability.

Install the **Model 730-85** pressure sustaining with high sensitivity hydraulic positioning.





Pilot System Specifications

Standard Materials:

Pilot:

Body: Stainless Steel 316 or Bronze

Elastomers: Synthetic Rubber

Spring: Galvanized Steel or Stainless Steel

Tubing & Fittings:

Stainless Steel 316 or Copper & Brass

Accessories:

Stainless Steel 316, Brass and Synthetic Rubber Elastomers

Pilot Adjustment Range:

0.5 to 3.0 bar ; 7 to 40 psi

0.8 to 6.5 bar ; 11 to 95 psi

1 to 16 bar ; 15 to 230 psi

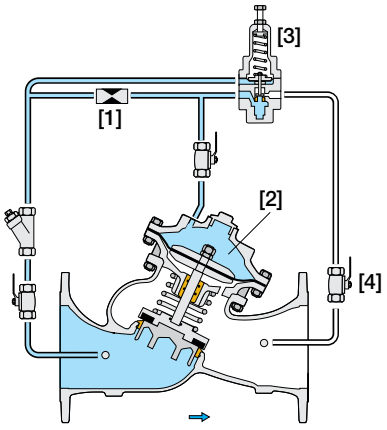
5 to 25 bar ; 70 to 360 psi

Notes:

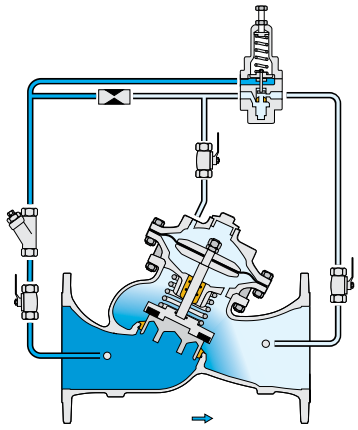
- Inlet pressure, outlet pressure and flow rate are required for optimal sizing and cavitation analysis
- Recommended continuous flow velocity: 0.3-6.0 m/sec ; 1-20 ft/sec
- Minimum operating pressure: 0.7 bar ; 10 psi. For lower pressure requirements consult factory.

Operation - Pressure Relief (Circulation)

The Model 730 is a pilot controlled valve equipped with an adjustable, 2-Way pressure sustaining pilot.
The restriction **[1]** continuously allows flow from the main valve inlet into the upper control chamber **[2]**. The pilot **[3]** senses upstream pressure and should be set slightly above system working pressure.
Should upstream pressure rise above pilot setting, the pilot releases pressure from the upper control chamber, causing the main valve to modulate open, relieving excessive upstream pressure. Should upstream pressure fall, the pilot throttles, enabling pressure to accumulate in the upper control chamber, causing the main valve to throttle closed, sustaining upstream (back) pressure at the pilot setting. Should upstream pressure be below pilot setting, the pilot closes, causing the main valve to close drip tight.
The downstream cock valve **[4]** enables manual closing.



Valve Closed
(Upstream pressure below pilot setting)

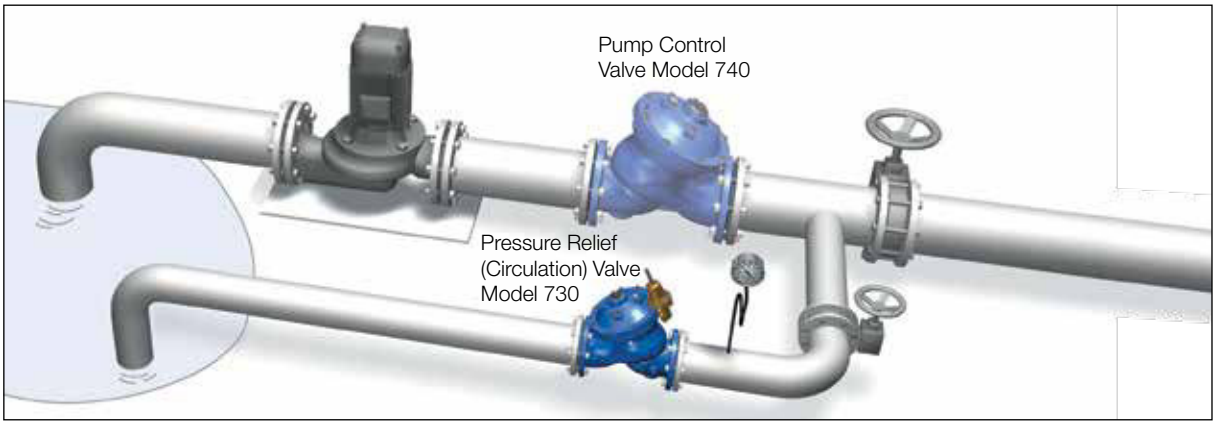


Valve Regulates

Typical Applications

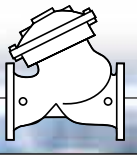
Safeguarding Pump Minimum Flow

The Model 730 relieves over pressure caused by excessive pump discharge during low demand. To keep a constant discharge pressure, the difference between pumped flow and consumer demand can be circulated back to pump suction.



Circulation valves are often exposed to severe cavitation because valve ΔP and velocity are usually high while downstream pressure is very low. On the other hand, the valves operate under these conditions for relatively short periods. Increased valve durability for applications requiring long operating periods will be achieved by using cavitation resistant materials, adding a downstream orifice, installing an upstream pressure reducing valve, increasing valve size, or any combination of these choices.

BERMAD Waterworks



700 Series

Technical Data

Size Range: DN40-900 ; 1½–36”
End Connections (Pressure Ratings):
Flanged: ISO PN16, PN25 (ANSI Class 150, 300)
Threaded: BSP or NPT
Others: Available on request
Valve Patterns: “Y” (globe) & angle, globe (DN600-900 ; 24”-36”)
Working Temperature: Water up to 80°C ; 180°F
Standard Materials:
Body & Actuator: Ductile Iron
Internals: Stainless Steel, Bronze & coated Steel
Diaphragm: Synthetic Rubber Nylon fabric-reinforced
Seals: Synthetic Rubber
Coating: Fusion Bonded Epoxy, RAL 5005 (Blue) approved for drinking water or Electrostatic Polyester Powder

Differential Pressure Calculation

$$\Delta P = \left(\frac{Q}{(Kv;Cv)}\right)^2$$

ΔP = Differential Pressure for fully open valve (bar; psi)

Q = Flow rate (m^3/h; gpm)

Kv = Metric system - valve flow coefficient (flow in m^3/h at 1 bar ΔP with 15°C water)

Cv = US system - Valve flow coefficient (flow in gpm at 1 psi ΔP with 60°F water)
Cv = 1.155 Kv

Flow Control Valve
with Solenoid Control

Model 770-55-U

- Limiting consumers over demand
- Controlling pipeline fill rate
- Pump overload & cavitation protection
- Switching between “on-duty” valves
- Selecting system flow regime

The Model 770-55-U Flow Control Valve with Solenoid Control is a hydraulically operated, diaphragm actuated control valve that maintains preset maximum flow, regardless of fluctuating demand or varying system pressure. The valve opens and shuts off in response to an electric signal.

Features and Benefits

- **Line pressure driven –** Independent operation
- **Hydraulic flow sensor (upstream installation)**
  - No moving parts
  - No electronic components
  - No need for flow straightening
- **Solenoid controlled**
  - Low power consumption
  - Wide range of pressure and voltage
  - Normally Open, Normally Closed or Last Position
- **In-line serviceable –** Easy maintenance
- **Double chamber design**
  - Moderated valve reaction
  - Protected diaphragm
- **Semi-straight flow –** Non-turbulent flow
- **Stainless Steel raised seat –** Cavitation damage resistant
- **Obstacle free, full bore –** Uncompromising reliability
- **V-Port Throttling Plug –** Low flow stability

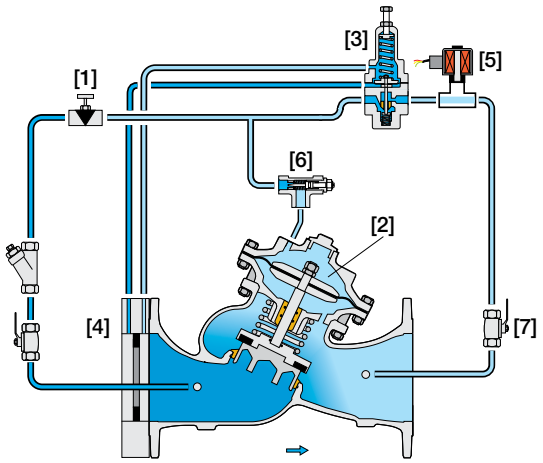
Major Additional Features

- Flow control (constant downstream pressure) – **727-U**
- Solenoid control & check feature – **770-25-U**
- High sensitivity pilot – **770-55-12-U**
- Pressure Reducing – **772-U**
- Electric override – **770-59-U**
- Level & flow control valve – **757-U**
- Pump & flow control valve – **747-U**
- Electronic control valve – **718-03**

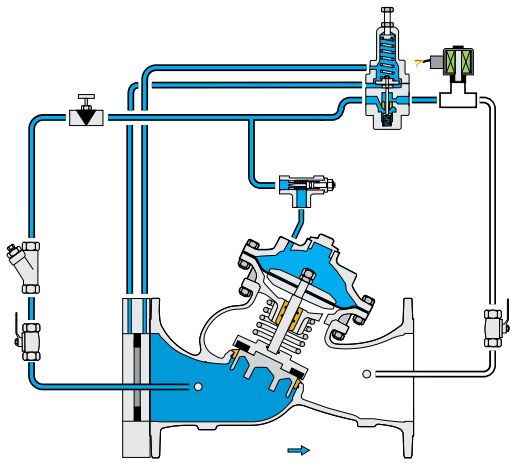
See relevant BERMAD publications.

Operation

The Model 770-55-U is a pilot controlled valve equipped with an adjustable, 2-Way flow pilot, an orifice assembly, and a solenoid pilot.
The needle valve **[1]** continuously allows flow from valve inlet into the upper control chamber **[2]**. The pilot **[3]** senses the differential pressure across the orifice plate **[4]**, and together with the solenoid **[5]**, controls outflow from the upper control chamber. Should orifice differential pressure rise above pilot setting, the pilot throttles, enabling pressure to accumulate in the upper control chamber, causing the main valve to throttle closed, thereby limiting flow to the pilot setting. Should orifice differential pressure fall below pilot setting, the pilot releases accumulated pressure causing the main valve to modulate open. Should the solenoid close, pressure in the upper control chamber accumulates causing the main valve to shut off.
Normally Closed, Normally Open and Last Position models are available.
The needle valve controls the closing speed.
The one-way flow control needle valve **[6]** stabilizes the valve's reaction in hard regulation conditions, by restricting the flow out of the control chamber.
The downstream cock valve **[7]** enables manual closing.



Energized Solenoid
Flow Control Mode



De-energized Solenoid
Valve Closed

Pilot System Specifications

Standard Materials:

Pilot:
Body: Stainless Steel 316 or Bronze
Elastomers: Synthetic Rubber
Spring: Stainless Steel
Solenoid:
Body: Brass or Stainless Steel
Elastomers: NBR or FPM
Enclosure: Molded epoxy
Tubing & Fittings:
Stainless Steel 316 or Copper & Brass
Accessories:
Stainless Steel 316, Brass and Synthetic Rubber Elastomers
Orifice Assembly:
Body: Fusion Bonded Epoxy Steel or Stainless Steel
Orifice Plate: Stainless Steel

Solenoid Electrical Data:

Voltages:
(ac): 24, 110-120, 220-240, (50-60Hz)
(dc): 12, 24, 110, 220
Power Consumption:
(ac): 30 VA, inrush; 15 VA (8W), holding or
70 VA, inrush; 40 VA (17.1W), holding
(dc): 8-11.6W

Values might vary according to specific solenoid model

Notes:

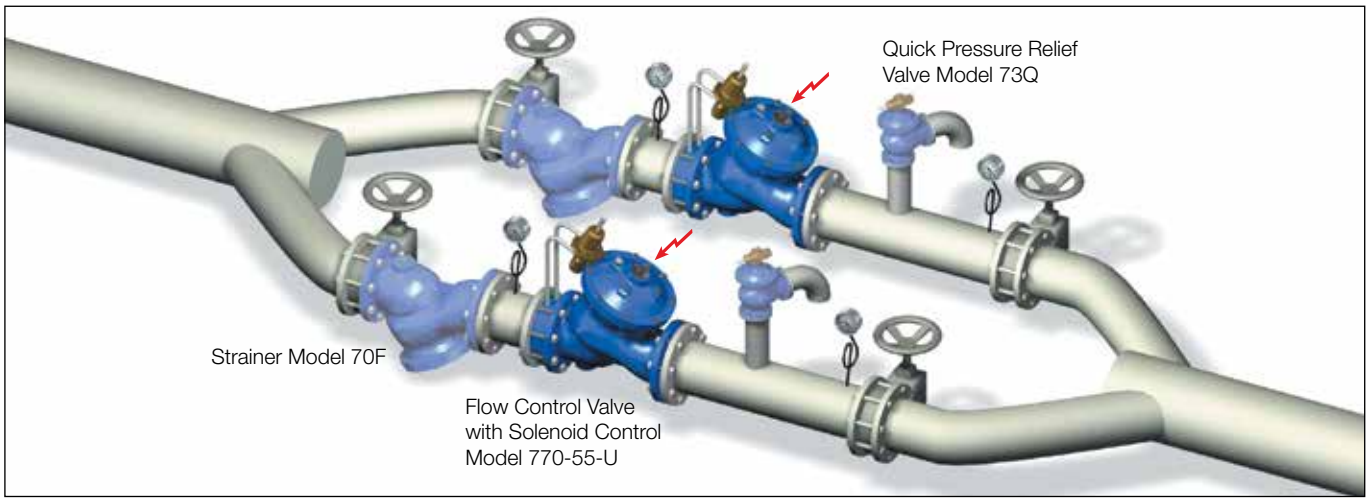
- Orifice diameter is calculated for each valve.
- Flow Setting Range:
  (-)15% & (+)25% from predetermined flow
- The orifice additional head loss is 0.2 bar ; 2.8 psi
- Orifice assembly adds 25mm ; 1" to valve length
- Recommended continuous flow velocity:
  0.3-6.0 m/sec ; 1-20 ft/sec
- Minimum operating pressure: 0.7 bar ; 10 psi.
  For lower pressure requirements consult factory
- When minimum head loss is essential and flow velocity is higher than 1.0 m/sec, consider using the Model 770-j equipped with a pitot tube flow sensor and high sensitivity flow pilot #7

Typical Applications

Parallel Valve Installation

In a distribution network, there is often a need to respond to several flow regimes. In flow control valves, the orifice limits the valve adjustment range to about ±15%. Parallel installation of two Model 770-55-U valves enable:

- Flow limiting for various flow regimes
- Equalizing operating hours between valves

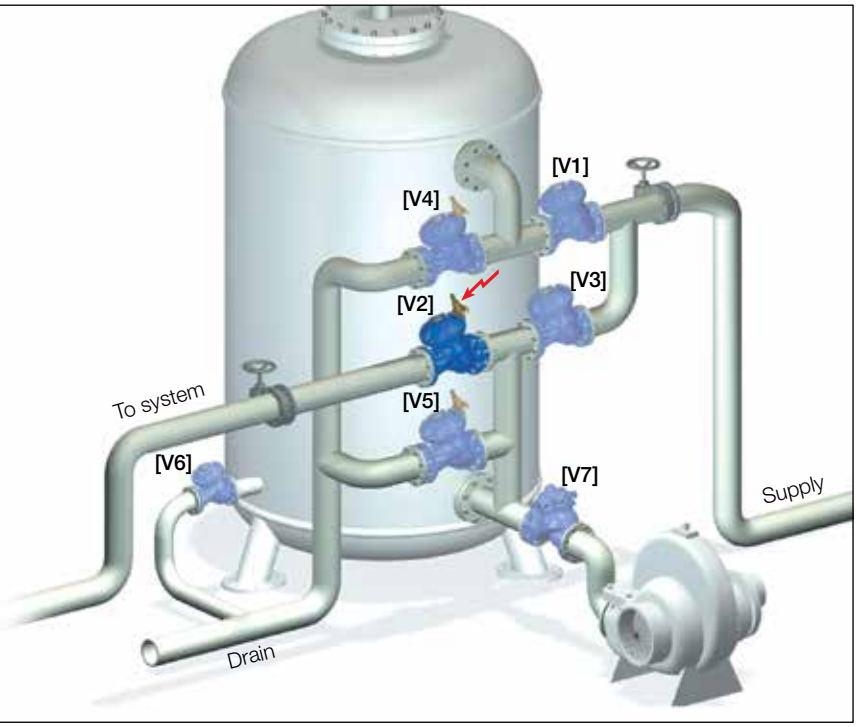


Filtration Systems

In a filter battery, installed as part of a water treatment system, excessive flow through any of the filters might cause:

- Unequal filter loading and blocking
- Reduced filter efficiency
- Structural damage to the filter element

The Model 770-55-U **[V2]** maintains the pre-set maximum flow through each of the filters. The solenoid control enables disconnecting each filter (in turn) from the filtration process allowing periodic back flushing.



[V1] Untreated water inlet - Model 710 (N.O.)
[V2] Treated water outlet - Model 770-55-U (N.O.)
[V3] Back flushing inlet - Model 710 (N.C.)
[V4] Back flushing outlet - Model 727-55-U (N.C.)
[V5] Rinse water outlet - Model 727-55-U (N.C.)
[V6] Scrubbing level drain - Model 710-B (N.C.)
[V7] Air scrubbing inlet - Model 710-B (N.C.)

See relevant BERMAD publications.

Technical Data

Size Range: DN40-900 ; 1½–36"
End Connections (Pressure Ratings):
Flanged: ISO PN16, PN25 (ANSI Class 150, 300)
Threaded: BSP or NPT
Others: Available on request
Valve Patterns: "Y" (globe) & angle, globe (DN600-900 ; 24"-36")
Working Temperature: Water up to 80°C ; 180°F
Standard Materials:
Body & Actuator: Ductile Iron
Internals: Stainless Steel, Bronze & coated Steel
Diaphragm: Synthetic Rubber Nylon fabric-reinforced
Seals: Synthetic Rubber
Coating: Fusion Bonded Epoxy, RAL 5005 (Blue) approved for drinking water or Electrostatic Polyester Powder

Differential Pressure Calculation

$$\Delta P = \left(\frac{Q}{(Kv;Cv)}\right)^2$$

ΔP = Differential Pressure for fully open valve (bar; psi)

Q = Flow rate (m^3/h; gpm)

Kv = Metric system - valve flow coefficient (flow in m^3/h at 1 bar ΔP with 15°C water)

Cv = US system - Valve flow coefficient (flow in gpm at 1 psi ΔP with 60°F water)

Cv = 1.155 Kv

VIBRANTZ TECHNOLOGIES™

vibrantz.com

Pyrolox®
Advantage

TECHNICAL MANUAL

NSF Certified to NSF/ANSI 61

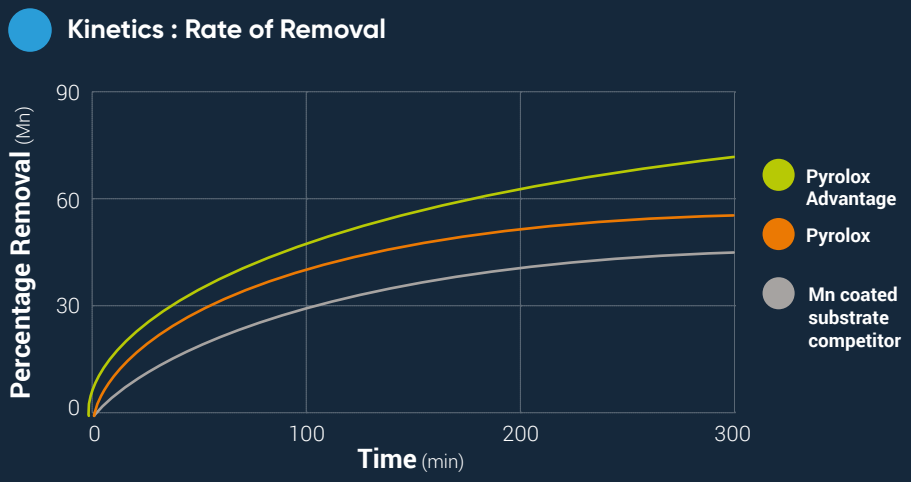
Capability

Pyrolox Advantage is the cleanest, lightweight solution for the removal or iron, manganese, arsenic, and/or hydrogen sulphide in water.

Pyrolox Advantage can be used to remove a range of soluble inorganic impurities from raw water by oxidation to insoluble form, precipitation, and flocculation. The media can be used in a catalytic configuration with a supplemental oxidant (eg. OCl- or dissolved O2) or as a depleted resource requiring regeneration or replacement (eg. cartridge)

Removal of Fe2+ & Mn2+

The most common application for this media is iron and manganese removal. Manganese minerals have a well-documented record of capability for removal of these species[1]. Pyrolox Advantage removes soluble ions by the same mechanism as natural ore products, but faster and with better efficiency at low contaminant concentration. Results of our kinetic measurements are given in the table below.



Pyrolox Advantage Value

vibrantz.com

Features	Customer Benefits
• **Lightweight** (engineered media with a lower density core and highest purity MnO2 surface)	✓ **Lower backwash rate** ✓ **Lower transportation costs** ✓ **Lower cost per cubic foot than competitive Mn coated products**
• **Highly porous surface area with durable, high-purity MnO2 coating**	✓ **Improved performance in Mn and Fe removal** ✓ **Allows for a smaller filter footprint** ✓ **Higher oxidation (higher removal capacity) than competing medias allowing for higher service flow rates**
• **True MnO2 coating** • **12.5% MnO2** (highest Mn content of any lightweight media)	✓ **No pre-treatment required** ✓ **Longer run times between backwash**
• **1,000 microns particle size** (by volume diffraction)	✓ **Does not stratify when used with sand in a mixed bed** (stays homogenous/mixed)
• **Engineered, quality-controlled product** (manufactured by Prince)	✓ **Cleanest start-up** (virtually no start up fines) ✓ **Reduced operational time and lower costs at the filter commissioning stage** ✓ **Directly certified by NSF** (not a 3rd party)
• **No regeneration required**	✓ **Does not require potassium permanganate or other chemicals** ✓ **Only requires sodium hypochlorite**
• **Engineered to be naturally catalytic** (mimicking pure manganese wore)	✓ **Provides high performance even without activation** ✓ **Will continue to perform its function in non-ideal conditions**

[1] *Removal of Soluble Manganese by Oxide-coated Filter Media, Knocke et al. (1991) https://doi.org/10.1002/j.1551-8833.1991.tb07201.x*

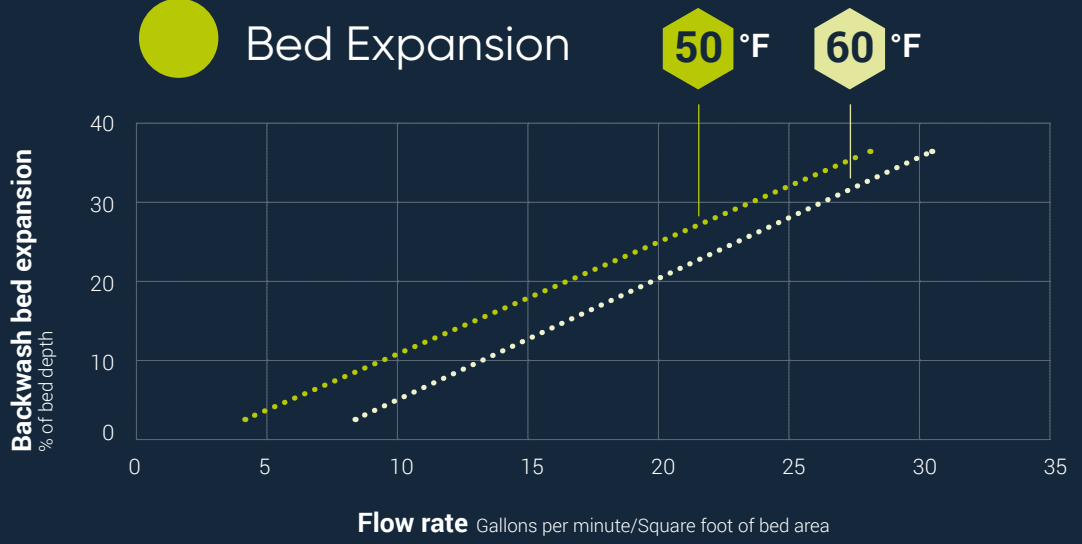
Backwash	Time 5 minutes	
Minimum Bed Depth	300mm	12 in
Minimum Empty Bed Contact Time EBCT	4 minutes	
Adsorption Capacity	Mn 1000 mg / kg	Fe > 10000 mg / kg

Bed Expansion



Pyrolox Advantage

[2] *Range of tapped to loose bulk density 1300 - 1500 kg/m^3 (81 – 94 lb/ft^3)*
[3] *Range represents the 5 % to 95 % retained on mesh*
[4] *Mn-based media are not suitable for treating water below pH 6.2 (BS:EN 13752:2012)*

Use of Product

Selection

Media depth, volume, and flow rate must be selected to optimise the bed contact time and achieve the desired reduction in contaminant concentration.

Commissioning

Pyrolox Advantage is engineered to be naturally catalytic (mimicking pure manganese ore) so it provides high performance even without activation. We acknowledge that the filter installation will require sterilization prior to use; the use of sodium hypochlorite is recommended and has no detrimental effect on the media. The use of hydrogen peroxide is not recommended at any stage based on the advice of BS:EN 13752:20125; it can lead to increased manganese concentrations if used with any manganese- based media.

Use

Pyrolox Advantage can be used in gravity or pressurized systems. Treated water should be monitored and regular backwashing performed. In catalytic configuration, the incoming raw water requires 60% oxygen saturation for optimum removal of iron and hypochlorite (OCl-) levels commensurate with the manganese concentration.

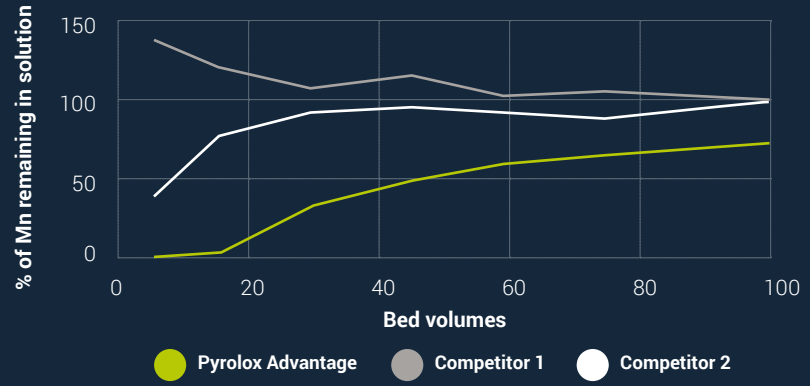
Where the level of dissolved oxygen is insufficient. Cl2 demand can be estimated from the level of Fe and Mn in the raw water as follows:

Cl2 1:1 Fe (mg/L)
Cl2 2:1 Mn (mg/L)

Backwash

Iron and manganese are precipitated and retained by the filter media. Periodic backwashing is required to ensure the efficiency of the filter media. Excessive run time without backwashing, or incomplete backwashing, will reduce the filter efficiency and deplete the oxidation capacity of the media surface. Maximum run time should be determined by the filter designer specific to the raw water composition. Typical bed expansion is 20%-30%.

Pyrolox Advantage is the Only Manganese Coated Media that Removes Almost 100% of Mn at Start-up



- **Does not depend on activation to perform**
- **Engineered to be naturally catalytic (out of the box catalytic)**
- **Does not require potassium permanganate**

[5] *Products used for treatment of water intended for human consumption. Annexe A*

Regeneration

In catalytic use, the media does not require regeneration. If media is used without sufficient dissolved oxygen or oxidising source (eg. hypochlorite) the surface will become depleted and require regeneration. Regeneration can be achieved using only sodium hypochlorite, but the time and concentration must be determined by the user. Pyrolox Advantage does not require potassium permanganate or other chemicals.

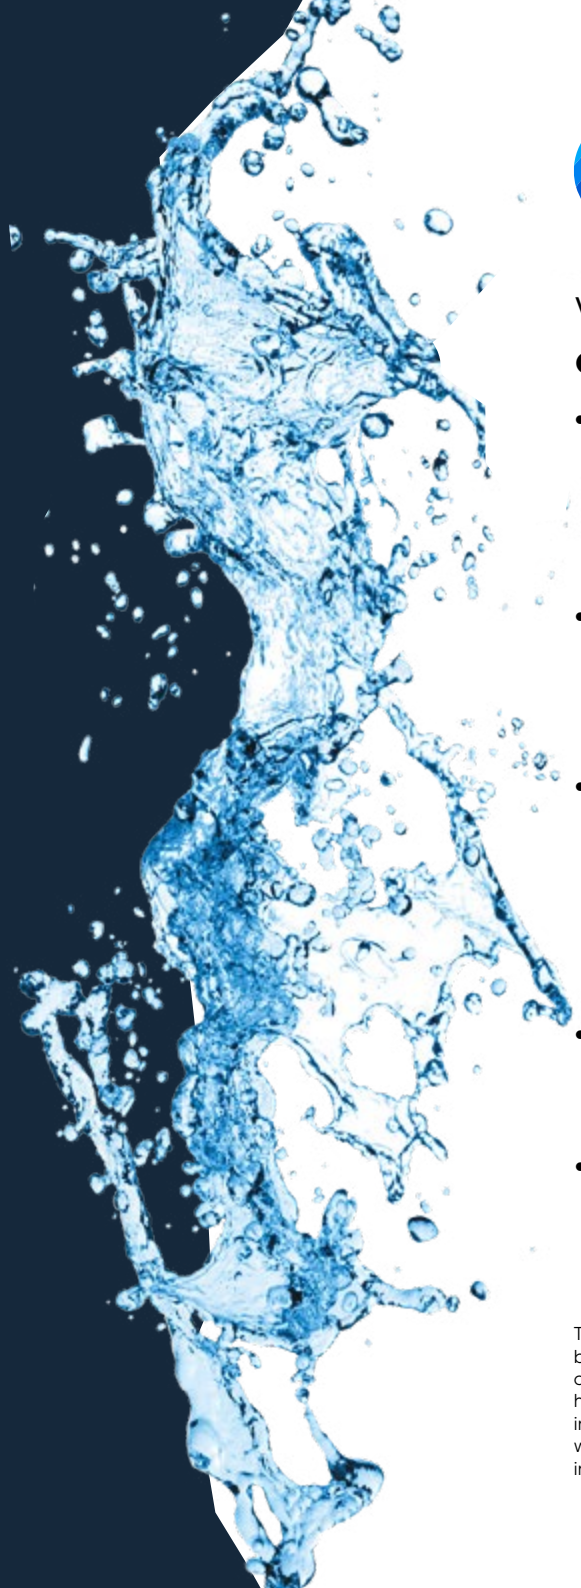
We recommend hypochlorite for compliance with local regulations and optimum performance. Where existing procedures allow for the use of other oxidants with Mn-based media these can be
used with our Pyrolox range but care should be taken for pressure relief and monitoring of Mn removal efficacy.

Removal of As3+

Pyrolox Advantage can be used to remove soluble arsenic indirectly by co-precipitation with Fe. This requires either the presence of Fe in the raw water or the addition of Fe ahead of the filter system. Pyrolox Advantage has no inherent capacity to remove arsenic ions and should not be used non-catalytically for the treatment of arsenic-contaminated raw water in the
absence of soluble iron.

Typical application requires Fe : As ratio of 30:1. Co-precipitation and removal is a function of bed-contact, pH and ion concentration. For this reason, Vibrantz recommends that filter designers pilot a small installation to confirm efficacy for specific situations. When treating water with > 10 ppb As it may be necessary to add a second polishing stage to the process.

Pyrolox Advantage



VIBRANTZ TECHNOLOGIES™

Vibrantz is the go-to for all **manganese dioxide** filter media needs

- **World leader in manganese chemicals**
  - ✓ Broadest manganese filter media product range
  - ✓ we have combined our proprietary aggregates coating process with our world class synthetic manganese dioxide production
  - ✓ ISO 9001 certification at all Vibrantz manufacturing locations
- **Technical expertise**
  - ✓ Manganese water treatment lab in the UK
  - ✓ Collaboration with Cranfield University for testing
  - ✓ Product testing & analytical services for manganese media
- **Responsiveness & flexibility of supply**
  - ✓ Not traded - products are manufactured by Vibrantz
  - ✓ Quality, consistency, and availability direct from the manufacturer
  - ✓ Strong production base & backup production locations
  - ✓ NSF Certified
  - ✓ For the European market, we control the specification to BS EN 13752:2012
- **Security of raw material supply**
  - ✓ Only select high quality raw materials from mines with long term reserves
  - ✓ Long term relationships with first and second source suppliers
- **Global distribution**
  - ✓ Regional sales force
  - ✓ Ships internationally

The information and recommendations contained herein are based on data we believe to be reliable and does not imply any warranty or performance guarantee, as conditions and methods of use of our products are beyond our control. The data herein is determined using Vibrantz's standard test methods. Hazard and safety information with respect to this product is available in the applicable SDS. Vibrantz will not be liable under any circumstance for consequential or incidental damages, including but not limited to, lost profits resulting from the use of our products.

NOTES:

SRL (State Reporting Level): indicates the minimum reporting level required by the Washington Department of Health (DOH).
MCL (Maximum Contaminant Level) maximum permissible level of a contaminant in water established by EPA; Federal Action Levels are 0.015 mg/L for Lead and 1.3 mg/L for Copper. Sodium has a recommended limit of 20 mg/L. A blank MCL value indicates a level is not currently established.
Trigger Level: DOH Drinking Water Response level. Systems with compounds detected in excess of this level are required to take additional samples. Contact your regional DOH office.
ND (Not Detected): indicates that the parameter was not detected above the Specified Reporting Limit (SRL).
An * in front of the parameter name indicates it is not NELAP accredited but it is accredited through WSDOH or USEPA Region 10.

These test results meet all the requirements of NELAC, unless otherwise stated in writing, and relate only to these samples.
If you have any questions concerning this report contact Lawrence J Henderson, PhD, Director of Laboratories, Vice President, at the toll-free phone number above.

Testing Performed by: _____

Date(s): _____

FACET

South Whidbey Parks & Rec District – Iron and Manganese Treatment System
Full-Scale Pilot Test Instructions

1. Turn flow control solenoid valve to OFF.
2. Set pumphouse valves for filter to waste operations.
3. Set chlorine metering pump manual speed setting to the percentage indicated on the plans.
4. Turn flow control solenoid valve to AUTO.
5. Confirm the chlorine metering pump is running.
6. Let well pump run for 15 minutes.
7. Measure free and total chlorine residuals of treated water.
8. If free chlorine residual is approximately 1.0 mg/L and total chlorine residual is 1.2 mg/L or less, proceed to Step 9. If free and total chlorine residuals are not as specified, consult with the engineer, adjust chlorine metering pump manual speed setting, and repeat Steps 6 through 8.
9. Record the chlorine metering pump manual speed setting that satisfies the requirements of Step 8 on the *Full-Scale Pilot Test Worksheet*.
10. Turn flow control solenoid valve to OFF.
11. Set pumphouse valves for filter to reservoir operations.
12. On the filter control panel, set the backwash frequency to 50 hours of filter run time.
13. Manually initiate backwash cycle on filter control panel.
14. Turn flow control solenoid valve to HAND.
15. During backwash, confirm backwash meter is reading the correct backwash flow rate as indicated on the plans. Adjust backwash throttling valve as required. Once backwash flow rate requirement is satisfied, record backwash flow rate the *Full-Scale Pilot Test Worksheet*.
16. Manually initiate one full backwash cycle with the backwash flow rate setting indicated on the plans. Observe complete backwash cycle and confirm target backwash flow rate and duration are maintained throughout the duration of each individual filter backwash.
17. Turn flow control solenoid valve to AUTO.
18. Start full-scale pilot test run. Collect and record all data requested on the *Full-Scale Pilot Test Worksheet*. Label all water quality samples for laboratory testing as either “Raw Water” or “Treated Water” and label with the corresponding “Approximate Filter Run Time (Hours)” value at the time the samples are collected. The well and treatment system should both be running for a minimum of 15 minutes before and during all sample collections.
19. Continue validation test run until the filters have been run for 30 hours and all requested data and water quality samples have been collected.
20. Manually initial one full backwash cycle.
21. On filter control panel, set backwash frequency to 12 hours of filter run time.
22. Send completed *Validation Test Worksheet* and water quality laboratory results to engineer.

Appendix I. Purification Plant Criteria Worksheet

Operator Certification

Water Treatment Purification Plant Criteria Worksheet

331-749 • June 2024

ABC Classification: WTPO

WTP Address & Contact Person		System Name
Plant Name/Source Numbers South Whidbey Parks & Rec District/Source 02		**System ID#** 02660 E
Address Physical: 5475 Maxwelton RD Contact: Jeffrey J. Olson, PO Box 699		
City Physical: Langley Contact: Newberg	**State** Physical: WA Contact: OR	**Zip Code +4** (Link to USPS Zip Code Lookup) Physical: 98260-0136 Contact: 97132
Phone Number (503) 554-8333		**Fax Number** (If applicable.) Fax number

A groundwater supply with only chlorination is considered a distribution system, not a water treatment facility. The addition of any chemical to a public water supply, other than a disinfectant, will be considered a treatment facility and should use this rating worksheet to determine the classification of the facility.* Unless otherwise noted, give full amount of points in the "Your Plant" box.

**With the exception of unit processes installed to allow in-line fluoridation, in-line chlorination, or chemical addition to inhibit corrosion are not included within the scope of the term "water treatment plant" per WAC 246-292-040(c).*

Example Table

Raw water quality is subject to or has elevated:	Points	Your Plant
Correct: Taste and/or odor levels	3	3
Incorrect: Taste and/or odor levels	3	1

***Note**: Do not double count. If the plant has two horizontal-flow (rectangular basins), DO NOT give 10 points, give 5 points. If the plant has more than one type of unit for each process, give points once for each unit.*

Item	Points Possible	Your Facility
Size		
Design flow average day, or peak month s average day, whichever is larger (1 point per 0.5 MGD. Round up.) Design flow: Consider this to be the design capacity of the plant. Examples: 9.2 MGD = 19 points, 4.7 MGD = 10 points (20 points maximum allowed)	1 – 20	1
Water Supply Sources (Rating based on public health significance)		
Seawater/saltwater	0	0
Groundwater	0	0
Groundwater under direct influence of surface water (GWI)	8	0
Surface water	10	0
Average Raw Water Quality Variation—Applies to all sources (surface and groundwater). Key is the effect on treatment process changes that would be necessary to achieve optimized performance. • Little or no variation—no treatment provided except disinfection (0 points) • Minor variation, e.g. "high quality" surface source appropriate for slow sand filtration (1 point) • Moderate variation in chemical feed, dosage changes made: monthly (2 points), weekly (3 points), or daily (4 points) • Variation significant enough to require pronounced and/or very frequent changes (5 points) • Severe variation—source subject to non-point discharges, agricultural/urban storm runoff, flooding (7 points) • Raw water quality subject to agricultural or municipal waste point source discharges (8 points) • Raw water quality subject to industrial waste pollution (10 points)	0 – 10	2
Raw water quality is subject to:		
• Taste and/or odor for which treatment process adjustments are routinely made	2	0
• Color > 15 CU (not due to precipitated metals). See exceptions in note at end of Example Table, page 1.	3	0
• Iron or/and manganese > MCL: Fe (2 points), Mn (3 points) (3 points maximum allowed) ○ See exceptions in note at end of Example Table, page 1.	2 – 3	3
• Algal growths for which treatment process adjustments are routinely made	3	0
Chemical Treatment/Addition Processes		
Fluoridation	4	0
Disinfection/Oxidation *(Note: Points are additive to a maximum of 15 points allowed for this category.)* CHECK _X_ ALL THAT APPLY: Chlorination: • Hypochlorites (5 points) X ○ If generated on site (add 1 point) ○ Chlorine gas (8 points) ○ Chloramination (10 points) ○ Chlorine dioxide (10 points) • Ozonation (10 points) • UV Irradiation (2 points) • Iodine, Peroxide, or similar (5 points) • Potassium permanganate (4 points) [If used with greensand filtration do not give 4 points]	0 - 15	5
pH adjustment for process control (e.g., pH adjustment aids coagulation)	4	0
Stability or Corrosion Control (If the same chemical is used for both Corrosion Control and pH adjustment, count points only once)	4	0

Item	Points Possible	Your Facility
Coagulation/Flocculation & Filter Aid		
Primary coagulant addition	6	0
Coagulant aid/Flocculant chemical addition (in addition to primary coagulant use)	2	0
Flocculation	2	0
Filter aid addition (Non-ionic/anionic polymers)	2	0
Clarification/Sedimentation		
Sedimentation (plain, tube, plate)	4	0
Contact adsorption	6	0
Other clarification processes (air flotation, ballasted clarification, etc.)	6	0
Up-flow clarification ("sludge blanket clarifier") [2]	8	0
Filtration		
Granular media filtration (Surface water/GWI) ≤ 3 gpm/sq ft	10	0
Granular media filtration (Surface water/GWI) > 3 gpm/sq ft	20	0
Groundwater filtration	6	6
Membrane filtration • For compliance with a primary regulation (10 points) • For compliance with a secondary regulation (6 points)	6 - 10	0
Diatomaceous earth (pre-coat filtration)	10	0
Cartridge/bag	5	0
Pre-filtration (staged cartridges, pressure sand w/o coagulation, etc.): add one point per stage to maximum of 3 points	1 – 3	0
Slow sand	5	0
Other Treatment Processes		
Aeration	3	0
Air stripping (including diffused air, packed tower aeration)	5	0
Ion-exchange/softening	5	0
Greensand filtration	10	0
Lime-soda ash softening (includes chemical addition, mixing/flocculation/clarification/filtration—do not add points for these processes separately)	20	0
Granular activated carbon filter (do not assign points when included as a bed layer in another filter)	5	0
Powdered activated carbon	2	0
Blending sources with significantly different water quality • To achieve MCL compliance (4 points) • For aesthetic reasons (2 points)	2 – 4	0
Reservoir management employing chemical addition	2	0
Electrodialysis	15	0
Other: Certification authority may assign 2 to 15 additional points for processes not listed elsewhere in this document. (Specify) Click or tap here to enter text.	2 – 15	0
Residuals Disposal		
• Discharge to surface, sewer, or equivalent (0 points) • On-site disposal, land application (1 point) • Discharge to lagoon/drying bed, with no recovery/recycling, e.g. downstream outfall (1 point) • Backwash recovery/recycling: discharge to basin or lagoon and then to source (2 points) • Backwash recovery/recycling: discharge to basin or lagoon and then to plant intake (3 points)	0 – 3	1

Item	Points Possible	Your Facility
Facility Characteristics		
Instrumentation—Use of SCADA or similar instrumentation systems to provide data, with: • Monitoring/alarm only, no process operation—plant has no automated shutdown capability (0 points) • Limited process operation, e.g. remote shutdown capability (1 point) • Moderate process operation—alarms and shutdown, plus partial remote operation of plant (2 points) • Extensive or total process operation—alarms and shutdown, full remote operation of plant possible (4 points)	0 - 4	0
	TOTAL	18

See WAC 246-292-050 for minimum certification requirements.

Class I	30 points or less	Class III	56-75 points
Class II	31-55 points	Class IV	76 points and greater

Form Completed by	Kristopher Keenan, PE
Phone	(360) 331-4131 ext. 211
Date	1/32/2025

Notes

[1]**Raw water quality** is subject to:

- Taste and/or odor for which treatment process adjustments are routinely made (2 points). 1) T&O issue has been identified in a pre-design report, etc., 2) a process has been installed to address, and 3) operational control adjustments are made at least seasonally. Do not give points for T&O when there is no specific additional impact on operation. E.g. if a system is already pre-chlorinating for disinfection, give no points for T&O.
- Color > 15 CU (not due to precipitated metals) (3 points) with following exceptions. Color will be considered elevated and points assigned when levels exceed 75 Color Units (CU) for conventional filtration, 40 CU for direct filtration, or 15 CU for all other technologies, except reverse osmosis (no points given for color for reverse osmosis).
- Iron and/or manganese > MCL: Fe (2 points), Mn (3 points) (3 points maximum allowed) ***with following exceptions.*** Iron and manganese levels will be considered elevated and points assigned if they are greater than the MCL, except for applications of manganese greensand filters. For applications of manganese greensand filters, iron and manganese levels will be considered elevated when their combined level exceeds 1.0 mg/L (3 points allowed).
- Algal growths for which treatment process adjustments are routinely made (3 points). Raw water will be considered subject to algae growths when treatment processes are specifically adjusted due to the presence of high levels of algae on at least a weekly basis for at least two months each year.

[2]**Upflow clarification** ("sludge blanket clarifier")—8 points. Also known as sludge blanket clarification. Includes such proprietary units as Super-Pulsator. These units include processes for flocculation and sedimentation. Important note: these are not the same as adsorption clarifiers.

Water Treatment Definitions

Definitions reprinted from Glossary of Water and Wastewater Terms, used with permission from Office of Water Programs, California State University, Sacramento.

Adsorption

The gathering of a gas, liquid, or dissolved substance on the surface or interface zone of another material.

Aeration

The process of adding air to water. Air can be added to water by passing air through water or passing water through air.

Air stripping

A treatment process used to remove dissolved gases and volatile substances from water. Large volumes of air are bubbled through the water being treated to remove (strip out) the dissolved gases and volatile substances.

Chloramination

The application of chlorine and ammonia to water to form chloramines for the purpose of disinfection.

Diatomaceous earth

A fine, siliceous (made of silica) "earth" composed mainly of the skeletal remains of diatoms.

Direct filtration

A method of treating water which consists of the addition of coagulant chemicals, flash mixing, coagulation, minimal flocculation, and filtration. The flocculation facilities may be omitted, but the physical-chemical reactions will occur to some extent. The sedimentation process is omitted.

Electrodialysis

The selective separation of dissolved solids on the basis of electrical charge, by diffusion through a semipermeable membrane across which an electrical potential is imposed.

Reverse osmosis

The application of pressure to a concentrated solution which causes the passage of a liquid from the concentrated solution to a weaker solution across a semipermeable membrane. The membrane allows the passage of the water (solvent) but not the dissolved solids (solutes).

SCADA system

The Supervisory Control And Data Acquisition system is a computer-monitored alarm, response, control and data acquisition system used by drinking water facilities to monitor their operations.

Stabilization

Processes that convert organic materials to a form that resists change. Organic material is stabilized by bacteria which convert the material to gases and other relatively inert substances. Stabilized organic material generally will not give off obnoxious odors.

Ferry Information – Mukilteo/Clinton

Current Round Trip Fare information. Annual adjustments usually go into effect in October and are published in August. Washington State Ferries (WSF) also sells Multi-Ride Commuter Cards (see pricing below). Multi-ride commuter cards can only be used for vehicles under 22' long.

Fare Description	Quantity	Cost
Passenger		
Adult (age 19 - 64)	0	$6.25
Senior (age 65 & over) / Disability	0	$3.10
Youth (age 18 and under)	0	*No Charge*
Multi-Ride Commuter Card 10 Ride	0	$50.45
WSF Monthly Pass 31 Ride	0	$80.70
Bicycle Surcharge Only (19 and over)	0	$1.00
Vehicle, Motorcycle, and Stowage Fares		
Vehicle Under 14' (less than 168") & Driver	0	$21.90
Vehicle Under 22' (standard veh) & Driver	0	$27.80
Vehicle U14' (less than 168") & Sr/Disability Driver	0	$18.70
Vehicle U22' (standard veh) & Sr/Disability Driver	0	$24.60
Multi-Ride Commuter Card - Vehicle U14' & Driver 20 Ride	0	$141.95
Multi-Ride Commuter Card - Vehicle U22' & Driver 20 Ride	0	$179.05
Motorcycle & Driver / Stowage Fare	0	$12.10
Motorcycle & Senior/Disability Driver / Stowage Fare	0	$8.90
Multi-Ride Commuter Card - Motorcycle & Driver 20 Ride	0	$80.30
Vehicle Length-Based		
Vehicle Under 30' Under 7'2 in.	0	$41.20
Vehicle Under 30' Over 7'2 in.	0	$81.40
Vehicle Under 40'	0	$108.20
Vehicle Under 50'	0	$135.00
Vehicle Under 60'	0	$161.80
Vehicle Under 70'	0	$188.60
Vehicle Under 80'	0	$215.40
Cost per foot over 80'	0	$2.70

Business Accounts:

https://wsdot.wa.gov/travel/washington-state-ferries/tickets/business-accounts

Business Accounts let companies provide their employees with an easy way to pay their fares. WSF will issue as many charge cards as the company needs. These cards can be used to pay for any fare or multi-ride product available at vehicle and passenger tollbooths. Companies will be billed monthly and must be paid by check only.

Commercial and oversized vehicles on ferries:

https://wsdot.wa.gov/travel/washington-state-ferries/rider-information/commercial-and-oversized-vehicles-ferries

Notes:

1. The normal schedule is a ferry every 30 minutes and the trip takes about 20 minutes.
2. Reservations are not available for the Mukilteo/Clinton route.
3. It is critical for GCs to look at commercial and oversized vehicle web page listed above. Oversize and/or Overweight vehicles require at least 2-day advance notice to WSF.
4. Clearance height varies by ferry – drivers will need to check schedule pages for vessels in use on Mukilteo/Clinton route each travel day as they can change.
5. Vehicles over 40’ long should arrive 45 minutes to 1 hour ahead of the ferry they want to catch

Date published: June 2, 2025
